firing position of piston No. 5 with flywheel mark '4 o 5' 15/16" before this point (manual spark control advanced). Then loosen lock screws on movable sub-plate (carrying second set of contacts), shift plate until contacts begin to open, tighten lock screws, check contact gap.

Synchronization of Contacts—Second Method. Use special Auto-Lite synchronizing tool and follow complete directions in Equipment Section.

Firing Order:—1-4-7-3-8-5-2-6. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set gaps at .026-.030".

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven by two-sprocket non-adjustable chain drive from crankshaft. Sprockets are marked. To set timing, with crankshaft turned so that pistons Nos. 1 and 8 are on top dead center and with camshaft turned so that No. 1 intake and exhaust valves are closed with .020" (intake), .026" (exhaust) tapppet clearance, mesh chain so that there are nine open links or ten pins between marks on sprockets (begin count with pin in line with tooth meshed opposite mark on crankshaft sprocket and mesh tooth in line with the tenth pin opposite mark on camshaft sprocket.

To Check Valve Timing. With No. 1 piston on top dead center entering power stroke, set tappet clearance of No. 1 valves at .020" (intake), .026" (exhaust). Turn engine over one complete revolution and stop with piston on top dead center with flywheel mark '1 o 8' in center of inspection hole in flywheel housing. Both No. 1 valves should be closed at this point. Reset tappet clearance at .018" (intake and exhaust) with engine warm.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1.494-1.504"	.3405-.3415"	45°	11/32"
Exhaust	1.338-1.348"	.3405-.3415"	45°	11/32"

	Operating Tappet Clearance	Timing
Intake	.018" (hot)	.020" opening side) .026" closing side)
Exhaust	.018" (hot)	.020" (opening side) .026" closing side)

Valve Springs

8 Coil Spring—Closed—16-20 pounds—2¼". Open—42-46 pounds—1 29/32"
5½ Coil Spring—Closed—17-21 pounds—2¼". Open—44-48 pounds—1 29/32"

Intake Valves	Valve Timing	Exhaust Valves
Open—at top dead center.		Open—40° before lower dead center.
Close—40° after lower dead center.		Close—At top dead center.

CARBURETION:—Stromberg Updraft Carburetor, Model UUR-2 (see Carburetor Section for complete data). Manifold heat control and choke control operated manually by buttons on instrument panel.

Fuel Pump:—Stewart-Warner Mechanical type operated by eccentric on camshaft (see Carburetion Section).

Gasoline and Oil Gauge:—Stewart-Warner electric combination gasoline and oil gauge (see Carburetion Section). Gasoline gauge registers whenever ignition is turned 'on'. The same dial functions as an oil gauge by pulling out button at right center of instrument panel.

STARTER:—Model MAD-4118. Starter drive—Outboard Bendix with switch mounted on starter field frame and operated through flexible cable control by button at lower left of instrument panel. Starter rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces on each brush.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3750	5.5	58
.7 "	2360	5.5	100
3.0 "	1260	5.0	200
5.7 "	770	4.5	300
8.8 "	425	4.0	400
13.0 "	Lock	3.0	500
20.2 "	Lock	4.0	730

Mounting:—Sleeve mounted in front of flywheel housing at left of engine. To remove, disconnect cable and switch control, take out large pilot mounting screw in housing above starter sleeve, pull starter forward to clear Bendix housing, lift out.

Oiling:—1000 Miles. Put 5-6 drops light engine oil in oiler at drive end of armature. Commutator end bearing is oilless.

GENERATOR:—Model GAR-4317. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate 17 amperes (cold) at 8.0 volts reached at 1775 R.P.M.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting stud counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	675	0	6.4	740
4	6.8	820	4	6.9	925
8	7.0	950	8	7.3	1100
12	7.4	1120	12	7.7	1420
16	7.8	1400	13.4	8.0	1875
17	8.0	1775	8.5	7.4	3200
9	7.2	3200			

Brush Spring Tension:—17-22 ounces on each brush.

Field Current:—4.56-5.04 amperes at 6.0 volts across field terminals.

Motoring:—5.17-5.72 amperes at 6.0 volts.

Field Fuse:—7½ ampere capacity.

Mounting:—Flange mounted on left hand front motor support arm and driven by the fan belt. To remove, disconnect lead, loosen mounting bolts, swing generator toward engine and slip off drive belt, take out flange mounting bolts, lift generator out.

Belt Adjustment. Belt should be inspected and adjusted, if necessary, at 1000-mile intervals. To take up belt, loosen clamp bolt and pivot bolts, swing generator away from engine until correct belt tension is secured, tighten mounting bolts. Belt should be just tight enough to drive generator and fan without slipping.

Oiling:—1000 Miles. Put 5-6 drops light engine oil in oiler at each end.

RELAY:—Model CB-4011. Mounted on generator field frame. Contacts close at 675 R.P.M. when generator voltage reaches 7-7.5 volts with charging current of approximately 2 amperes and open with discharge current of .5-2.5 amperes.

Contact Gap:—.025-.035". **Air Gap:**—.010-.030 inch with contacts closed.

LIGHTING:——Soreng-Manegold Switch, Model D-5670-A. Dimmer Switch Model A-2100-A. Lighting switch mounted on back of instrument board and controlled by push-pull button at lower right center of instrument panel. Double filament headlight bulbs are used for 'depressed beam' dimming and are controlled by foot-operated dimmer switch on toeboard.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Parking Bulbs	6-8	3	S.C.	63
Instrument and Tail Lights	6-8	3	S.C.	63
Stop Lights	6-8	15	S.C.	87
Pillar (Corner) Lights	6-8	6	S.C.	81

FUSES:—20 ampere capacity lighting fuse mounted on back of lighting switch. 20 ampere capacity horn fuse mounted on junction block on engine front splash shield. 7½ ampere capacity field fuse mounted on generator.

HORNS:—Sparton Twin horns mounted under headlights.

HUPMOBILE

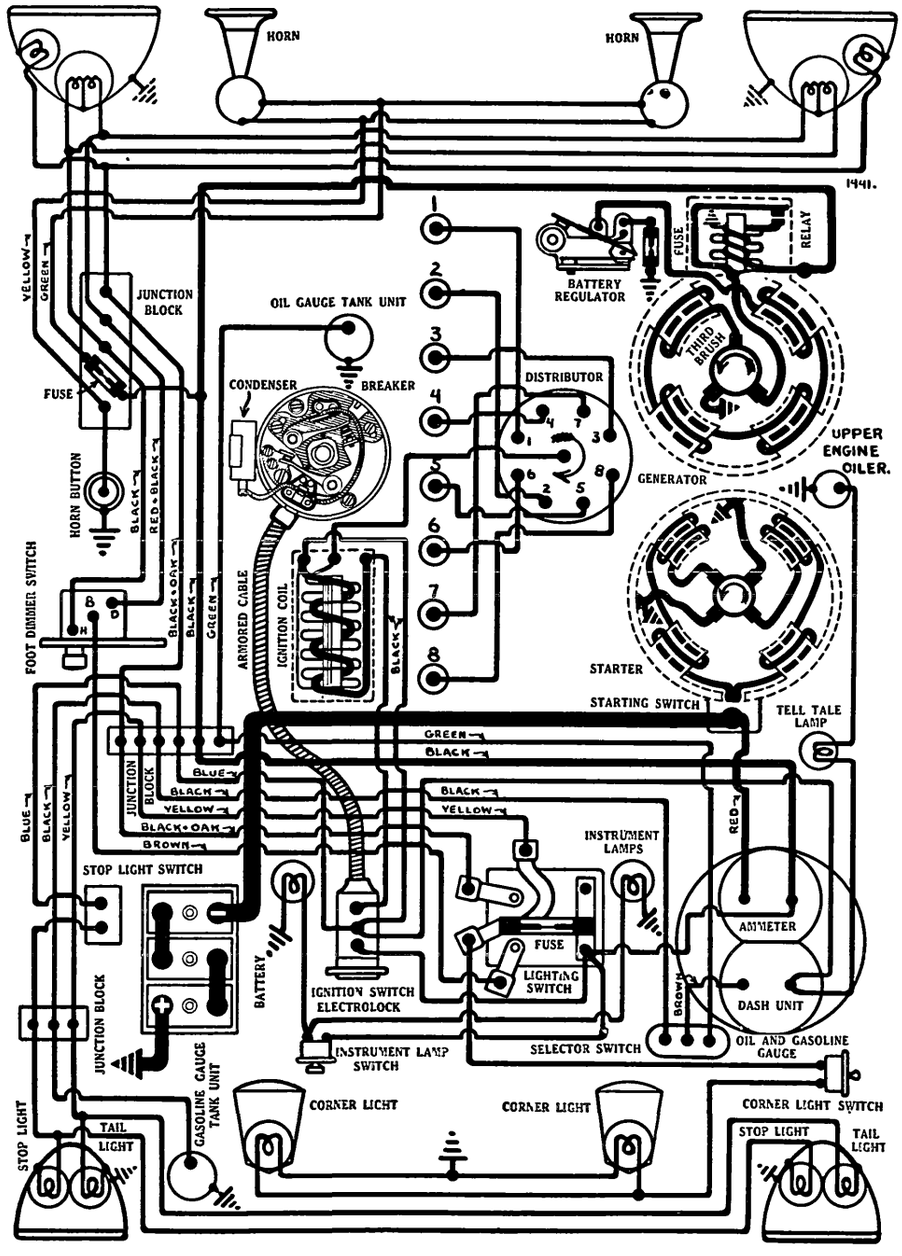
SERIES 326, MODEL I (1933), SERIAL NUMBERS I-5751 UP
SERIES 426 (1934)
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On plate on right hand side of dash under hood.

ENGINE NUMBER:—Stamped on left hand side of center of crankcase.

ENGINE:—Eight cylinder 'in line', 'L' head type, 3 3/16x4¾" bore and stroke, 303.2 cubic inch displacement, rated at 32.51 H.P., develops 109 H.P. at 3500 R.P.M. Standard compression ratio 5.35-1. No optional compression ratios are offered.

BATTERY:—**Willard, Type WH-2-15,** 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate). Starting capacity 140 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to frame.
Mounting:—Battery mounted on left frame member under driver's seat.
Dimensions:—Width, 7 1/16". Length, 10 5/16". Height, 9 5/16".



IGNITION:—**Coil Model CE-4402.** Coil mounted on left hand side of engine
Ignition Current:—1-3 amperes at 6 volts (engine running), 3-4.5 amperes at 6 volts (engine stopped).
Ignition Switch:—**Electrolock, Type 5-B.** Assembled as unit with coil (see Equipment Section for complete data).
Distributor Model IGH-4021-A. Two-breaker, 4-lobe cam, semi-automatic advance type. Breaker contacts open alternately at 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized (see Timing). Manual advance controlled by button at lower right of instrument panel. Pulling out spark control button retards spark. Maximum manual advance (with button pushed in) is 26° (engine).
Breaker Gap:—Set contact gaps at .020-.022".
Breaker Arm Spring Tension:—16-20 ounces measured at tip of breaker arm with spring scale at right angles to back of arm.
Cam Angles—Closed 34.5°. Open 10.5° (distributor) when synchronized.

Automatic Advance

Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	400	0	800
2	760	4	1520
4	1140	8	2280
6.5	1600	13	3200

Mounting:—Distributor mounted on right hand side of cylinder head. Electrolock must be removed as unit with distributor (see Equipment Section for complete instructions on removing Electrolock from distributor). To remove distributor, disconnect all wiring on Electrolock and free Electrolock from dash, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.
Oiling:—**1000 Miles.** Put 8-10 drops light engine oil in oiler on distributor.

IGNITION TIMING:—Standard Setting 9° or 1" (flywheel), .0365" (piston travel before top dead center with manual spark control advanced.
To Set Ignition Timing:—First advance manual spark control (push button in toward dash) and see that distributor is rotated counter-clockwise to limit of advance arm slot, take off cover over inspection hole in top of flywheel housing at right of engine. With No. 8 piston on compression stroke, turn engine over by hand until piston reaches firing position with ignition mark '/' on the flywheel in the exact center of the inspection hole. This mark is 9° or 1" before the top dead center mark '1 o 8'. Then loosen clamp bolt in advance arm, rotate distributor until first or 'fixed' set of contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, see that rotor is directly opposite No. 8 segment in distributor cap (see diagram), connect spark plugs as indicated. Distributor must then be synchronized to complete timing operation.
Synchronization of Contacts. No flywheel mark is provided for advanced timing point for cylinder No. 5 but a mark can be made on flywheel 1 inch before top dead center mark '4 o 5' for synchronization. After fixed contacts have been timed to engine (above), turn crankshaft 90° or ¼ revolution to firing position of piston No. 5 with flywheel mark '4 o 5' 1" before this point (manual spark control advanced). Then loosen lock screws on movable sub-

HUPMOBILE

SERIES 426 (1934)
AUTO-LITE SYSTEM

plate (carrying second set of contacts), shift plate until contacts begin to open, tighten lock screws, check contact gap.

Synchronization of Contacts—Second Method. Use special Auto-Lite synchronizing tool and follow complete directions in Equipment Section.

Firing Order:—1-4-7-3-8-5-2-6. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set gaps at .026-.030".

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is chain driven from crankshaft in tandem with generator sprocket. Sprockets are marked. To set timing, with crankshaft turned so that pistons Nos. 1 and 8 are on top dead center and camshaft turned so that No. 1 intake and exhaust valves are closed with tappet clearance of .020" (intake), .026" (exhaust), mesh chain so there are 11 links or 12 pins between marks on camshaft sprocket and crankshaft sprocket.

To Check Valve Timing. With piston No. 1 on top dead center entering power stroke set tappet clearance of No. 1 valves at .020" (intake), .026" (exhaust). Turn engine over one complete revolution and stop with piston on top dead center with flywheel mark '1-8' in exact center of inspection hole in flywheel housing. Both No. 1 valves should be closed at this point. Reset tappet clearance .018" (intake and exhaust) with engine hot.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1.526-1.536"	.3405-.3415"	45°	11/32"
Exhaust	1.401-1.411"	.3405-.3415"	45°	11/32"

	Operating Tappet Clearance	Timing
Intake	.018" (hot)	.020" (opening side) .026" (closing side)
Exhaust	.018" (hot)	.020" (opening side) .026" (closing side)

Valve Springs

8 Coil Spring:—Closed—18-22 pounds.—2 7/16". Open—44-48 pounds—2 3/32"

5½ Coil Spring:—Closed—19-21 pounds—2 7/16". Open—46-50 pounds—2 3/32"

Intake Valves	Valve Timing	Exhaust Valves
Open—3° after top dead center.	Open—41° before lower dead center.	
Close—49° after lower dead center.	Close—5° after top dead center.	

CARBURETION:—Stromberg Updraft Carburetor, Model UUR-2 (see Carburetor Section for complete data). Manifold heat control and choke control operated manually by buttons on instrument panel.

Fuel Pump:—Stewart-Warner mechanical type operated by eccentric on camshaft (see Carburetion Section for complete data). Remove glass sediment bowl under pump when necessary, empty water and sediment, clean filter screen (located above bowl) before reassembling.

Gasoline and Oil Gauge:—Stewart-Warner electric combination gasoline and oil gauge (see Carburetion Section). Gasoline gauge registers whenever ignition is turned 'on'. The same dial registers amount of oil in crankcase when selector button at right center of instrument panel is pulled out.

STARTER:—Model MAB-4042. Starter drive—Outboard Bendix with starting switch mounted on starter field frame and operated through flexible cable control by button at lower left of instrument panel. Starter rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	5.5	46
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	700	4.5	300
10.2 "	428	4.0	400
24.0 "	Lock	4.0	725

Mounting:—Sleeve mounted on forward face of flywheel housing at right of engine. To remove, disconnect cable and starting switch control, take out large pilot mounting screw in housing directly above starter sleeve, pull starter straight forward to clear Bendix housing, lift out.

GENERATOR:—Model GAG-4138. Third brush regulation combined with Owen-Dyneto Battery Charge Regulator (see Equipment Section for data on Regulator). Generator rotation counter-clockwise at commutator end. Maximum charging rate 19 amperes (cold) at 8.0 volts reached at 1500 R.P.M.

Charging Rate Adjustment. Take off commutator band, shift third brush by prying on brush mounting stud, counterclockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	550	0	6.4	640
4	6.7	660	4	6.9	800
8	7.0	760	8	7.3	980
12	7.4	900	10	7.6	1110
16	7.8	1120	12	7.8	1280
19	8.0	1540	14.2	8.0	1680
13	7.4	2400	11.5	7.7	2400

Brush Spring Tension:—22-27 ounces on each brush.

Field Current:—3.99-4.41 amperes at 6.0 volts across field terminals.

Field Fuse:—7½ ampere capacity fuse mounted in plug in relay housing.

Motoring:—5.13-5.67 amperes at 6.0 volts.

Mounting:—Flange mounted on right hand rear face of timing chain case. To remove, disconnect lead, back off chain adjusting set screw, take out flange mounting screws, lift off timing chain, pull generator out. Tie up chain and do not crank engine with generator out.

Timing Chain Adjustment. Chain should be adjusted at end of first 1000 miles and at 5000 mile intervals during the life of the car. To take up chain, back off adjustment screw locknut, loosen flange mounting screws, turn up adjusting screw until chain begins to hum with engine running at speed equivalent to 25 M.P.H., back off adjusting screw until chain runs noiselessly, tighten adjusting screw locknut and mounting screws.

RELAY REGULATOR:—Owen-Dyneto, Model 21611. Auto-Lite No. XA-407-BS. Battery Charge Regulator mounted on generator field frame (see Equipment Section for complete data). Regulator is adjusted to operate with generator voltage of 7.6-8.0 volts reducing charging rate approximately one-half. Regulator is adjusted by turning adjusting screw under lower thermostatic arm to left or counter-clockwise to increase operating voltage and to right or clockwise to decrease operating voltage. Adjusting screw accessible after taking out field fuse and fuse holder and taking off cover. Relay contacts close when generator voltage reaches 6.2-6.4 volts and open with 0-2 ampere discharge current.

Relay Contact Gap:—.015". **Air Gap:**—.010" with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model D-5670-A. Dimmer Switch Model A-2100-A. Lighting switch mounted on back of instrument board and operated by push-pull button at lower right center of instrument panel. Double filament headlight bulbs are used for 'depressed beam' dimming controlled by foot-operated switch on toeboard.

Lamp Sizes

IGNITION TIMING: Flywheel Degs. Piston Position
All engines .....7° BTDC. .....0194" BTDC.
Timing—With #1 piston on compression, turn engine over until piston is 7° or .0194" before top dead center, stop when ignition mark on flywheel (located 7° before top dead center mark 'DC/1-6') lines up with finished bosses on right hand front face of clutch housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).
Motor Gauge—Weidenhoff Adapter #104. Rod #5 (W), #2 (J).

Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—Champion, Type C-7. 18 MM. Metric type.
Spark Plug Gaps—.028". Limits, .026-.030".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.
Carburetor:—Stromberg, Model EX-32, 1½" plain tube downdraft type.
Fuel Pump:—Stewart-Warner Model 706-E (W), AC. Type F Combination fuel and vacuum pump (J).
Gasoline Gauge:—Stewart Electric Type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 valves at .014" (intake), .021" (exhaust). With #6 piston on top dead center entering power

stroke and flywheel mark 'DC"1-6' in line with finished bosses on right hand front face of clutch housing, #1 intake and exhaust valves should be closed. Reset tappet clearance at .010" (intake), .013" (exhaust).
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.010" Int., .013" Exh., running.

LUBRICATION:—Crankcase Capacity—6 quarts
Normal Oil Pressure—3-5 lbs. (idling), 30 lbs. at 30 M.P.H. with engine warm.

BATTERY (W):—Willard, Type WMB-17. 6 volt, 17 plate, 90 ampere hour capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under floor boards.

BATTERY (J):—Willard, Type WST-2-17. 6 volt, 17 plate, 112 ampere hour capacity (20 hour rate).
Starting Capacity—134 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under floor boards.

STARTER:—Model MAB-4065. Armature No. MAB-2047.
Starter drive—Inboard Bendix.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ozs.
Cranking Engine—100-125 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE:—Lock torque figures correct without switch.

Starting Switch:—Type SS-4001. Solenoid type switch mounted on starter field frame and controlled by pushbutton on instrument panel.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out two mounting cap screws.

GENERATOR:—Model GBK-4603. Armature No. GBK-2055. Third brush control. Ventilated type.

Charging Rate Adjustment:—Take off commutator cover band, shift third brush by prying on brush mounting plate, counter-clockwise to increase, or clockwise to decrease charging rate. Brush held in position by friction.

Performance Data

(Generator Cold)

Amperes	Volts	R.P.M.
0	6.4	850
4	6.7	1000
8	7.05	1160
12	7.4	1320
16	7.7	1550
20	8.0	2250

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—18-22 ounces.

Field Current—3.94-4.36 amperes at 6.0 volts.

Field Fuse—7½ ampere capacity (under cover on top of field frame.

Motoring Current—4.56-5.04 amperes at 6.0 volts.

Mounting:—Pivot mounted at left front of engine. Fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment—Inspect belt at 1000-mile intervals. To adjust, loosen pivot bolts and clamp bolt, pull generator away from engine until all slack in belt has been taken up, tighten clamp bolt before releasing generator, tighten pivot bolts.

CUTOUT RELAY:—Model CB-4021. Mounted on generator field frame.

Cuts in—7.0-7.5 volts.

Cuts out—.5-2.5 ampere discharge current.

Relay Contact Gap—.025-.035".

Air Gap—.010-.030" (contacts closed).

LIGHTING:—Clum Switch, Model 9526. Clum Foot Control Switch, Model 9505. Foot Control Switch provides assymetrical passing beam (lower beam left hand headlight, upper beam right hand headlight). Headlights are aimed straight ahead. Headlight bulbs are prefocused type.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking, Instrument, Tail	3	63
Stop Light	15	87
Dome Light	6	81

FUSES:—Lighting—Two 20 ampere fuses on fuse block behind instrument board.

Generator Field—7½ ampere on generator field frame.

Horn Fuse (W only)—20 ampere capacity on junction block (see diagram). This fuse not used on Model J and horn connected directly to starting switch.

SERIAL NUMBER:—First number, T-5001. On plate on right hand side of dash under engine hood.

COMPRESSION:—Ratio—5.80-1 std. hd. No optl. ratios.
Pressure—Approx. 105 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model CE-4602. Ignition switch assembled as part of coil.
Ignition Current—1-3 amperes (running), 3-4.5 amperes (stopped).
Ignition Switch—Mitchellock Mod. 16-B. Type 6700.

Distributor Model IGP-4003. Single breaker, 8 lobe cam, full automatic advance type. No synchronization required.
Breaker Gap—Set gap at .020". Limits, .018-.020".
Breaker Arm Spring Tension—18 ozs. (min.), 20 ozs. (max.).
Cam Angles—Closed 27.5°. Open 17.5° (distributor).

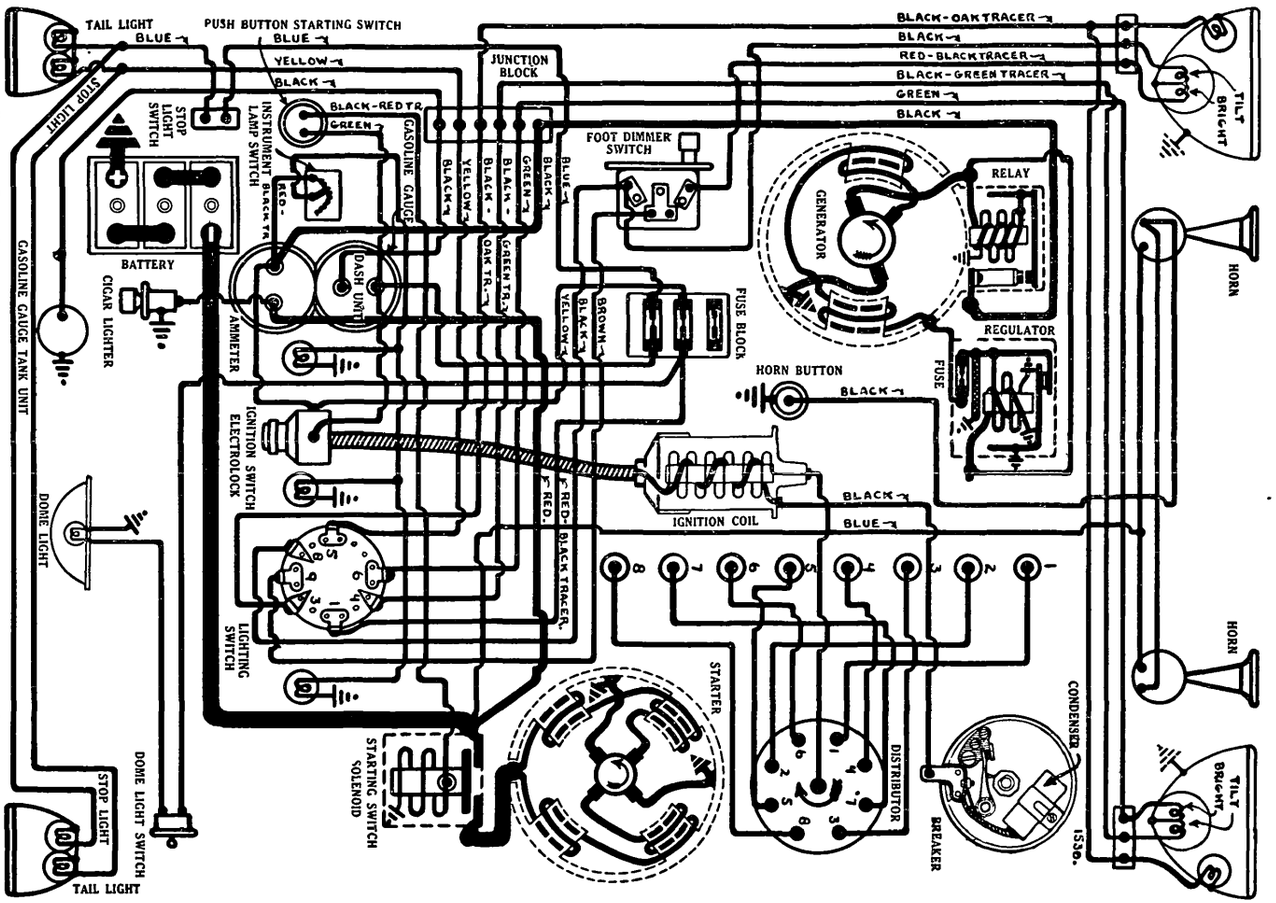
IGNITION TIMING: Flywheel Degs. Piston Position
All engines .....7° BTDC. ..... .0221" BTDC.
Timing:—With #1 piston on compression, turn engine over until piston is 7° before top dead center, stop when straight line mark '/' on flywheel (located 7° before top dead center mark '1o8') lines up with indicator in inspection hole in flywheel housing on right hand side, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug cable connections (see diagram).
Synchronization—No synchronization required.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Firing Order:—1-4-7-3-8-5-2-6 (see diagram).

Spark Plugs:—Champion, Type C-7. 18 MM. Metric type.
Spark Plug Gaps—.028". Limits, .026-.030".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.



Carburetor:—Stromberg, Model EE-22, 1¼" dual, downdraft type.

Fuel Pump:—AC, Type F. Combination fuel and vacuum pump.

Gasoline Gauge:—Stewart Electric Type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 valves at .020" (intake) .026" (exhaust). With #8 piston on top dead center entering power stroke and flywheel mark '1-8' lined up with indicator on edge of inspection hole in right hand side of flywheel housing #1 intake and exhaust valves should be closed. Reset tappet clearance at .018".
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.018" all valves—engine running.

LUBRICATION:—Crankcase Capacity—8 quarts.
Normal Oil Pressure—3-5 lbs. (idling), 30 lbs. at 50 M.P.H. with engine warm.

BATTERY:—Willard, Type WH-2-15, 6 volt, 15 plate, 119 A.H. capacity (20 hour rate).
Starting Capacity—140 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under driver's seat.

STARTER:—Model MAB-4066. Armature No. MAB-2046. Starter drive—Outboard Bendix.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ounces.
Cranking Engine—125-150 amperes, 5.25 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE:—Lock torque figures correct without switch.

Starting Switch:—Solenoid type mounted on starter field frame. Controlled by pushbutton on instrument board.

Mounting:—Sleeve mounted in flywheel housing, right hand front face. To remove, take out large pilot mounting screw in flywheel housing.

GENERATOR:—Model GAR-4606-3. Armature No. GAR-2089. Ventilated, third brush control type with external voltage regulator. See Equipment Section for complete data on Voltage Regulator.

Charging Rate Adjustment—Use test meters to check generator output. Short out voltage regulator by connecting short jumper wire between 'F' generator terminal and ground. Take off commutator cover band, shift third brush by prying on brush mounting plate, counter-clockwise to increase or clockwise to decrease charging rate. Third brush held in any position by friction.

Performance Data

(Cold—without regulator field resistance)

Amperes	Volts	R.P.M.
0	6.4	760
4	6.75	920
8	7.05	1100
12	7.35	1300
16	7.7	1560
20	8.0	2300

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ozs. (new brushes).
Field Current—3.70-4.10 amperes at 6.0 volts.
Field Fuse—7½ amperes (in voltage regulator case).
Motoring—4.65-5.15 amperes at 6.0 volts.

Mounting:—Pivot mounted at left front of engine. Fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment—Inspect belt at 1000-mile intervals. To adjust, loosen pivot bolts and clamp bolt, pull generator away from engine until all slack has been taken up, tighten clamp bolt before releasing generator, tighten pivot bolts.

CUTOUT RELAY:—Model CB-4021. Mounted on generator field frame.
Cuts in—7.0-7.5 volts.
Cuts out—.5-2.5 ampere discharge current.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" (contacts closed).

VOLTAGE REGULATOR:—Mod. TC-4101A. Two Charge Regulator mounted on generator. See article in Electrical Equipment Section for complete data.
Contacts Open—8.26-8.67 volts at 70°F.
Contacts Close—6.46-6.86 volts at 70°F.
Contact Gap—.005" minimum.
Core Gap—.030" plus or minus .001" with contacts closed.

LIGHTING:—Clum Switch, Model 9526. Foot Control Switch Model 9505. Foot Control Switch provides assymetrical passing beam (lower beam left hand headlight, upper beam right hand headlight). Headlights are aimed straight ahead. Headlight bulbs are prefocused type.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking, Instrument, Tail	3	63
Stop Light	15	87
Dome Light	6	81

FUSES:—Lighting—Two 20 ampere fuses on fuse block behind instrument board.
Generator Field—7½ amperes in plug under regulator case.

HORNS:—Sparton Twin horns. Vibrator type.

SERIAL NUMBER:—First number, D-5001. On left hand frame side rail or on plate on right side of dash under engine hood.

COMPRESSION:—**Ratio**—5.75-1 std. 6.20-1 Optl.
Pressure—145 lbs. at 3100 R.P.M. or 110 lbs. at 150 R.P.M. (cranking speed) for std. 5.75-1 head.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model IG-4619.**
Ignition Current—2½ amperes idling, 4-5 stopped.
Ignition Switch—Mitchellock Mod. 24-B, Type 6702.

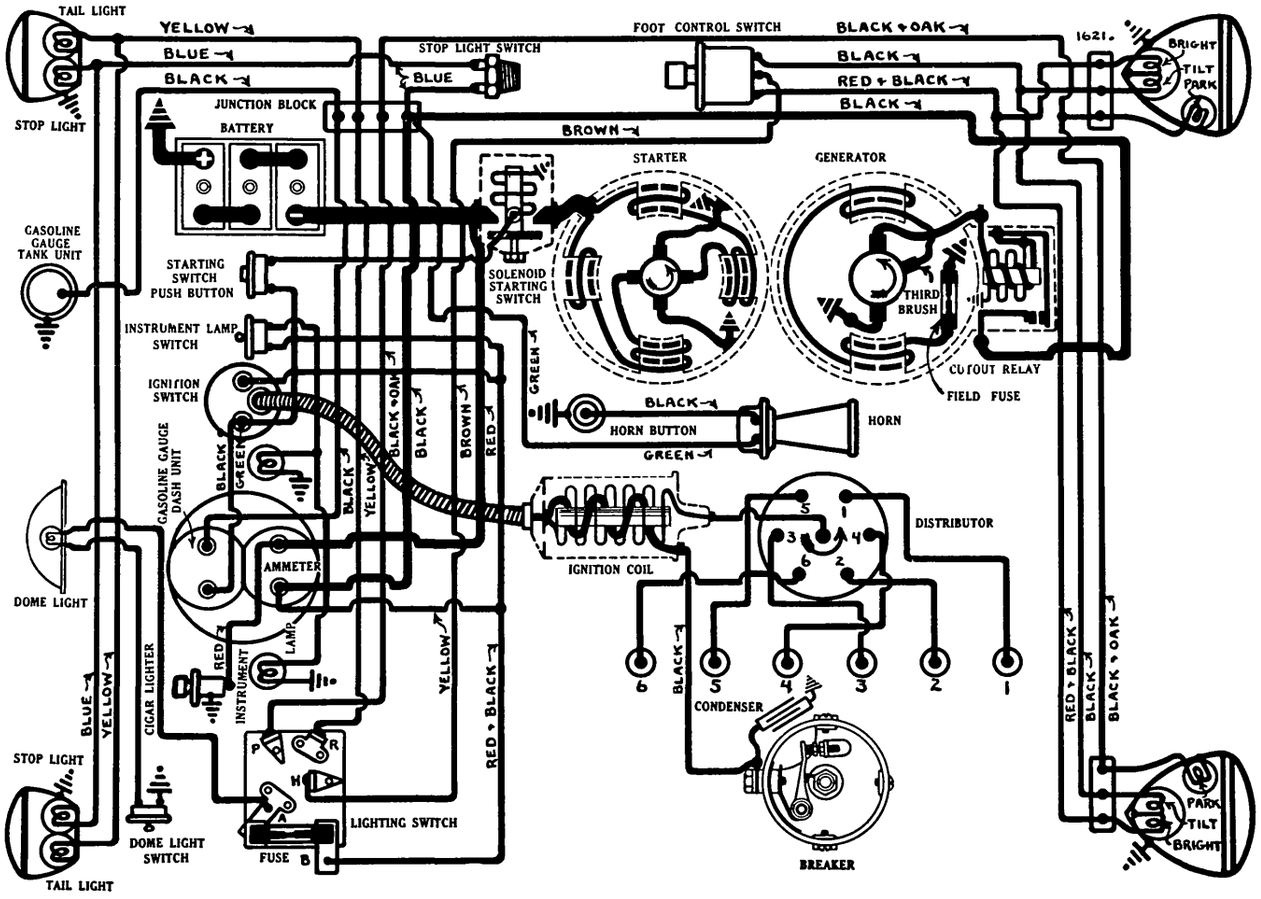
Distributor Model IGB-4319. Single breaker, 6 lobe cam, full automatic advance type. Manual advance consists of adjustment at distributor.
Breaker Gap—Set at .018-.020".
Breaker Arm Spring Tension—16-22 ounces.
Cam Angles—34° closed, 26° open. (distributor).
Manual Advance—12° (engine). Slot in advance arm permits distributor to be advanced or retarded 6° from center '0' position.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	0	800
2	680	4	1360
4	970	8	1940
6	1260	12	2520
7	1400	14	2800

Removal:—Distributor mounted on left side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....7° BTDC.....0194" BTDC
Timing—With piston #1 on compression, turn engine over until piston is 7° or .0194" before top dead center, stop when ignition mark on flywheel lines up with finished bosses on right hand front face of clutch housing. This mark is 7° before the top dead center mark 'DC/1-6'. Loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt and rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).
Motor Gauge—Weidenhoff Adapter #104, Rod #2.



Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—Champion Type C7-A. 18 MM. Metric.
Spark Plug Gaps—Set at .0275-.030".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.
Carburetor:—Stromberg, Model EX-32, 1½" downdraft type (first cars), Carter, Model 316-S (later cars).
Fuel Pump:—A.C., Type T-1521811 diaphragm type.
Gasoline Gauge:—Stewart electric type.

VALVE TIMING:—**To Check Timing**—Set tappet clearance of #1 valves at .014" Int., .021" Exh. With #6 piston on top dead center entering power stroke and flywheel mark 'DC/1-6' lined up with finished bosses on right front face of flywheel housing, #1 intake and exhaust valves should be closed. Reset tappet clearance at .010" Int., .013" Exh.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Tappet Clearance:—.010" Int., .013" Exh. running clearance with engine warm. Clearance for timing is .014" Int. opening, .018" Int. closing, .017" Exh. opening, .021" Exh. closing.
Valve Spring Pressure:—40 lbs. at 1 13/16" (valve closed). 100 lbs. at 1 15/32" (valve open).

LUBRICATION:—**Crankcase Capacity**—6 quarts.
Normal Oil Pressure—3-5 lbs. idling, 30 lbs. at 30 M.P.H. with engine warm.

BATTERY:—Willard, Type WS-2-15, R-2-15 (export). 6 volt, 15 plate, 100 A.H. capacity (20 hour rate).
Starting Capacity—122 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under front floor boards.

STARTER:—Model MAJ-4039. Armature No. MAJ-2048.
Starter Drive—Inboard Bendix Type LCD-11FX-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—31-42 ozs. (new brushes).
Cranking Engine—160 R.P.M., 100-125 amps., 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4100	5.5	67
.3 "	2500	5.5	100
2.25 "	1450	5.0	200
4.6 "	960	4.5	300
7.3 "	575	4.0	400
10.3 "	225	3.5	500
12.0 "	Lock	3.0	550
17.0 "	Lock	4.0	750

Starting Switch:—Model SS-4002. Solenoid type mounted on starter and controlled by pushbutton on instrument panel. See Equipment Section for complete data.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange capscrews.

GENERATOR: — Model GBK-4604. Armature No. GBK-2055. Air cooled. Third brush control type.
Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.
Maximum Charging Rate—20 amperes (cold), 17 amperes (hot), 8.0 volts, 2200 R.P.M., 29-30 M.P.H.

Performance Data

Cold			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	840	0	6.4	850
4	6.7	1000	4	6.8	1040
8	7.05	1160	8	7.2	1200
12	7.4	1325	12	7.55	1480
16	7.7	1550	16	7.95	2000
20	8.0	2200	17	8.0	2400

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ozs. (new brushes).
Field Current—3.94-4.36 amperes at 6.0 volts.
Field Fuse—5 amperes under cover on generator field frame.
Motoring Current—4.56-5.04 amperes at 6.0 volts.
NOTE—Commutator end bearing cannot be serviced due to special construction of commutator end plate. Install new Part No. GAM-2050E.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment—Inspect at 1000-mile intervals. Adjust in usual manner by loosening pivot and clamp bolts and swinging generator away from engine to take up all slack in belt.

CUTOUT RELAY:—Model CB-4023. Mounted on generator. See Equipment Section for complete data on this unit.
Cuts In—6.75-7.5 volts, 10 M.P.H.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

LIGHTING:—Cole (Hersee) Switch. R.B.M., Type 1050A Foot Control Switch. Foot operated switch is used to control headlamp upper and lower beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Instr., Tail	3	63
Stop	15	87
Dome	6	81

FUSES:—Lighting—20 amperes on back of lighting switch.
Generator Field—5 amperes under fuse cover on generator field frame.

HORNS:—Auto-Lite Vibrator type. Horn current 12 amperes.

SERIAL NUMBER:—First number, O-5001. On plate on right side of dash under engine hood.

COMPRESSION:—**Ratio**—5.80-1. No optl. ratios.
Pressure—142 lbs. at 2300 R.P.M. or 105 lbs. at 150 R.P.M. (cranking speed).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model CE-4611.**
Ignition Current—2-3 amperes idling, 4½-5½ amperes stopped.
Ignition Switch—Part of coil assembly (connected by armored cable).

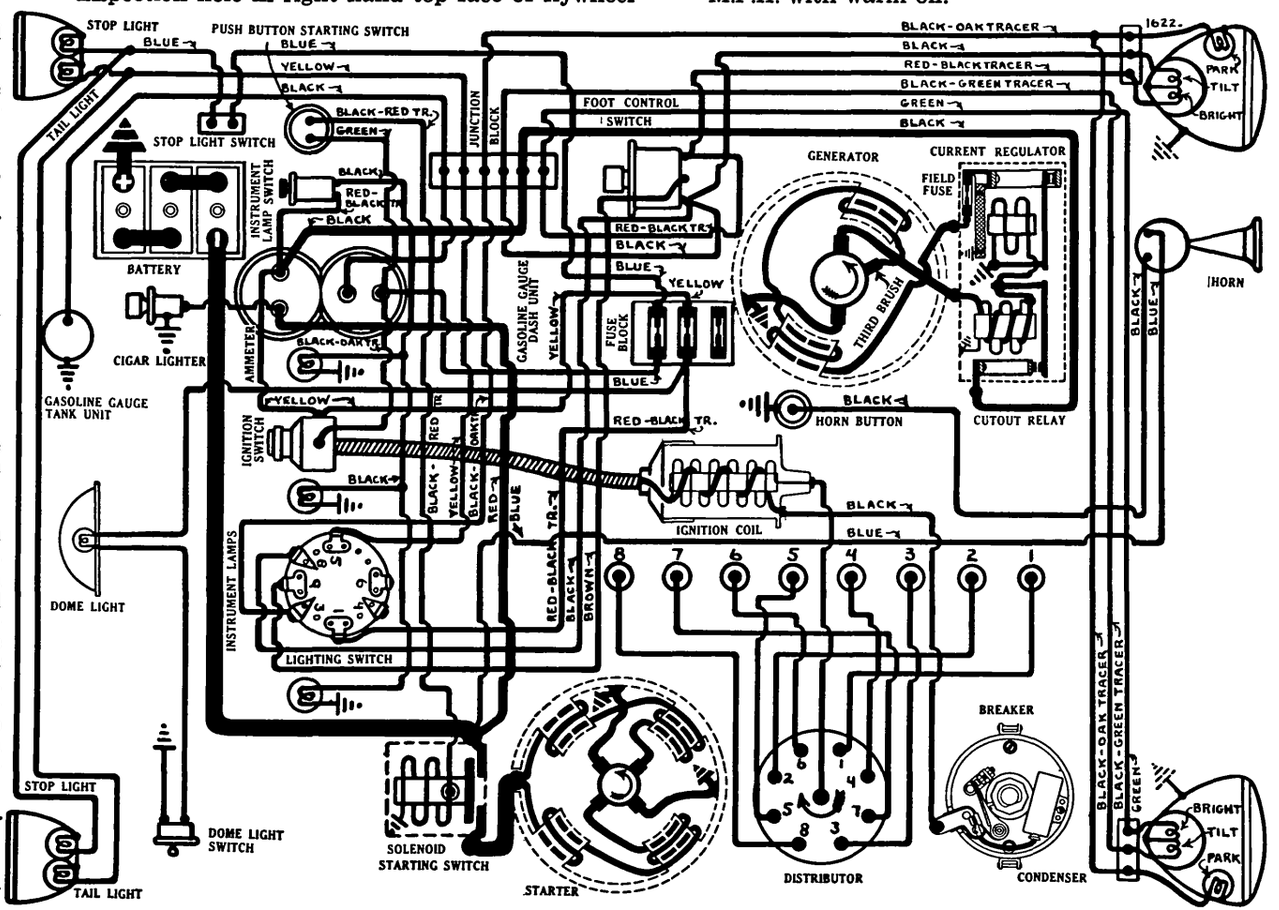
Distributor Model IGP-4003. Single breaker, 8 lobe cam, full automatic advance type. Manual advance consists of adjustment at distributor.
Breaker Gap—Set at .015-.017".
Breaker Arm Spring Tension—18 ozs. minimum, 20 ozs. maximum.
Cam Angles—Closed 27.5°. Open 17.5° (distributor).

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	0	800
2	750	4	1500
4	1150	8	2300
6	1500	12	3000
6.5	1600	13	3200

Removal:—Distributor mounted on right hand side of cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....7° BTDC. ..... .0221" BTDC.
Timing—With #1 piston on compression, turn engine over until piston is 7° before top dead center, stop when straight line mark '/' on flywheel lines up with indicator in inspection hole in right front face of flywheel housing. This mark is 7° before the dead center mark '1°8'. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug cable connections.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.



Firing Order:—1-4-7-3-8-5-2-6 (see diagram).

Spark Plugs:—Champion Type C-7A. 18 MM. Metric.
Spark Plug Gaps—Set at .0275-.030".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.
Carburetor:—Carter, Model WDO, 1" dual, downdraft type.
Fuel Pump:—A.C., Type T-1521811 diaphragm type.
Gasoline Gauge:—Stewart electric type.

VALVE TIMING:—**To Check Timing**—Set tappet clearance of #1 valves at .010" Int., .017" Exh. With #8 piston on top dead center entering power stroke and flywheel mark '1°8' lined up with indicator in inspection hole in right hand top face of flywheel housing, #1 intake and exhaust valves should be closed. Reset tappet clearance at .006" Int., .013" Exh., with engine warm.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Tappet Clearance:—.006" Int., .013" Exh., running clearance with engine warm. Clearance for timing is .010" Int., .017" Exh.
Valve Spring Pressure:—40 lbs. at 1 13/16" (valve closed). 100 lbs. at 1 15/32" (valve open).

LUBRICATION:—**Crankcase Capacity**—8 quarts.
Normal Oil Pressure—3-5 lbs. idling, 30 lbs. at 50 M.P.H. with warm oil.

BATTERY:—Willard, Type WH-2-15, RH-2-15 (export). 6 volt, 15 plate, 119 A.H. capacity (20 hour rate).

Starting Capacity—140 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under driver's seat.

STARTER:—Model MAB-4066. Armature MAB-2046.
Starter Drive—Outboard Bendix.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—33-45 ozs. (new brushes).
Cranking Engine—160 R.P.M., 100-125 amps., 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

Lock torque figures correct without solenoid switch.

Starting Switch:—Type SS-4002. Mounted on starter field frame and controlled by push button on instrument panel. See Equipment Section for complete data.

Removal:—Starter sleeve mounted in right front face of flywheel housing. To remove, take out pilot mouting screw in top of flywheel housing.

GENERATOR: — Model GAR-4620-5. Armature No. GAR-2116-B. Air cooled. Third brush control type in conjunction with Current Regulator (two-rate charge control). See Equipment Section for complete data on Regulator.

Charging Rate Adjustment—Use test meters to check generator output. Short out Regulator by connecting jumper wire between fuse cup on regulator case and ground on generator frame. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate. Third brush held in position by friction. Remove jumper wire.

Maximum Charging Rate—22 amperes (cold), 19 amperes (hot), 8.75 volts, 2200 R.P.M., 28 M.P.H.

Performance Data

Cold — Regulator Contacts Closed — Hot					
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
20	8.5	1660	19.2	8.4	2600
22.4	8.8	2200			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ozs. (new brushes).
Field Current—3.51-3.89 amperes at 6.0 volts.
Field Fuse—5 amperes in knurled cup on side of regulator case.

Motoring Current—5.03-5.57 amperes at 6.0 volts (½ ampere additional if relay and regulator in circuit).

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment—Inspect at 1000-mile intervals. Adjust in usual manner by loosening pivot and clamp bolts and swinging generator away from engine to take up all slack in belt.

RELAY-REGULATOR:—Model TC-4302-A. Mounted on generator. Consists of Cutout Relay and Current Regulator in a single case. See Equipment Section for complete data on these units.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current at 6.5 volts.
Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Clum Switch, Model 9526. R.B.M. Foot Control Switch Type 1050A. Foot operated switch used to control headlamp upper and lower beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Tail	3	63
Instrument, Dome	6	81
Stop	15	87

FUSES:—Lighting—Two 20-ampere fuses on fuse block behind instrument panel.

Generator Field—5 amperes in knurled cup on side of regulator case.

HORN:—Sparton. Vibrator type. Horn current 15 amperes.

SERIAL NUMBER:—First number—G-5001. On plate on right side of dash under engine hood.

COMPRESSION:—Ratio—5.75-1 Std. cast-iron head, 6.2-1 optl. aluminum head.

Pressure—(5.75-1 std. head) 141 lbs. at 3000 R.P.M. or 107 lbs. at 160 R.P.M. (cranking speed).

VACUUM READING:—Gauge should show steady reading of 18-20" at idling speed.

IGNITION:—Coil Model IG-4619. Service Winding (coil less switch and cable) IG-3224S.

Ignition Current—2.5 amperes idling, 4-5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 6702. Conected to coil by armored cable.

Ignition Lock—Briggs & Stratton Model 50184, Mitchell No. 6095.

Distributor Model IGB-4319. Single breaker, 6 lobe cam, full automatic advance type. Manual adjustment consists of adjustment at distributor.

Breaker Gap—Set at .018-.020".

Cam Angle or Dwell—Closed 34°, Open 26° distributor.

Breaker Arm Spring Tension—16-22 ounces.

Condenser—Part No. IGB-1025. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	0	800
2	680	4	1360
4	970	8	1940
6	1260	12	2520
7	1400	14	2800

Manual Advance—12° (engine). Slot in advance arm permits distributor to be advanced or retarded 6° from center '0' position.

Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—

	Flywheel Degrees	Piston Pos.
All engines	7° BTDC	.022"BTDC

Timing—With piston #1 on compression, turn engine over until piston is 7° (.022") before top dead center, stop when ignition mark on flywheel lines up with finished bosses on right hand front face of clutch housing. This mark is 7° before the top dead center mark 'DC/1-6'. Loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt and rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type C7-A. 18 MM. Metric.

Spark Plug Gap—Set at .0275-.030".

CARBURETION:—Carburetor—Carter Model 333-S, 1¼" downdraft type. See Carburetion Section for complete adjustment, overhaul and Jet Specifications.

NOTE—Do not make carburetor adjustments until engine is warmed up with choke valve wide open and choke control on instrument panel pushed in.

Idle Adjustment—Adjust throttle stopscrew so that idle speed is 300 R.P.M. Turn idle adjusting screw in until engine begins to hesitate or miss, then out until engine begins to roll, finally turn screw in until engine fires smoothly. Final setting should be ⅜-1 turn of screw from inner closed position. Readjust throttle stopscrew for correct idling speed.

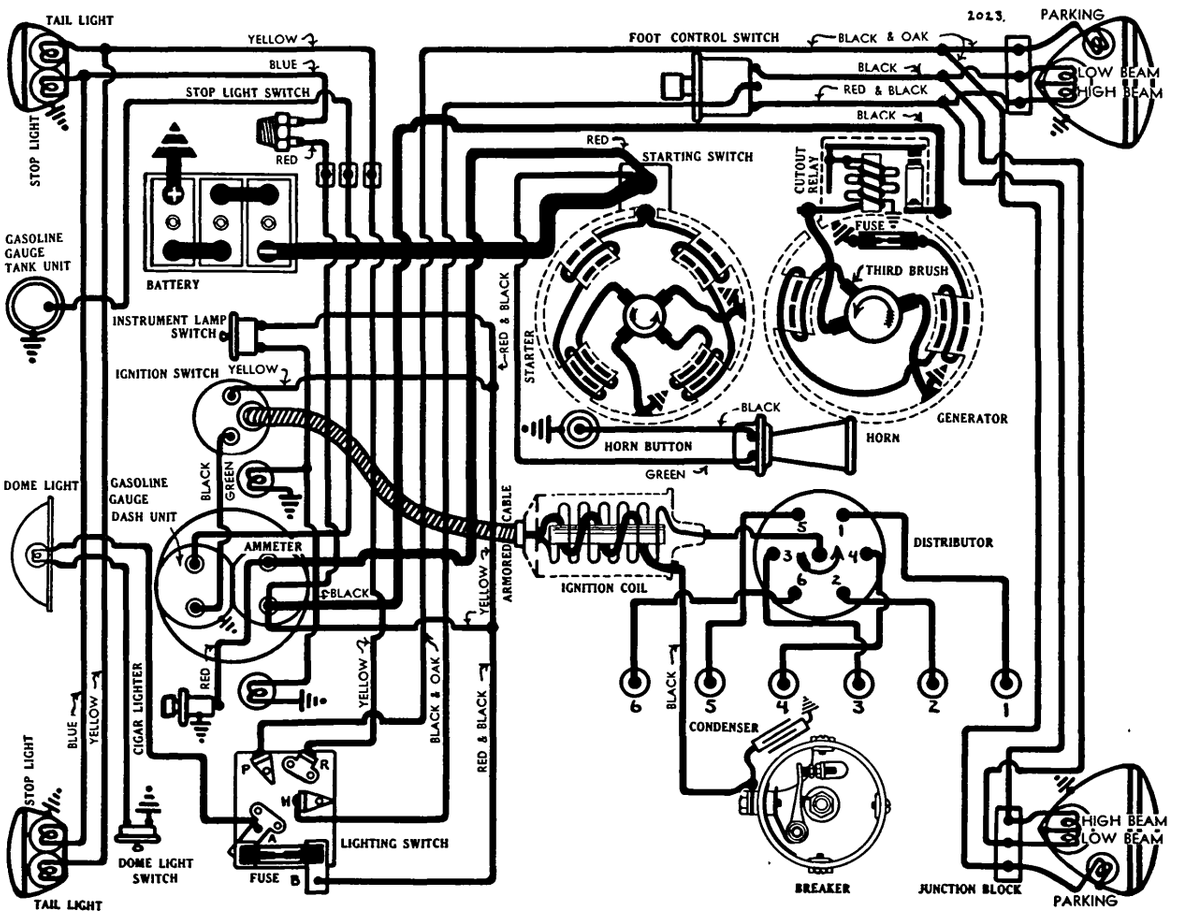
Accelerating Pump Setting—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:
Inner Hole—(Min. stroke)—Extremely warm weath.
Center Hole—Normal summer temperatures.
Outer Hole—(Max. stroke)—Winter temperatures.

Air Cleaner—Burgess oil-wetted type.

Fuel Pump:—AC. Type T #1521811. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—Stewart-Warner, Electric type. See article in Carburetion Section.

VALVE TIMING:—To Check Timing—Set tappet clearance of #1 valves at .014" Int., .021" Exh. With #6 piston on top dead center entering power stroke and flywheel mark 'DC/1-6' lined up with finished bosses on right front face of clutch housing, #1 intake and exhaust valves should be closed. Reset tappet clearance at .010" Int., .013" Exh., engine warm.



Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.010" Int., .013" Exh., running clearance with engine warm. Clearance for timing is .014" Int. opening, .018" Int., closing, .017" Exh. opening, .021" Exh. closing.

Valve Spring Pressure:—40 lbs. at 1 13/16" (valve closed). 100 lbs. at 1 15/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. (refill).

Normal Oil Pressure—3-5 lbs. idling, 30 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WS-2-15, R-2-15 (Export). 6 volt, 15 plate, 100 ampere hour (20 hour rate).

Starting Capacity—122 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.3 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under front floor boards.

STARTER:—Model MAJ-4044. Armature MAJ-2048.

Drive—Inboard Bendix Type LCD-11FX-10.

Cranking Engine—160 R.P.M., 150 amperes at 5.25 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4100	5.5	67
.3 "	2500	5.5	100
2.25 "	1450	5.0	200
4.6 "	960	4.5	300
7.3 "	575	4.0	400
10.3 "	225	3.5	500
12.0 "	Lock	3.0	550
17.0 "	Lock	4.0	750

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out two flange capscrews.

Starting Switch:—Model SW-3737. Pull switch type mounted on starter controlled by pull button on instrument panel. Pull of not less than 5½ lbs. required to close switch as measured at end of switch lever and at right angles to lever.

GENERATOR:—Model GBK-4604. Armature GBK-2055. Air cooled. Third brush control type.

Charging Rate Adjustment—Take off commutator band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.

Maximum Charging Rate—20 amperes (cold), 17 amperes (hot), 8.0 volts, 2200 R.P.M., 29-30 M.P.H.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	840	0	6.4	850
4	6.7	1000	4	6.8	1040
8	7.05	1160	8	7.2	1200
12	7.4	1325	12	7.55	1480
16	7.7	1550	16	7.95	2000
20	8.0	2200	17	8.0	2400

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—18-22 ozs. (new brushes).

Field Current—3.94-4.36 amperes at 6.0 volts.

Motoring Current—4.56-5.04 amperes at 6.0 volts.

Field Fuse—5 amperes under cover on generator field frame.

Removal:—Pivot mounted at left front of engine. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Swing generator away from engine taking up all slack in belt, tighten pivot and clamp bolts.

CUTOUT RELAY:—Model CB-4023. Mounted on generator. See Equipment Section for complete data on this unit.

Cuts In—6.75-7.5 volts. 10 M.P.H.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.025-.035".

Air Gap—.010-.030" with contacts closed.

LIGHTING:—Headlamps—Hall, Pre-focused type. Headlamps aimed straight ahead (upper beam, lenses in place). Upper and lower beams controlled by foot selector switch.

Switches

Lighting—Cole-Hersee.

Stop Light—Hydraulic type mounted at forward end of brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Instr., Tail	3	63
Stop	15	87
Dome	6	81

FUSES:—Lighting—20 amperes on back of lighting switch.

Generator Field—5 amperes under fuse cover on generator field frame.

HORNS:—Auto-Lite Vibrator type. Horn current draw 12 amperes.

SERIAL NUMBER:—First number—'N'-5001. On plate on right hand side of dash under engine hood.

COMPRESSION:—Ratio—5.80-1 Std. cast-iron head, no optional.

Pressure—5.80-1 std. head, 142 lbs. at 2000 R.P.M. or 113 lbs. at 160 R.P.M. (cranking speed).

VACUUM READING:—Gauge should show steady reading of 18-20" at idling speed.

IGNITION:—Coil Model CE-4611. Service Winding (coil less switch and cable) CE-3224S.

Ignition Current—2-3 amperes idling, 4½-5½ amperes stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 6704. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton.

Distributor Model IGP-4003. Single breaker, 8 lobe cam, full automatic advance type. Manual advance consists of adjustment at distributor.

Breaker Gap—Set at .017".

Cam Angle or Dwell—27.5° closed, 17.5° open.

Breaker Arm Spring Tension—18-20 ounces.

Condenser—Part No. IG-2671. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	0	800
2	750	4	1500
4	1150	8	2300
6	1500	12	3000
6.5	1600	13	3200

Removal:—Mounted on right hand side of cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—

Flywheel Degrees	Piston Pos.
All engines 7° BTDC	.0221 BTDC

Timing—With #1 piston on compression, turn engine over until piston is 7° (.0221") before top dead center, stop when straight line mark '/' on flywheel lines up with indicator in inspection hole in right front face of flywheel housing. This mark is 7° before the dead center mark '1°8'. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug cable connections.

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Firing Order:—1-4-7-3-8-5-2-6. See diagram

Spark Plugs:—Champion Type C-7A. 18 MM. Metric.

Spark Plug Gap—Set at .0275-.030".

CARBURETION:—Carburetor—Carter Model 317-S. Dual downdraft type. See Carburetion Section for complete adjustment, overhaul and Jet Specifications.

NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idles at hot or slow idle speed.

Idle Adjustment—Adjust throttle stopscrew so that engine idles at 350 R.P.M. Turn idle adjusting screw for each carburetor barrel (in succession) in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in until engine fires smoothly. Final setting for each screw should be ¾-1¼ turns from closed or seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Seting—Pump lever under dust cover at top of carburetor has two holes for pump link engagement. Change for reasonal requirem'ts: Outer Stroke—(max. stroke)—Cold weather. Inner Stroke—(min. stroke)—Hot weather.

Fast Idle:—Integral with carburetor. See article on Carter Fast Idle in Carburetion Section.

Automatic Choke:—Carter Climatic Control. See article in Carburetion for servicing directions.

Air Cleaner:—Burgess oil-wetted type.

Fuel Pump:—AC. Type D #1523014 Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—Stewart-Warner Electric.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 valves at .010" Int., .017" Exh. With #8 piston on top dead center entering power stroke and flywheel mark '1°8' lined up with indicator in inspection hole in right hand top face of flywheel housing, #1 intake and exhaust valves should be closed. Reset tappet clearance at .006" Int., .013" Exh., engine warm.

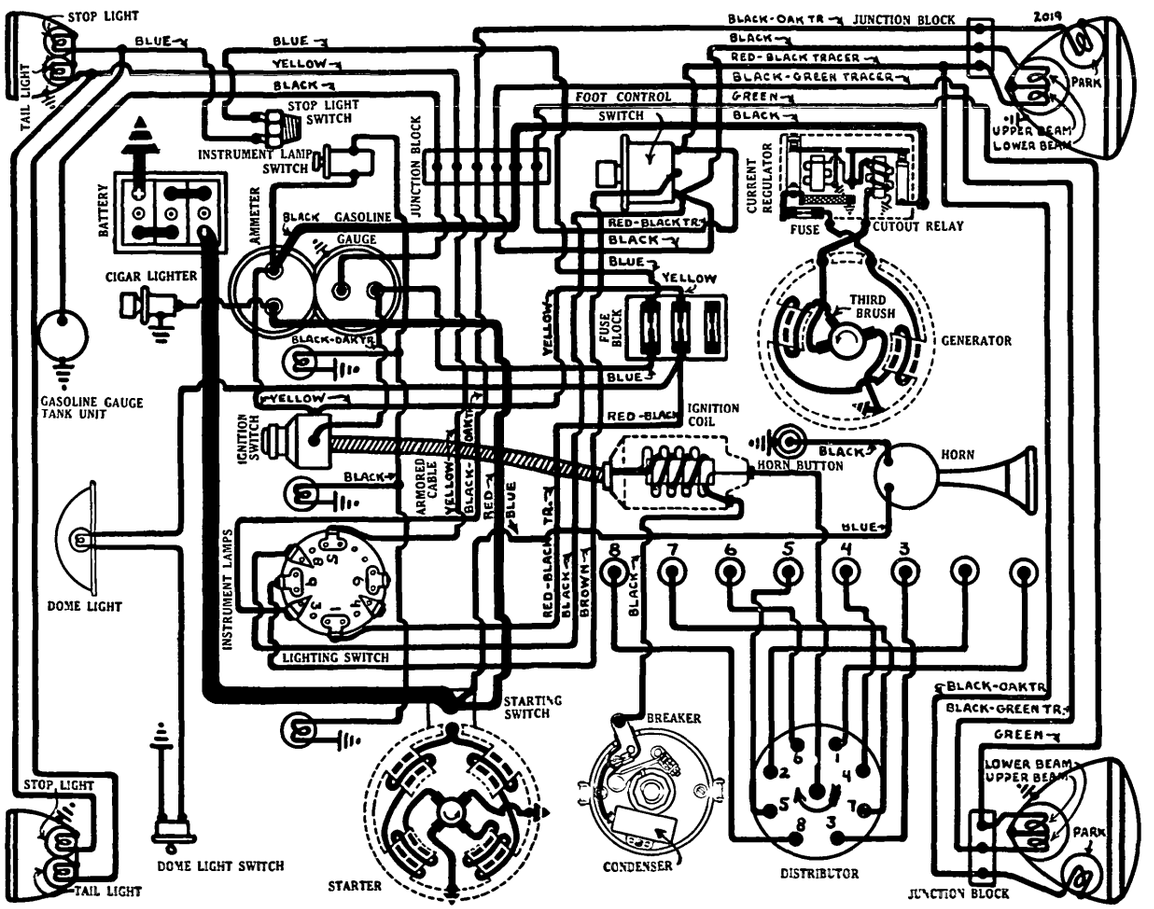
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.006" Int., .013" Exh., running clearance with engine warm. Clearance for timing is .010" Int., .017" Exh.

Valve Spring Pressure:—40 lbs. at 1 13/16" (valve closed), 100 lbs. at 1 15/32" (valve open).

LUBRICATION:—Crankcase Capacity—8 qts. (refill).

Normal Oil Pressure—3-5 lbs. idling, 30 lbs. at 50 M.P.H.



BATTERY:—Willard, Type WH-2-15, RH-2-15 (Export). 6 volt, 15 plates, 119 ampere hours (20 hour rate).

Starting Capacity—140 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.3 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under driver's seat.

STARTER:—Model MAB-4081. Armature MAB-2046.

Drive—Outboard Bendix Type RCD-10FXD-9.

Cranking Engine—160 R.P.M., 110 amperes, 5.48 v.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

Lock Torque figures correct without starting switch.

Removal:—Starter sleeve mounted in right front face of flywheel housing. To remove, take out pilot mounting screw in top of flywheel housing.

Starting Switch:—Model SW-3752. Pull switch type mounted on starter controlled by pull button on instrument panel. Pull of not less than 5½ lbs. required to close switch as measured at end of switch lever and at right angle to it.

GENERATOR:—Model GAR-4620-5. Armature GAR-2116-B. Third brush control type in conjunction with Current Regulator (two-rate charge control). Ventilated by fan on drive pulley. See Equipment Section for complete data.

Charging Rate Adjustment—Use test meters to check charging rate. Connect jumper between fuse cup on regulator and ground. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate. Third brush held in position by friction. Remove jumper wire.

Maximum Charging Rate—22 amperes (cold), 19 amperes (hot), 8.75 volts, 2200 R.P.M., 28 M.P.H.

Performance Data

Cold — Regulator Contacts Closed			— Hot		
Amperes	Volts	R.P.M.	Ampere	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
20	8.5	1660	19.2	8.4	2600
22.4	8.8	2200			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-36 ozs. (new brushes).

Field Current—3.51-3.89 amperes at 6.0 volts.

Motor Current—5.03-5.57 amperes at 6.0 volts (½ ampere additional if relay and regulator in circuit).

Field Fuse—5 ampere in knurled cup on side of regulator case.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Inspect at 1000-mile intervals. Adjust in usual manner by loosening pivot and clamp bolts and swinging generator away from engine to take up all slack in belt.

RELAY-REGULATOR:—Model TC-4302-A. Mounted on generator. Consists of Cutout Relay and Current Regulator in a single case. See article in Equipment Section for complete data.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Hall, Pre-focused type. Headlamps aimed straight ahead (upper beam, lenses in place). Upper and lower beams controlled by foot selector switch.

Switches

Lighting—Clum Switch Model 9526.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Tail	3	63
Instrument, Dome	6	81
Stop	15	87

FUSES:—Lighting—15 amperes on fuse block behind instrument panel.

Stop Light—15 amperes on fuse block behind instrument panel.

NOTE—Spare (third) fuse mounted on fuse block.

Generator Field—5 amperes in knurled cup on regulator case.

HORN:—Sparton—Vibrator type. Horn current 15 amp.

KISSEL

MODEL 6-73 (1929-30-31)
SERIAL NUMBERS 73-1000 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

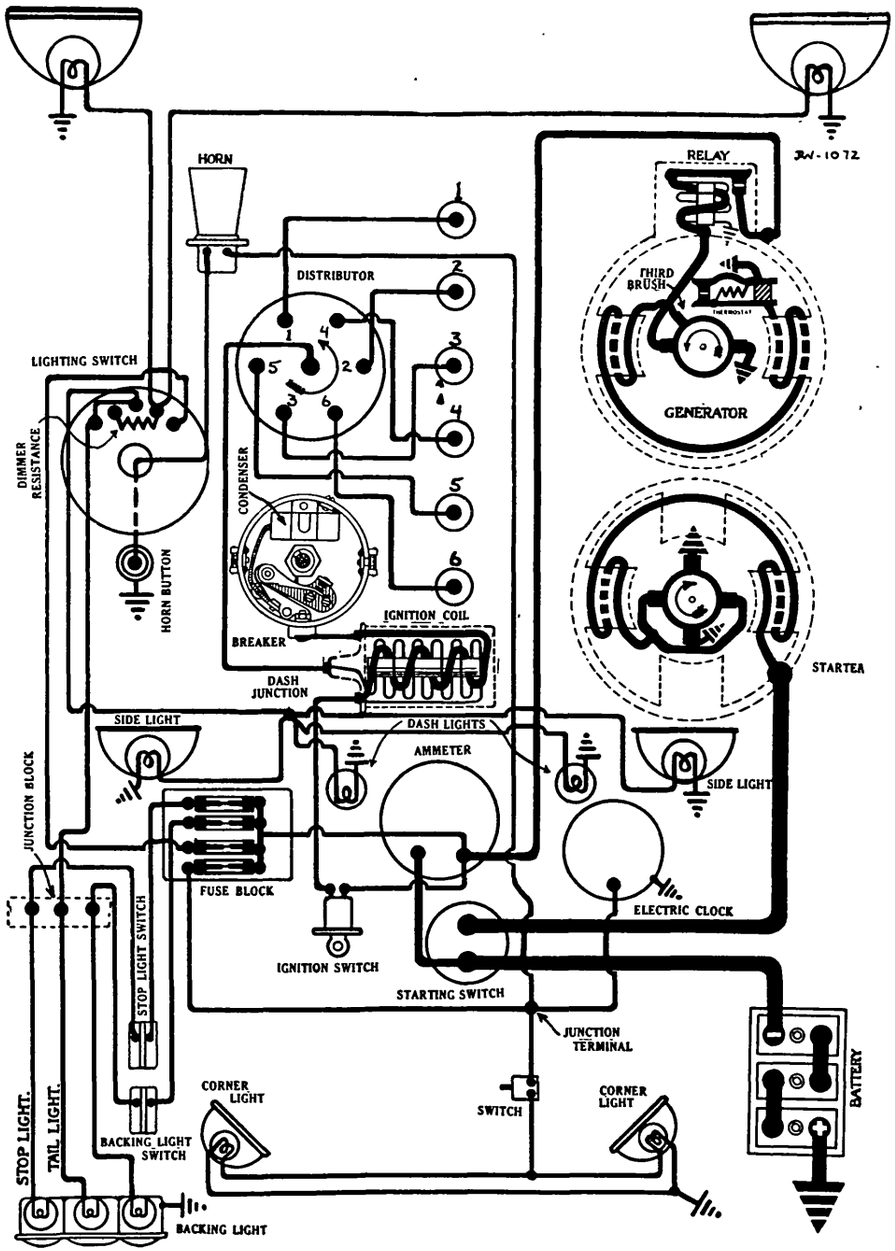
BATTERY:—Willard, Type CWR-13, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. The battery is cradle mounted under the front seat.

IGNITION:—Coil Model 528-C. Coil is mounted on the dash. Ignition current is .6-1.5 amperes at 6 volts with engine running and 3.4-4.5 amperes at 6 volts with engine stopped.

Distributor Model 640-L. Breaker contacts separate .018-.024 inch with breaker arm on lobe of cam. Set contact gap by loosening lock screw on stationary contact mounting plate (directly behind contacts) and turning up eccentric adjusting screw until correct gap is secured. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 20 degrees reached at 2200 R.P.M. of engine.

Mounting:—Coil is mounted on the dash. Distributor is mounted on the cylinder head with a SAE Type B mounting. To remove the distributor, disconnect primary lead and manual advance rod. Remove distributor head with high tension cables intact. Loosen the hold-down screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one turn every 500 miles. Put a small bit of vaseline on the face of the breaker cam and a drop of light engine oil on the breaker arm pivot every 1000 miles. Put a few drops of light engine oil in the wick oiler under the rotor every 2000 miles.



Timing:—Breaker contacts separate when the piston entering power stroke reaches a position 10 degrees after top dead center (measured on the flywheel) with the spark control in the fully retarded position. To check timing, crank engine over until piston No. 1 is coming up on the compression stroke. This is the up stroke with both valves closed. Fully retard the spark. Continue to crank the engine until piston reaches the firing position when the ignition mark '1&6' on the flywheel will be 10 degrees past the indicator on the flywheel housing. Breaker contacts should separate at this point. If they do not, loosen the clamp screw on the side of the distributor mounting and rotate distributor until contacts separate. Tighten the screw. Make certain that the rotor is opposite the segment connected to the spark plug in cylinder No. 1 and connect the remaining plugs in order 5-3-6-2-4 around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4. No. 1 cylinder nearest the radiator.

Spark Plugs:—Spark plugs are ⅞-18 Long. Gaps are .030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 17/32 inches. Stem diameter, .342 inch. Stem length, 5 15/16 inches. Tappet clearance, .008 inch (hot). Spring pressure, 85 pounds. Valve lift, 11/32 inch. Inlet valves open 5 degrees before top dead center and close 40 degrees after lower dead center. On 1929 models, inlet valves open at top dead center.

EXHAUST VALVES:—Head diameter, 1 13/32 inches. Stem diameter, .342 inch. Stem length, 5 15/16 inches. Tappet clearance, .008 inch (hot). Spring pressure, 85 pounds. Valve lift, 11/32 inch. Exhaust valves open at 50 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Oversize valves are not made.

KISSEL

MODEL 6-73 (1929-30-31)
SERIAL NUMBERS 73-1000 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

STARTER:—Model 716-A. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, viewed from the commutator end. Starter cranks the engine at 150 R.P.M. drawing 175 amperes at 4.5 volts. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
Free	3000	5.0	70
15 lb. ft.	Lock	3.7	450

Mounting:—Starter is mounted with a SAE No. 1 flange mounting on the right of the engine on the forward side of the flywheel housing. To remove starter, disconnect cable and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 8-10 drops of light engine oil in the oiler on the commutator end of the starter every 1000 miles. The drive end bearing is oilless and requires no attention. Every six months remove the plug in the reduction gear case and repack the gear compartment with graphite grease.

GENERATOR:—Model 955-H. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 160 degrees F. cutting a resistance in the field circuit and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 18-19 amperes (cold) reached at 1450 R.P.M. or 25-26 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	1450	9-12	7.35-7.65	1800-2000

Motoring freely, generator draws 5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted at right of engine on special swinging bracket and is belt driven from the engine crankshaft. The water pump is mounted directly on the rear of the generator and is driven by the generator shaft. To remove generator, first drain the radiator and remove the water pump hose connections. Then take out adjustment clamp bolt and swing generator toward the engine. Slip off the drive belt. Take out the two bolts mounting the generator on the bracket and lift the generator and water pump from place. The water pump can be removed by taking out the cap screws which mount the pump on the generator bosses.

Belt Adjustment:—To tighten drive belt, loosen the adjustment clamp bolt and swing the generator away from the engine until the correct belt tension is secured. Tighten the clamp bolt. Do not tighten the drive belt more than is necessary to secure positive drive without slipping or the belt will crowd the generator bearings.

Oiling:—Put 8-10 drops of light engine oil in each of the generator oilers every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 3 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .012-.017 inch.

LIGHTING: — Clum Switch Model 10677. Switch is mounted at lower end of the steering column on the frame. Dimming is by resistance. Headlights are 6-8 volt, 32 cp. S.C. Mazda 1133. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and dome lights are 6-8 volt, 3 cp. D.C. Mazda 64. Tail, stop and backing lights are 6-8 volt, 3 cp. S.C. Mazda 63. Corner lights are 6-8 volt, 3 cp. D.C. Mazda 64.

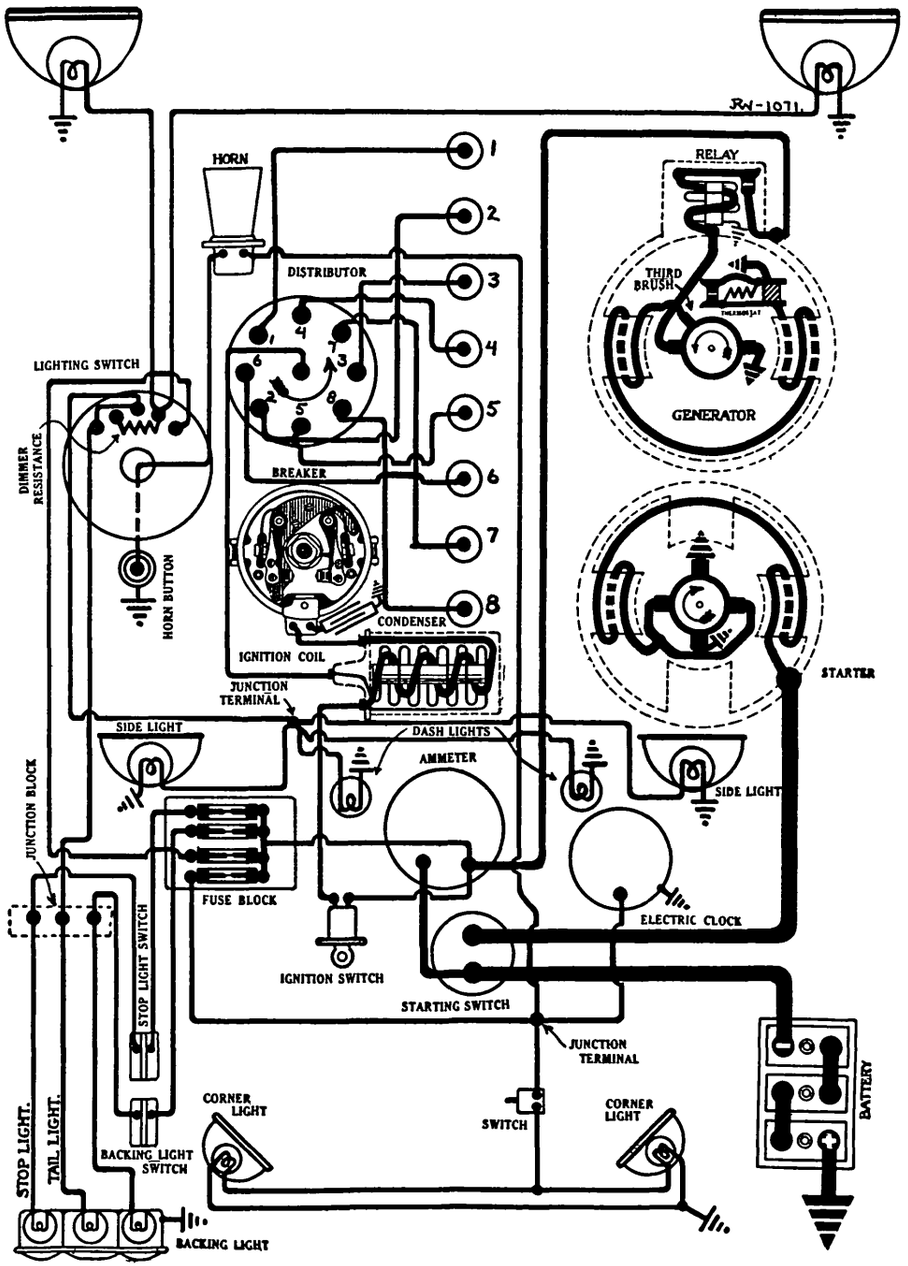
FUSES:—Fuses are mounted on the dash. They are 10 ampere capacity.

KISSEL

MODEL 8-95 (1929-30-31)
SERIAL NUMBERS 95-1000 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type SJWR-4, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. The battery is cradle mounted under the front seat.

IGNITION:—Coil Model 528-C. Coil is mounted on the dash. Ignition current is .6-1.5 amperes at 6 volts with engine running and 3.4-4.5 amperes at 6 volts with engine stopped.



Distributor Model 658-L. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning up eccentric adjusting screw until breaker gap is .022 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 22 degrees reached at 3000 R.P.M. of engine. Breaker has two sets of contacts operating on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. This firing interval must be accurately set by synchronizing contacts for satisfactory engine performance. See Timing.

Mounting:—Coil is mounted on the dash. Distributor is mounted on the cylinder head with a SAE Type B mounting. To remove the distributor, disconnect primary lead and manual advance rod. Remove distributor head with high tension cables intact. Loosen mounting stud clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one turn every 500 miles. Put a small bit of vaseline on the face of the breaker cam and a drop of light engine oil on the breaker arm pivot every 1000 miles. Put a few drops of light engine oil in the wick oiler under the rotor every 2000 miles.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 820738, and follow complete directions given in Equipment Section. Contacts may be synchronized without special equipment after distributor has been timed to the engine by cranking the engine over exactly 90 degrees when piston No. 6 will reach firing position (10 degrees past top dead center with spark retarded). If the second set of contacts are not beginning to open, loosen the two lock screws on the movable sub-plate and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine:—Breaker contacts begin to separate when piston entering power stroke reaches a position 10 degrees past top dead center (measured on the flywheel) with the manual advance control in the fully retarded position. To set timing, crank engine over until piston No. 1 is coming up on the compression stroke. This is the up stroke with both valves closed. Fully retard the spark. Continue to crank engine until the ignition mark '1&8' is ¾ inch or 10 degrees after top dead center on the flywhen the mark 'Time' will be opposite the indicator on the flywheel housing. Breaker contacts should separate at this point. If they do not, loosen the advance arm clamp screw and rotate distributor until contacts sep-

arate. Tighten the clamp screw and make certain that the rotor is opposite the segment connected to the spark plug in cylinder No. 1 and connect the remaining plugs in order 6-2-5-8-3-7-4 around the distributor head.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are ⅞-18 Long. Gaps are .030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 17/32 inches. Stem diameter, .342 inch. Stem length, 5 15/16 inches. Tappet clearance, .008 inch (hot). Spring pressure, 85 pounds. Valve lift, 11/32 inch. Inlet valves open at top dead center and close at 45 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/32 inches. Stem diameter, .342 inch. Stem length, 5 15/16 inches. Tappet clearance, .008 inch (hot). Spring pressure, 85 pounds. Valve lift, 11/32 inch. Exhaust valves open at 50 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Oversize valves are not made.

STARTER:—Model 716-A. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, viewed from the commutator end. Starter cranks the engine at 150 R.P.M. drawing 175 amperes at 4.5 volts. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
Free	3000	5.0	70
15 lb. ft.	Lock	3.7	450

Mounting:—Starter is mounted with a SAE No. 1 flange mounting on the right of the engine on the forward side of the flywheel housing. To remove starter, disconnect cable and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 8-10 drops of light engine oil in the oiler on the commutator end of the starter every 1000 miles. The drive end bearing is oilless and requires no attention. Every six months remove the plug in the reduction gear case and repack the gear compartment with graphite grease.

GENERATOR:—Model 955-H. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 160 degrees F. cutting a resistance in the field circuit and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 18-19 amperes (cold) reached at 1450 R.P.M. or 25-26 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	1450	9-12	7.35-7.65	1800-2000

Motoring freely, generator draws 5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted at right of engine on special swinging bracket and is belt driven from the engine crankshaft. The water pump is mounted directly on the rear of the generator and is driven by the generator shaft. To remove generator, first drain the radiator and remove the water pump hose connections. Then take out adjustment clamp bolt and swing generator toward the engine. Slip off the drive belt. Take out two bolts mounting generator on bracket and lift generator and water pump from the engine.

Belt Adjustment:—To adjust belt tension, loosen the adjustment clamp screw and swing generator away from the engine until the correct belt tension is secured. Tighten the clamp bolt. Do not tighten the drive belt more than is necessary or it will crowd the generator bearings.

Oiling:—Put 8-10 drops of light engine in each of the generator oilers every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 3 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .012-.017 inch.

LIGHTING:—Clum Switch Model 10677. Switch is mounted at lower end of the steering column on the frame. Dimming is by resistance. Headlights are 6-8 volt, 32 cp. S.C. Mazda 1133. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash, dome and corner lights are 6-8 volt, 3 cp. D.C. Mazda 64. Tail, stop and backing lights are 6-8 volt, 3 cp. S.C. Mazda 63.

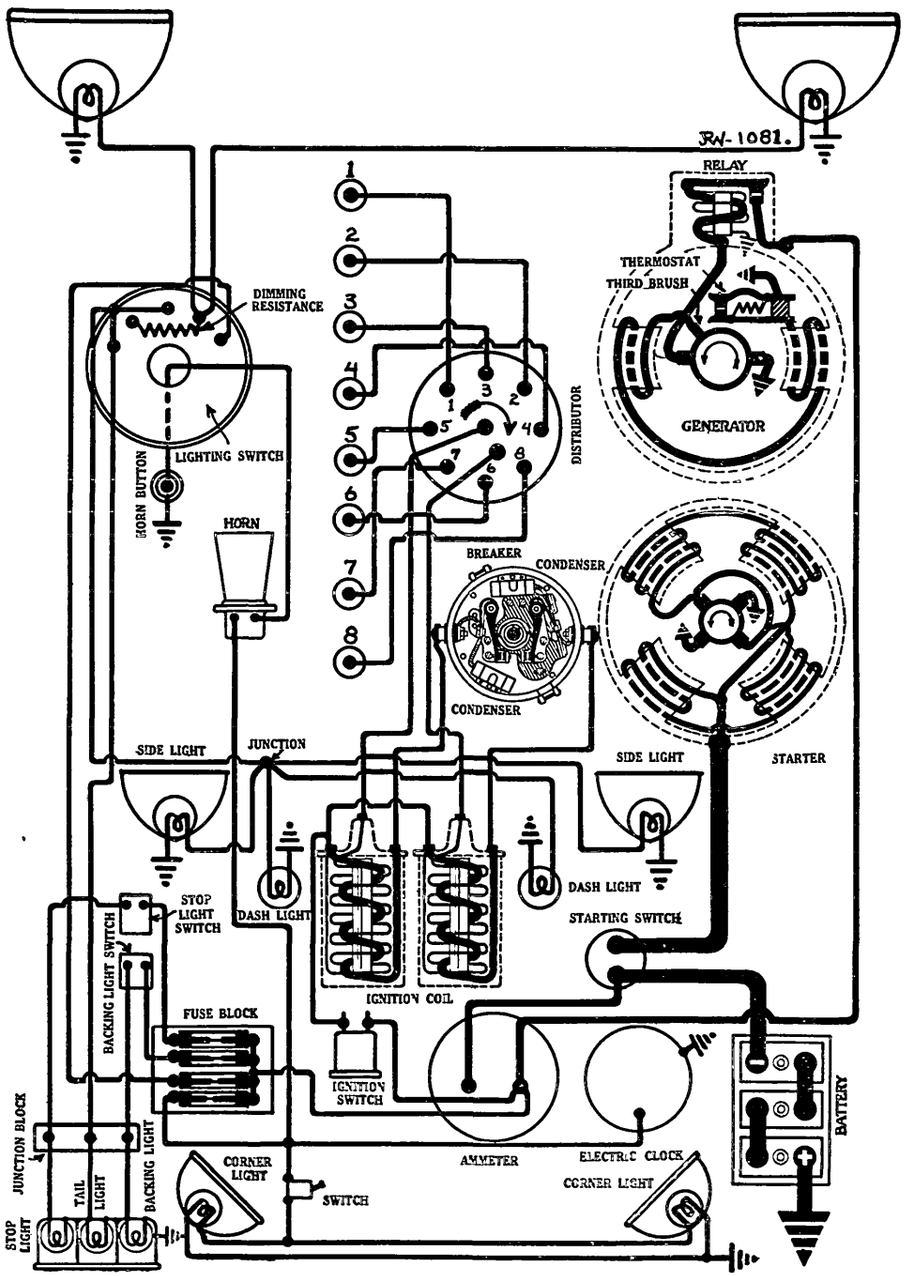
FUSES:—Fuses are mounted on the dash. They are 10 ampere capacity.

KISSEL

MODEL 8-126 (1929-30-31)
SERIAL NUMBERS 126-001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type SJWR-4, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. The battery is cradle mounted under the front seat.

IGNITION:—Coil Model 528-C (2 used). Coils are mounted on the dash. Ignition current is 1.2-3 amperes at 6 volts with engine running and 6.8-9 amperes at 6 volts with engine stopped.



Distributor Model 668-B. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until contact gap is .022 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 15 degrees reached at 4200 R.P.M. of engine. Breaker has two sets of contacts operating on a single four sided cam. Each set of contacts controls one coil and fires the spark plugs in four cylinders. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. This firing interval must be accurately set by synchronizing contacts for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head by an S.A.E. Type B mounting. To remove distributor, disconnect primary leads and manual advance rod. Remove distributor head with cables intact. Then loosen mounting stud clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one turn every 500 miles. Put a small bit of vaseline on the face of the breaker cam and a drop of light engine oil on the breaker arm pivots every 1000 miles. Put a few drops of light engine oil in the wick oiler under the rotor every 2000 miles.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 1835009, and follow complete directions in Equipment Section. Contacts can be synchronized after distributor has been timed to the engine by cranking engine over exactly 90 degrees when piston No. 6 will reach firing position (¾ inch on flywheel past top dead center. If the second set of contacts do not open at this point, loosen the two lock screws and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check th contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to separate when the piston entering power stroke reaches a position 10 degrees or ¾ inch on the flywheel past top dead center with the manual spark control fully retarded. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully retard spark control and continue to turn engine over until the flywheel mark '1&8' is 10 degrees or ¾ inch past the indicator on the flywheel housing when the ignition mark 'Time' will be directly opposite the indicator. Then loosen advance arm clamp screw and rotate distributor until the set of contacts mounted on the fixed base plate begin to open. Tighten the clamp screw and see that the segment in the distributor head directly opposite the rotor contact (connected to center terminal in head) is connected to the spark plug in cylinder No. 1. Connect spark plugs as shown on diagram.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4. No 1 cylinder nearest the radiator. Spark plug cables not connected in this order.

Spark Plugs:—Spark plugs are ⅞-18 Long. Gaps are .030 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1⅝ inches. Stem diameter, 11/32 inch. Stem length, 5½ inches. Tappet clearance, .008 inch (hot). Spring pressure, 85 pounds. Valve lift, 11/32 inch. Inlet valves open at top dead center and close 45 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1½ inches. Stem diameter, 11/32 inch. Stem length, 5½ inches. Tappet clearance, .008 inch (hot). Spring pressure, 85 pounds. Valve lift, 11/32 inch. Exhaust valves open 50 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Oversize valves are not made.

STARTER:—**Model 720-Q.** Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 150 R.P.M. drawing 175 amperes at 4.5 volts. Starter switch is Model 406-A. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
Free	6000	5.0	65
15 lb. ft.	Lock	3.15	570

Mounting:—Starter is mounted with a SAE No. 1 flange mounting at the right of the engine on the forward side of the flywheel housing. To remove starter, disconnect cable and remove flange mounting studs. Then pull starter forward and out.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter oilers every month or each 1000 miles.

GENERATOR:—**Model 941-W.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165 degrees F. cutting the resistance across the thermostat contacts in series and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35	1450	9-12	7.35-7.65	1800-2000

Motoring, generator draws 6 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is base mounted at right of engine and is driven by an extension of the water pump shaft. To remove generator, disconnect lead and drive coupling and take out base mounting bolts. Then lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator oilers every month or each 1000 miles.

RELAY:—**Model 265-B.** Relay contacts close at approximately 575 R.P.M. of the armature when the voltage of the generator reaches 6.75-7 volts. The charging current at closing of contacts must not exceed 3 amperes. Discharge current at opening of contacts is 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .012-.017 inch with contacts closed.

LIGHTING:—**Clum Switch Model 10677.** Switch is mounted at the lower end of the steering column on the frame. Dimming is by resistance. Headlights are 6-8 volt, 32 cp. S.C. Mazda 1133. Side, tail, stop and backing lights are 6-8 volt, 6 cp. S.C. Mazda 81. Dash and corner lights are 6-8 volt, 6 cp. D.C. Mazda 82. Dome light is 6-8 volt, 3 cp. D.C. Mazda 64.

FUSES:—Fuses are mounted on the dash. They are 10 ampere capacity.

SERIAL NUMBER:—First number (110) L-1001, (3510) L-13,701. On right hand side of frame under engine hood.

COMPRESSION:—Ratio—5.54-1 std. hd. No optl. heads.
Pressure—125 lbs. at 350 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model CE-4401. Mounted on dash.
Ignition Switch—Oakes 'Hershey' co-incidental ignition switch and steering post lock.

Distributor Model IGB-4317. Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set gap at .020". Limits, .018-.020".
Breaker Arm Spring Tension—16-20 ounces.
Cam Angles—Closed 40°. Open 20° (distributor).

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	500	4	1000
4	700	8	1400
6	900	12	1800
8	1100	16	2200
10	1300	20	2600

Advance is 1° for each 100 R.P.M. (distributor).

Mounting:—Distributor mounted on cylinder head. To remove, loosen locknut, take out mounting screw on side of cylinder head.

IGNITION TIMING:—With #1 piston on compression, turn engine over until 'IGN' mark (first line) on vibration dampener at front of engine lines up with pointer on chain case cover, loosen locknut and mounting set screw on side of cylinder head below distributor, rotate distributor until contacts begin to open, tighten screw and lock nut, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).
The second line on the vibration dampener is the top dead center mark for cylinders #1 and #6.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Firing Order:—1-5-3-6-2-4. See diagram.

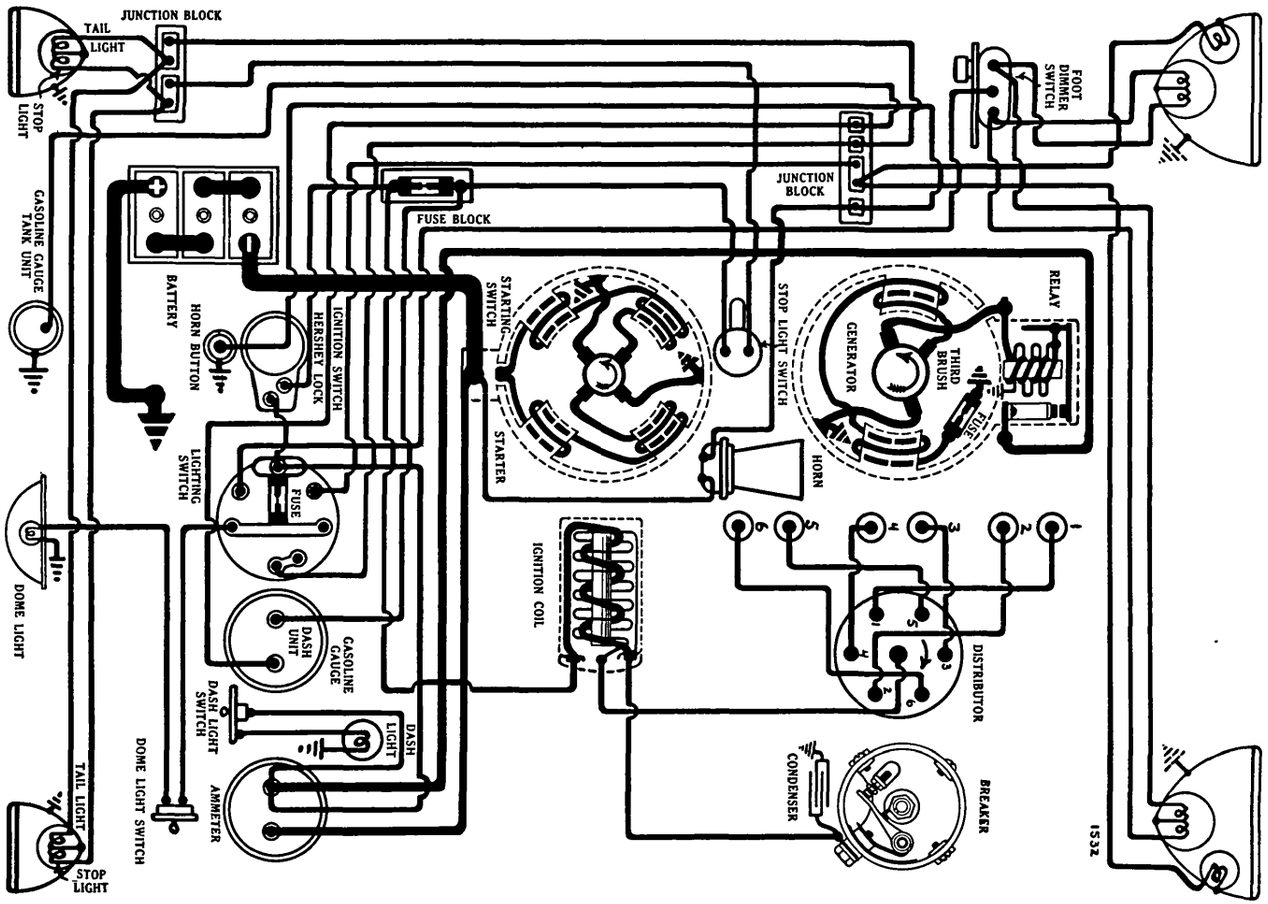
Spark Plugs:—Champion, Type C-15 (110) #7, (3510) . 18 MM. Metric type.

Spark Plug Gaps—.025" (.030" on cars with radio).

CARBURETION:—(Fuel System). See Carburetion Section for compete data on Carburetor, Fuel Pump, and Gasoline Gauge.

Carburetor:—Marvel, Model B-2. 1¼" plain tube, downdraft type.

Fuel Pump:—AC. Type R.



Gasoline Gauge:—Stewart-Warner Electric type.

VALVE TIMING:—To Check Timing—Check Camshaft setting. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across shaft centers. Remove and install chain 'endless'. Use special pullers and pushers. Keep sprockets lined up so as to avoid sidestrain on chain and sprockets.

Tappet Clearance:—.012" (110), .015" (3510) all valves—engine hot or cold.

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—20 lbs. at 20 M.P.H.

BATTERY:—Globe, Type No. 71. 6 volt, 13 plate, 102 A.H. capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under driver's seat.

STARTER:—Model MAB-4062 (110), MAB-4068 (3510). Armature No. MAB-2057.

Starter Drive—Inboard Bendix.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—44-56 ozs. (MAB-4062), 31-42 ozs. (MAB-4068).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

Starting Switch:—Mounted on starter field frame. Controlled by button on instrument board through flexible cable. Pull required to close starter switch contacts must be not less than 2.3 pounds (measured at right angles to switch lever at extreme tip).

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out 2 flange mounting capscrews.

GENERATOR:—(110) Model GAR-4205, (3510) Model GAR-4601-3. Armature No. GAR-2214. Third brush control type. Model GAR-4601-3 is air-cooled and a higher charging rate is allowable.

Charging Rate Adjustment—Take off commutator cover band, shift third brush by prying on brush mounting stud, counter-clockwise to increase or clockwise to decrease charging rate. Third brush held in position by friction.

Maximum Charging Rate—(GAR-4205) 18 amperes cold, 17 amperes hot, at 8.0 volts reached at 1700 R.P.M., (GAR-4601-3) 20 amperes cold, 18 amperes hot, at 8.0 volts reached at 2400 R.P.M.

Performance Data—Model GAR-4601-3

Cold			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	760	0	6.4	800
4	6.75	920	4	6.8	950
8	7.05	1100	8	7.15	1140
12	7.35	1300	12	7.5	1400
16	7.7	1560	16	7.85	1840
20	8.0	2300	18	8.0	2400

Performance Data—Model GAR-4205

Amperes	Volts	R.P.M.
2	6.4	750
6	6.9	885
10	7.3	1030
14	7.65	1230
17	8.0	1700
14	7.65	2200

Rotation—Counter-clockwise at commutator end.
Field Current—4.46-4.94 amperes at 6.0 volts.
Motoring—5.13-5.67 (GAR-4205), 4.89-5.41 (GAR-4601-3) amperes at 6 volts.
Brush Spring Tension—24-36 ounces each.
Field Fuse—7½ ampere capacity.

Mounting:—Cradle mounted at left front of engine. Driven by fan belt. Drives water pump through shaft extension. To remove, disconnect water pump drive coupling, slack off fan belt, loosen mounting clamp band. When mounting generator see that dowel in field frame is in place to prevent generator moving in cradle.

Belt Adjustment—Loosen two cap screws on fan bracket, move bracket upward until fan belt can be moved 1" (sideplay) at point midway between pulleys, tighten bracket screws.

CUT-OUT RELAY:—Model CB-4021. Mounted on generator field frame.
Cuts in—7.0-7.5 volts or approximately 750 R.P.M.
Cuts out—.5-2.5 ampere discharge current.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" (contacts closed).

LIGHTING:—Delco-Remy Switch Model 478-N. Foot Control Switch Model 465-Z. Lighting switch mounted on back of instrument board. Foot control switch controls upper or driving beam and lower depressed or passing beam.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-21	1116
Parking, Instrument	3	63
Stop and Tail	21-2	1158
Dome	4	64 (DC)

FUSES:—Lighting—20 ampere on lighting switch.
Accessory—20 ampere capacity on fuse block (connected in stop light and gasoline gauge circuits).
Generator Field—7½ ampere under fuse cover on generator.

SERIAL NUMBER:—First number, L-23,001.

COMPRESSION:—**Ratio**—5.54-1 std. head. High compression aluminum head optional.
Pressure—125 lbs. at 350 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model IG-4626.**
Ignition Current—2.5 amperes idling, 4 stopped.
Ignition Switch—Electrolock, Type No. 6708 connected to coil by armored cable.

Distributor Model IGB-4317, IGB-4317-A (aluminum head engines). Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set at .020". Limits .018-.020".
Breaker Arm Spring Tension—16-20 ounces.
Cam Angles—Closed 40°. Open 20° (distributor).

Automatic Advance—IGB-4317

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	500	4	1000
4	700	8	1400
6	900	12	1800
8	1100	16	2200
10	1300	20	2600

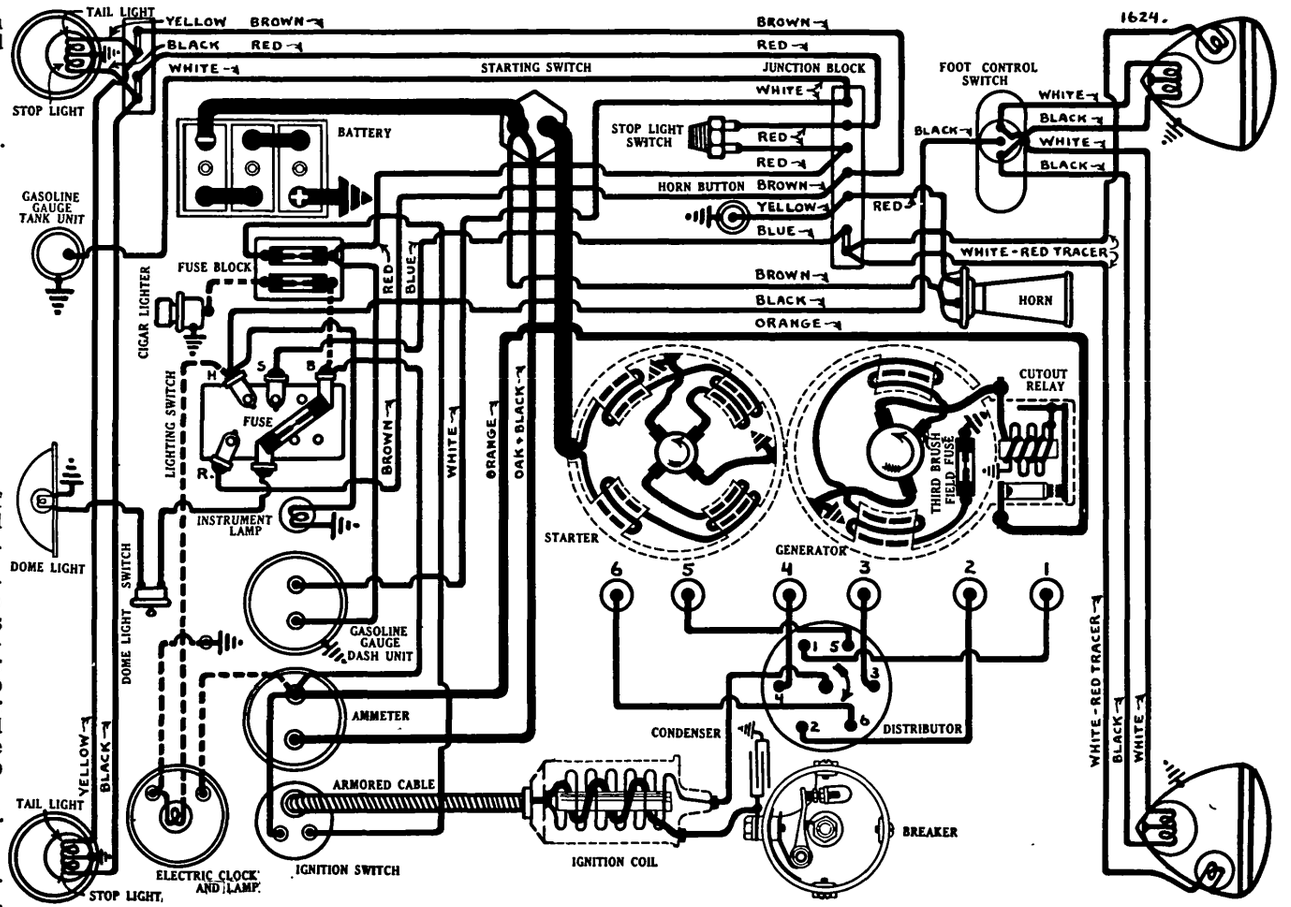
Automatic Advance—IGB-4317-A

Start	300	0	600
2	600	4	1200
4	900	8	1800
5	1050	10	2100

Removal:—Distributor mounted on right side of cylinder head. To remove, loosen locknut and take out mounting screw on side of cylinder head.

IGNITION TIMING:—With #1 piston on compression, turn engine over until 'IGN' mark (first line) on vibration dampener at front of engine lines up with pointer on chain case cover, loosen locknut and mounting setscrew on side of cylinder head, rotate distributor until contacts begin to open, tighten setscrew and locknut. See that rotor is opposite #1 segment in distributor cap and check spark plug connections (see diagram). The second line on the vibration dampener is the top dead center mark for cylinders #1 and 6.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Firing Order:—1-5-3-6-2-4 (see diagram).



Spark Plugs:—Champion, Type #7. 18MM. Metric.
Spark Plug Gaps—.025" (.030" on cars with radio).

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.
Carburetor:—Marvel, Model B-2 10-1603, 1¼" downdraft type.
Fuel Pump:—A.C., Type R-1521454 diaphragm type.
Gasoline Gauge:—Stewart electric type.

VALVE TIMING:—**To Check Timing**—Check camshaft setting. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Remove and install chain 'endless.' Use special gear pullers and pushers, keep sprockets lined up so as to avoid sidestrain on chain or sprockets.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.
Tappet Clearance:—.015" all valves—engine hot or cold.

LUBRICATION:—**Crankcase Capacity**—7 quarts.
Normal Oil Pressure—25 lbs. (10 lbs. idling).

BATTERY:—**U.S.L., Type KW-13A,** 6 volt, 13 plate, 96 A.H. capacity (20 hour rate).

Starting Capacity—106 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal. Is grounded to frame and to transmission cover bolt.
Location—On left side under driver's seat.

STARTER:—MAB-4068 (first cars), MAB-4076 (later cars). Armature MAB-2057.

Starter Drive—Inboard Bendix Type LCD11FX-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—31-42 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

Starting Switch:—Type SW-4001. Mounted at left of engine, operated by depressing clutch pedal.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting capscrews.

GENERATOR:—Model GAR-4601-3 (first), GAR-4601-5 (later). Armature No. GAR-2214. Air-cooled, third brush control type.

Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.

Maximum Charging Rate—20 amperes (cold), 18 amperes (hot), 8.0 volts, 2400 R.P.M.

Performance Data—GAR-4601-3

Cold			Hot

20	8.5	1660	19.2	8.4	2600
22.4	8.8	2300			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ounces.
Field Current—4.46-4.94 amperes at 6.0 volts.
Field Fuse—7½amperes under cover on generator.
Motoring Current—4.89-5.41 amperes at 6.0 volts.

Removal:—Generator cradle mounted at left front of engine with fan belt drive. Water pump driven by generator shaft extension. To remove, disconnect water pump drive coupling, slack off belt adjustment, loosen mounting clamp band, lift generator out.

Belt Adjustment—Adjust when belt sideplay exceeds 1½" midway between generator and fan pulleys. To adjust, loosen two capscrews on fan bracket, raise bracket up (bracket pivots on one screw) until belt sideplay is approximately 1", tighten mounting screws.

CUTOUT RELAY:—Model CB-4021. Mounted on generator. See Equipment Section for complete data.
Cuts In—6.75-7.5 volts, 750 R.P.M.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 5820-A. R.B.M. Foot Control Switch. Foot operated control switch used to control headlamp upper and lower beams.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320C
Parking, Instrument	3	63
Stop and Tail	21-3	1158
Dome	3	64 (DC.)

FUSES:—Lighting—20 ampere on back of switch.
Generator Field—7½ ampere on generator.
Accessory—One or two 20 ampere fuses on fuse block on steering column brace behind instrument panel.

SERIAL NUMBER:—First number—L-23101. On right side of frame under hood.

COMPRESSION:—**Ratio** 5.54-1 Std. cast-iron head, aluminum high compression head optional. **Pressure**—Aprpoximately 95 lbs. at cranking speed (std. cast-iron head).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 5 M.P.H.

IGNITION:—**Coil Model IG-4626, IG-4626-A.** Service Winding (coil less switch and cable) IG-3224-S (IG-4626), IG-3224-DS (IG-4626-A).

Ignition Current—2.5 amperes idling, 4 stopped.

Ignition Switch:—Mitchellock Model 24-B. Type 6708. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton #50184, Mitchell #6760.

Distributor Model IGB-4317-A, IGB-4317-B. Single breaker, 6 lobe cam, full automatic advance type.

Breaker Gap—Set at .020". Limits .018-.020".

Cam Angle or Dwell—Closed 40°. Open 20°.

Breaker Arm Spring Tension—16-20 ounces.

Condenser—Part No. IGB-1025. Capacity .20-.25 mfds.

Automatic Advance—IGB-4317-A.

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
2	600	4	1200
4	900	8	1800
5	1050	10	2100

Automatic Advance—IGB-4317-B

2	500	4	1000
4	700	8	1400
6	900	12	1800
8	1100	16	2200
10	1300	20	2600

Distributor Removal:—Mounted on right side of cylinder head. To remove, loosen locknut and take out mounting screw on side of cylinder head.

IGNITION TIMING:— **Flywheel Deg. Piston Position**
All engines ..... at TDC.. ....0000" TDC

Timing—With #1 piston on compression, turn engine over until 'DC/IGN' mark on vibration dampener at front of engine lines up with pointer on chain case cover, loosen locknut and mounting setscrew on side of cylinder head, rotate distributor until contacts begin to open, tighten setscrew and locknut. See that rotor is opposite #1 segment in distributor cap and check spark plug connections (see diagram).

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Firing Order:—1-5-3-6-2-4. See diagram.

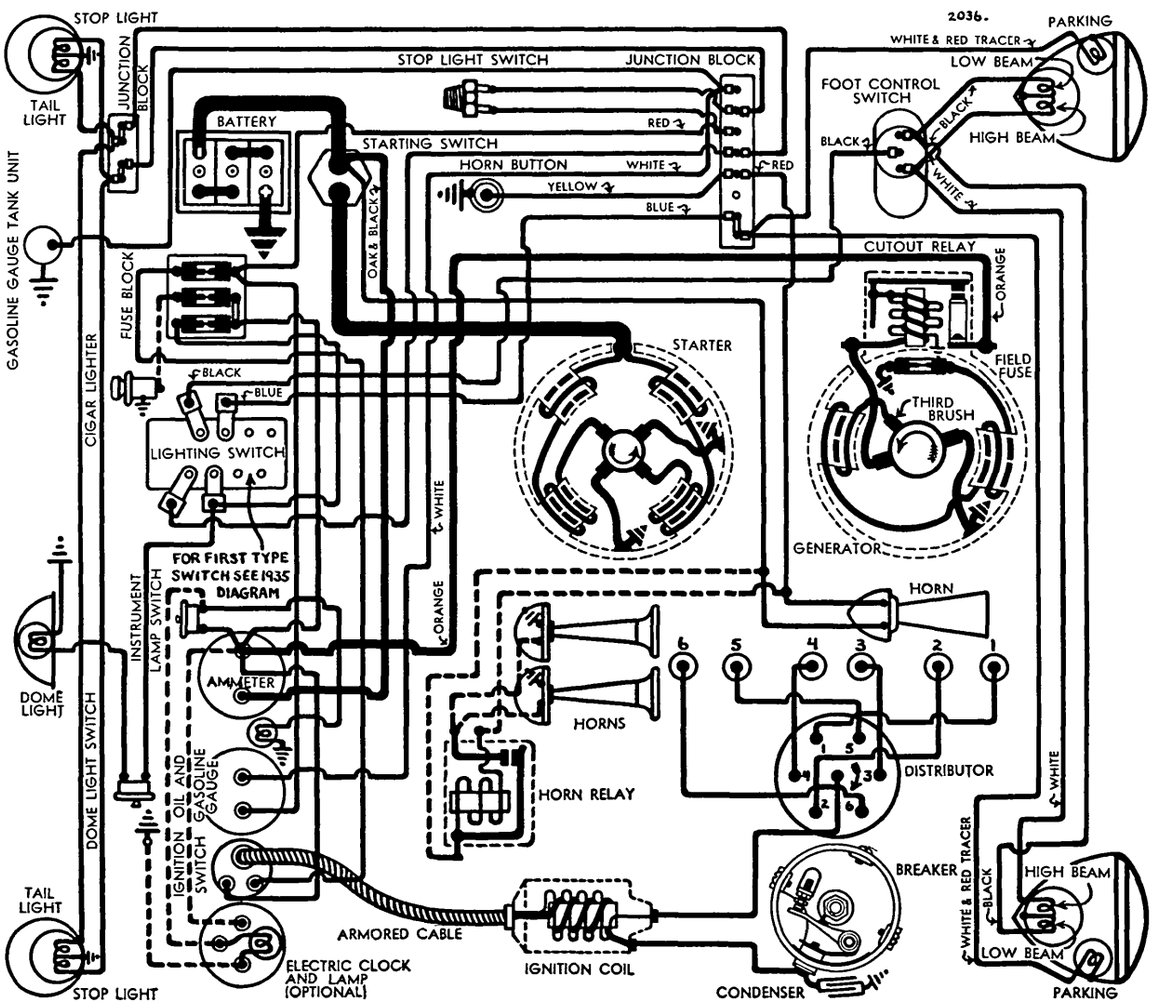
Spark Plugs:—Champion Type #7. 18 MM. Metric. **Spark Plug Gaps**—.025" (.030" cars with radio).

CARBURETION:—**Carburetors**—Marvel Model B-2 10-1603 (Early cars)., 1¼" downdraft type. Stromberg Model AX-2 (Later cars), downdraft type. See Carburetion Section for complete adjustment, overhaul, and Jet Specifications.

NOTE—Do not adjust carburetor until engine is thoroughly warmed up and choke valve is wide open.

Idle Adjustment—Adjust throttle stopscrew so that idle speed is 5-7 M.P.H. Turn idle adjusting screw in until engine begins to hesitate or miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:



#1 Inner Hole (Min. stroke)—Extremely hot weather.
#2 Normal summer driving.
#3 Normal winter driving.
#4 (Marvel only)—Extremely cold weather.

Air Cleaner:—AC. #1525967 oil-wetted type standard. Heavy duty oil-bath type optional.

Fuel Pump:—AC. Type W #1522152. Type R #1522133 (RHD). Diaphragm types. See article in Carburetion Section for complete data.

Gasoline Gauge:—Motometer Electric No. NG-7623-D (dash unit), NG-7441-T (tank unit). See article in Carburetion Section for complete data.

VALVE TIMING:—**To Check Timing**—No means provided for checking timing other than Camshaft Setting. Remove chain case cover at front of engine. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Remove and install chain 'endless.' Use special gear pullers and pushers, keep sprockets lined up so as to avoid side-strain on chain or sprockets.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Tappet Clearance:—.015" all valves—hot or cold.

LUBRICATION:—Crankcase Capacity—7 quarts.

Normal Oil Pressure—25 lbs. (10 lbs. idling).

BATTERY:—U.S.L. Type KL-1-13. 6 volt, 13 plate, 100 ampere hour (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.1 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under driver's seat.

STARTER:—Model MAB-4076. Armature MAB-2057.

Drive—Inboard Bendix Type LCD11FX-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ounces (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft.lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.2 "	Lock	3.0	575
22.5 "	Lock	4.0	750

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting capscrews.

Starting Switch:—Type SW-4005. Mounted at left of engine at lower end of steering column. Operated by depressing clutch pedal.

GENERATOR:—Model GAR-4601-5. Armature GAR-2214. Third brush control type. Air cooled.

Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.

Standard Charging Rate Setting—20 amperes (cold), 16 amperes (hot), 2300 R.P.M.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

20	8.5	1660	19.2	8.4	2600
22.4	8.8	2300			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-36 ounces.

Field Current—4.46-4.94 amperes at 6.0 volts.

Motoring Current—4.89-5.41 amperes at 6.0 volts.

Field Fuse—7½ amperes. Under cover on generator.

Removal:—Cradle mounted at left front of engine with fan belt drive. Water pump driven by generator shaft extension. To remove, disconnect water pump drive coupling, slack off belt adjustment, loosen mounting clamp band, lift generator out.

Belt Adjustment:—Adjust when belt sideplay exceeds 1½" midway between generator and fan pulleys. To adjust, loosen two capscrews on fan bracket, raise bracket up (bracket pivots on one screw) until belt sideplay is approximately 1", tighten mounting screws.

CUTOUT RELAY:—Model CB-4014. Mounted on generator. See article in Equipment Section for complete data.

Cuts In—6.75-7.5 volts, 750 R.P.M.

Cuts Out—.5-2.5 amperes discharge current.

Contact Gap—.025-.035".

Air Gap—.010-.030" with contacts closed.

LIGHTING:—Headlamps—Corcoran-Brown, Pre-focused type. Upper and lower beams controlled by foot selector switch.

Switches

Lighting—Soreng-Manegold Model 5820-A (early cars), Model A-5820-A (later cars).

Foot Selector—H. A. Douglas.

Stop Light—Hydraulic type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Stop and Tail	21-3	1158
Parking, Instrument	3	63
Dome	6	81

FUSES:—Lighting—20 ampere capacity on lighting switch (early cars), on fuse block (later cars).

Generator Field—7½ ampere on generator.

Accessory—One or two 20 ampere fuses on fuse block on steering column brace behind instrument panel.

HORNS:—Auto-Lite Model HA-4014, Std. single horn. Dual horns optl. operated by horn relay.

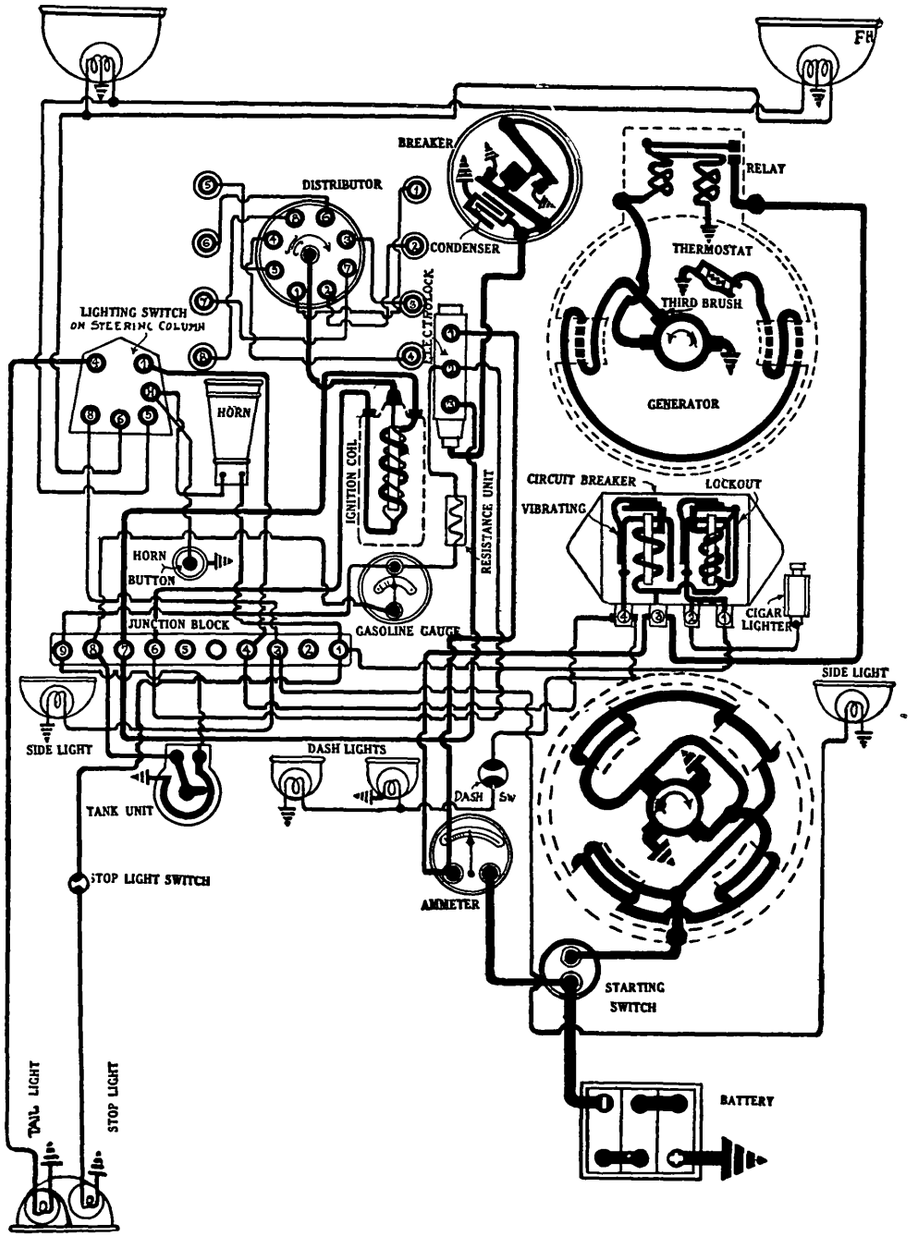
Horn Relay:—R.B.M. Type 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with 4 volts across winding with relay in inverted position.

LA SALLE

SERIES 303 (1927-28), SERIAL NOS. 2-12001 UP
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-XC-15-I-G. 6 volt. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded. Battery is mounted under the front seat on the right side.

IGNITION:—Coil Model 2195. Distributor Model 4032. Breaker contacts separate .022-.027 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 38° (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 20° at 2800 R.P.M. Breaker arm spring tension is 16-20 ounces. There are two breakers on a four sided cam opening alternately at intervals of 45° corresponding to 90° of crankshaft rotation which is the correct firing interval for the La Salle engine. The firing interval must be accurately set (see Timing).



Mounting:—The ignition system is equipped with an Electrolock switch. This must be removed from the car with the distributor when the distributor is to be taken from its mounting. To remove distributor, disconnect manual advance rod and remove head with high tension cables attached. Then remove hold-down screw and lift unit from place. The distributor is mounted at the front of the engine between the cylinder banks. The coil is mounted on the side of the distributor support.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

Timing:—Synchronization of Contacts. Use special Delco-Remy tool, Part No. 822572, and follow complete directions in Equipment Section on Synchronization of Contacts. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking the engine over 90 degrees until the flywheel mark 'IG/A-2/6' is opposite the indicator. If the second set of contacts (mounted on the movable sub-plate) do not open at this point, loosen the two lock screws and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap.

Timing Distributor to Engine:—One set of breaker contacts begin to separate when the piston entering power stroke reaches a position 7/8 inch on the flywheel before top dead center with the spark lever fully advanced. With piston No. 1 in firing position the flywheel mark 'IG/A-1-5' will be opposite the indicator on the flywheel case. This mark is 7/8 inch before the top dead center mark. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark lever. Continue to crank engine until the flywheel mark 'IG/A-1-5' is opposite the indicator on the case. If contacts do not separate at this point, loosen taper screw in center of breaker cam and rotate cam until contacts open. Tighten the screw. The second set of contacts will be open but just closing. They will break 45 degrees (distributor) after this point with the flywheel mark 'IG/A-2-6' opposite the indicator. These directions apply only to standard compression engines. For special direction on high compression engines see following paragraph.

Special Directions for Timing High Compression Engines:—On La Salle engines with high compression heads (with letters 'H.C.' cast in head) contacts separate with the piston entering power stroke 1/2 inch on the flywheel before top dead center with the spark lever fully advanced. Crank enegine over until a point on the flywheel approximately half way between the ignition mark 'IG/A-1-5' and the top dead center mark is opposite the indicator. Set distributor so one set of contacts is beginning to separate. With engines using high compression heads it is important that the spark plug gaps be set at .026 inch.

LA SALLE

SERIES 303 (1927-28) SERIAL NUMBERS 2-12001 UP
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Firing Order:—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R. No. 1 cylinder is nearest the radiator. Right hand block is right viewed from the driver's seat.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .027-.028 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1½ inches; stem diameter, ⅜ inch; stem length, 6 17/64 inches; valve lift, 25/64 inch; tappet clearance, .004 inch (cold) spring pressure, 133 pounds compressed to 2 9/64 inches. Inlet valves open 11° 2′ before upper dead center and close 58° 38′ after lower dead center.

EXHAUST VALVES:—Head diameter, 1½ inches; stem diameter, ⅜ inch; stem length, 6¼ inches (over all); valve lift, 25/64 inch; tappet clearance, .006 inch (cold); spring pressure, 133 pounds compressed to 2 9/64 inches. Exhaust valves open 38° 12′ before lower dead center and close 7° 38′ after upper dead center. Valve stem guides are removable. Oversize valves are not made.

To Set Valve Timing:—Camshaft driven by two sprocket non-adjustable chain drive. Mesh chain with sprockets turned so that '0' marks are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 725-C. Starter is connected to the engine through a mechanical gear shift connected to the starting pedal. The direction of rotation is clockwise, looking at the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
16 "	Lock	3	600

Mounting:—Starter is mounted on rear of flywheel housing on right side. To remove starter, disconnect cable and starter pedal linkage and remove three flange mounting capscrews. Then slide starter to rear and lift from place.

GENERATOR:—Model 384. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting a resistance in the field circuit and reducing the output approximately 40%. Generator output is adjusted by shifting the third brush. To make this adjustment, loosen the commutator cover band and shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any position by springs. The maximum charging rate is 18-20 amperes reached at 1600 R.P.M. or 22-25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.6	1400	10-12	7.3-7.7	1600

Third brush shunt field draws 1.8-2.3 amperes at 6 volts. Brush spring tension is 16-20 ounces.

Mounting:—Generator is flange mounted on the rear of the accessory drive chain case at the right of the engine. The water pump is mounted on the front of the chain case. To remove the generator, disconnect the generator lead and carburetor drain pipe and drop right hand mud pan. Then remove nuts on two upper flange mounting bolts and take out lower flange mounting screw. Slide generator to the rear to disengage drive coupling. The generator can then be removed from underneath.

Chain Adjustment. Accessory drive chain is adjusted by shifting the generator. To take up the timing chain, loosen the generator mounting bolts and lower screw and also loosen the lower mounting screw on the front face of the chain case. Then pry the generator away from the engine as far as possible. Back off ⅛ inch to provide the necessary play and tighten the bolts and mounting screws.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 266-N. Relay is mounted on the generator. Relay closes at approximately 8 M.P.H. when the generator voltage reaches 7.75 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed.

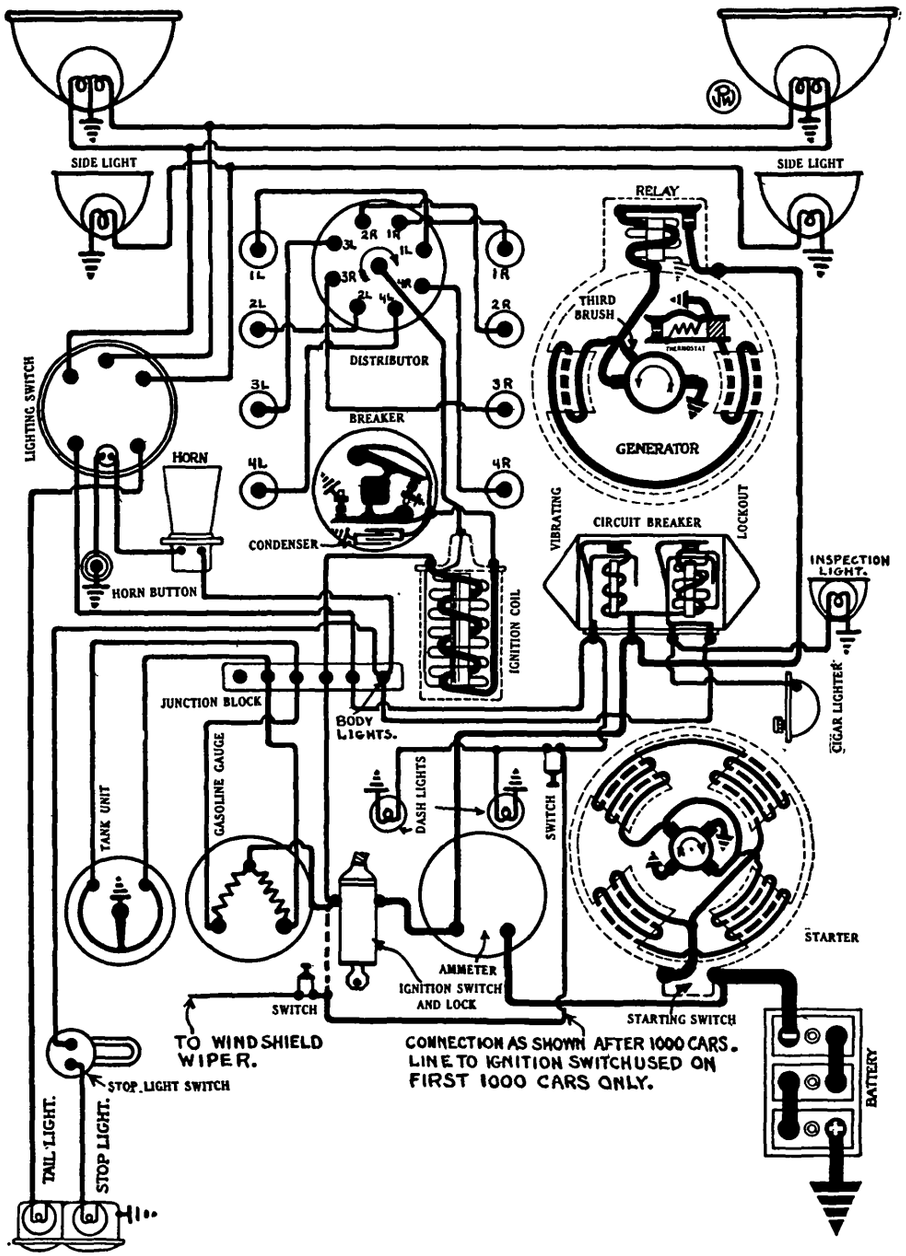
LIGHTING:—Lighting Switch Model 1313 is mounted at the foot of the steering column. Head lamps are 6-8 volt, 21 cp. double filament using lower 21 cp. filament instead of dimmers. Stop lamp is 6-8 volt, 21 cp. S.C. Side, dash, tail and dome lamps are each 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER:—Model 5759. A combined vibrating and lockout circuit breaker is mounted on the dash. The vibrating circuit breaker protects the lighting circuits. It begins to operate with a current of 25-30 amperes and limits the current to 10-15 amperes. The lockout circuit breaker protects the horn, cigar lighter, and stop lamp circuits. It begins to operate at 25-30 amperes. Current while operating is less than 1 ampere.

LA SALLE

SERIES 328 (1929)—BEGINNING WITH ENGINE NO. 400,001
PRODUCTION STARTED AUGUST, 1928
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-MXV-15-1. 6 volt. Rated capacity 100 ampere hours. Starting capacity 114 amperes for 20 minutes (20 minute rate). Lighting capactiy (5 ampere rate) is 5 amperes for 20 hours. The positive (+) terminal is grounded. The battery is mounted under the front seat on the right side.



IGNITION:—Coil Model 2195. Distributor Model 4041, 4042. Breaker contacts separate .022-.027 inch. They are made of tungsten. Resurface contacts when necessary with fine flat contact file or on medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 38 degrees (engine). Automatic advance begins at approximately 1100 R.P.M. Maximum automatic advance is 21 degrees (engine). Breaker arm spring tension is 16-20 ounces. There are two sets of breaker contacts set at an angle of 135 degrees and operating on a four lobed cam. Contacts open alternately at intervals of 45 degrees, corresponding to 90 degrees of crankshaft rotation. This is the correct firing interval for the La Salle engine and must be accurately set. (See Timing.) Ignition switch is a Delco-Remy Dual-lock, Model 426-B or F.

Mounting:—Ignition coil is mounted on side of distributor support. Distributor is mounted at front of engine between cylinder banks. A Blossom Coincidental ignition switch is used. To remove the distributor, disconnect the primary feed wire, manual advance rod and remove the distributor cap with the high tension cables attached. Then remove the hold-down screw and lift the distributor from place. (NOTE:—The lower end of the distributor shaft has an offset tongue which fits a groove in the top of the driving shaft. Do not try to force the distributor into place as the tongue may be turned 180 degrees from its correct position.)

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

Timing:—Synchronization of Contacts. Use special Delco-Remy tool, Part No. 822572, and follow complete directions in Equipment Section on Synchronization of Contacts. Contacts can be synchronized without special equipment after distributor has been timed to the engine if the engine is cranked over 90 degrees until the flywheel mark 'IG/A-2/6' is opposite the indicator. See next paragraph. Synchronization of contacts is very important.

Timing Distributor to Engine:—One set of breaker contacts begin to separate when the piston entering power stroke reaches a position ⅞ inch on the flywheel before top dead center with the spark lever fully advanced. With piston No. 1 in firing position the flywheel mark 'IG/A-1-5' will be opposite the indicator on the flywheel case. This mark is ⅞ inch before the top dead center mark. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark lever. Continue to crank engine until the flywheel mark "IG/A-1-5" is opposite the indicator on the case. If contacts do not separate at this point loosen taper screw in center of breaker cam and rotate cam until contacts open. Tighten the screw. The second set of contacts will be open but closing. They will break 45 degrees (distributor) after this point with the flywheel mark "IG/A-2-6" opposite the indicator. Beginning with Series 328, engine unit 400001, high compression heads are standard equipment. The flywheel setting remains the same as for former low compression heads (⅞ of an inch before top dead center). The reason for this same setting is that the new distributor 4041 has different advance characteristics which take care of the high compression heads.

LA SALLE

SERIES 328 (1929)—BEGINNING WITH ENGINE NO. 400,001
PRODUCTION STARTED AUGUST, 1928
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Firing Order:—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R. No. 1 cylinder is nearest the radiator. Right hand block is right viewed from the driver's seat.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. All engines are equipped with A.C. type Y special high compression or semi-aircraft type plugs. Gaps set at .025-.028 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1½ inches; stem diameter, ⅜ inch; stem length, 6 17/64 inch. Valve lift, 25/64 inch. Tappet clearance .004 inch (cold). Spring pressure is 156-164 pounds compressed to 2 5/32 of an inch. Inlet valves open 9½ degrees before top dead center and close 58½ degrees after lower dead center. Width of valve seat on cylinder block is 1/16 of an inch.

EXHAUST VALVES:—Head diameter, 1½ inches; stem diameter, ⅜ inch; stem length, 6¼ inches. Valve lift, 25/64 inch. Tappet clearance .006 inch (cold). Spring pressure, 156-164 pounds compressed to 2 5/32 of an inch. Exhaust valves open 46 degrees before lower dead center and close 5 degrees after top dead center. Width of valve seat on cylinder block 5/64 of an inch.

To Set Valve Timing:—Camshaft driven by two sprocket non-adjustable chain drive. Mesh chain with sprockets turned so that '0' marks are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—Model 725-C. Starter is connected to the engine through a mechanical gear shift connected to the starting pedal. The direction of rotation is clockwise, looking at the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
16 "	Lock	3	600

Mounting:—Starter is mounted on rear of flywheel housing on right side. To remove starter, disconnect cable and starter pedal linkage and remove three flange mounting capscrews. Then slide starter to rear and lift from place.

GENERATOR:—Model 384. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165 degrees F. cutting a resistance in the field circuit and reducing the output approximately 40%. Generator output is adjusted by shifting the third brush. To make this adjustment, loosen the commutator cover band and shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any position by springs. The maximum charging rate is 18-20 amperes reached at 1600 R.P.M. or 22-25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.6	1400	10-12	7.3-7.7	1600

Third brush shunt field draws 1.8-2.3 amperes at 6 volts. Brush spring tension is 16-20 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of accessory drive chain case. The water pump is mounted on the forward face of the chain case. To remove generator, disconnect lead and drop right hand mud pan under engine. Then remove nuts on two upper flange mounting bolts and take out lower flange mounting cap screw. Slide generator to the rear to disengage drive coupling. Generator can then be dropped down and removed from underneath.

Chain Adjustment. Accessory drive chain is adjusted by shifting the generator and water pump. To take up the chain, loosen the mounting bolts and cap screw and also the mounting screw on the front of the chain case. Then pry the generator and water pump away from the engine as far as possible and back off ⅛ inch. Tighten the mounting bolts and screws.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 266-N. Relay is mounted on the generator. Relay closes at approximately 8 M.P.H. when the generator voltage reaches 7.75 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed.

LIGHTING:—Switch Model 486-D. Lighting switch is mounted at the foot of the steering column. Head lights are 6-8 volt, 21-21 cp (double filament-double contact). Stop light is 6-8 volt, 15 cp. S.C. Side, dash, tail and dome lights are each 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER:—Model 5759. A combined vibrating and lockout circuit breaker is mounted on the dash. The vibrating circuit breaker protects the lighting circuits. It begins to operate with a current of 25-30 amperes and limits the current to 10-15 amperes. The lockout breaker protects the horn, cigar lighter, and stop light circuits. It begins to operate at 25-30 amperes. Current while operating is less than 1 ampere.

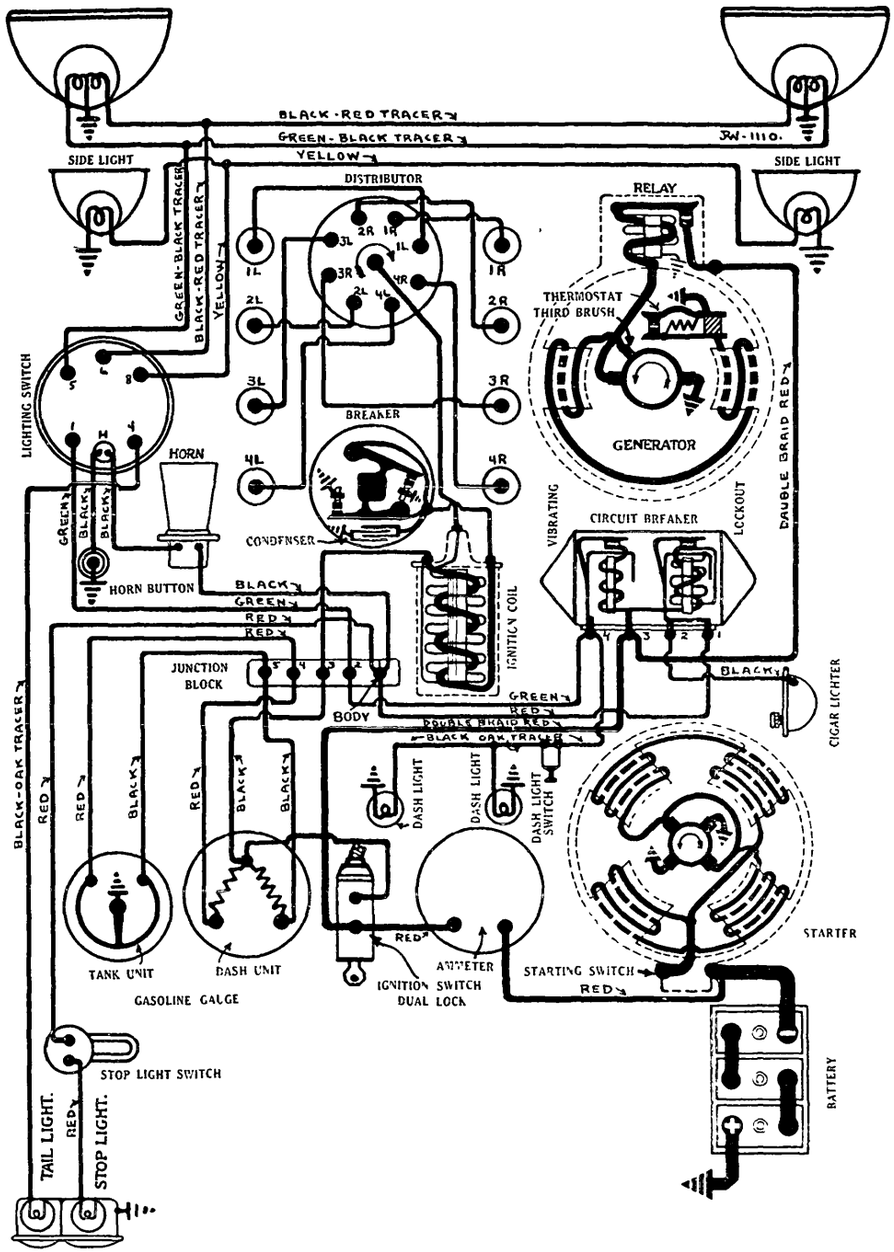
LA SALLE

SERIES 340 (1930), SERIAL NUMBERS 600,001 UP
PRODUCTION STARTED AUGUST 1929
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-LXV-15-2G, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 137 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 26 hours. Battery is mounted under the right front seat.

IGNITION:—Coil Model 530-B. Coil is mounted on the radiator brace rods directly over the distributor. Ignition current is 2.5 amperes with engine running and 2 amperes with engine stopped.

Distributor Models 4050, 4056, 4055. Breaker contacts separate .018-.022 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Tighten the lock nut. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 40 degrees (engine). Automatic advance begins at 1000 R.P.M. (engine). Maximum automatic advance is 30 degrees reached at 3800 R.P.M. Breaker has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized for correct performance. See Timing. Ignition switch is Delco-Remy Dual Lock Model 426-L, 426-M or 426-P (Export).



NOTE:—Distributor Model 4050 as used on first 2893 cars has the condenser mounted inside the distributor case. After Engine Unit No. 6-2893 condenser is mounted outside the distributor case. Distributor Model 4055 is used after Serial No. 5170.

Mounting:—Distributor is mounted at the front of the engine between the cylinder blocks. To remove distributor, disconnect primary lead and spark control rod and remove distributor head with cables intact. Then take out two hold-down screws and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every 1000 miles of operation. At the same time put a drop of oil on the breaker arm pivot pins and in the hole drilled in the top of the breaker cam which oils the path of the breaker arm rubbing blocks on the face of the cam.

Timing:—Synchronization of Contacts. The interval between the opening of the two sets of contacts must be exactly 45 degrees (distributor). This can be set by using special Delco-Remy Tool, Part No. 822572, and following directions on Distributors in Equipment section. The breakers may be synchronized without use of the tool after the distributor has been timed to the engine by cranking the engine over 90 degrees from the firing position of piston No. 1 when the flywheel mark 'IG/A-2-6' will be opposite the indicator. If the second set of contacts does not open at this point, the lock screws on the breaker arm mounting plate should be loosened and the eccentric adjusting screw turned until the contacts begin to open. Then tighten the lock screws and check the contact gap.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 2¼ inches (on the flywheel) before top dead center with the spark control lever in the fully advanced position. With piston No. 1 in firing position the flywheel mark 'IG/A-1-5' will be opposite the indicator on the flywheel case. This mark is 2¼ inches before the top dead center position of the piston. To set timing, crank engine over until piston No. 1 reaches firing position. Fully advance spark control lever. Then loosen taper screw in center of breaker

LA SALLE

PRODUCTION STARTED AUGUST 1929
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

cam and rotate cam until the set of contacts mounted on the stationary breaker plate begin to open. Tighten the screw and check to see that segment directly opposite rotor is connected to the spark plug in cylinder No. 1. The second set of contacts open exactly 45 degrees after this point.

Firing Order:—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R. Cylinder banks are right and left as viewed from the driver's seat. No. 1 cylinder is nearest the radiator.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-10. Gaps are .025-.028 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1.785-1.791 inch. Stem diameter, 3/8 inch. Stem length, 6 1/8 inches. Valve lift, 23/64 inch. Spring pressure, 79 pounds compressed to 2 1/2 inches (valve closed). Tappet clearance, .004 inch (cold). Inlet valves open 11 degrees before top dead center and close 59 degrees after lower dead centr.

EXHAUST VALVES:—Head diameter, 1.696-1.702 inches. Stem diameter, 3/8 inch. Stem length, 6 7/64 inches. Valve lift, 23/64 inch. Spring pressure, 79 pounds compressed to 2 1/2 inches (valve closed). Tappet clearance, .006 inch (cold). Exhaust valves open 48 degrees before lower dead center and close 8 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Set Valve Timing:—Camshaft driven by two sprocket non-adjustable chain drive. Mesh chain with sprockets turned so that '0' marks are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—**Model 728-D.** Starter is connected to the engine through a manual pinion shift interconnected with the starting switch and an overrunning clutch. Then direction of rotation is counter-clockwise (armature shaft), viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3	600

Mounting:—Starter is mounted at right of engine on rear of flywheel case. To remove starter, disconnect cable and starting pedal linkage and take out three flange mounting cap screws. Then pull starter to rear to clear drive and lift from place.

GENERATOR:—**Model 927-D.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at approximately 165°F. cutting the resistance in series with the field and reducing the output 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the end plate. Then shift the third brush mounting plate by hand. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. The maximum standard charging rate is 10-12 amperes (hot) at 7.3-7.7 volts reached at 1400 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.2-8.6	1400	10-12	7.3-7.7	1600

Brush spring tension is 16-20 ounces. Generator field current is 1.8-2.3 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and take out lower flange mounting cap screw and remove nuts on upper flange mounting bolts. Then pull generator to rear to disengage coupling and lift from place.

Drive Chain Adjustment:—To adjust generator and water pump drive chain, loosen two pivot screws and nuts on flange mounting. Then force water pump away from engine until chain is tight. Then back off approximately 1/8 inch and tighten mounting screws and nuts.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 500 miles of operation.

RELAY:—**Model 266-N.** Relay is mounted on the generator. Relay closes at 420 R.P.M. or 8-10 miles per hour when the generator voltage reaches 7.5 volts and opens with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.021 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—**Switch Model 486-H.** Lighting switch is mounted at lower end of the steering column. Double filament headlights using the second 21 cp filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights or parking lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome and corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

CURRENT LIMIT RELAY:—**Model 5759.** This device consists of a vibrating and lockout circuit breaker mounted on the dash. The vibrating unit protects the lighting circuits. It starts to operate when the current reaches 25-30 amperes and continues limiting the current to 5-15 amperes. The lockout circuit breaker protects the horn, stop light, inspection light, cigar lighter and body light circuits. It begins to operate when the current reaches 25-30 amperes and continues limiting the current to less than 1 ampere. Contact gap is .012-.030 inch. Air gap between armature and coil core is .015-.025 inch. Plunger spring tension is 5 ounces.

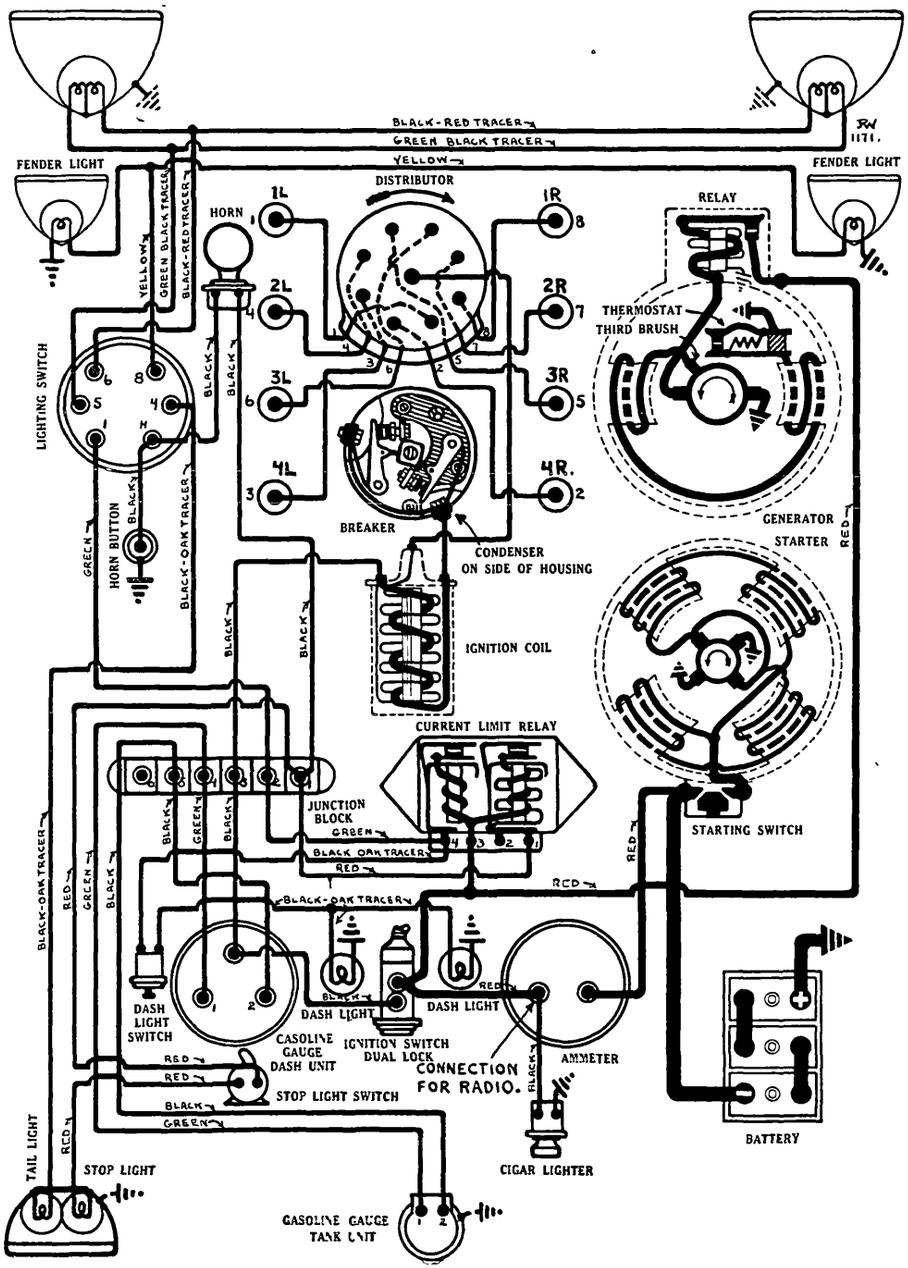
LA SALLE

SERIES 345 (1931), SERIAL NUMBERS 900,001 UP
PRODUCTION STARTED OCTOBER 1930
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Delco, Type 15-CW, 6 volt, 120 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 120 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 24 hours. Battery is mounted under the right front seat.

IGNITION:—Coil Model 530-D. Coil is mounted on the radiator brace rods directly over the distributor. Ignition current is 2.5 amperes with engine running and 2 ampere with engine stopped.

Distributor Model 4055. Breaker contacts separate .018-.022 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Tighten the lock nut. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 40 degrees (engine). Automatic advance begins at 1000 R.P.M. (engine). Maximum automatic advance is 30 degrees reached at 3800 R.P.M. Breaker has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized for correct performance. See Timing. Ignition switch is Delco-Remy Dual-lock, Model 426-M or 426-P (Export).



Mounting:—Distributor is mounted at the front of the engine between the cylinder blocks. To remove distributor, disconnect primary lead and spark control rod and remove distributor head with cables intact. Then take out two hold-down screws and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every 1000 miles of operation. At the same time put a drop of oil on the breaker arm pivot pins and in the hole drilled in the top of the breaker cam which oils the path of the breaker arm rubbing blocks on the face of the cam.

Timing:—Synchronization of Contacts. The interval between the opening of the two sets of contacts must be exactly 45 degrees (distributor). This can be set by using special Delco-Remy Tool, Part No. 822572, and following directions on Distributors in Equipment Section. The breakers may be synchronized without use of the tool after the distributor has been timed to the engine by cranking the engine over 90 degrees from the firing position of piston No. 1 when the flywheel mark 'IG/A-2-6' will be opposite the indicator. If the second set of contacts does not open at this point, the lock screws on the breaker arm mounting plate should be loosened and the eccentric adjusting screw turned until the contacts begin to open. Then tighten the lock screws and check the contact gap.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position ⅞ inch (on the flywheel) before top dead center with the spark control lever in the fully advanced position. With piston No. 1 in firing position the flywheel mark 'IG/A-1-5' will be opposite the indicator on the flywheel case. This mark is ⅞ inch before the top dead center position of the piston. To set timing, crank engine over until piston No. 1 reaches firing position. Fully advance spark control lever. Then loosen taper screw in center of breaker cam and rotate cam until the set of contacts mounted on the stationary breaker plate begin to open. Tighten the screw and check to see that segment directly opposite rotor is connected to the spark plug in cylinder No. 1. The second set of contacts open exactly 45 degrees after this point.

Firing Order:—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R. Cylinder banks

SERIES 345 (1931), SERIAL NUMBERS 900,001 UP
PRODUCTION STARTED OCTOBER, 1930
DELCO-REMY GENERATING STARTING SYSTEM
DELCO-REMY IGNITION

are right and left as viewed from the driver's seat. No. 1 cylinder is nearest the radiator.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-10. Gaps are .025-.028 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1.660-1.666 inch. Stem diameter, ⅜ inch. Stem length, 6 17/64 inches. Valve lift, 23/64 inch. Spring pressure, 79 pounds (spring length, 2½ inches) and 160 pounds (spring length, 2.148 inches). Tappet clearance, .004 inch (cold). Inlet valves open 9 degrees before top dead center and close 58 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1.634-1.640 inches. Stem diameter, ⅜ inch. Stem length, 6¼ inches. Valve lift, 23/64 inch. Spring pressure, 79 pounds (spring length, 2½ inches) and 160 pounds (spring length, 2.148 inches). Tappet clearance, .006 inch (cold). Exhaust valves open 46.5 degrees before lower dead center and close 7 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Set Valve Timing:—Camshaft driven by two sprocket non-adjustable chain drive. Mesh chain with sprockets turned so that '0' marks are adjacent to and in line with a straightedge across the shaft centers.

STARTER:—**Model 728-D.** Starter is connected to the engine through a manual pinion shift interconnected with the starting switch and an overrunning clutch. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3	600

Mounting:—Starter is mounted at right of engine on rear of flywheel case. To remove starter, disconnect cable and starting pedal linkage and take out three flange mounting cap screws. Then pull starter to rear to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each starter oiler every 1000 miles. Every six months repack the reduction gear housing with graphite grease.

GENERATOR:—**Model 927-D.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at approximately 165°F. cutting the resistance in series with the field and reducing the output 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the end plate. Then shift the third brush mounting plate by hand. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. The maximum standard charging rate is 10-12 amperes (hot) at 7.3-7.7 volts reached at 1400 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.2-8.6	1400	10-12	7.3-7.7	1600

Brush spring tension is 20-28 ounces. Generator field current is 1.8-2.3 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine on the rear of the chain case. The water pump is mounted on the front face of the chain case. To remove generator, disconnect lead and drop mud pan at right of engine. Then remove nuts on two upper flange mounting bolts and take out lower flange mounting cap screw. Pull generator to the rear to disengage drive coupling. The generator can then be taken out from underneath the car.

Drive Chain Adjustment. To adjust generator and water pump drive chain, loosen two pivot screws and nuts on flange mounting. Then force water pump away from engine until chain is tight. Then back off approximately ⅛ inch and tighten mounting screws and nuts.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 500 miles of operation.

RELAY:—**Model 266-N.** Relay is mounted on the generator. Relay closes at 420 R.P.M. or 8-10 miles per hour when the generator voltage reaches 7.5 volts and opens with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.021 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—**Switch Model 486-D.** Lighting switch is mounted at lower end of the steering column. Double filament headlights using the second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights or parking lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome and corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

CURRENT LIMIT RELAY:—**Model 5759.** This device consists of a vibrating and lockout circuit breaker mounted on the dash. The vibrating unit protects the lighting circuits. It starts to operate when the current reaches 25-30 amperes and continues limiting the current to 5-15 amperes. The lockout circuit breaker protects the horn, stop light, inspection light, cigar lighter and body light circuits. It begins to operate when the current reaches 25-30 amperes and continues limiting the current to less than 1 ampere. Contact gap is .012-.030 inch. Air gap between armature and coil core is .015-.025 inch. Plunger spring tension is 5 ounces.

LA SALLE

MODEL 345-B (1932), SERIAL NUMBERS 1,100,001 UP
MODEL 345-C (1933), SERIAL NUMBERS 2,000,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Same as engine number.

ENGINE NUMBER:—Stamped on right hand side of crankcase below water inlet.

ENGINE:—Eight cylinder 90 degree 'V', 'L' head type, 3⅜x4 15/16" bore and stroke, 353 cubic inch displacement, rated at 36.45 H.P., develops 115 H.P. at 3000 R.P.M. Standard compression ratio 5.4-1. Optional high compression ratio of 5.7-1 and low compression ratio of 5.2-1 are available. When installed at factory to compensate for fuel characteristics or altitude conditions the standard ignition setting is used. Standard compression pressure 104 pounds at 1000 R.P.M.

BATTERY:—Delco, Type 17-BW ('32), 17-CF ('33), 6 volt, 17 plate, 130 ampere hour capacity (20 hour rate). Starting capacity 156 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to frame.
Mounting:—On outside of frame under right hand front fender.
Dimensions:—Width, 7". Length, 11¾". Height, 9⅜".

IGNITION:—Coil Model 528-G. Coil is mounted on dash under cowl.
Ignition Current:—.5-2 amperes (engine idling), 2 amperes (engine stopped).
Ignition Switch:—Delco-Remy Dual-lock Model 426-T co-incidental ignition switch and transmission lock (see Equipment Section).

Distributor Model 660-Y, 662-Y. Two breaker, 4 lobe cam, full automatic advance type. Contacts open alternately at 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized (see Timing).
Breaker Gap:—Set contact gap at .020". Hold within limits of .018-.024".
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.
Cam Angles—Closed 34°. Open 11° (distributor) when synchronized.

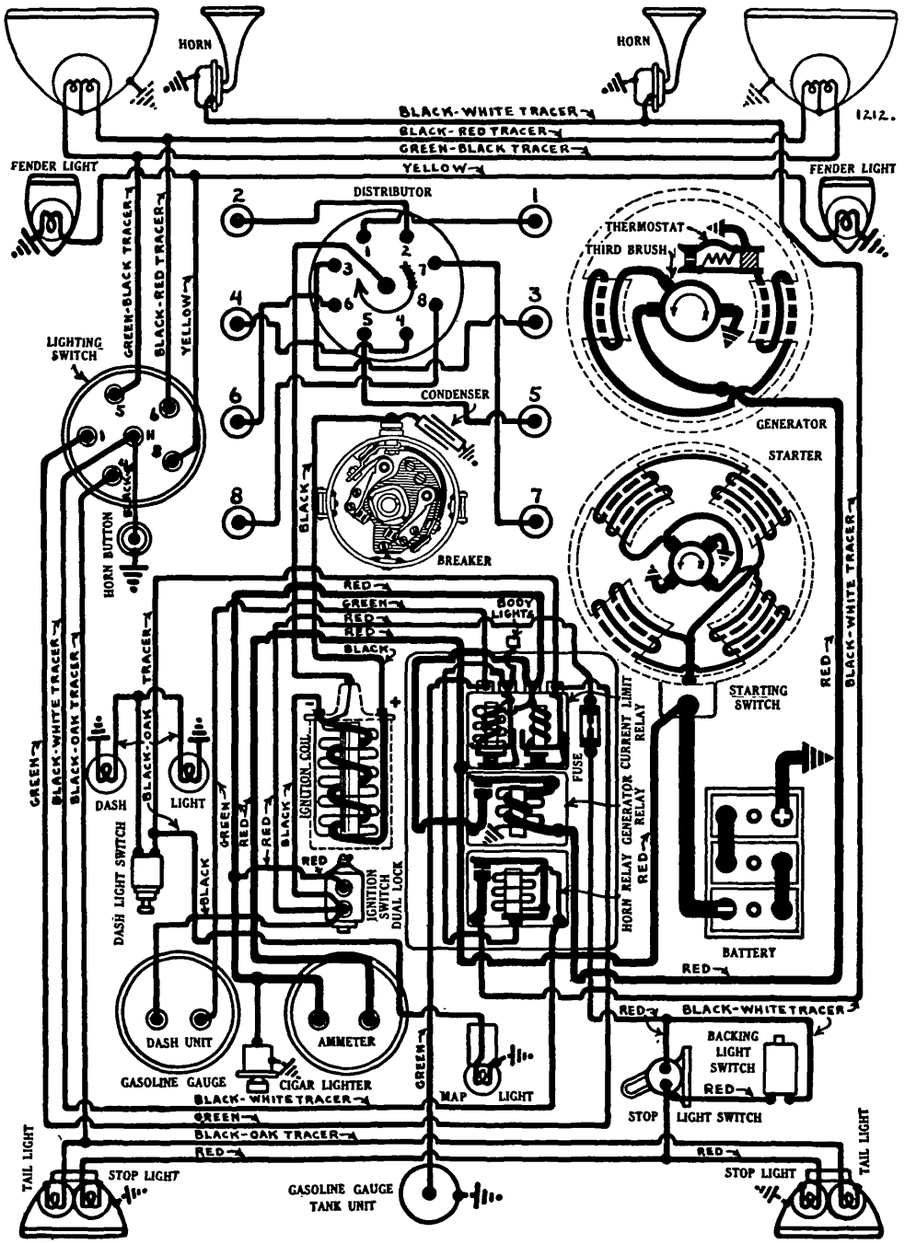
Distributor Model 661-P (late 1933 cars). Single breaker, 8 lobe cam, full automatic advance type. No synchronization required.
Breaker Gap—Set at .015". Hold within limits of .0125-.0175".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles—Closed 31°. Open 14° (distributor degrees).

Automatic Advance—Model 660-Y

Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	250	4	500
10	1475	20	2950

Automatic Advance—Model 661-Y, 661P

Start	250	2	500
3.75	500	7.5	1000
5.5	800	11	1600



Mounting:—Distributor is mounted at front of engine between cylinder banks. Driven by gears from the camshaft. To remove, disconnect primary lead, take off distributor cap, take out two cap screws in distributor bracket, lift distributor out.

Oiling:—1000 Miles. Use Alemite grease and gun on Alemite fitting under distributor until grease appears at relief hole above fitting. Take off distributor cap and rotor. Put light oil on breaker arm pivot pins and fill wick oiler in center of shaft. Apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting 9°12' (flywheel) or .039" (piston) before top dead center. To set timing, remove cover plate on flywheel housing. Center distributor pointer on quadrant scale by loosening hold-down screw in pointer arm and rotating distributor cup, tighten hold-down screw. With No. 1 piston (right hand block) on compression stroke rotate crankshaft until flywheel mark 'IG/A-1' is directly opposite indicator on flywheel housing. Loosen advance arm clamp bolt, rotate distributor cup until first set of contacts (mounted directly on breaker plate) begin to open (use test lamp). Tighten clamp bolt, connect spark plugs as indicated on diagram.

Synchronization of Contacts—first method as part of timing operation. After timing has been completed (as above), turn crankshaft 90 degrees to firing position of piston No. 2 when flywheel mark 'IG/A-2' should be opposite indicator. Loosen two lock screws on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open, tighten lock screws. Check contact gap; if outside limits of .018-.022 inch, reset at .020 inch and repeat synchronization.

Second Method—using synchronizing tool. Use Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section.

LA SALLE

MODEL 345-B (1932), SERIAL NUMBERS 1,100,001 UP
MODEL 345-C (1933), SERIAL NUMBERS 2,000,001 UP
DELCO-REMY SYSTEM

Firing Order:—1-2-7-8-4-5-6-3 with cylinders numbered as shown on diagram, or 1R-1L-4R-4L-2L-3R-3L-2R with cylinder banks right (R) and left (L) as viewed from the driver's seat. No. 1 cylinder nearest radiator in each case.

Spark Plugs:—18 MM. A.C. Type D-8. Hold gap within limits of .025-.028 inch.

VALVE TIMING:—Camshaft mounted directly above crankshaft driven by two-sprocket non-adjustable chain drive. Valves adjustable at center of engine between cylinder banks. New manifolding on 345-B engine requires new location of valves. With valves numbered 1 to 8, beginning at radiator, valves are #1—exhaust, #2—intake, #3—exhaust, #4 and #5—intake, #6—exhaust, #7—intake, #8—exhaust. Both cylinder blocks are identical.

To Set Valve Timing:—Camshaft sprocket and crankshaft sprocket are marked. Chain should be assembled with crankshaft and camshaft turned so that sprocket marks are directly opposite and in line with a straightedge across the shaft centers.

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1.660-1.666"	3/8"	6 17/32"	30°	23/64"
Exhaust	1.634-1.640"	3/8"	6 1/2 "	45°	23/64"

Tappet Clearance		Valve Springs	
Intake	.004" (cold)	Closed	79 pounds (2 1/2")
Exhaust	.008" (cold)	Open	160 pounds (2.148")

Timing

Intake valves open 6 degrees before top dead center. Intake valves close 42 degrees after lower dead center. This applies with .004" tappet clearance.

Exhaust valves open 38 degrees before lower dead center. Exhaust valves close 2 degrees after top dead center. This applies with .008" tappet clearance.

CARBURETION:—Updraft type carburetor, Cadillac make (see Carburetor Section for complete data).

Fuel Pump:—A.C. mechanical type fuel pump operated by eccentric on camshaft (see Carburetion Section).

Gasoline Gauge:—A.C. Electric type (see Carburetion Section).

STARTER:—**Model 728-P.** Manual pinion engagement connected to starting switch lever (not adjustable). Starter drives through reduction gears and an overrunning clutch. Rotation (armature shaft) counter-clockwise at commutator end. Brush spring tension 24-28 ounces. Starter cranks engine at 80-90 R.P.M.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3.0	600

Mounting:—Starter flange mounted on rear face of flywheel housing at right of transmission. To remove, disconnect cable, disconnect starting pedal linkage, take out 3 flange mounting cap screws, pull starter to rear to clear housing, lift from place.

Oiling:—**1000 Miles.** Put 8-10 drops light oil in oiler at each end of armature shaft. Outer bearing in pinion housing is oilless.

Six Months. Take out grease plug in reduction gear case. Repack gears with graphite grease.

GENERATOR:—**Model 927-S.** Third brush regulation, thermostat control. Thermostat contacts open at 175°F. reducing generator output approximately 40%. Rotation is counter-clockwise at commutator end. With standard setting maximum charging rate is 14-17 amperes at 8 volts (hot) reached at 1400 R.P.M. or 22 M.P.H.

Charging Rate Adjustment:—Loosen hexagonal lock screw on endplate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
22-24	8.6-9.0	1400	14-17	7.8-8.2	1800

Brush Spring Tension:—23-27 ounces on each brush.

Field Current:—4.4-5.0 amperes at 6 volts across field terminals.

Mounting:—Generator flange mounted at right of engine on rear of accessory drive chain case. Water pump mounted on front of chain case. Driven by special chain from crankshaft. To remove, drop mud pan at right of engine, disconnect lead, take off nuts on two upper flange mounting bolts, take out lower flange mounting cap screw, pull generator to rear to disengage drive coupling, take out from underneath car.

Chain Adjustment. Loosen nuts on flange mounting bolts, loosen two pivot screws (second screw on front of chain case), pull generator away from engine until chain is tight, slack off 1/8 inch, tighten bolts and screws.

Oiling:—**1000 Miles.** Put 8-10 drops light engine oil in oiler at each end of generator.

RELAY:—See paragraph on 'Apparatus Box'.

LIGHTING:—**Delco-Remy Switch, Model 486-H.** Lighting switch is mounted at lower end of steering column controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Fender Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Backing and Stop Light	6-8	15	S.C.	87
Map Reading Lights	6-8	3	S.C.	63
Dome and Corner Light	6-8	6	S.C.	81

NOTE:—The map reading light in the center of the instrument panel has a switch built in the socket. Switch is operated by pulling the light out against the stop. To remove map reading light bulb, pull lamp out part way until the end of the threaded shaft on the lamp plunger is flush with the end of the cylinder (behind the instrument panel), turn bulb shield until the hole in the plunger lines up with the hole in the cylinder, insert a nail to prevent plunger turning, unscrew bulb shield (right hand thread).

APPARATUS BOX:—**Delco-Remy, Model 480-Z.** Mounted on rear of dash under cowl. Consists of current limit relay (vibrating and lock-out circuit breaker), generator cut-out relay, horn relay, and a 10-ampere capacity fuse (in circuit to backing and stop lights).

Current Limit Relay:—Vibrating circuit breaker begins to operate with current load of 35-40 amperes limiting current to 5-20 amperes maximum with direct short-circuit. Lock-out circuit breaker begins to operate with current load of 25-30 amperes limiting current to less than 1 ampere with direct short-circuit. Circuit breaker contact gap limits .012-.030 inch. Air gap limits .015-.025 inch (contacts closed). Spring tension 5 ounces minimum (measured at brass button with spring scale at right angles to contact arm.

Cut-out Relay:—Contacts close at 8-9 M.P.H. or 420 R.P.M. (generator) with a generator voltage of 6.75-7.5 volts and open with a discharge current of 0-2 amperes. Contact gap limits, .015-.025 inch. Air gap limits, .012-.017 inch (contacts closed).

Horn Relay:—**Model 266-T.** Pressing horn button energizes horn relay winding, closing horn relay contacts and completing horn circuit. Horn current does not pass through horn button. Horn relay requires .25 amperes to close contacts. Horn relay contact gap limits, .015-.025 inch. Air gap limits, .012-.017 inch (contacts closed).

FUSES:—Stop and backing light fuse in Apparatus Box 10 ampere capacity.

HORNS:—Klaxon vibrator type matched set with blended tone, Model K-26-C Type 1379 (low note) and Model K-26-C Type 1380 (high note). Horns draw 6.0-8.5 amperes at 6 volts (Type 1379), and 5.0-6.5 amperes at 6 volts (Type 1380.

SERIAL NUMBER:—Same as engine number. First number 2,100,001 (1934), 2,106,175 (1935). Located on top of left frame side member in front of dash.

COMPRESSION:—**Ratio**—6.5-1 (std.), 5.75-1 (optl.). **Pressure**—162 lbs. at 1000 R.P.M. or 183 lbs. at 2700 R.P.M. or approx. 110 lbs. at cranking speed (Std. head).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model 539-B.** Lock coil type.
Ignition Current—2.2 amperes (idling), 4.4 amperes (engine stopped).
Ignition Switch—Model 431-G (part of coil assembly). Switch and coil connected by armored cable protecting primary lead.
Distributor Model 662-P. Two breaker, 4 lobe cam, semi-automatic advance type (manual advance adjustable at distributor only). Contacts must be synchronized as part of timing operation (see Ignition Timing).
Breaker Gap—Set gap at .020". Limits, .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Manual Advance—20° (engine) adjustment only.
Cam Angles (Distributor Degrees)—Closed 34°. Open 11°. Both sets together when properly synchronized.

Automatic Advance

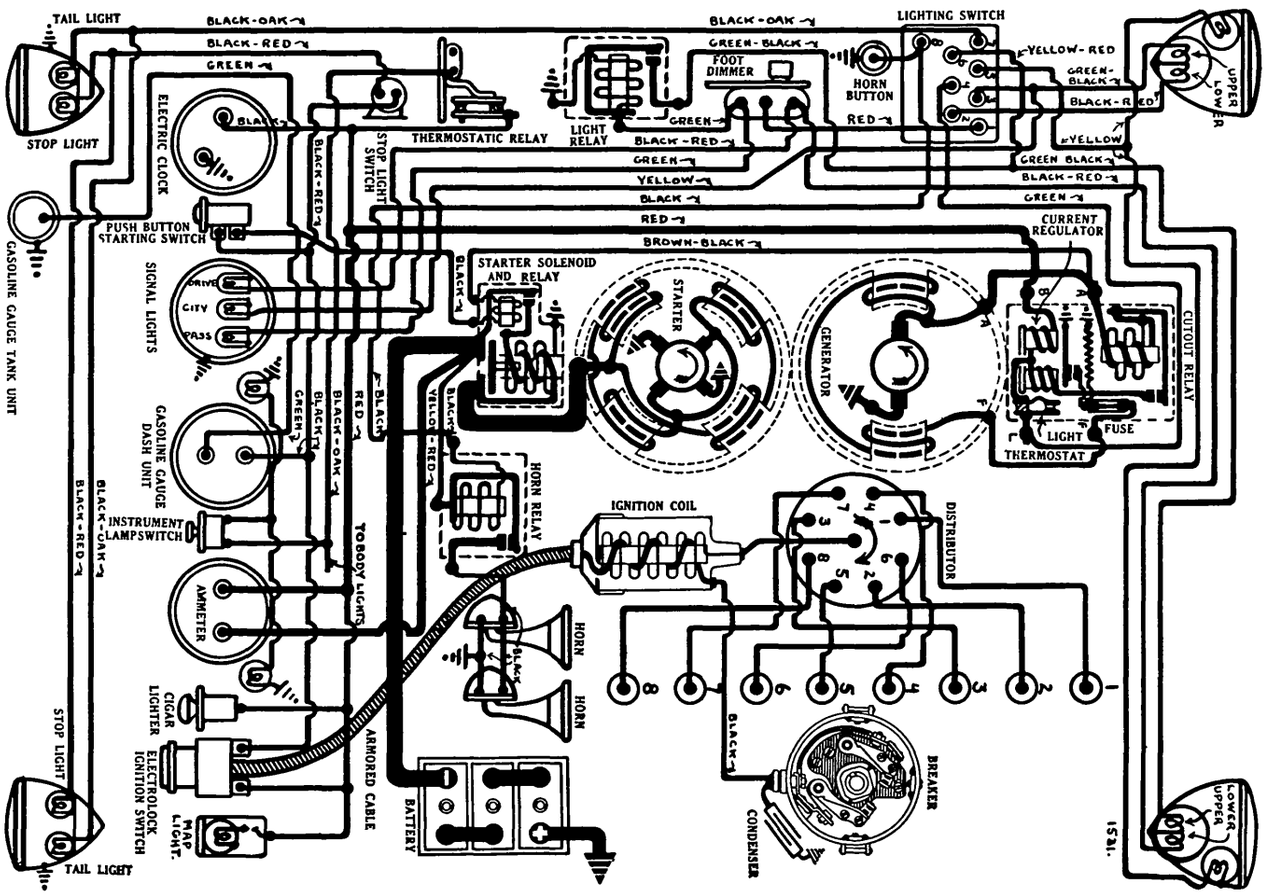
Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	500	1	1000
4.75	1200	9.5	2400
14	1850	28	3700

Mounting—On top of cylinder head. To remove, take out hold-down screw.

IGNITION TIMING:—

Flywheel Degrees	Piston Position
All engines 8° BTDC	.0255" BTDC.

To Set Timing:—Crank engine by placing transmission gears in 'high', jack up one rear wheel, turn wheel by hand. With No. 1 piston on compression, turn engine over until 'IGA' mark on harmonic balancer at front of engine (which is 8° before TDC. mark for cylinder #1) is directly under pointer on chain case, loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate), begin to open, tighten clamp bolt, see that rotor is directly opposite #1 segment in distributor cap, check spark plug connections (see diagram). Second or movable set of contacts checked by synchronizing.
Synchronization of Contacts—After timing stationary contacts (above), turn engine over 90° or ¼ revolution to firing point for cylinder #6, stop when 'IGA #6' mark on harmonic balancer registers with pointer, loosen lock screws on movable sub-plate, turn eccentric adjusting screw until contacts just open, tighten lock screws.
Synchronization (using Tool)—Use Delco-Remy synchronizing tool, Part No. 1838182. See Equipment Section for complete data.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.



Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—A.C., Type G-6. 18 MM. Metric type.
Spark Plug Gaps—Set at .026". Limits, .025-.027".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, Gasoline Gauge, and Automatic Choke.
Carburetor:—Stromberg, Model EE-23, 1¼" dual, downdraft type.
Automatic Choke—Stromberg.

Fuel Pump:—A.C., Type I combination fuel and vacuum pump.
Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—**To Check Timing**—No. 1 intake valve should open with piston on top dead center with tappet clearance set at .0118".
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Tappet Clearance:—Running .006" Int., .008" Exh.
Valve Spring Pressure:—Valve Closed—43 lbs. at 2.25" Int., 2.248" Exh. Valve Open—96 lbs. at 1.906" Int., 1.904" Ehx.

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—30 lbs. at 60 M.P.H.

BATTERY:—Delco, Type 17-D, 17-DF (Export), 6 volt, 17 plate, 130 A.H. capacity (20 hour rate).
Starting Capacity—156 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under right front seat.

STARTER:—Model 727-N. Armature No. 823881. Four pole mechanical shift (solenoid type).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
15 "	Lock	3.0	600

Starting Switch: — Solenoid Switch, Model 1514. Pushbutton Switch, Model 1379. Solenoid (starting switch and pinion shift) mounted on starter field frame. Controlled by relay (on switch case) operated by pushbutton switch on instrument panel. Operative only with ignition 'on'. See Equipment Section 'Starter Controls' for complete data.

Mounting:—Starter flange mounted on left hand front face of flywheel housing. To remove, take out flange mounting screws.

GENERATOR:—Model 961-C. Armature No. 1836971. Straight shunt type with external current regulation (regulator mounted on generator field frame). Generator is air cooled by fan incorporated in drive pulley. Lamp load capacity, 11 amperes (do not exceed this figure).

Adjustment—See Control Unit paragraph and complete data in Equipment Section. Generator is two brush type—no third brush used. Lamp load must not exceed 11 amperes. Do not connect lamps or accessories in excess of this amount to 'L' terminal of generator or lighting switch.

Charging Rate—Constant rate at all speeds above 1200 R.P.M. or 16 M.P.H.

Performance Data

	Amperes Lamps off	Amperes Lamps on	Volts	R.P.M.
Cold	13-16	19-22	7.7-8.1	1300
Hot	9-11	14-16	7.3-7.55	1400

Rotation—Counter-clockwise at commutator end.
Shunt Field Current—1.7-1.9 amperes at 6.0 volts.
Brush Spring Tension—22-26 ounces.
Field Fuse—6 ampere capacity (in control unit).

Mounting:—Pivot mounted at left front of engine. Driven by fan belt. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, swing generator away from engine, tighten clamp bolt before slacking off on generator, tighten pivot bolts.

RELAY REGULATOR (CONTROL UNIT):—Model 5541. Consists of relay cut-out, current regulator, field fuse, field resistance and thermostat. See Delco-Remy Regulators (Lamp-Load Type) in Electrical Equipment Section.
Adjustment—Increase current regulator spring tension to increase generator output, decrease spring tension to decrease output.
Setting—13-16 amperes at 7.7-8.1 volts (cold—lamps off), 19-22 amperes (cold—lamps on). 'Lamps on' figure correct with 11 ampere lamp load. Setting must be checked with cover on unit.

Relay Cut-out

Cut in—6.75-7.25 volts or 12 M.P.H.
Cuts out—3.0 amperes discharge current at 6.3 volts.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

Current Regulator

Contact Gap—.015-.025".
Contact Spring Tension—2.0-2.5 ounces.
Air Gap—.055-.060" between armature and center of core (armature down and fibre bumper just touching stop).
.006-.008" between fibre bumper and stop (armature up).

LIGHTING:—Delco-Remy Switch, Model 487-J, 487-G (RHD.). Foot Control Switch Model 465-Z. Lighting switch mounted at lower end of steering columlmn, foot control switch on toeboard at left of clutch pedal.
Headlight Indicator—Illuminated dial on instrument panel indicates position of lighting switch —'Pass' (see below), 'City' (lower beam—upper filaments), 'Drive' (high beam—lower filaments). Assymetrical passing beam (depressed beam from right hand headlamp only) controlled by foot switch in 'Country' or Driving Position.
Headlight Adjustment—Pre-focused type bulb with flanged base. No focusing operation required. Headlamps aimed straight forward (with lenses removed), adjustable by turning lamps on ball and socket mounting. Lenses marked 'Right' and 'Left' are not interchangeable.
Headlight Thermostat Relay:—Thermostatic arm type current limit relay (no winding) in control unit. Contacts open with current of 20 amperes at210°F. (air thermostatic arm temp., 375°-385°F.).

Bulb Specifications

Lamps	Candlepower	Mazda No.
Headlights (Pre-focused type)	32-32	2330-L
Rear Signal (Stop)	15	87
Rear (Tail), Map, Park., Inst.	3	63
Dome, Quarter, Deck, Tonneau	6	81
Headlight Indicators		40

THERMOSTAT RELAY:—Model 411-A. New type current limit relay operated by thermostatic arm (no winding). Adjustment is sealed and complete unit should be replaced if found to be defective. Contacts will remain closed with current of 25 amperes but will open in one minute with current of 38 amperes at temperature of 70-80°F.

FUSES:—Generator field fuse, 6 ampere capacity (in Control Unit case on generator).

HORNS:—Klaxon, Model 33-B. Matched set air-tone type. Current draw, 24-28 amperes. Horns operated by horn relay.

Horn Relay, Model 266-T. Relay requires .25 amperes at 2.0 volts (min.) to close contacts. Current draw .8 amperes.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

SERIAL NUMBER:—Same as engine number. First number 2,200,001. On left hand top front corner of cylinder block (below head).

COMPRESSION:—Ratio—6.25-1 Std. 5.75-1 Export.

Pressure—160 lbs. at 1000 R.P.M. or 180 lbs. at 2600 R.P.M. or approx. 105-110 lbs. at cranking speed (Std. head).

VACUUM READING:—Gauge should show steady reading of 20-21" with engine idling at 6 M.P.H.

IGNITION:—Coil Model 539-C. Mounted on front of dash.

Ignition Current—Idling 2.2 amperes, 4.4 stopped.
Ignition Switch—Model 431-L. Connected to coil by armored cable.

Distributor Model 662-P. Double breaker, 4 lobe cam, full automatic advance type. Contacts open alternately at 45° firing intervals corresponding to 90° firing interval of engine and must be synchronized—See Timing.

Breaker Gap—Set at .020". Limits .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Cam Angles—Closed 34°. Open 11° (distributor). Both sets together when properly synchronized.
Manual Adjustment—20° (see Timing).

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	500	1	1000
4.75	1200	9.5	2400
14	1850	28	3700

Distributor Model 663-J (after engine #30-3608). Single breaker, 8 lobe cam, automatic advance type with auxiliary vacuum spark control and manual adjustment (see Timing). No synchronization required for this model.

Breaker Gap—Set at .016". Limits .012-.018".
Cam Angle or Dwell—31° (closed), 14° (open).
Breaker Arm Spring Tension—19-23 ounces.
Condenser—Part No. 1837231. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	500	1	1000
5.75	1300	11.5	2600
14.	1800	28	3700

Vacuum Spark Control—Integral with distributor. Mounted on housing and linked directly to breaker plate. Provides additional advance at speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring in unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG).
Start	8-10"
18° Max.	15-18"

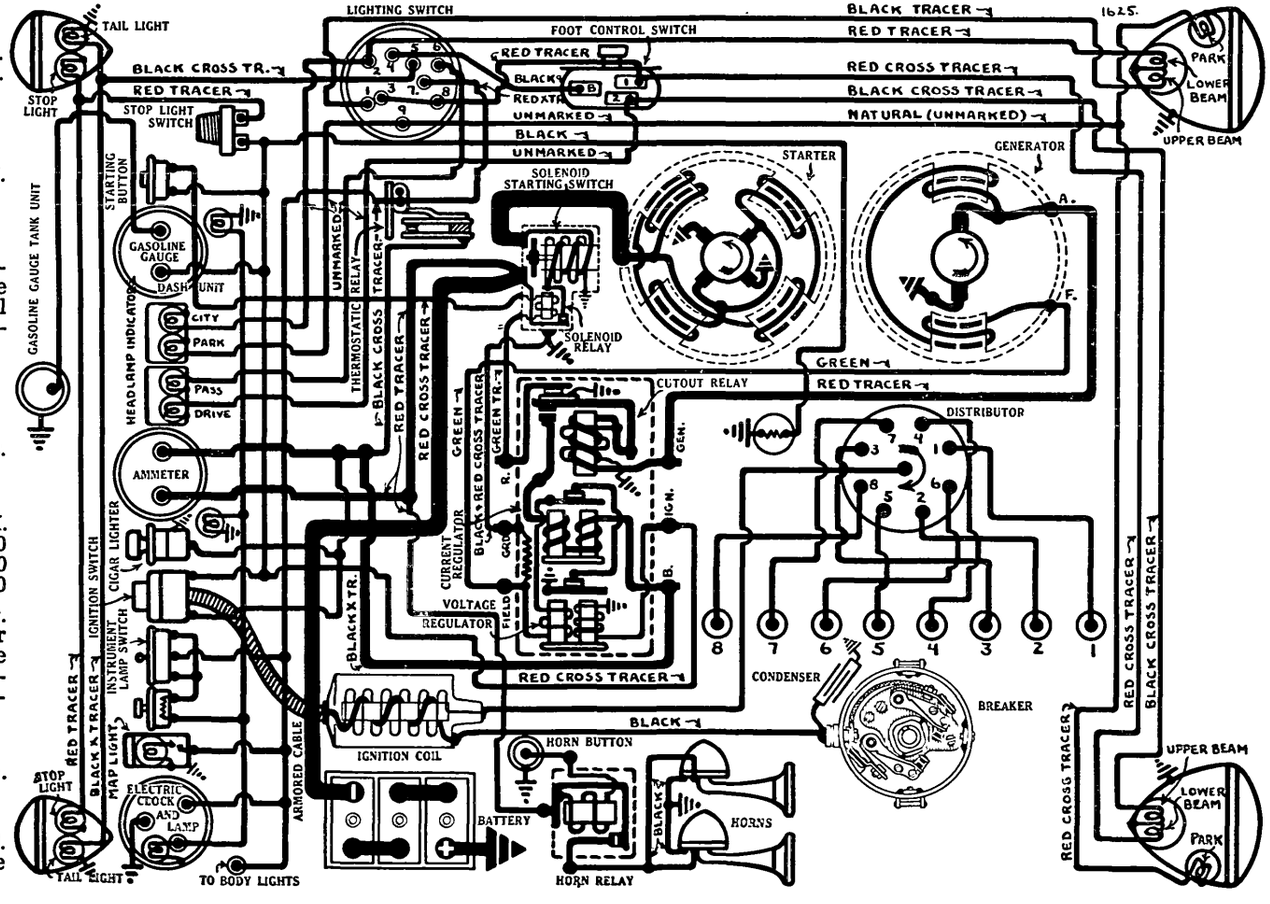
Removal—Distributor mounted on cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—

	Flywheel Deg.	Piston Pos.
All engines	8° BTDC	.0264" BTDC.

Timing (Stationary Contacts)—Crank engine by placing transmission gears in 'high', jack up one rear wheel, turn wheel by hand. With #1 piston on compression, crank engine until piston is 8° before top dead center, and 'IGA' mark on vibration dampener at front of engine lines up with pointer on chain case. This mark is 8° before top dead center mark for cylinder #1. Loosen advance clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, see that rotor is directly opposite #1 segment in distributor cap. Then synchronize movable contacts.

Synchronization (Movable Contacts) On Engine—Crank engine over 90° to firing position for piston #6, stop when 'IGA#6' mark on vibration dampener lines up with pointer, loosen lockscrews on movable sub-plate, turn eccentric adjusting screw until movable contacts begin to open, tighten lockscrews.



Synchronization (Using Tool)—Use Delco-Remy tool, Part #1838182, follow complete directions given in Equipment Section. Distributor firing intervals are regular 45-45-45 (distributor degrees).

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Manual Adjustment—With ignition set as above, slight 'ping' should be noticeable when engine is accelerated with wide open throttle at speeds below 15 M.P.H. If 'ping' is too severe, loosen hold-down screw in advance arm, rotate distributor one graduation on scale clockwise to retard spark, repeat test. Adjustment permits 10° advance or retard from center '0' position.

NOTE—Check engine for faulty spark plugs, excessive carbon deposit or localized 'hot spots' before changing manual adjustment.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—AC. Type K-9. 14MM. Metric.
Spark Plug Gaps—Set at .026". Limits .025-.027".

CARBURETION:—See Carburetion Section for complete data on Carburetion, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg Model EE-15, 1" dual downdraft type.
Automatic Choke—Stromberg 'Triple Range' combination automatic and manual choke control.

Fuel Pump:—AC. Type I-1521673 combination fuel pump and vacuum pump.

Gasoline Gauge:—AC. electric type.

VALVE TIMING:—**To Check Timing**—#1 intake valve opens with piston on top dead center with .0118" tappet clearance.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Tappet Clearance:—Running .006" Int., .009" Exh.

Valve Spring Pressure:—49 lbs. at 2.255" (valve closed). 115 lbs. at 1.943" (valve open).

LUBRICATION:—**Crankcase Capacity**—7 quarts.
Normal Oil Pressure—25 lbs. at 60 M.P.H.

BATTERY:—**Delco, Type 17-K.** 6 volt, 17 plate, 107 A.H. capacity (20 hour rate).
Starting Capacity—131 amperes for 20 minutes.
Grounded Terminal—Postive (+) terminal.
Location—Under right hand front seat.

STARTER:—**Model 727-N. Armature No. 823881.** Mechanical shift (solenoid operated) type. Drive through overrunning clutch.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
15 "	Lock	3.0	600

Starting Switch:—Solenoid Switch Type 1514. Push-button Switch Type 1389. Solenoid (switch and pinion shift) mounted on starter field frame, controlled by relay in switch case operated by pushbutton switch on instrument panel. See Equipment Section for complete data.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

GENERATOR:—**Model 961-D. Armature No. 1857866.** Straight shunt type with external current control and voltage regulation (Current Regulator, Voltage Regulator, Cutout Relay mounted in sealed case on engine side of dash). Generator charges at maximum rate with discharged battery and charging current tapers off as battery becomes charged. Output is automatically increased to maintain charge when lights or other load is turned on.

Charging Rate Adjustment—No adjustment provided. Regulator case is sealed. See Equipment Section for complete article on this type generator and control unit.
Maximum Charging Rate—20 amperes with discharged battery. Constant at all speeds above 1700 R.P.M. or 20 M.P.H. Actual charging rate depends upon condition of battery.

Performance Data—Cold

Amperes	Volts	R.P.M.
7	7.0-7.2	900
22	8.1-8.3	1900

Rotation—Counter-clockwise at commutator end.
Field Current—1.7-1.9 amperes at 6.0 volts.
Brush Spring Tension—22-26 ozs.
Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.
Belt Adjustment—Loosen pivot bolts and clamp bolt, swing generator away from engine to take up belt.

CONTROL UNIT:—**Model 5559.** Mounted on engine side of dash. Consists of Cutout Relay, Current Regulator, and Voltage Regulator in a single case. Cover of case is sealed and units are serviced on an exchange basis if seals are not broken. Complete directions below for testing units without breaking seals.
See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5-7.0 volts or 12 M.P.H.
Cuts Out—0-3 amperes discharge.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Current Regulator

Setting—Contacts open at 20-22 amperes
To Check—Connect ammeter in charging line at 'BAT' terminal on regulator, disconnect lead on 'IGN' terminal (to eliminate voltage regulator action). Turn on lights, operate generator and increase speed until current regulator operates and output remains constant. Ammeter reading should agree with setting given above.
To Adjust—Change regulator armature spring tension by bending spring hanger at lower end of spring slightly.
NOTE—Do not allow voltage to exceed 8.6 volts with voltage regulator shorted out.
Contact Gap—.015-.025".
Contact Spring Tension—3.5 ozs. minimum.
Air Gap—.070-.080" (between armature and core with contacts closed), .008-.013" (between fibre bumper and contract spring stop).

Voltage Regulator

Setting—Contacts open at 7.55-7.85 volts (70°F), or 7.45-7.55 volts (150°F.) with generator output of 8-10 amperes.
To Check—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3200 R.P.M., adjust charging rate to 8-10 amperes, note voltmeter reading. Voltage should agree with setting given above.
To Adjust—Change regulator armature spring tension by bending spring hanger at lower end of spring slightly.
NOTE—Do not operate generator on open-circuit at any time. Regulator readings should be taken with cover on unit. Check setting by decreasing speed until Cutout Relay contacts open and then increasing speed to original figure.
Contact Gap—.015-.025".
Contact Spring Tension—2.7-3.5 ozs.
Air Gap—.060-.070" between armature and core with contacts closed), .008-.013" (between fibre bumper and contract spring stop).

LIGHTING:—**Switch Model 487-L, M. Foot Control Switch Model 471-Z.** Lighting switch now mounted at left of instrument panel. Lighting system similar to previous type except for Indicator bulbs. Assymetrical passing beam controlled by foot operated switch. Headlight bulbs are prefocused type.
Headlight Indicators—Four illuminated dials across the bottom of the instrument panel as follows:
City—Lower beam or upper filaments lighted.
Park—Parking bulbs lighted.
Pass—Assymetrical passing beam.
Drive—Upper beam or lower filaments lighted.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights	32-32	2330-L.
Parking, Clock	1.5	55.
Instrmt., Tail, Map	3	63.
Stop	15	87.
Indicators	....	51.

NOTE—An instrument dimmer switch (rheostat) is now mounted beside the instrument switch (see diagram).

THERMOSTAT RELAY:—**Model 411-A.** Thermostatic arm type current limit relay (no winding). Contacts will remain closed with current of 25 amperes but will open in one minute with load of 38 amperes at temperature of 70-80°F. Adjustment is sealed and unit should be replaced if defective.

HORNS:—**Klaxon Model K-33-D.** Type 1951 (low note), 1952 (high note). Vibrator type, matched tone, twin horns. Horn current 24-28 amperes (total). Operated by horn relay.

Horn Relay Model 266-TK:—Relay requires .25 amperes to close contacts. Current draw .8 amperes
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

SERIAL NUMBER:—Same as engine number. Located on left hand top front corner of cylinder block (below head). First No. 2,210,001.

COMPRESSION:—Ratio—6.25-1 Std. 5.75-1 Optl. **Pressure**—160 lbs. at 1000 R.P.M. or approximately 105-110 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 20-21" with engine idling at 6 M.P.H.

IGNITION:—Coil Model 539-C. Mounted on dash. **Ignition Current**—2.2 amperes idling, 4.4 stopped.

Ignition Switch:—Delco-Remy Model 431-L. Switch and cable asembly. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton.

Distributor Model 663-J. Single breaker, 8 lobe cam, automatic advance type with auxiliary vacuum spark control and manual adjustment (see Timing). **Breaker Gap**—Set at .016". Limits .012-.018". **Cam Angle or Dwell**—31° (closed), 14° open). **Breaker Arm Spring Tension**—19-23 ounces. **Condenser**—Part No. 1837231. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	500	1	1000
5.75	1300	11.5	2600
14.	1800	28	3700

Vacuum Spark Control—Integral with distributor. Mounted on housing and linked directly to breaker plate. Provides additional advance at speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring in unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG)
Start	8-10"
18° Max.	15-18"

Distributor Removal:—Mounted on cylinder head. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING:—Setting for all engines as follows. See Manual Adjustment Section below.

	Flywheel Degrees	Piston Position
All engines	8° BTDC	.0264" BTDC

To Set Timing (Using Synchroscope)—Recommended by manufacturer. Clip Synchroscope lead to #1 spark plug and direct light on harmonic balancer at front of engine. Idle engine, loosen hold-down screw in advance arm, rotate distributor until timing mark 'IG/A' which is 8° before top dead center mark 'C.1/6', lines up with pointer on chain case, tighten hold-down screw.

Timing (Without Synchroscope)—With #1 piston on compression, turn engine over until piston is 8° (or .0264") before top dead center, stop when 'IG/A' mark on harmonic balancer lines up with pointer on chain case, losen hold-down screw, rotate distributor until contacts begin to open, tighten hold-down screw.

Motor Gauge—Weidenhoff Adapter #114, Rod #40.

Manual Adjustment—With ignition set as above, slight 'ping' should be noticeable when engine is accelerated with wide open throttle at speeds below 15 M.P.H. If 'ping' is too severe, loosen hold-down screw in advance arm, rotate distributor one graduation on scale clockwise to retard spark, repeat test. Adjustment permits 10° advance or retard from center '0' position.

NOTE—Check engine for faulty spark plugs, excessive carbon deposits or localized 'hot spots' before changing manual adjustment.

Firing Order:—1-5-2-6-8-3-7-4. See diagram.

Spark Plugs:—AC. Type K-7. 14 MM. Metric type.

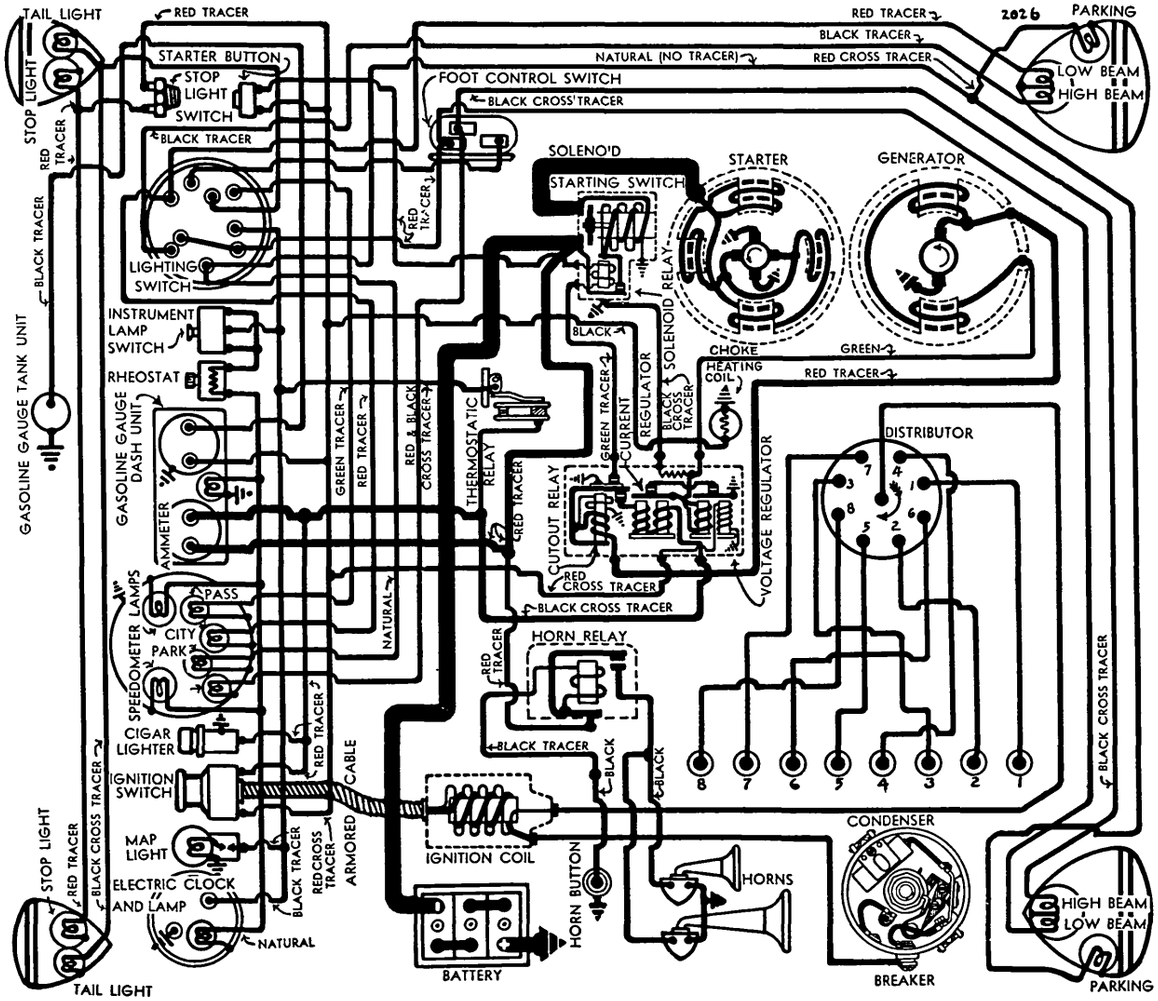
Spark Plug Gaps—Set at .025-.030".

CARBURETION:—Carburetor—Stromberg Model EE-15, 1" dual downdraft type. See Carburetion Section for adjustment, overhaul and Jet Specifications.

NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at hot or slow idling speed.

Idle Adjustment—Set throttle stopscrew so that idling speed is 6 M.P.H. Turn each idle adjusting screw in until engine begins to lag or miss, then turn each out until engine begins to roll, finally turn screws in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Acceelrating Pump Setting—Not adjustable.



Fast Idle:—Integral with carburetor. See article on Fast Idle and Automatic Choke as used on EE-15 and EE-24 carburetors in Carburetion Section.

Automatic Choke:—Triple Range Automatic and manual choke control. See article in Carburetion Section.

Air Cleaner:—A.C. #1525600 oil-wetted type standard, #1525979 oil-bath type heavy duty optional.

NOTE—Smaller main metering jet must be used in carburetor when heavy duty oil-bath type cleaner used. See Stromberg Jet Specifications in Carburetion Section.

Fuel Pump:—AC. Type I #1522248 combination fuel-and-vacuum pump. See article in Carburetion Sec.

Gasoline Gauge:—AC. Electric type. #1515303 (dash unit), #1515428 (tank unit).

VALVE TIMING:—To Check Timing—Intake valve for #1 cylinder should open with piston on top dead center when 'C.1/6' (TDC) mark on harmonic balancer lines up with pointer on chain case, with tappet clearance of .0118". Reset tappet clearance .006" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #40.

Tappet Clearance:—.006" Int., .009" Exh., hot.

Valve Spring Pressure:—40-46 lbs. at 2¼" (valve closed), 112-120 lbs. at 1 15/16" (valve open).

LUBRICATION:—Crankcase Capacity—7 qts. (refill).
Normal Oil Pressure—15 lbs. idling, 25 lbs. at 60 M.P.H.

BATTERY:—Delco, Type 17-K. 6 volt, 17 plate, 110 ampere hour capacity (20 hour rate).
Starting Capacity—131 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.4 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under right hand front seat.

STARTER:—Model 727-N. Armature No. 823881.
Drive—Overrunning clutch and manual pinion shift operated by solenoid switch.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
15 "	Lock	3.0	600

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Solenoid Switch Type 1516. Push-button Switch Type 1405. Solenoid switch controlled through relay by push button on instrument board. Operative only with ignition turned 'on'. See article in Equipment Section for complete data.

Solenoid Switch

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—4 volts max. **Open**—1.6-2.0 volts.
Contact Gap—.030-.045". **Air Gap**—.010-.014" (closed).

GENERATOR:—Model 961-D. Armature No. 1857866. Stralght shunt (two brush) type with external voltage and current regulation. Ventilated by fan on drive pulley.

Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output controlled by Current Regulator. See Control Unit Section below and speciti article in Equipment Section.

Maximum Charging Rate—20 amperes (cold) with discharged battery as indicated on test ammeter connected in charging line at 'BAT' terminal on control unit. Decreases as battery comes up on charge. Generator output constant at all speeds above 1550 R.P.M. or aproximately 20 M.P.H.

Performance Data—Generator Cold

Amperes	Volts	R.P.M.
7	7.0-7.2	900
22	8.0.	1550

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ounces each.

Field Current—1.7-1.9 amperes at 6 volts.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen generator pivot bolts and clamp bolt, pull generator out until belt deflection midway between fan and generator pulleys is ⅞-1" (measured from straightedge with ⅞" projection at center laid along belt).

CONTROL UNIT:—Model 5559. Mounted on dash. Consists of Vibrating Voltage Regulator, Vibrating Current Regulator, and Cutout Relay. See article in Equipment Section for complete data on these units.

NOTE—Units are sealed. Performance can be checked as directed below without breaking seals. Seals must be broken and cover removed (voiding warranty) to make adjustments.

Cutout Relay

Cuts In—6.5-7.0 volts, 12 M.P.H.

Cuts Out—3 ampere max. discharge at 6.3 volts.

Contact Gap—.018-.025".

Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 72° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.

To Check—Disconnect lead at 'IGN' terminal on regulator case, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3200 R.P.M., adjust charging rate to 8-10 amperes, note voltmeter reading. Voltage should agree with setting given above.
To Adjust—Change regulator spring tension slightly by bending spring hanger at lower end of armature spring.

NOTE—Do not operate generator on open-circuit at any time. All Voltage Regulator readings must be taken with cover on unit and setting should be checked by decreasing speed until Cutout Relay contacts open, and then increasing speed to original point.

Contact Gap—.015-.025".

Contact Spring Tension—3.5 ozs. minimum.

Air Gap—.060-.070" between armature and core with armature down so that fibre bumper just touches stop, .007-.010" between fibre bumper and stop with armature up.

Current Regulator

Setting—20-22 amperes.

To Check—Connect ammeter in charging line at 'BAT' terminal on regulator, discconect lead on 'IGN' terminal (to eliminate voltage regulator action). Turn on lights, operate generator and increase speed until current regulator begins to operate and output remains constant. Ammeter reading should agree with setting given above.
To Adjust—Change regulator spring tension slightly by bending spring hanger at lower end of armature spring slightly.
NOTE—Generator voltage must not be allowed to exceed 8.5 volts with Voltage Regulator shorted out.

Contact Gap—.015-.025".

Contact Spring Tension—3.5 ozs. minimum.

Air Gap—.070-.080" between armature and core with armature down so that fibre bumper just touches stop, .007-.010" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused, Cross-beam type with special non-interchangeable lenses. Headlamps aimed straight-ahead with lenses removed. Assymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp), controlled by foot selector switch with lighting switch in 'Country Driving' position.

Headlamp Beam Indicators—Consist of four bulbs in lower half of speedometer which illuminate markers as follows:
City—Lower beam both headlamps.
Drive—Upper beam both headlamps.
Pass—Assymetrical passing beam (as above).
Park—Parking bulbs in headlamps.

Switches

Lighting—Delco-Remy Model 487-N,P. 487-R (RHD).

Foot Selector—Delco-Remy Model 471-Z.

Instrument Lamp—Delco-Remy Model 1364.

Stop Lamp—Hydraulic type on distributor at rear of brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamp (Right)	50-32	2530-L
Headlamp (Left)	32-32	2330-L
Instrmt., Map, Qtr., Step, Tail	3	63
Parking, Clock	1.5	55
Beam Indicators	1	51
Stop, Dome	15	87

NOTE—Headlamp bulbs are Pre-focused, 'Long-life' type. In all states where 50 cp. bulbs are prohibited, the 32-32 cp. 2330-L bulb is used in both headlamps.

THERMOSTATIC RELAY:—Model 411-A. Contacts remain closed with current of 25 amperes but open within one minute with load of 38 amperes. Non-adjustable.

HORNS:—Klaxon Model K-33-D, Type 1951 (low note), 1952 (high note). Vibrator type, twin horns with blended tone operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
1951	12-14	.045-.050"
1952	11-13	.036-.040"

NOTE—Horns identified by letter stamped on front of power unit cover and projectors must be assembled as follows: 'S'—low note, short projector; 'L' high note, long projector.

Horn Relay:—Model 266-T. Requires .25 amperes at 2 volts min. to close contacts. Current draw .8 amp.
Contact Gap—.015-.025". **Spring Tension**—6-8 ozs.
Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—Same as engine number 2230001 and Up. Stamped on crankcase behind left cylinder block (visible from left side with engine hood up).

COMPRESSION:—Ratio—6.25-1 Std. 5.75-1 Optl.
Pressure—155 lbs. at 1000 R.P.M. or approximately 105-110 lbs. at cranking speed (6.25-1 head).

VACUUM READING:—20-21" steady reading with engine idling at 6 M.P.H.

IGNITION:—Coil Model 539-C. Mounted on the dash.
Coil Draw—2.2 amperes idling, 4.4 stopped.

Ignition Switch:—Delco-Remy Model 435-K. Connected to coil by armored cable.
Ignition Lock—Briggs & Stratton No. 45792 (cylinder), 80203 (case). **Key Series**—8000-9499.

Distributor Model 665-G. Single breaker, 8 lobe cam, full automatic advance type with manual adjustment at distributor. Vacuum spark control not used.
Breaker Gap—Set at .015". Limits .0125-.0175".
Cam Angle or Dwell—31° closed. 14° open.
Breaker Arm Spring Tension—19-23 ounces.
Condenser—Part No. 829107. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	500	1	1000
3	820	6	1640
6	1200	12	2400
9	1600	18	3200
12	2000	24	4000

Removal:—Distributor mounted between cylinder banks at rear of engine. To remove, take out two capscrews in mounting bracket.
NOTE—When installing distributor on engine, turn crankshaft to firing position for #1 piston, mesh distributor drive gear so that slot in upper end of shaft is offset toward rear of engine.

IGNITION TIMING:—Setting for all engines (with fuel of 70 Octane Rating) as follows. See Manual Adjustment section below for final setting giving best performance with type of fuel regularly used.

Flywheel Degrees	Piston Position
5° BTDC.	.0114" BTDC.

To Set Timing (With Synchroscope)—Recommended by manufacturer. Clip Synchroscope lead to #1 spark plug, direct light on crankshaft pulley at front of engine. Idle engine, loosen hold-down screw in advance arm, rotate distributor until 'IG/A' mark on pulley (which is 5° before dead center mark 'C.1/6) appears to line up with pointer on chain case cover, tighten hold-down screw. Adjust for fuel (see Manual Adjustment).

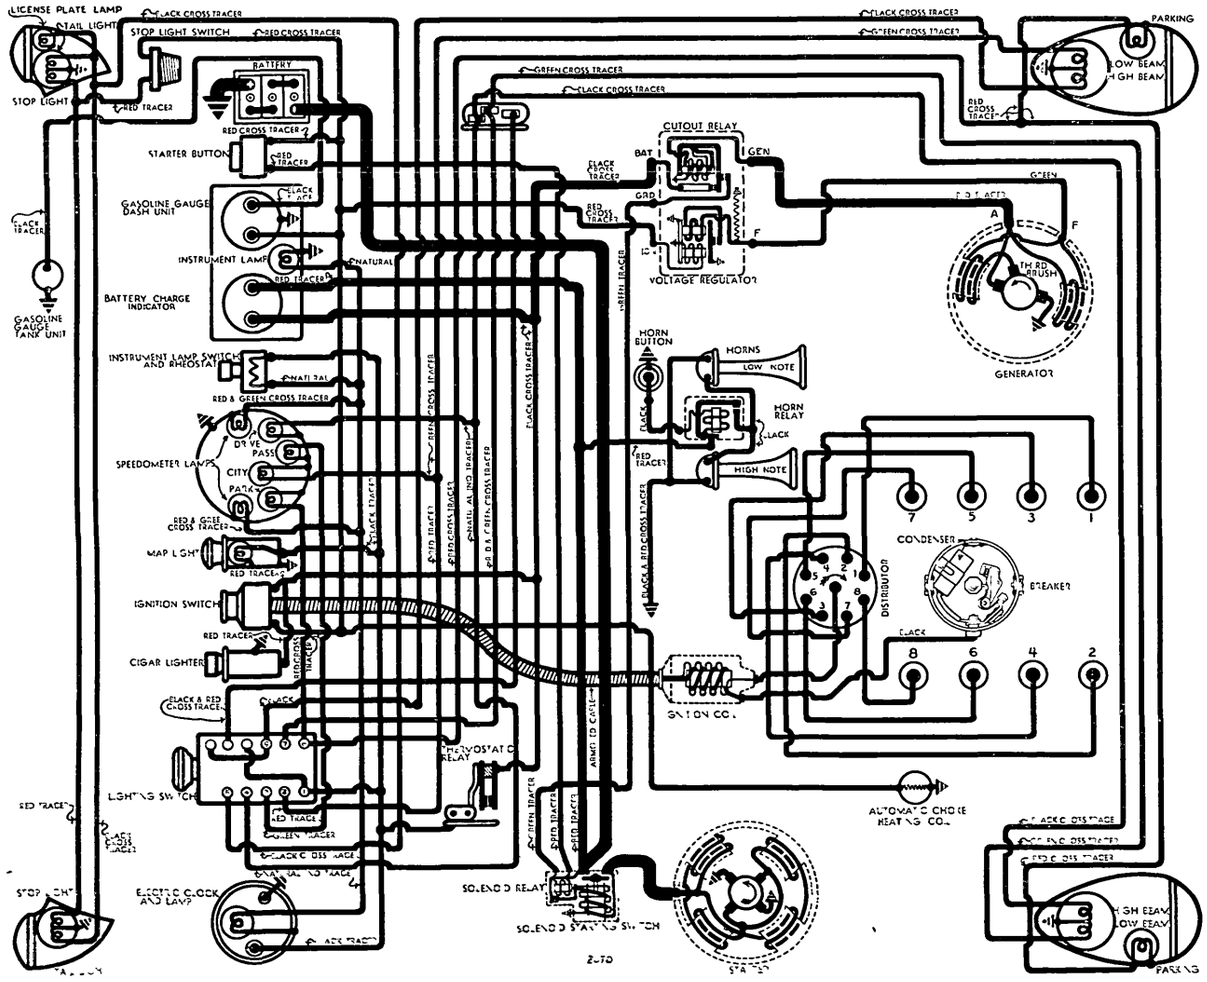
Timing (Without Synchroscope)—Turn engine over to firing position for piston #1 (front piston, left bank) with mark 'IG/A' on crankshaft pulley (5° fore dead center mark 'C.1/6') lined up with pointer on chain case. Loosen hold-down screw on advance arm, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt. Adjust for fuel (see Manual Adjustment).

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Manual Adjustment—Slight ping should be evident at speeds below 15 M.P.H. when car accelerated with wide open throttle. To adjust, loosen hold-down screw in advance arm, rotate distributor one graduation on scale clockwise (if ping too severe), counter-clockwise (if no ping noted), repeat test, adjust until best performance is secured.
NOTE—Check engine for faulty spark plugs, excessive carbon deposits, localized hot spots, or lean carburetor setting before changing manual adjustment.

Firing Order:—1-8-7-3-6-5-4-2 with spark plugs numbered as shown on diagram.

Spark Plugs:—AC. Type K-7. 14 MM. Metric type.
NOTE—K-7 discontinued by AC. Use No. 45.
Spark Plug Gaps—.025-.027".



CARBURETION:—Carburetor—Stromberg Model AA-25 1¼" Dual Downdraft Aircraft type (first cars), Carter Model WDO Type 374-S, 1¼" Dual Downdraft type (later cars).
See articles in Carburetion Section for data.

Idle Adjustment (all models)—Engine must be warmed up so that Automatic Choke and Fast Idle are inoperative. Set throttle lever stopscrew so that engine idles at 6 M.P.H. Turn each idle adjusting screw in until engine begins to miss, then turn screws out until engine begins to roll, finally turn screws in slowly until engine fires smoothly. Both screws must be adjusted equally. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting (Stromberg)—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:
Inner Hole (Min. stroke)—Summer temperatures.
Outer Hole (Max. stroke)—Winter temperatures.

Accelerating Pump Setting (Carter)—Accelerating pump adjustment requires partial dismantling of carburetor. See article in Carburetion Section for instructions.

Fast Idle (Stromberg & Carter):—Integral with carburetor.
See articles in Carburetion Equipment Section.

Automatic Choke (Stromberg & Carter):—Integral with carburetor (linked directly to choke valve shaft).

See articles in Carburetion Equipment Section.

Air Cleaner:—AC. #1528136 Std., #1528137 Heavy Duty oil-bath type.

Fuel Pump:—AC. Model AB #1522119. Diaphragm type combination fuel-and-vacuum pump.

See article in Carburetion Equipment Section.

Gasoline Gauge:—AC Electric type. No. 1515338 (dash unit), 1515442 (tank unit).

See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Intake valve for cylinder #1 (front cylinder, left bank) should open when piston reaches top dead center when mark 'C.1-6' on crankshaft pulley lines up with pointer on chain case cover.

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Tappet Clearance:—None in service (hydraulic take-up).

See article in Mechanical Equipment Section.

Valve Spring Pressure:—66 lbs. at 1.926" (valve closed) 145 lbs. at 1.581" (valve open).

LUBRICATION:—Crankcase Capacity—7 quarts.

Normal Oil Pressure—30 lbs. at 60 M.P.H.

BATTERY:—Delco, Type 17-K. 6 volt, 17 plate, 110 amp. hour capacity (20 hour rate).

Starting Capacity—131 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.4 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under left front seat.

STARTER:—Model 727-V. 729-F (RHD). Armature No. 820158.

Drive—Overrunning clutch and solenoid pinion shift.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
16 ft. lbs.	Lock	3.0	600

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws, pull starter forward, remove from below.

Starting Switch:—Solenoid Switch Type 1542. Push-button Switch Type 1389. Solenoid switch controlled through relay in switch case by pushbutton on instrument panel. See article in Electrical Equipment Section.

Solenoid Switch Specifications

Closes against 70 lbs. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay Specifications

Contacts Close—1.9 volts max. **Open**—1.0-1.2 volts.

Contact Gap—.025-.045". **Air Gap**—.010-.013" closed.

GENERATOR:—Model 918-C. Armature No. 1866789. New type 'Split-Field' generator (one straight-shunt coil, one third-brush coil—see diagram) with fixed third brush and vibrating voltage regulator control.
NOTE—Field coils changed in production.

See article in Electrical Equipment Section.

Charging Rate Adjustment—No adjustment at generator (fixed third brush). Adjusted by changing setting of Voltage Regulator. See Regulator data below.

Maximum Charging Rate—As given in table below. Reached at 4000 R.P.M. or 48 M.P.H. Actual charging rate controlled by Voltage Regulator and dependent on battery condition. To check generator output, connect test ammeter in charging line at 'BAT' terminal on regulator, voltmeter between 'GEN' terminal and ground, ground 'F" terminal to eliminate regulator action.
NOTE—Do not operate generator at excessive speed with regulator cut out. Do not operate generator on open-circuit.

Performance Data

	Amperes	Volts	R.P.M.
Cold	27-31	8.0	4000
Hot	25-28	8.0	4200

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces (main), 16-20 ounces (third brush).
Field Current—1.44-1.56 amperes (shunt), .89-.94 amperes (third brush field) at 6.0 volts.

Removal:—Generator pivot mounted at front of engine between cylinder banks. Belt driven in tandem with water pump (separate belt for fan). To remove, take out pivot bolts and clamp bolt, slip off drive belt.

Belt Adjustment:—Loosen generator pivot bolts and clamp bolt, lift generator up until belt deflection midway between generator and pump pulleys is ⅞-1" (measure with straightedge along belt, use ⅞" projection on straightedge at center).

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5817. Mounted on dash. Consists of Cutout Relay and Vibrating Voltage Regulator in single case.

See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5-7.0 volts.

Cuts Out—0-3.0 ampere discharge current.

Contact Gap—.018-.025".

Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator over-compensated for temperature and must be checked at these points.

Adjustment—Disconnect lead on 'IGN' regulator terminal, connect jumper between 'IGN' and 'BAT' terminals, connect ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes. Adjust regulator armature spring tension by bending spring hanger at lower end of armature spring slightly until setting is as given above.
NOTE—Regulator cover must be in place when tests made. Do not operate generator on open-circuit.

Contact Gap—.015-.025".

Contact Spring Tension—2.7-3.5 ounces.

Air Gap—.060-.070" between armature and center of core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused type with special non-interchangeable lenses. Asymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in third or Country Driving position.
NOTE—With lighting switch in second position, foot selector switch controls upper driving beam and lower city beam (for both headlamps).

Headlamp Adjustment—With driving (upper beam) lighted and lenses in place, aim left hand headlamp so that upper edge of hot spot is at lamp center height and left edge is at vertical line for lamp center (entire hot spot to right of this center line) at 25'. Aim right hand headlamp for same height but center hot spot on lamp-center vertical line (right cut-off of hot spot about 1' to right of center-line).

Headlamp Indicators—Consists of 4 bulbs in speedometer dial which illuminates markers at follows:
City—Lower beam, both headlamps.
Drive—Upper beam, both headlamps.
Pass—Special passing beam (see above).
Park—Parking bulbs in headlamps lighted.

Switches

Lighting—Delco-Remy Model 480-S, 480-N (Exp.).

Foot Selector—Delco-Remy Model 471-T, 471-U (RHD).

Bulb Specifications

Position	Candlepower	Mazda No.
R. H. Headlamp (see note)	32-50	2530-L
L. H. Headlamp	32-32	2330-L
Parking, Instrument	1½	55
Clock, Indicators	1	51
Map, Quarter, License	3	63
Stop and Tail	21-3	1154-L
Dome	15	87

NOTE—In states where this bulb not legal, 32-32 cp., 2330-L bulb used in both headlamps. Type 1154 bulb has stop pin which insures correct installation.

THERMOSTATIC RELAY:—Part No. 1866707. Mounted on lighting switch. Contacts open within 1 minute with load of 38 amperes. Not adjustable.

HORNS:—Delco-Remy Model K-33-D, Type 1965 (low note), 1966 (high note). Vibrator type, twin horns with blended tone. Operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
1965	12-14 amperes	.045-.050"
1966	11-13 amperes	.036-.040"

Horn Relay Model 271-A:—Contacts close at 2.7-4.0 volts.

Contact Gap—.015-.030".

Air Gap—.010-.014" with contacts closed.

LINCOLN

1928-29-30

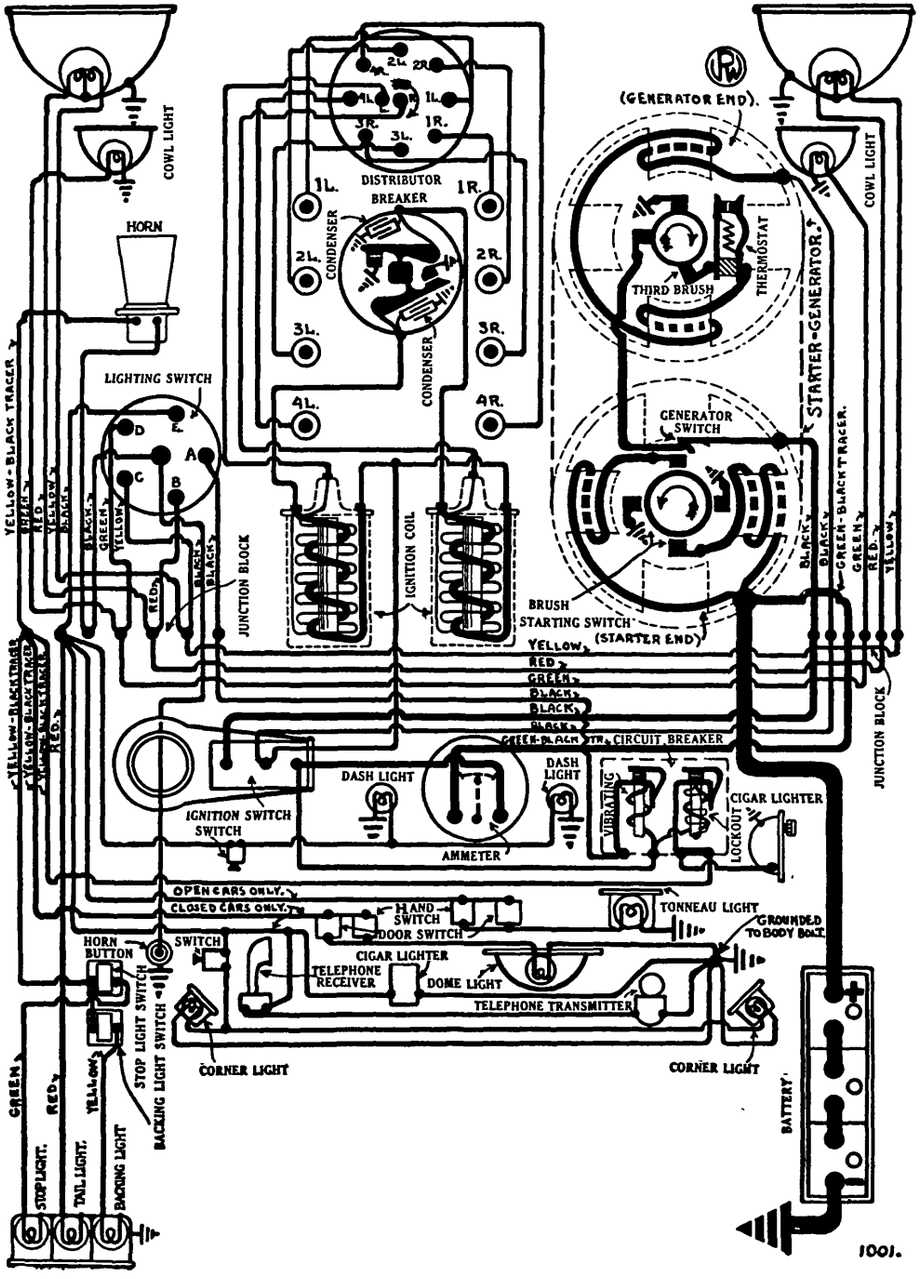
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-LXRV-15-2, 6 volt, 135 ampere hour. The starting capacity (20 minute rate) is 137 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 26 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 2195. Distributor Model 4029. Breaker contacts separate .015-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. Two sets of contacts are used with a four sided cam. Contacts open alternately at intervals of 30 degrees and 60 degrees corresponding to 60 degrees and 120 degrees of crankshaft rotation. This is the correct firing interval for the Lincoln engine. Contacts must be synchronized (see Timing). Distributor is semi-automatic. Maximum manual advance is 18-23 degrees. Automatic advance begins at 900 R.P.M. and reaches a maximum of 24-28 degrees at 3000 R.P.M. Breaker arm spring tension is 16-20 ounces.

Oiling:—Put 3 or 4 drops of light engine oil in the oiler on the side of the distributor housing every 250 miles. Remove the grease plug and pack the gear case with light cup grease to a level just below the cover plate located on the front of the unit near the spark control lever) every 5000 miles. Place a small amount of vaseline or heavy grease on the face of the breaker cam and in the distributor head every 1000 miles. Remove all excess and polish the rotor track with a soft clean cloth.

Mounting:—Distributor is mounted at the forward end of the engine. To remove, remove 4 hold-down screws and lift distributor upward and out from position.



Timing:—Synchronization of Contacts. Use special Delco-Remy tool, Part No. 820570, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over 60 degrees to firing position of piston No. 2 (No. 4 of the left hand bank) when the flywheel mark 'RI' which is slightly past the top dead centermark 'D/C.2/5' will be exactly opposite the indicator. If the second set of contacts do not open at this point, loosen the lock screws on the movable sub-plate and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap.

Timing Distributor:—Right hand breaker contacts begin to separate when piston No. 1R on compression stroke reaches a position at which the vertical mark preceding the marking '/R1' on the clutch ring is opposite the indicator with the spark control lever in the fully retarded position. This mark is ⅜ inch past the 'T.D.C.' mark on the flywheel. This breaker controls the right hand coil and fires the four cylinders of the right hand block. To set timing, loosen lock screws in center of cam and rotate cam until right hand contacts separate. Use a test lamp connected in series with each primary circuit to determine this point. Then tighten lock screw. Connect spark plugs in order around distributor head as shown on diagram.

Firing Order:—The firing order is 1R-4L-2R-3L-4R-1L-3R-2L. Cylinder banks are right and left as viewed from driver's seat. No. 1 cylinder is nearest the radiator.

Spark Plugs:—Spark plugs are ⅞ inch. Gaps are .020-.025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1⅞ inches; stem diameter, ⅜ inch; stem length, 6¾ inches. Tappet clearance, .003-.004 inch (cold).

LINCOLN

1928-29-30

DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Spring pressure, 85 pounds. Valve lift, 5/16 inch. Intake opens 2½ degrees before top dead center and close 46 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1¾ inches; stem diameter, ⅜ inch; stem length, 6¾ inches. Tappet clearance, .003-.004 inch (cold). Spring pressure, 85 pounds. Valve lift, 5/16 inch. Exhaust valves open 48 degrees before lower dead center and close at top dead center. Valve stem guides are removable.

To Check Valve Timing:—Check tappet clearance No. 1 exhaust valve (set at .005"). This valve should close with piston on top dead center when the mark 'DC/1-5' on the clutch ring is directly under the pointer. The marks 'I.1/5' and 'E.1/5' are for use in setting the tappet clearance and do not indicate the intake or exhaust opening or closing points.

STARTER-GENERATOR:—Model 193-C. Starter and generator are combined in one unit. Starter is connected to the engine through a set of reduction gears meshed by the operator. Depressing the starter pedal meshes the gears, opens the generator circuit and brings the starter brushes in contact with the commutator, allowing it to crank the engine. When the pedal is released, a spring reverses these operations. Two over-running clutches permit the high speed necessary in cranking the engine and prevent the engine driving the starter. The direction of rotation is counter-clockwise, looking at the starter commutator end. Starter brush tension should be 2¼-2¾ pounds.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	4000	6	60
10 "	Lock	3	....

GENERATOR:—Generator current regulation is by the third brush system. To adjust charging rate, loosen cover band on the generator end (front) of unit. exposing the brush regulating lever. Raising the lever increases the charging rate; lowering it decreases the charging rate. Replace the cover band after adjusting. A thermostat mounted with third brush opens at 195-200 degrees F. cutting down the output 30%. The brush tension should be 1½-1¾ pounds each.

Generator Data

Amperes	R.P.M.
3	600
16-18	1400

Mounting:—Starter-generator is mounted at right of engine. To remove, drain radiator, disconnect pump shaft, and remove drip pan under starter-generator. Then remove all pump bolts and drop pump down past engine. Remove two cap screws extending through to back of crank case arm holding starter-generator to engine and remove unit by slipping it down past the engine.

Timing Chain Adjustment:—Chain is adjusted by rotating generator drive sprocket eccentric bushing. Adjust chain when sideplay at inspection plug exceeds ¾". To adjust, remove lock screws and lock (on rear of chain case), use special spanner wrenches, loosen lock nut, turn castellated bearing sleeve clockwise (away from engine) until chain sideplay is ½-¾", tighten lock nut, replace lock and lock screws.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter-generator oilers every 500 miles. Once each year, remove, disassemble and clean motor and generator clutches. Repack with vaseline.

RELAY:—No relay is used. Generator is connected to the battery through the ignition switch.

LIGHTING:—Lincoln Make. Lighting switch is mounted on steering wheel. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using 21 cp. filament instead of dimming) Madza No. 1110. Side lights are 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash and tail lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop and backing lights are 6-8 volt, 21 cp. S.C. Mazda No. 1129.

CIRCUIT BREAKER:—Model 5778. Two circuit breakers are mounted on the rear of the dash. A vibrating circuit breaker opens when the current flow reaches 25-30 amperes and continues with a flow of 10-15 amperes. A lock-out circuit breaker operates when the current flow reaches 25-30 amperes and continues with less than 1 ampere.

LINCOLN

EIGHT CYLINDER MODEL V8 (1931-32)

AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on front side of dash.

ENGINE NUMBER:—Stamped on left side of crankcase between Nos. 1 and 2 cylinders.

BATTERY:—Exide, Type 3-LXV-15-1RD, 6 volt, 135 ampere hour (5 ampere rate). Starting capacity 150 amperes for 20 minutes. Negative (—) terminal is grounded. Battery mounted under left front fender. Battery size, 7 inches wide, 15½ inches long, 8¾ inches high.

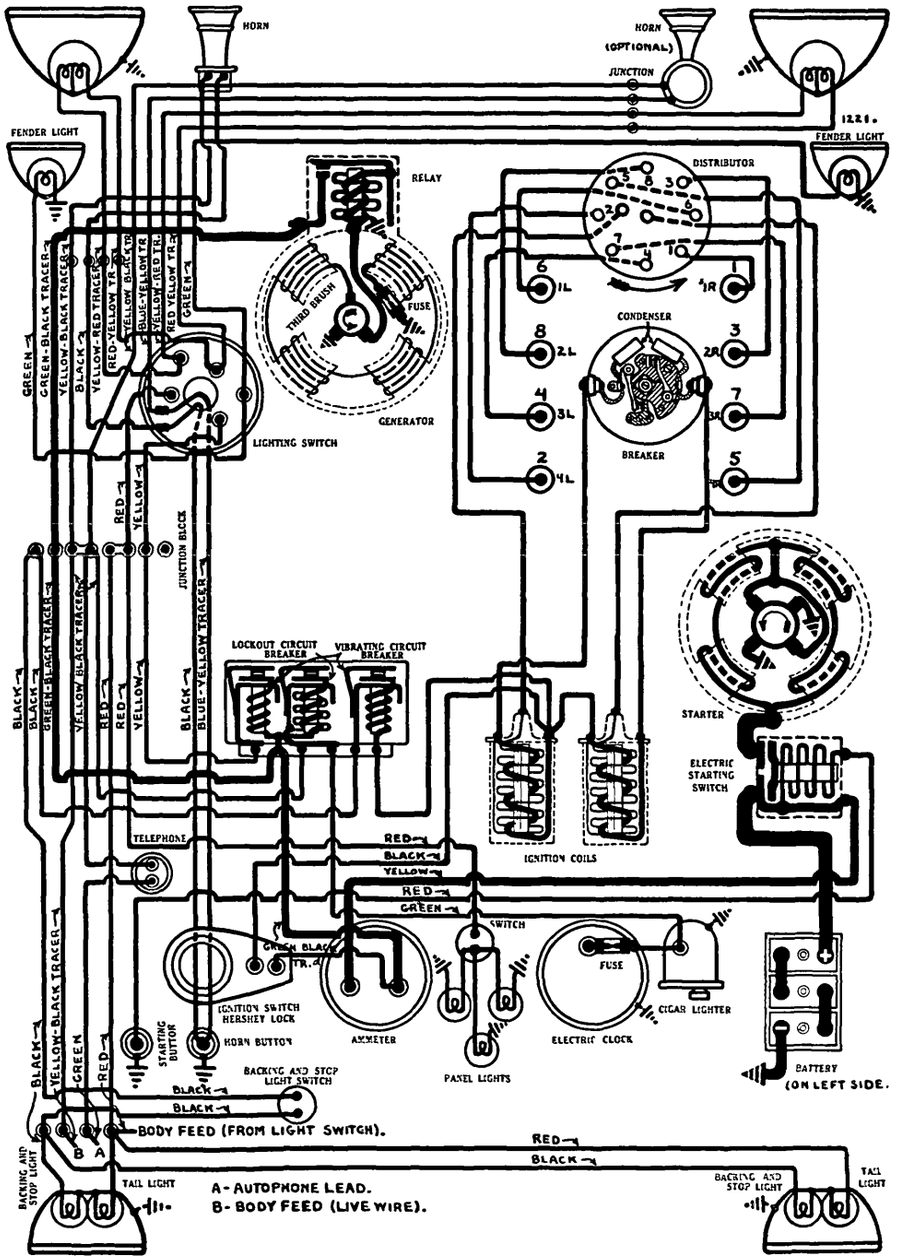
IGNITION:—Coil Model CE-4001-L (2 used). Coils are mounted on dash under cowl. Ignition current is 1.45-4 amperes at 6 volts (engine running), 3-4.5 amperes at 6 volts (engine stopped) for each coil. Ignition switch is a Cutler-Hammer push-pull switch built in the co-incidental ignition switch and steering post lock.

Distributor Model IGL-4001, 1A, 3, IGL-4002, 2A, 4 (Export). Two breaker 4 lobe cam, semi-automatic advance type. Contacts open alternately at 30° and 60° corresponding to engine firing intervals of 60 and 120 degrees. Contacts must be synchronized (see Timing). Breaker gap set at .020 inch. To set gap (first set mounted on breaker plate), loosen lock screws on stationary contact mounting plate, turn eccentric adjusting screw, tighten locking screws or (second set mounted on movable sub-plate), loosen lock nut on stationary contact mounting stud, turn up stud, tighten lock nut. Breaker arm spring tension 24 ounces. Maximum manual advance 20 degrees (engine).

Cam Angles—Closed 50°. Open 40° (distributor) each set independently.

Automatic Advance

Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	550	0	1100
3	840	6	1680
6	1130	12	2260
9	1420	18	2840
13	1800	26	3600



Mounting:—Distributor mounted at forward end of engine between cylinder banks. To remove, disconnect primary leads, disconnect manual spark control, take off distributor cap and cable assembly, take out two hold-down screws in advance arm and lift distributor out.

Oiling:—1000 Miles. Put 5-6 drops light engine oil in each of two oilers on side of distributor housing.

5000 Miles. Take off distributor cap and rotor. Put one drop oil on breaker arm pivot pins and apply thin film of vaseline to face of breaker cam.

Timing:—To set timing, first check contact gaps, fully advance manual spark control, see that distributor is rotated clockwise to end of advance arm slot, take off cover plate over inspection hole in flywheel housing. With piston No. 2 (No. 4 left hand bank—see diagram) on compression, turn engine over until flywheel mark 'A/2' (which is slightly before top dead center mark 'DC/2-6') is directly under pointer on flywheel housing. Then loosen lock screw in center of breaker cam, carefully locate cam so that left hand breaker contacts (mounted directly on breaker plate) are beginning to open, tighten locking screw, connect spark plugs as indicated on diagram.

Synchronization of Contacts:—Turn engine over 300° or slightly more than ¾ turn to firing position of piston No. 5 (No. 4 on right hand block —see diagram) when the flywheel mark 'A/1' (which is slightly before the top dead center mark 'DC/1-5') should be directly under pointer on flywheel housing. Then loosen three lockscrews on the movable sub-plate (carrying

LINCOLN

EIGHT CYLINDER MODEL V8 (1931-32)

AUTO-LITE SYSTEM

second set of contacts), turn eccentric adjusting screw until contacts open, tighten lock screws. This will establish the proper alternate 30 and 60 degree firing interval between contact openings. It is important that the contact gap on each set of contacts be kept exactly the same.

Firing Order:—1-2-3-4-5-6-7-8 with cylinders numbered as shown on diagram, or 1R-4L-2R-3L-4R-1L-3R-2L with cylinder banks right (R) and left (L) as viewed from the driver's seat and No. 1 cylinder nearest the radiator.

Spark Plugs:—⅞-18 S.A.E. Champion Type C-4. Set gaps at .022-.024 inch.

VALVE TIMING:—Valves on inner side of each cylinder bank and adjustable in valve alley at center of engine. Camshaft directly above crankshaft and chain driven. Timing chain adjusted manually by shifting accessory drive sprocket (see Adjustment paragraph below).

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	2"	⅜"	6¾"	45°	11/32"
Exhaust	1⅞"	⅜"	6¾"	45°	11/32"

Tappet Clearance		Spring Pressure	
Intake	.005" (cold)	Valve open	160 pounds
Exhaust	.005" (cold)		

Timing

Intake valves open 22½° before top dead center. Intake valves close 66° after lower dead center.

Exhaust valves open 48½° before lower dead center. Exhaust valves close at top dead center. Flywheel is marked 'DC/1-5' at point of exhaust closing for cylinders Nos. 1 and 5 and also 'DC/2-6' at point of exhaust closing for cylinders Nos. 2 and 6. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Check tappet clearance No. 1 exhaust valve (set at .004"). This valve should close with piston on top dead center when flywheel mark 'D/C.1/5' is directly under pointer on housing.

Timing Chain Adjustment. Timing chain is adjusted by shifting accessory drive sprocket. To take up timing chain, loosen flange mounting screws on water pump bracket, back off lock nut and turn up adjusting set screw until correct chain tension is secured, tighten lock nut and mounting screws. With correct adjustment, chain will operate noiselessly. If chain hum, adjustment must be backed off slightly. Chain should be adjusted whenever sideplay at inspection plug hole exceeds ¾". Sideplay at this point should be ½-¾" with chain correctly adjusted.

STARTER:—**Model MAL-4001 (Domestic), MAL-4002 (Export).** Starter drives engine through an outboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces. Starter switch electromagnetic type mounted on starter field frame and controlled by starting push button on instrument panel.

Starter Data

Torque	R.P.M.	Volts	Amperes
1 lb. ft.	2000	5.5	100
4.5 "	1000	5.0	200
8.25 "	640	4.5	300
12.75 "	375	4.0	400
22.0 "	Lock	3.0	600
32.0 "	Lock	4.0	825

Mounting:—Starter flange mounted on front face of flywheel housing at right (domestic models) or left (export models) of engine. To remove, disconnect cable and switch control wires or take off starting switch, take out three flange mounting screws, pull starter forward to clear Bendix housing.

GENERATOR:—**Model GAU-4001 ('31), GBC-4002 ('32).** Third brush control. To adjust output, take off commutator cover band, shift third brush plate by hand counter-clockwise to increase or clockwise to decrease charging rate. The third brush plate is held in position by friction. With standard car setting maximum charging rate is 20 amperes (cold) at 8.0 volts reached at 1325 R.P.M.

Generator Data—Model GAU-4001

20	7.8	940	17.2	8.0	1400
22	8.0	1325	12.4	7.5	2500

Brush Spring Tension—22-27 ounces on each brush.
Field Current—2.0-2.2 amperes (GAU-4001), 2.75-3.05 amperes (GBC-4002) at 6.0 volts.
Field Fuse—7½ ampere in plug on commutator end of generator.
Motoring Current—3.0-3.3 amperes (GAU-4001), 5.32-5.88 amperes (GBC-4002) at 6.0 volts.

Mounting:—Generator mounted at left front of engine on swinging bracket mounting and is belt driven from crankshaft. To remove, disconnect lead, loosen adjustment clamp bolt, swing generator toward engine, slip off drive belt, take out two bolts under generator forming bracket hinge, lift generator out.

RELAY:—**Model CB-4001L ('31), CB-4001B ('32).** Mounted on generator. Relay contacts close at 450-525 R.P.M. of generator or 7 M.P.H. when generator voltage reaches 6.4 volts and open with discharge current of 1-2.5 amperes. Relay contact gap limits .025-.035 inch. Air gap limits .010-.030 inch (contacts closed).

LIGHTING:—**Essex Switch.** Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Fender Lights	6-8	6	S.C.	81
Instrument Lights	6-8	3	S.C.	63
Tail Lights	6-8	3	S.C.	63
Stop and Backing Lights	6-8	21	S.C.	1129
Dome and Corner Lights	6-8	6	S.C.	81

NOTE—Headlamps for 1932 model were 21-21 cp. Mazda No. 1110.

CURRENT LIMIT RELAY:—Mounted on dash, consists of two vibrating circuit breaker and one lockout circuit breaker (mounted in center).

Vibrating Circuit Breaker:—Begins to operate with current load of 35-40 amperes limiting current to 15 amperes with direct short-circuit.

Lock-out Circuit Breaker:—Begins to operate with current load of 35-40 amperes limiting current to less than 1 ampere with direct short-circuit.

Contact Spring Tension:—5 ounces minimum.

GASOLINE GAUGE:—**K-S** Telegauge hydrostatic type (see Carburetion Section).

FUEL PUMP:—A.C. mechanical fuel pump mounted on left side of crankcase (see Carburetion Section).

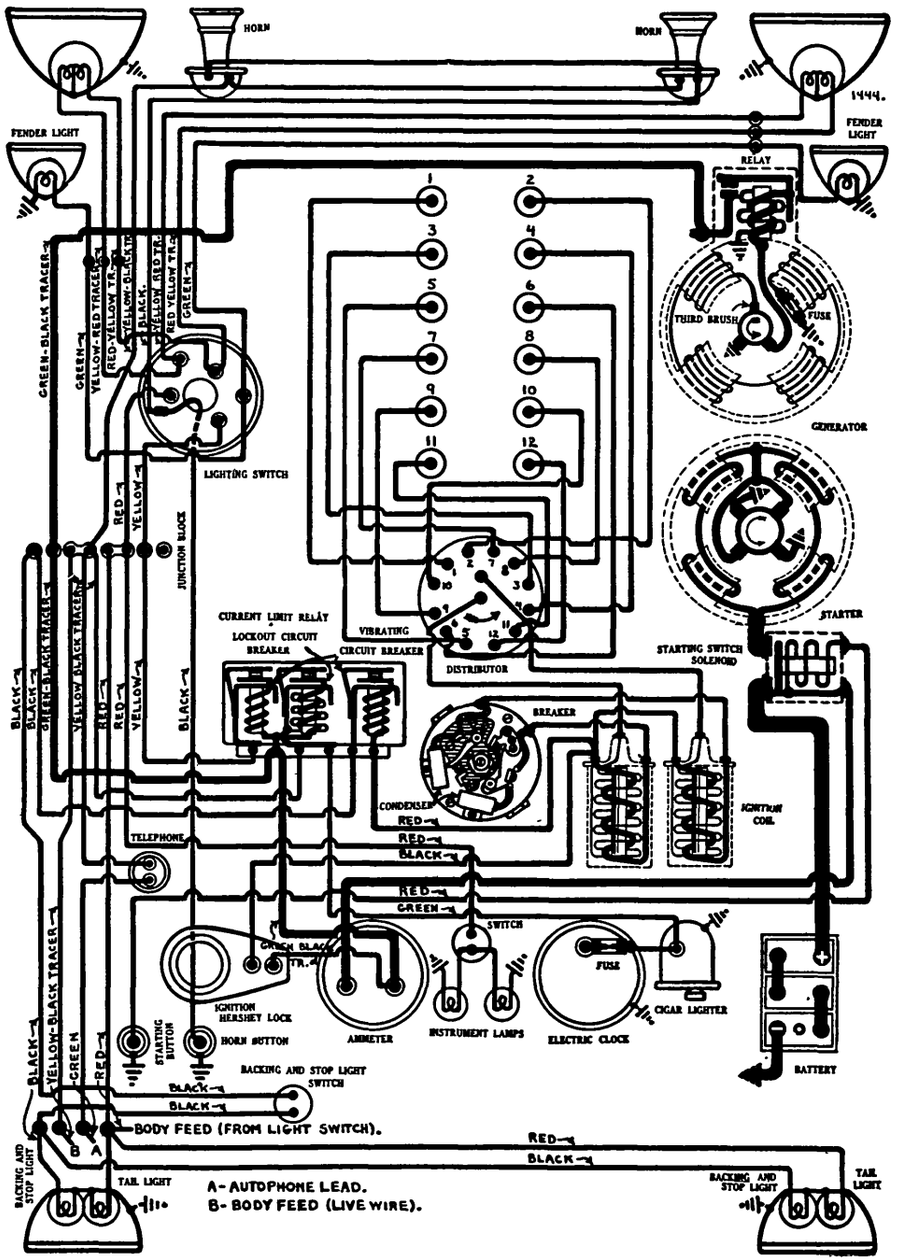
LINCOLN

MODEL V-12-136 (1933)
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On plate on front of dash under engine hood.

ENGINE NUMBER:—Stamped on left side of crankcase below center of cylinder block.

ENGINE:—Twelve cylinder, 67 degree 'V', 'L' head type, 3x4½" bore and stroke, 381.7 cubic inch displacement, rated at 43.2 H.P., develops 125 H.P. at 3400 R.P.M. Standard compression ratio 5.5-1.



BATTERY:—**Exide, Type LX-15-21L,** 6 volt, 15 plate, 148 ampere hour capacity (20 hour rate). Starting capacity 155 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—On shelf at right of transmission under front floor boards.
Dimensions:—Width, 7 1/32". Length, 15½". Height, 8⅞".

IGNITION:—**Coil Model CE-4001-L (2 used).** Coils are mounted on the dash. Stop light lead is connected to coil feed terminal.
Ignition Current:—1.45-4 amperes at 6 volts (engine running), 3-4.5 amperes at 6 volts (engine stopped) for each coil.
Ignition Switch:—Oakes 'Hershey' co-incidental ignition switch and steering post lock. Ignition switch used to control stop light circuit (stop light operative only with ignition turned 'on').
Distributor Model IGM-4002. Two-breaker, 6-lobe cam, semi-automatic advance type. Contacts open alternately at 33½ and 26½ degree intervals corresponding to the 67 and 53 degree alternate firing intervals of the engine. Contacts must be synchronized to secure these correct firing intervals (see Timing). Manual spark advance controlled by button at right of instrument panel. Maximum manual advance 20° (engine).
Breaker Gap:—Set contact gap at .020". Both gaps must be exactly the same.
Breaker Arm Spring Tension:—20-22 ounces.
Cam Angles—Closed 36°. Open 24° (distributor) each set independently.

Automatic Advance					
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	0		600
4		900	8		1800
8		1500	16		3000
12		2100	24		4200
13		2250	26		4500

Mounting:—Distributor mounted between cylinder banks at extreme rear of engine. To remove, disconnect primary leads, disconnect manual spark control, take off distributor cap, take out two hold-down bolts in advance arm, lift distributor out.
Oiling:—**1000 Miles.** Few drops medium engine oil in each of two oilers on side of distributor cup.

IGNITION TIMING:—Standard setting 7° on flywheel before top dead center with manual spark control button advanced.
To Set Ignition Timing. Advance manual spark control button and see that distributor is rotated clockwise to limit of advance arm slot, take off cover plate over inspection hole in top of flywheel housing at right of engine. With No. 2 piston (No. 1 of the right hand block) on compression, turn engine over by hand until piston reaches firing position with the flywheel mark 'A/2' (which is 7° before top dead center mark 'D2/12C') directly opposite the pointer in the inspection hole. Take off distributor cap and rotor, loosen locking screw in center of breaker cam, carefully locate cam so that right hand set of contacts (fixed set mounted directly on breaker plate) are beginning to open, tighten locking screw, see that rotor terminal connected to center terminal in distributor cap is directly opposite No. 2 segment in distributor cap (see diagram), connect spark plugs as indicated. The second or 'movable' set of contacts (mounted on movable sub-plate) should then be checked for correct synchronization.
Synchronization of Contacts. Turn crankshaft 67° to firing position of piston No. 11 (or rotate crankshaft one revolution plus 67° to firing position

LINCOLN
MODEL V-12-136 (1933)
AUTO-LITE SYSTEM

of piston No. 1) with flywheel mark 'A/1' (which is 7° before top dead center mark 'D-1/11C') directly opposite pointer in inspection hole in flywheel housing. Then loosen lock screws on movable sub-plate, turn eccentric adjusting screw until the left hand or 'movable' contacts begin to open, tighten lock screws, recheck contact gap. This operation will secure the correct 33½° interval between the opening of the first or 'fixed' set and the second or 'movable' set of contacts. The first set of contacts will open again after 26½° of distributor shaft rotation, or 53° on the crankshaft.

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as indicated on the diagram, or 1L-2R-5L-4R-3L-1R-6L-5R-2L-3R-4L-6R with cylinder banks right (R) and left (L) as viewed from the driver's seat and No. 1 cylinder nearest radiator. See diagram for correct connection of spak plug cables.

Spark Plugs:—⅞-18 S.A.E. Champion Type S-4. Set plug gaps at .025-.030".

VALVE TIMING:—Camshaft Setting. Camshaft is mounted directly above crankshaft between cylinder banks and is driven from the crankshaft by a chain drive in tandem with the generator drive sprocket. Automatic chain adjustment is provided for by means of an automatic idler sprocket take-up.

Timing

Intake Valves	Exhaust Valves
Open—21° before top dead center.	Open—57° before lower dead center.
Close—47° after lower dead center.	Close—11° after top dead center.

CARBURETION:—Stromberg Dual Downdraft Carburetor, Model EE-22 (see Carburetor Section for complete data). Choke is controlled manually by button on instrument panel.

Air Cleaner:—Oil-wetted wire mesh type. Remove complete unit when necessary, clean by dipping air cleaner end in pan of gasoline, dry thoroughly, re-oil by dipping in engine oil, drain before reassembling.

Fuel Pump:—A.C. combination fuel pump and vacuum pump mounted on side of crankcase at front of engine (see Carburetion Section for complete data). Remove glass sediment bowl under pump when necessary, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—Model MAO-4003, MAO-4004 (R.H.D.). Starter drive—Outboard Bendix. Electro-magnetic starting switch is mounted on starter field frame and is controlled by push-button starting switch on instrument board. Starter switch is Part No. K-3652-B. Starter rotation is counter-clockwise at commutator end. Brush spring tension 24-32 ozs. (new brushes).

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2800	5.8	50
1.5 "	1380	5.5	100
5.75 "	750	5.0	200
11.2 "	500	4.5	300
17.0 "	325	4.0	400
22.4 "	180	3.5	500
28.0 "	60	3.0	600
34.0 "	Lock	3.0	715
48.5 "	Lock	4.0	975

Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, disconnect cable and switch lead or take off switch, take out three flange mounting screws, pull starter forward to clear Bendix housing.

GENERATOR:—Model GBC-4101. Third brush regulation. Rotation is counter-clockwise at commutator end. With standard setting maximum charging rate is 20 amperes at 8.0 volts (cold) reached at 1325 R.P.M. or approximately 20 M.P.H.

Charging Rate Adjustment. Charging rate is adjusted by shifting third brush by means of an adjusting screw located on the commutator end plate. Turn the adjusting screw clockwise to increase, or counter-clockwise to decrease charging rate (third brush is moved in a direction opposite to the rotation of the adjusting screw).

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	400	0	6.4	460
4	6.9	460	4	6.7	550
8	7.0	525	8	7.1	650
12	7.3	600	12	7.4	790
16	7.5	725	16	7.8	1025

22	8.0	1325	12.4	7.5	2800
13	7.3	2800			

Brush Spring Tension—22-27 ounces on each brush.
Field Current:—2.75-3.05 amperes at 6.0 volts across field terminals.
Field Fuse:—7½-ampere capacity mounted in plug on end plate.
Motoring:—5.32-5.88 amperes at 6.0 volts.

Mounting:—Flange mounted on right hand rear face of timing chain case. Water pump is mounted on commutator end of generator and is driven by extension of generator shaft. To remove, drain radiator, disconnect hose couplings or take off water pump, take out three flange mounting screws, pull generator to rear to disengage drive coupling, lift out. Do not disturb intermediate plate carrying drive sprocket.

RELAY:—Model CB-4014-B. Mounted on generator field frame. Contacts close when generator voltage reaches 7.0-7.5 volts and open with discharge current of .5-2.5 amperes.
Contact Gap:—.025-.035". **Air Gap:**—.010-.030" with contacts closed.

LIGHTING:—Essex Wire Co. Switch. Lighting switch is mounted at lower end of steering column and is controlled by lower lever on steering wheel. Double filament bulbs are used in the headlights for 'depressed beam' dimming and are controlled by the lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Fender Lights	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Tail Lights	6-8	3	S.C.	63
Stop and Backing Lights	6-8	15	S.C.	87
Dome and Corner Lights	6-8	6	S.C.	81

CURRENT LIMIT RELAY:—Mounted on dash. Consists of two vibrating and one lock-out circuit breaker (see diagram for details and circuits in which each unit is connected).

Vibrating Circuit Breaker:—Begins to operate with current load of 35-40 amperes limiting load to 15 amperes with direct short-circuit.

Lock-out Circuit Breaker:—Begins to operate with current load of 35-40 amperes limiting load to less than 1 ampere.

Contact Spring Tension:—5 ounces minimum.

CLOCK:—Waltham electric clock. A 5-ampere capacity fuse is mounted on the back of the clock.

HORNS:—Sparton twin horns mounted under headlights. Horns are Part No. **A3F2.**

LINCOLN

TWELVE CYLINDER, MODEL V-12 (1932), V-12-145 (1933)
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on front side of dash.

ENGINE NUMBER:—Stamped on left side of crankcase below first cylinder.

ENGINE:—Twelve cylinder 65-degree 'V' type, 'L' head engine 3¼x4½" bore and stroke, 448 cubic inch displacement, rated at 50.7 H.P., develops 150 H.P. at 3400 R.P.M. Standard compression ratio 5.25-1. Optional compression ratios are not offered.

BATTERY:—**1932 Exide, Type 3-LXV-15-1RD,** 6 volt, 135 ampere capacity (5 ampere rate). Starting capacity 150 amperes for 20 minutes.

1933. Exide, Type LX-15-21L, 6 volt, 15 plate, 148 ampere hour capacity (20 hour rate). Starting capacity 155 amperes for 20 minutes.

Grounded Terminal:—Negative (—) terminal grounded to frame.

Mounting:—In cradle on right hand side of frame under front floor boards.

Dimensions:—Width, 7 1/32". Length, 15½". Height, 8⅞".

IGNITION:—**Coil Model CE-4001-L (2 used).** Coils are mounted on the dash.

Ignition Current:—1.45-4 amperes at 6 volts per coil (engine running), 3-4.5 amperes at 6 volts per coil (engine stopped).

Ignition Switch:—Oakes 'Hershey' type co-incidental ignition switch and steering post lock.

Distributor Model IGM-4001 ('32), IGM-4002 ('33). Two breaker, 6 lobe cam, semi-automatic advance type. Contacts open alternately at 27½ and 32½ degree intervals corresponding to the 55 and 65 degree firing intervals of the engine (engine banks are set at an included angle of 65°, resulting in this unequal firing interval). Contacts must be synchronized (see Timing). Manual advance is controlled by button at left of instrument panel.

Manual Advance:—Maximum 20° (engine).

Breaker Gap:—Set contact gap at .020". Both gaps must be exactly the same.

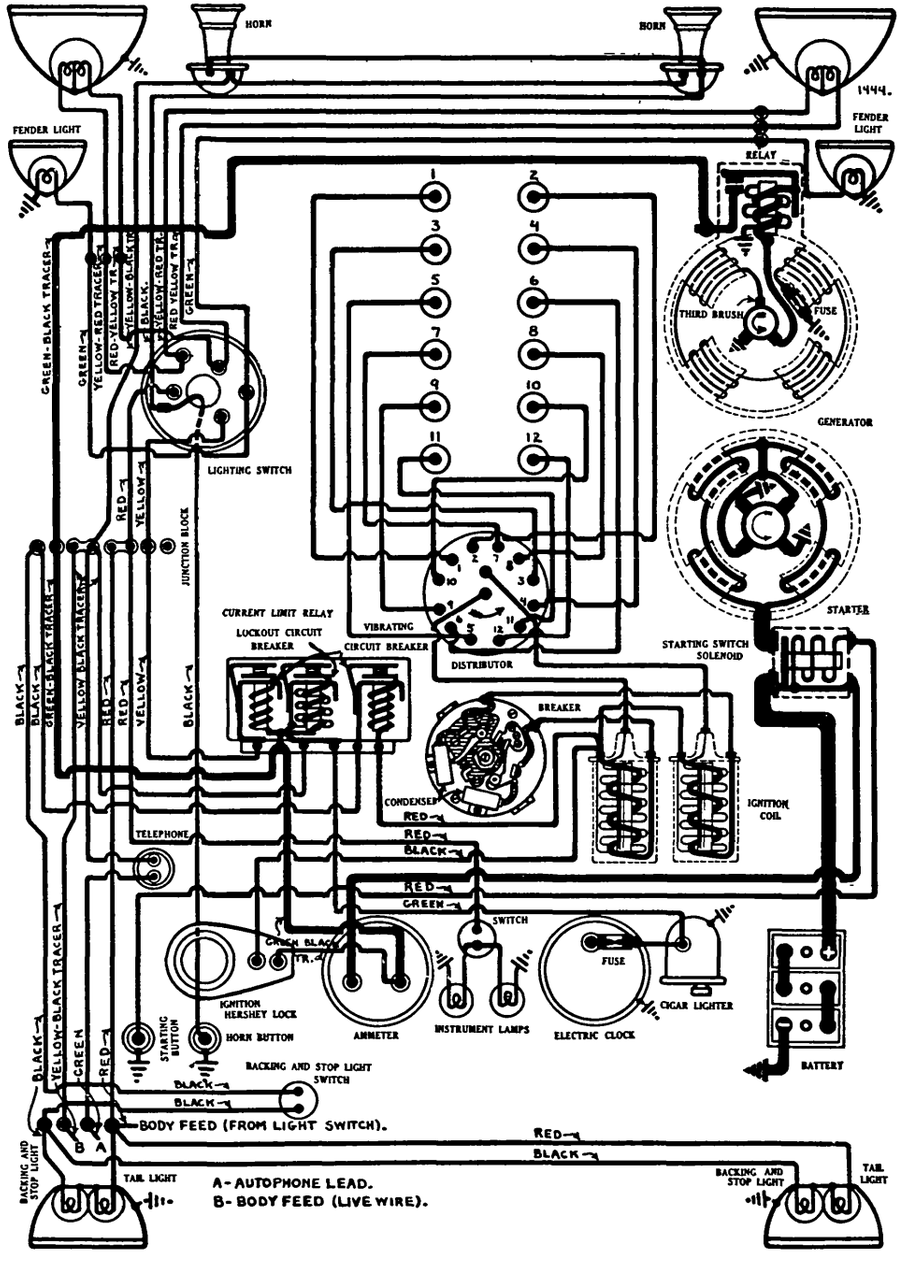
Breaker Arm Spring Tension:—20-22 ounces.

Cam Angles—Closed 36°. Open 24° (distributor) each set independently.

Automatic Advance—Model IGM-4001

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	0		600
4		900	8		1800
8		1500	16		3000
11.5		2000	23		4000

Automatic Advance—Model IGM-4002



Start		300	0		600
4		900	8		1800
8		1500	16		3000
13		2250	26		4500

Mounting:—Distributor mounted between cylinder banks at extreme rear of engine. To remove, disconnect primary leads, disconnect manual spark control, take off cable conduits and distributor cap, take out two hold-down screws in advance arm, lift distributor out.

Oiling:—**1000 Miles.** Few drops medium engine oil in two oilers on side of distributor cup.

5000 Miles. Take off distributor cap and rotor. Put one drop castor oil on breaker arm pivot pins. Apply thin film of grease to face of breaker cam.

IGNITION TIMING:—Standard setting 7° before top dead center (manual advance. To set timing, advance manual spark control, see that distributor is rotated clockwise to end of advance arm slot, take off cover plate on inspection hole in top of flywheel housing at right of engine. With piston No. 2 (No. 1 of the right hand block) on compression, turn engine over until flywheel mark 'A/2' (which is before the top dead center mark 'D2/12C') is directly under pointer on the housing, take off distributor cap and rotor, loosen locking screw in center of breaker cam, carefully locate cam so that first set of contacts (mounted directly on breaker plate) are beginning to open, tighten locking screw, connect spark plugs as indicated on diagram (No. 1 terminal as designated).

LINCOLN

TWELVE CYLINDER, MODEL V-12 (1932), V-12-145 (1933)
AUTO-LITE SYSTEM

Synchronization of Contacts. After timing distributor (above) crank engine over 65 degrees to firing position of piston No. 11 (or if desired, turn engine over 1 revolution plus 65 degrees to firing position of piston No. 1) with flywheel mark 'A/1' (which is before the top dead center mark 'D1/11C') directly opposite pointer on housing. Loosen three lock screws on movable sub-plate carrying second set of contacts, turn eccentric adjusting screw until contacts begin to open, tighten lock screws. The first set or fixed contacts should open again after an interval of 27½ degrees (distributor) or 55 degrees of crankshaft rotation.

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as shown on diagram, or 1L-2R-5L-4R-3L-1R-6L-5R-2L-3R-4L-6R with cylinder banks right (R) and left (L) as viewed from driver's seat. No. 1 cylinder nearest radiator in each case. See diagram for proper connection of spark plug cables on distributor cap.

Spark Plugs:—⅞-18 S.A.E. Std. Champion Type C-4 (1932), S-2 (1933).
Spark Plug Gaps:—Set at .025-.030".

VALVE TIMING:—Valves on inner side of each cylinder bank operated by single camshaft mounted directly above crankshaft. Camshaft driven in tandem with generator sprocket by chain drive with automatic chain adjustment

Valve Specifications

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	2"	⅜"	6⅝"	45°	5/16"
Exhaust	2"	⅜"	6⅝"	45°	5/16"

NOTE:—Valve lift on 1932 cars was 11/32".

Tappet Clearance		Spring Pressure
Intake	.003 (cold)	Closed .. 75- 80 pounds (2 15/16")
Exhaust	.005" cold)	Open . . 175-180 pounds (2 19/32")

Timing

Intake Valves	Exhaust Valves
Open—21° before top dead center.	Open—57° before lower dead center.
Close—47° after lower dead center.	Close—11° after top dead center.

CARBURETION:—Stromberg Dual Downdraft Carburetor, Model DD-3 (see Carburetor Section for complete data). Choke is operated manually by button on instrument panel.

Air Cleaner:—Oil-wetted wire mesh type integral with silencer. Remove unit when necessary, wash air cleaner by dipping in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. combination fuel pump and vacuum pump (see Carburetion Section for complete data). Remove glass sediment bowl under pump when necessary, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—Model MAO-4001, 4002 Exp. ('32), MAO-4005, 4006 Exp. ('33). Starter drive Outboard Bendix. Rotation counter-clockwise at commutator end. Electric starting switch is mounted on starter field frame and controlled by pushbutton on instrument panel. Brush spring tension 24-32 ounces (new brushes).

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2800	5.8	50
1 5 "	1380.	5.5	100
5.75 "	750	5.0	200
11 2 "	500	4 5	300
17.0 "	325	4.0	400
22.4 "	180	3.5	500
28 0 "	60	3 0	600
34.0 "	Lock	3.0	715
48.5 "	Lock	4.0	975

Mounting:—Starter flange mounted on front face of flywheel housing at right of engine. To remove, disconnect cable and switch lead or take off starting switch, take out 3 flange mounting screws, pull starter straight forward to clear Bendix housing, lift out.

Oiling:—**1000 Miles.** Few drops medium engine oil in oiler at each end of armature shaft. Outboard bearing (Bendix housing) is oilless.

GENERATOR:—**Model GBC-4001.** Third brush regulation. Rotation is counter-clockwise at the commutator end. With standard setting maximum charging rate is 20-22 amperes at 8 0 volts (cold) reached at 1325 R.P.M. or 25 M.P.H.

Charging Rate Adjustment. Charging rate is adjusted by shifting third brush. An adjusting screw is located on the commutator end plate and third brush is moved by turning this screw. Shift third brush counter-clockwise to increase or clockwise to decrease charging rate (adjusting screw should be turned clockwise to increase or counter-clockwise to decrease the charging rate).

Generator Data

Stop and Backing Lights	6-8	15	S.C.	87
Dome and Corner Lights	6-8	6	S C.	81

CURRENT LIMIT RELAY:—Mounted on dash Consists of two vibrating circuit breakers and one lock-out circuit breaker (in center).

Vibrating Circuit Breaker:—Begins to operate with current load of 35-40 amperes limiting load to 15 amperes with direct short-circuit.

Lock-out Circuit Breaker:—Begins to operate with current load of 35-40 amperes limiting load to less than 1 ampere with direct short-circuit.

Contact Spring Tension:—5 ounces minimum.

CLOCK:—Waltham Electric type. Five ampere capacity fuse mounted on back of clock.

SERIAL NUMBER:—First number (136) 1501, (145) 3001. On plate on dash.

COMPRESSION:—**Ratio**—6.1-1 std. aluminum head. **Pressure**—138 lbs. at 1000 R.P.M. or 105 lbs. at cranking speed (100 R.P.M.).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model CE-4001-L (2 used).** Coils mounted on dash.
Ignition Current—1.25 amperes (engine running), 4.5 amperes (stopped) per coil.
Ignition Switch—Oakes 'Hershey' type combination ignition switch and steering post lock.

Distributor Model IGM-4002,A. Double breaker, 6 lobe cam, semi-automatic advance type. Contacts open alternately at 33½ and 26½ degree intervals corresponding to unequal 67 and 53 degree firing intervals of the engine (caused by 67° included angle between cylinder banks). Contacts must be synchronized—see Timing. Manual advance is controlled by lower left hand button on instrument panel.
BreakerGap—Set gap at .020".
Breaker Arm Spring Tension—20-22 ounces.
Manual Advance—20° (engine-maximum).
Cam Angles (Distributor Degrees)—Closed 36°. Open 24°. Each set operates independently and controls one coil.

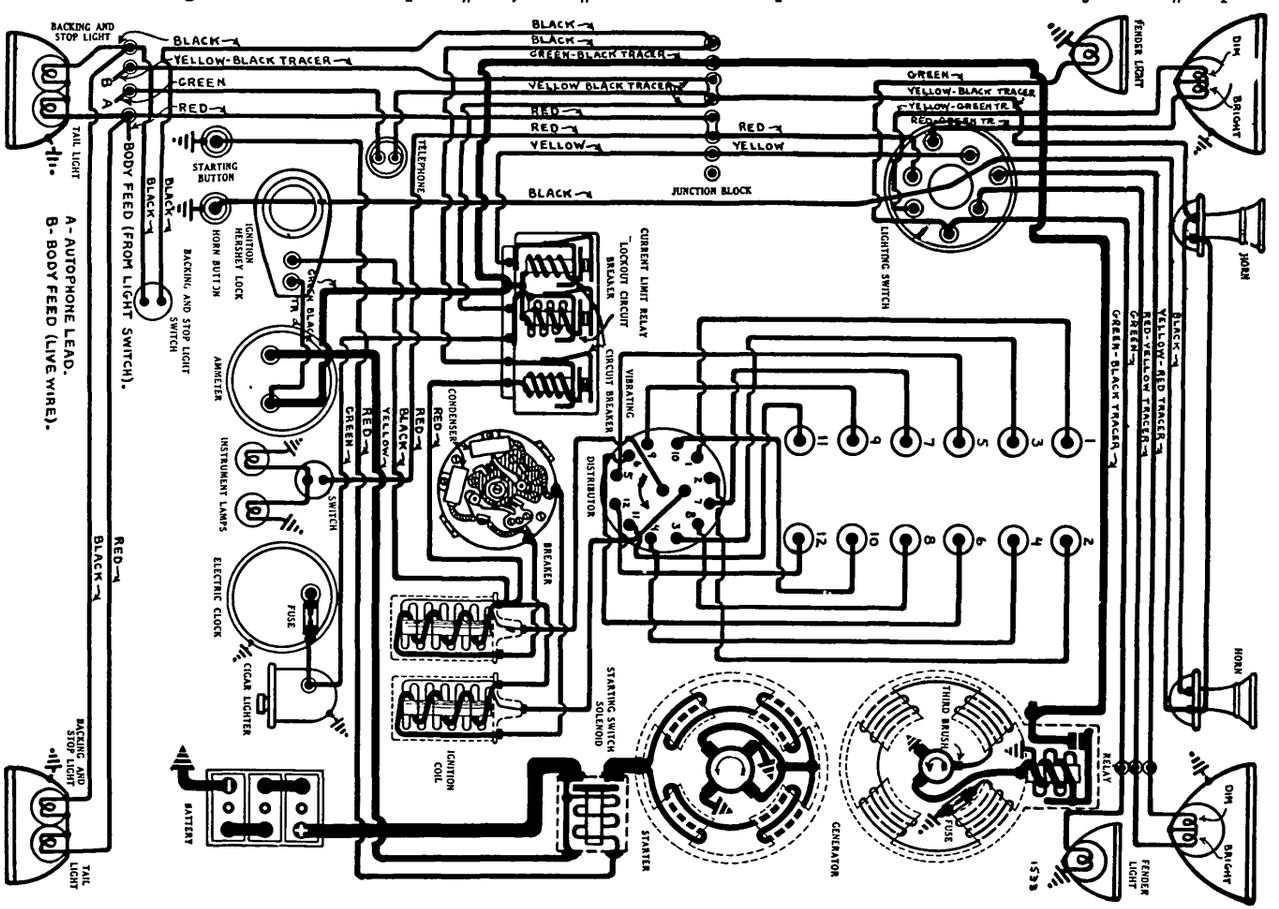
Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	600	4	1200
4	900	8	1800
6	1200	12	2400
8	1500	16	3000
10	1800	20	3600
11½	2000	23	4000

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines ..... 7° BTDC ..... .020" BTDC
Timing (Stationary Contacts):—Stationary contacts (right hand—mounted directly on breaker plate) control right hand coil and fire spark plugs of right cylinder bank. To set timing, first see that spark control button on instrument panel is advanced and distributor rotated clockwise to extent of advance arm slot, take off cover plate over inspection hole in flywheel housing. With #2 (front cylinder—right hand bank) on compression turn engine over until flywheel mark 'A-2' lines up with pointer on housing. This mark is 7° before top dead center mark 'D-2/12C'. Then loosen taper lockscrew in center of breaker cam, carefully locate cam so that right hand contacts are beginning to open, tighten lockscrew, check rotor position and spark plug cable connections (see diagram). Check synchronization of second or movable contacts. They should open 33½° (distributor) or 67° (engine) after this point.

Synchronization (Movable Contacts):—After setting stationary contacts (above), turn engine over 67° to firing position for piston #1 (front cylinder—left hand bank) with flywheel mark 'A-1' lined up with indicator on housing. This mark is 7° before top dead center mark 'D1/11C'. Then loosen lockscrews on movable sub-plate (carrying second set of contacts), shift plate by turning eccentric adjusting screw until contacts begin to open, tighten lockscrews. This will provide correct 33½° interval between opening of stationary and movable contacts.

If distributor is synchronized by using rotary spark gap or other service equipment, set movable contacts to open 33½° after first or stationary set. Firing interval is unequal 33½-26½-33½ (distributor degrees).



Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as shown on diagram (right bank—2, 4, 6, 8, 10, 12. Left bank, 1, 3, 5, 7, 9, 11).

Spark Plugs:—Champion Type C-7, 18 MM. Metric type.
Spark Plug Gaps—.022".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.
Carburetor:—Stromberg, Model EE-22, 1½" plain tube, dual downdraft type.
Fuel Pump:—AC, Type I combination fuel and vacuum pump.
Gasoline Gauge:—K-S Telegauge, hydrostatic type.

VALVE TIMING:—**To Check Timing**—No flywheel marks provided. Intake valve for cylinder #2 open

with piston 21° or .1768" before top dead center when point on flywheel approximately 6.77 teeth before top dead center mark 'D2/12C' lines up with indicator in inspection hole in right top face of housing.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Tappet Clearance:—.003" Intake, .005" Exhaust (cold).

Valv Spring Pressure:—60-66 lbs. at 2 11/16" (valve closed). 187-199 lbs. at 2 11/32" (valve open).

LUBRICATION:—Crankcase Capacity—13 quarts.
Normal Oil Pressure—40 lbs. at 50 M.P.H.

BATTERY:—Exide, Type LX-15-21L. 6 volt, 15 plate, 148 A.H. capacity (20 hour rate).

Starting Capacity—155 amperes for 20 minutes.

Grounded Terminal—Negative (-) terminal.

Location—Right hand side under front floor boards.

STARTER: — Model MAO-4003, MAO-4004 (Export). Armature No. MAO-2006.
Starter Drive—Outboard Bendix.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-32 ounces measured at right angle bend at extreme end of spring overhang beyond brush.
Cranking Engine—100 R.P.M., 150-200 amperes at 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	2700	5.5	44
1.5 "	1360	5.5	100
5.7 "	740	5.0	200
11.1 "	500	4.5	300
16.8 "	320	4.0	400
22.3 "	180	3.5	500
34.0 "	Lock	3.0	715
48.5 "	Lock	4.0	975

Starting Switch:—Owen-Dyneto Type. Electric solenoid type switch mounted on starter field frame and controlled by button on instrument board.

Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, take out 3 flange mounting screws.

GENERATOR:—(V-12-136) Model GBC-4101. Armature No. GBC-2035. (V-12-145) Model GBC-4001, 4101. Armature No. GBC-2006 (4001). Third brush control type.

Charging Rate Adjustment—Third brush shifted by slotted screw on commutator end plate. Turn screw clockwise to increase charging rate and in opposite direction to decrease charging rate.

Maximum Charging Rate—18 amperes, 1300 R.P.M. or 20 M.P.H.

Performance Data

Amperes	Volts	R.P.M.
0	6.4	400
4	6.9	460
8	7.0	520
12	7.3	600
16	7.5	725
20	7.8	940
21	8.0	1250
13	7.3	2800

Rotation—Counter-clockwise at commutator end.
Shunt Field Current—2.75-3.05 amperes at 6.0 volts.
Motoring—5.32-5.88 amperes at 6.0 volts.
Brush Spring Tension—22-27 ounces.
Field Fuse—7½ ampere capacity in plug on commutator endplate.

Mounting:—Flange mounted on right hand rear face of timing chain case. Water pump and oil temperature regulator mounted on commutator end of generator. To remove, drain radiator, disconnect hose couplings and oil leads or remove water pump, take out three flange mounting screws, pull generator to rear to disengage drive coupling. Do not disturb intermediate plate carrying drive sprocket.

CUT-OUT RELAY:—Model CB-4014-B (GBC-4101), CB-4014-L (GBC-4001). Mounted on generator field frame.

Cuts in—7.0-7.5 volts.

Cuts out—.5-2.5 ampere discharge.

Relay Contact Gap—.025-.035".

Air Gap—.010-.030" (contacts closed).

LIGHTING:—Lighting switch mounted at lower end of steering column controlled by lever on steering wheel. Special 'Passing' position of switch provides assymmetrical passing beam (lower beam left hand headlight, upper beam right hand headlight). Headlights are aimed straight ahead.

Bulb Specifications

Lamp	Candlepower	Mazda No
Headlights	32-21	1116
Fender, Instrument, Tail	3	63
Stop and Backing	15	87
Dome, Corner	6	81

CIRCUIT BREAKER:—R.B.M. Model. Consists of two vibrating and one lock-out circuit breaker on dash (see diagram for circuits). Vibrating circuit breakers begin to operate with current load of 25-30 amperes limiting load to 10-15 amperes. Lock-out circuit breaker begins to operate with current load of 25-30 amperes limiting load to approximately 1 ampere.

HORNS:—Sparton Twin horns.

SERIAL NUMBER:—On plate on front of dash.

COMPRESSION:—Ratio—6.38-1 Std. aluminum head. **Pressure**—138 lbs. at 1000 R.P.M. or 105-110 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20″ with engine idling.

IGNITION:—Coil Model CE-4001-L (2 used). Mounted on the dash above distributor.
Ignition Current—1.5 amperes (idling), 5 amperes (stopped) per coil.
Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock.

Distributor Model IGM-4003. Double breaker, 6 lobe cam, semi-automatic advance type. Contacts open alternately at 33½° and 26½° intervals, corresponding to unequal 67° and 53° firing intervals of the engine. Caused by 67° included angle between cylinder banks. Contacts must be synchronized (see Timing).
Breaker Gap—Set at .020″ (both sets).
Breaker Arm Spring Tension—20-22 ounces.
Cam Angles—Closed 36°. Open 24° distributor. Each set operates independently and controls one coil.
Manual Advance—20° (engine) adjustment only.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
2	660	4	1320
4	1000	8	2000
6	1365	12	2730
8	1720	16	3440
8.5	1800	17	3600

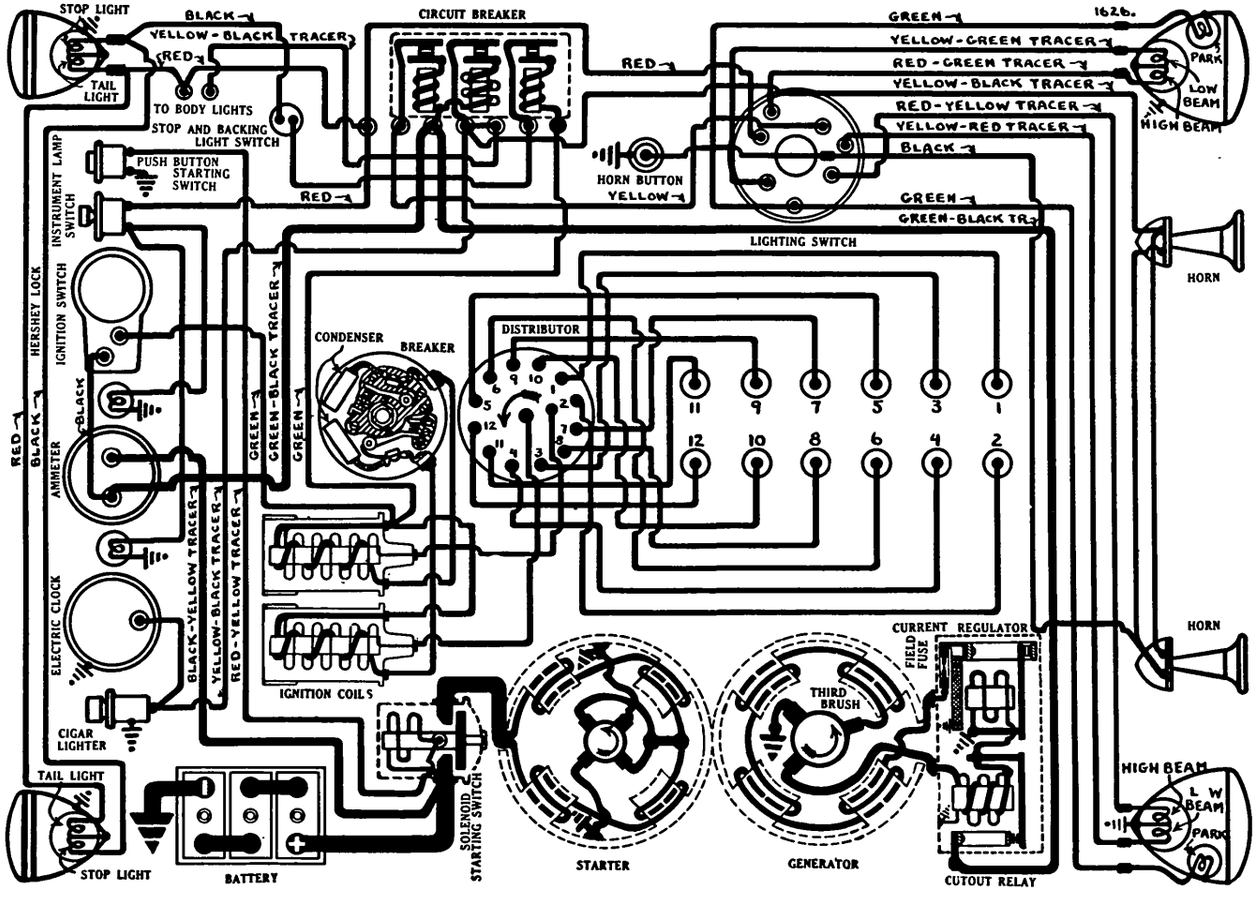
Removal:—Distributor mounted between cylinder banks at rear of engine. To remove, take off cable conduits and distributor cap, take out hold-down screws in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....7° BTDC. .....020″ BTDC.

NOTE—Right hand (stationary) contacts control right hand coil and fire spark plugs in right cylinder bank. Left hand (movable) contacts control left hand coil and fire plugs in left bank.

Timing (Stationary Contacts)—With #2 piston front cylinder—right hand bank) on compression, turn engine over until piston reaches firing position, stop when flywheel mark 'A/2' lines up with pointer on housing in inspection hole in right top of flywheel housing. This mark is 7° before dead center mark 'D2/12C'. Then loosen taper lockscrew in center of breaker cam, carefully locate cam so that right hand or stationary contacts are beginning to open, tighten lockscrew, check rotor position and spark plug cable connections. Then synchronize movable contacts.

Synchronization (Movable Contacts)—Turn engine over 67° to firing position for piston #1 (front cylinder—left hand bank), stop when flywheel mark 'A/1' lines up with indicator. This mark is 7° before dead center mark 'D1/11C'. Then loosen lockscrews on movable sub-plate, shift plate by turning eccentric adjusting screw until movable contacts begin to open, tighten lockscrews. This will provide correct 33½° interval between opening of stationary and movable contacts.



Synchronization (Other Methods)—If distributor synchronized on rotary spark gap or other equipment, set movable contacts to open 33½° after stationary contacts. Firing intervals are unequal 33½-26½-33½ (distributor degrees).

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Firing Order—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as shown on diagram. Spark plugs not connected in accordance with firing order.

Spark Plugs:—Champion, Type 7. 18 MM. Metric.

Spark Plug Gaps—Set at .022″.

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump and Gasoline Gauge.

Carburetor:—Stromberg, Model EE-22, 1 7/16" dual downdraft type.

Fuel Pump:—AC. Type I-1521518 combination fuel and vacuum pump.

Gasoline Gauge:—K-S Telegauge hydrostatic type.

VALVE TIMING:—**To Check Timing**—No flywheel marks provided. No. 2 intake valve opens when a point on the flywheel approximately 6.77 teeth before dead center mark 'D2/12C' lines up with indicator on housing.
Motor Gauge—Weidenhoff Adapter #104, Rod #40. Piston position .1768" before top dead center.

Tappet Clearance:—.004" Int., .006" Exh., cold.
Valve Spring Pressure:—60-66 lbs. at 2 11/16" (valve closed). 187-199 lbs. at 2 11/32" (valve open).

LUBRICATION:—**Crankcase Capacity**—12 qts. (refill).
Normal Oil Pressure—40 lbs. at 50 M.P.H.

BATTERY:—**Exide, Type X-21-L.** 6 volt, 21 plate, 147 A.H. capacity (20 hour rate).
Starting Capacity—175 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—On right side under front floor.

STARTER:—**Model MAO-4003-B. Armature MAO-2006.**
Starter Drive—Outboard Bendix Type RB10FXXTD.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-32 ounces with new brushes.
Cranking Engine—100 R.P.M., 150-200 amps., 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	2700 Min.	5.5	44 Max.
1.5 "	1360	5.5	100
5.7 "	740	5.0	200
11.1 "	500	4.5	300
16.8 "	320	4.0	400
22.3 "	180	3.5	500
34.0 "	Lock	3.0	715
48.5 "	Lock	4.0	975

Starting Switch:—Type SS-4004. Solenoid type switch mounted on starter field frame. Controlled by push button on instrument panel. See Equipment Section.

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out three flange mounting screws.

GENERATOR:—**Model GBC-4103. Armature No. GBC-2035.** Air-cooled. Third brush control in conjunction with Current Regulator (two-step charging control). See Equipment Section for complete data on Regulator.

Charging Rate Adjustment—Third brush shifted by slotted screw on commutator end plate. Turn screw clockwise to increase, or counter-clockwise to decrease charging rate.

Maximum Charging Rate—18 amperes, 20-25 M.P.H.

Cold — **Performance Data** — Hot

Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	460	0	6.4	525
4	6.7	525	4	6.8	640
8	6.95	600	8	7.2	750
12	7.25	680	12	7.6	940
16	7.55	800	16	8.0	1500
22	8.0	1300			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-27 ounces with new brushes.

Field Current—2.47-2.73 amperes at 6.0 volts.

Field Fuse—5 ampere in knurled cup on side of regulator case.
Motoring Current—4.46-4.94 amperes at 6.0 volts.

Removal:—Generator flange mounted on right rear face of timing chain case. Water pump and oil temperature regulator mounted on commutator end of generator. To remove, drain radiator, disconnect hose couplings and oil leads or remove water pump, take out three flange mounting screws, pull generator to the rear to disengage drive coupling, do not disturb intermediate plate carrying drive sprocket.

RELAY-REGULATOR:—**Model TC-4302-A, TC-4305-A.** Mounted on generator. Consists of Cutout Relay and Current Regulator in a single case. See Equipment Section for complete data on these units.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—**R.B.M. Switch Model 1301, 1315, 1316, 1317. Lincoln Part No. K-10335-B (complete assembly).** Switch is mounted at lower end of steering column and controlled by lever on steering wheel. Headlamp upper and lower beams controlled by lighting switch. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking	1½	55
Stop and Tail	21-2	1158
Dome	6	81

CIRCUIT BREAKER:—**R.B.M. Model 1630.** Consists of two vibrating and one lockout circuit breaker in a case on the dash (see diagram for circuits).
Vibrating Units—Begin to operate with current load of 35-45 amperes, limiting load to 15 amperes.
Lockout Unit—Begins to operate with current load of 35-45 amperes, limiting load to less than 1 ampere.
Contact Spring Tension—5 ozs. minimum.

FUSES:—**Generator Field**—5 ampere in knurled cup on side of regulator case on generator.

HORNS:—Sparton Twin horns. Vibrator type. Horn current 20 amperes (total for both horns).

SERIAL NUMBER:—On plate on front of dash. Use engine number (5501) stamped on left side of crankcase at center.

COMPRESSION:—Ratio—6.38-1. Std. Aluminum head. **Pressure**—105-110 lbs. at cranking speed of 100 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 5-7 M.P.H.

IGNITION:—Coil Model CE-4001-L. Two coil unit mounted on dash above distributor.

Ignition Current—1.5 amperes idling, 5 amperes stopped for each coil.

Ignition Switch:—Oakes Hershey co-incidental ignition switch and steering post lock.

Distributor Model IGM-4003, IGM-4003A (export). Double breaker, 6 lobe cam, full automatic advance type.

Firing Interval—Alternate opening at 33½ and 26½° intervals corresponding to unequal 67 and 53° firing intervals of engine. Contacts must be synchronized. See Timing.

Breaker Gap—Set at .020" (both sets equal).

Cam Angle or Dwell—36° closed, 24° open. Each set operates independently.

Breaker Arm Spring Tension—14-16 ounces.

Condenser—Part No. IG-2671A, IG-2671E (one each).

Condenser Capacity—.20-.25 mfd.

Automatic Advance—IGM-4003

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	660	4	1320
4	1000	8	2000
6	1365	12	2730
8.5	1800	17	3600

Automatic Advance—IGM-4003-A

Start	300	0	600
4	450	8	900
6	800	12	1600
8	1140	16	2280
10	1500	20	3000
12	1840	24	3680

Removal:—Distributor mounted between banks at rear of engine. To remove, take off distributor conduits and cap, take out hold-down screws in advance arm.

IGNITION TIMING:— **Flywheel Degrees** **Piston Pos.**
All engines.....At TDC.....000" TDC.

NOTE—Right hand (stationary) contacts control right coil and fire spark plugs in right cylinder bank. Left hand (movable) contacts control left coil and fire plugs in left bank.

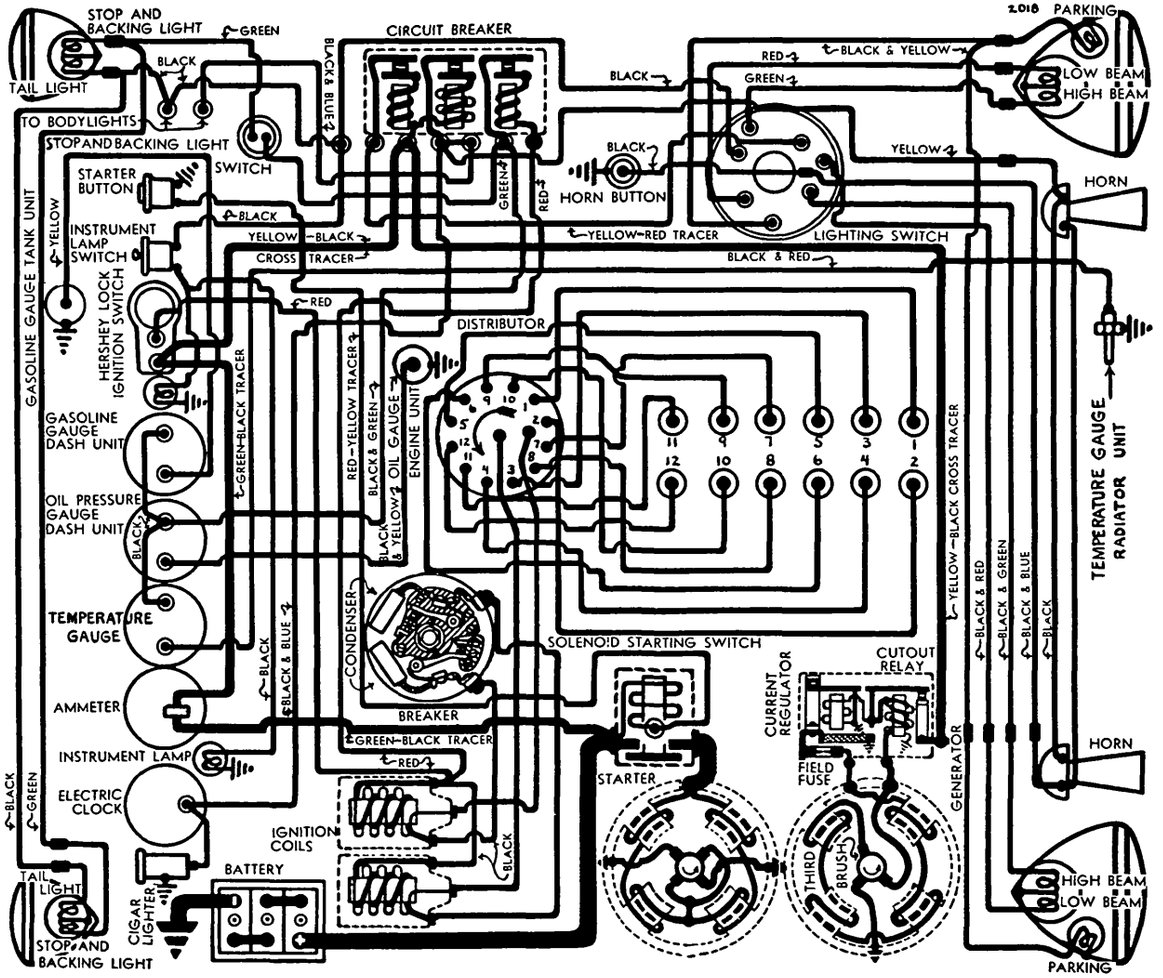
Timing (Stationary Contacts)—With #2 piston (front cylinder, right bank) on top dead center entering power stroke and flywheel mark 'D2/12C' at indicator in inspection hole in right top face of flywheel housing, loosen taper lockscrew in center of breaker cam, carefully locate cam so that right hand (stationary) contacts are beginning to open, tighten lockscrew. Then synchronize movable contacts.

Synchronization (Movable Contacts)—Turn engine over 67° to firing position of piston #1 (front cylinder, left bank), stop with piston on top dead center when flywheel mark 'D1/11C' lines up with indicator. Loosen lockscrews on movable subplate, shift plate by turning eccentric adjusting screw until movable contacts begin to open, tighten lockscrews.

Synchronization (Other methods)—If distributor synchronized on rotary spark gap or other types of equipment, set movable contacts to open 33½° after stationary contacts. Firing intervals unequal 33½-26½-33½ distributor degrees.

Motor Gauge—Weidenhoff #113 Adapter, #37 Rod.

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as indicated on diagram. Spark plugs not connected in this order on distributor cap.



Spark Plugs:—Champion Type 7. 18 MM. Metric. **Spark Plug Gaps**—.025".

CARBURETION:—Carburetor—Stromberg Model EE-22, 1.437" (1 7/16"), dual downdraft type. See Carburetion Section for complete adjustment, overhaul, and Jet Specifications.

NOTE—Do not make carburetor adjustments until engine is warmed up and choke valve is wide open.

Idle Adjustment—Manufacturer recommends use of vacuum gauge and adjustment of idle adjusting screws for highest steady vacuum. If vacuum gauge not used, adjust throttle stopscrew for 5-7 M.P.H. idling speed, cut out one bank of cylinders by disconnecting coil primary lead, adjust idling adjusting screw for carburetor barrel feeding the other bank by turning screw in until engine begins to miss and then out until engine fires smoothly. Reconnect coil, disconnect second coil and repeat adjustment for other idle adjusting screw. Idle engine on all 12 cylinders and readjust throttle stopscrew for correct idling speed.

Idling adjustment can also be made by turning one idling adjusting screw in until it is seated and then adjusting the second idling adjusting screw as directed above. The first adjusting screw should

then be turned out slowly until engine fires evenly on all 12 cylinders.

Accelerating Pump Adjustment—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:
Inner Hole—Minimum stroke—Summer setting.
Outer Hole—Maximum stroke—Winter setting.

Air Cleaner:—AC. #1525939 oil-wetted type std.

Fuel Pump:—AC. Type I #1521218 combination fuel and vacuum pump. See article in Carburetion Sec.

Gasoline Gauge:—King-Seeley Electric. Part No. 5766 (dash unit), 5852 (tank unit). See article in Carburetion Section.
NOTE—Dash unit identified by letter 'G' stamped on edge, tank unit stampedl 'Lincoln K-8380-E'.

VALVE TIMING:—To Check Timing—No flywheel marks provided. Intake valve for cylinder #2 open with piston 21° or .1768" before top dead center when point on flywheel approximately 6.77 teeth before top dead center mark 'D2/12C' lines up with indicator in inspection hole in right top face of housing.

Tappet Clearance:—.004" Int., .006" Exh. Cold.

Valve Spring Pressure:—60-66 lbs. at 2.687" (valve closed), 187-199 lbs. at 2.343" (valve open).

LUBRICATION:—Crankcase Capacity—12 qts. (refill).
Normal Oil Pressure—40 lbs. at 50 M.P.H.

BATTERY:—Exide, Type X-21-L. 6 volt, 21 plate, 147 ampere hour capacity (20 hour rate).
Starting Capacity—175 amperes for 20 minutes.
Zero Capacity—300 amperes for 6.1 minutes.
Grounded Terminal—Negative (—) terminal.
Location—On right side under front floor.

STARTER:—Model MAO-4003B, MAO-4004B Export.
Armature No. MAO-2006.
Drive—Outboard Bendix Type RB10FXXTD.
Cranking Engine—100 R.P.M., 150-200 amperes at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-32 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	2700 Min.	5.5	44 Max.
1.5 "	1360	5.5	100
5.7 "	740	5.0	200
11.1 "	500	4.5	300
16.8 "	320	4.0	400
22.3 "	180	3.5	500
34.0 "	Lock	3.0	715
48.5 "	Lock	4.0	975

Starting Switch:—Model SS-4004 (MAO-4003B), SS-4005 (MAO-4004B). Magnetic type mounted on starter and controlled by pushbutton on instrument panel. See article in Equipment Section.

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out 3 flange mounting screws.

GENERATOR:—Model GBC-4103. Armature No. GBC-2035. Third brush control in conjunction with Current Regulator (two rate charging control).
Charging Rate Adjustment—Use test meters to check output. Ground regulator by connecting short jumper between fuse cup on regulator and generator frame while making adjustment. Turn slotted screw on commutator endplate (upper hexagonal headed screw) clockwise to increase or counter-clockwise to decrease charging rate. Remove jumper wire.
Maximum Charging Rate—22 amperes (cold), 16 amperes (hot), 1300 R.P.M., 20-25 M.P.H.

Performance Data

Cold Regulator Contacts Closed			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	460	0	6.4	525
4	6.7	525	4	6.8	640
8	6.95	600	8	7.2	750

16	7.55	800	16	8.0	1500
22	8.0	1300			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-27 ounces.
Field Current—2.47-2.73 amperes at 6.0 volts.
Field Fuse—5 ampere in cup on regulator.
Motoring Current—4.46-4.94 amperes at 6.0 volts.

Removal:—Generator flange mounted on right rear face of timing chain case. Water pump and oil temperature regulator mounted on commutator end of generator. To remove, drain radiator, disconnect hose couplings and oil leads, remove water pump (optional). Take out 3 capscrews in generator mounting flange, pull generator to rear to disengage drive coupling. Do not disturb intermediate plate carrying drive sprocket or timing chain automatic idler sprocket setting will be lost requiring resetting.

RELAY - REGULATOR:—Model TC-4302A, TC-4305A (Export). Mounted on generator. Consists of Cutout Relay and Current Regulator (two-rate charge control). See article in Equipment Section for complete data.

Cutout Relay

Cuts In—6.5-7.25 volts, 10 M.P.H.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.025-.040".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Hall, Pre-focused type. Upper and lower beams controlled by lighting switch lever on steering wheel. Assymetrical passing beam (lower beam left hand headlamp, upper beam, right hand headlamp) provided with switch lever in #2 position. Left hand headlamp aimed straight ahead, right hand headlamp slightly to right.

Switches

Lighting—R.B.M. Model 1300.
Compartment—R.B.M. Model 1260.
Door Switch—R.B.M. Model 1550.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking	1½	55
Stop and Tail	21-3	1158
All others	6	81

CIRCUIT BREAKER:—R.B.M. Model 1630. Consists of two vibrating and one lock-out circuit breaker in case on dash (see diagram for circuits controlled by each unit.
Performance—Begin to operate with load of 35-40 amperes, limiting load to 15 amperes maximum with dead short-circuit across terminals.
Contact Spring Tension—5 ozs. minimum.

FUSES:—Generator Field—5 ampere in cup on regulator.

HORNS:—Sparton. Vibrator type twin horns. Operated by horn relay. Horn current 20 amperes (both).
Horn Relay:—R.B.M. Model 10072. Contacts close at 4 volts maximum across winding with relay inverted.
Current Draw—.4-.55 amperes at 6.0 volts.
Coil Resistance –11-14 ohms.

SERIAL NUMBER:—On plate on front of dash.

COMPRESSION:—Ratio—6.38-1 Std. aluminum head.
Pressure—138 lbs. at 1000 R.P.M. or 105-110 lbs. at cranking speed of 100 R.P.M.

VACUUM READING:—18-20" steady reading with engine idling at 5-7 M.P.H.

IGNITION:—Coil Model CE-4001-L. Two coil unit mounted on dash above distributor.
Ignition Current—1.5 amperes idling, 5 amperes stopped for each coil.
Ignition Switch:—Oakes Hershey co-incidental ignition switch and steering post lock.
Distributor Model IGM-4003, IGM-4003A (export). Double breaker, 6 lobe cam, full automatic advance type.
Firing Interval—Alternate opening at 33½ and 26½° intervals corresponding to unequal 67 and 53° firing intervals of engine. Contacts must be synchronized. See Timing.
Breaker Gap—Set at .020" (both sets equal).
Cam Angle or Dwell—36° closed, 24° open. Each set operates independently.
Breaker Arm Spring Tension—14-16 ounces.
Condenser—Part No. IG-2671A, IG-2671E (one each).
Condenser Capacity—.20-.25 mfd.

Automatic Advance—IGM-4003

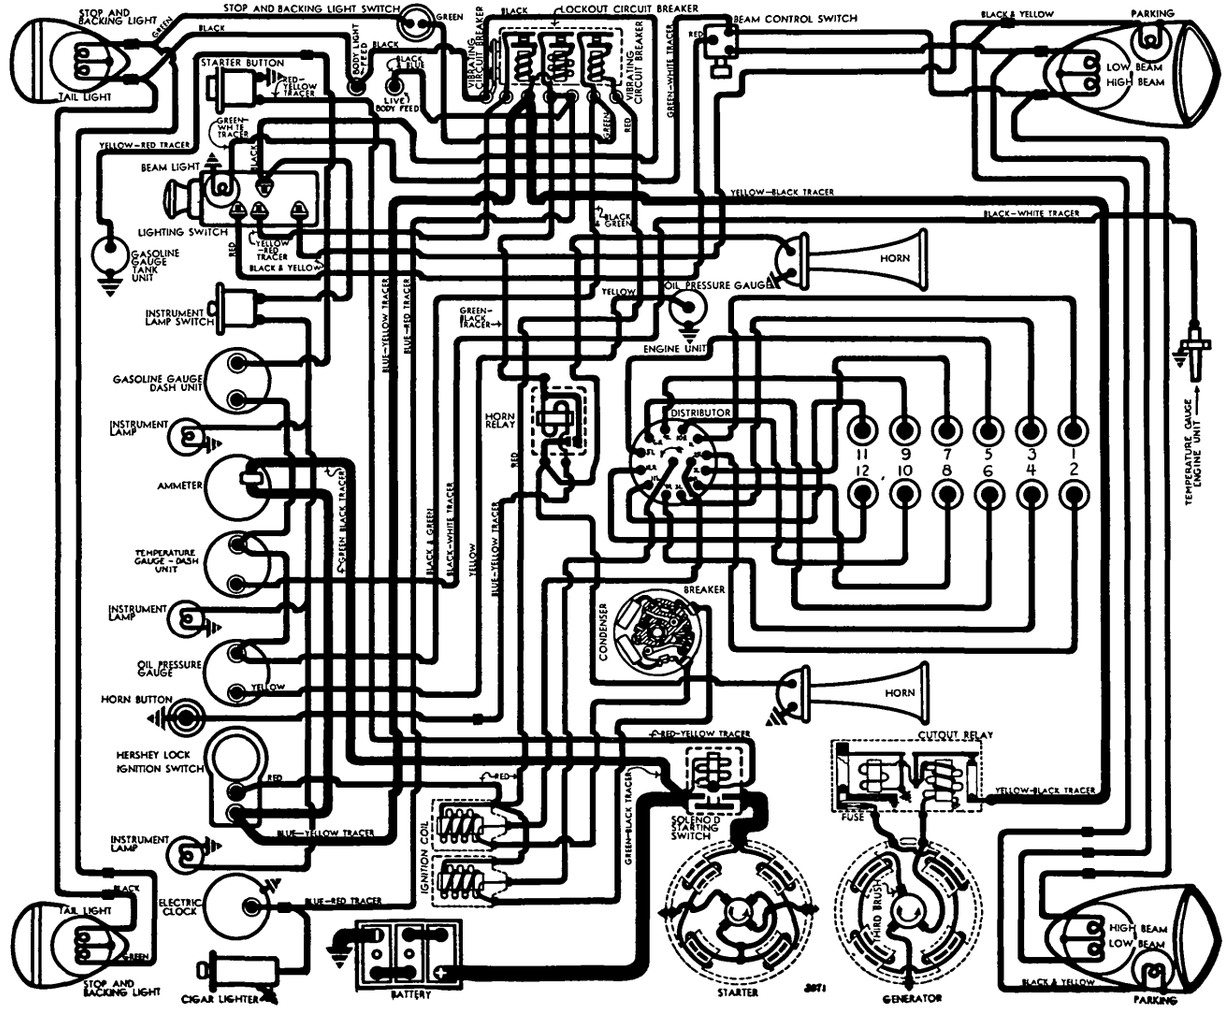
8	1140	16	2280
10	1500	20	3000
12	1840	24	3680

Removal:—Distributor mounted between banks at rear of engine. To remove, take off distributor conduits and cap, take out hold-down screws in advance arm.

IGNITION TIMING:— **Flywheel Degrees** **Piston Pos.**
All engines ..... At TDC ..... .000" TDC.
NOTE—Right hand (stationary) contacts control right coil and fire spark plugs in right cylinder bank. Left hand (movable) contacts control left coil and fire plugs in left bank.
Timing (Stationary Contacts)—With #2 piston (front cylinder, right bank) on top dead center entering power stroke and flywheel mark 'D2/12C' at indicator in inspection hole in right top face of flywheel housing, loosen taper lockscrew in center of breaker cam, carefully locate cam so that right hand (stationary) contacts are beginning to open, tighten lockscrew. Then synchronize movable contacts.
Synchronization (Movable Contacts)—Turn engine over 67° to firing position of piston #1 (front cylinder, left bank), stop with piston on top dead center when flywheel mark 'D1/11C' lines up with indicator. Loosen lockscrews on movable subplate, shift plate by turning eccentric adjusting screw until movable contacts begin to open, tighten lockscrews.
Synchronization (Other methods)—If distributor synchronized on rotary spark gap or other types of equipment, set movable contacts to open 33½° after stationary contacts. Firing intervals unequal 33½-26½-33½ distributor degrees.
Motor Gauge—Weidenhoff #113 Adapter, #37 Rod.



Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as indicated on diagram. Spark plugs not connected in this order on distributor cap.

Spark Plugs:—Champion Type 7. 18 MM. Metric.
Spark Plug Gaps—.025".

CARBURETION:—Carburetor—Stromberg Model EE-22, 1.437" (1 7/16") dual downdraft type.
See article in Carburetion Section for data.

Idle Adjustment—Warm up engine before adjusting. Manufacturer recommends use of vacuum gauge and adjustment of idle adjusting screws for highest steady vacuum. If vacuum gauge not used, adjust throttle stopscrew for 5-7 M.P.H. idling speed, cut out one bank of cylinders by disconnecting coil primary lead, adjust idling adjusting screw for carburetor barrel feeding the other bank by turning screw in until engine begins to miss and then out until engine fires smoothly. Reconnect coil, disconnect second coil and repeat adjustment for other idle adjusting screw. Idle engine for all 12 cylinders and readjust throttle stopscrew for correct idling speed.

Idling adjustment can also be made by turning one idling adjusting screw in until it is seated and then adjusting the second idling adjusting screw as directed above. The first adjusting screw should then be turned out slowly until engine fires evenly on all 12 cylinders.

Accelerating Pump Adjustment—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:
Inner Hole—Minimum stroke—Summer setting.
Outer Hole—Maximum stroke—Winter setting.

Air Cleaner:—AC. #1528347 oil-wetted type Std.

Fuel Pump:—AC. Type I #1521218 Diaphragm type combination fuel-and-vacuum pump.

See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric. K-S No. 6250, Lincoln No. K-13099D (dash unit), K-S No. 5850, Lincoln No. H9275 (tank unit—Lincoln No. stamped on case).

See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—No flywheel marks provided. Intake valve for cylinder #2 open with piston 21° or .1768" before top dead center when point on flywheel approximately 6.77 teeth before top dead center mark 'D2/12C' lines up with indicator in inspection hole in right top face of housing.
Motor Gauge—Weidenhoff Adapter #113, Rod #37.

Tappet Clearance:—None in service (hydraulic tappet take-up used).

See article in Mechanical Equipment Section.

Valve Spring Pressure:—55-60 lbs. at 2.687" (valve closed), 130-140 lbs. at 2.343" (valve open).

LUBRICATION:—Crankcase Capacity—12 qts. (refill).
Normal Oil Pressure—40 lbs. at 50 M.P.H.

BATTERY:—Exide, Type X-21-L. 6 volt, 21 plate, 147 ampere hour capacity (20 hour rate).
Starting Capacity—175 amperes for 20 minutes.
Zero Capacity—300 amperes for 6.1 minutes.
Grounded Terminal—Negative (—) terminal.
Location—On right side under front floor.

STARTER:—Model MAO-4003-B, MAO-4004B Export Armature No. MAB-2006.
Drive—Outboard Bendix Type RB10FXXTD.
Cranking Engine—100 R.P.M., 150-200 amperes at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-32 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-27 ounces.
Field Current—2.47-2.73 amperes at 6.0 volts.
Field Fuse—5 ampere in cup on regulator.
Motoring Current—4.46-4.94 amperes at 6.0 volts.

Removal:—Generator flange mounted on right rear face of timing chain case. Water pump and oil temperature regulator mounted on commutator end of generator. To remove, drain radiator, disconnect hose couplings and oil leads, remove water pump (optional). Take out 3 capscrews in generator mounting flange, pull generator to rear to disengage drive coupling. Do not disturb intermediate plate carrying drive sprocket or timing chain automatic idler sprocket setting will be lost requiring resetting.

RELAY - REGULATOR:—Model TC-4302A, TC-4305-A (Export). Mounted on generator. Consists of Cutout Relay and Current Regulator (two-rate charge control).
See article in Electrical Equipment Section.

Cutout Relay
Cuts In—6.5-7.25 volts, 10 M.P.H.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.025-.040".
Air Gap—.010-.030" with contacts closed.

Current Regulator
Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Hall, Pre-focused type. Upper and lower beams controlled by foot selector switch on toeboard.
Adjustment—Aim headlamps straight ahead with top of upper beam 37" (lamp bulb height) above floor at 25 feet. Adjusting screws located on reflector flange and lense must be removed. Make final check with lenses in place.
Beam Indicator—Located in light switch button. Lighted whenever upper beams are lighted.

Switches
Lighting—R.B.M. No. 2400.
Foot Selector—R.B.M. No. 2450.
Luggage Compartment Light—R.B.M. No. 1260.
Door Switch—R.B.M. No. 1550.

CIRCUIT BREAKER:—R.B.M. Model 1630. Consists of two vibrating and one lock-out circuit breaker in case on dash (see diagram for circuits controlled by each unit.
Performance—Begin to operate with load of 35-40 amperes, limiting load to 15 amperes maximum with dead short-circuit across terminals.
Contact Spring Tension—5 ounces minimum.

FUSES:—Generator Field—5 ampere in cup on regulator.

HORNS:—Sparton. Vibrator type twin horns. Operated by horn relay. Horn current 11-13 amperes each.
Horn Relay:—R.B.M. Model 10072. Contacts close at 4 volts maximum across winding with relay inverted.
Current Draw—.4-.55 amperes at 6.0 volts.
Coil Resistance—11-14 ohms.

SERIAL NUMBER:—Same as engine number. Stamped on top of clutch housing and on left side of front frame cross member (on frame channel on first cars). First number—H-1.

COMPRESSION:—**Ratio**—6.7-1 Std. aluminum head. **Pressure**—105 lbs. at cranking speed of 100 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 5 M.P.H.

IGNITION:—**Part No. H-12000 (Complete Ignition Unit).** Mounted on front of gear case and driven through tongue-and-slot coupling from camshaft.

Ignition Coil Part No. H-12004. Two coil unit mounted on top of ignition unit (one coil for each bank).

Ignition Current—3.2 amperes idling, 4.2 stopped.

Ignition Resistance—Mounted on lighting circuit breaker. One resistance unit connected in each coil primary circuit. Resistance per unit .325-.375 ohms at 68° F.

Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock.

Distributor Model H-12000. Double breaker, 6 lobe cam, full automatic advance type with Vacuum Brake Control (see Ignition Setting for adjustment). Right hand contacts (movable or adjustable set) control right hand coil and fire spark plugs in right cylinder bank. Left hand contacts (fixed set) control left hand coil and fire plugs in left bank. Contacts open alternately at 37½ and 22½ degree intervals corresponding to 75 and 45 degree engine firing intervals (caused by 75° angle between banks) and must be synchronized (see Ignition Timing).

Breaker Gap—.014-.016" (both sets). Adjusted by loosening lockscrew and turning eccentric adjusting screw on stationary contact mounting bracket. Accessible through terminal plate opening after plates removed.

NOTE—New two-step feeler blade marked '014-.016"' can be added to Ford BV-45 Feeler Gauge Set and used as 'Go'—'No Go' gauge in setting gaps.

Cam Angle or Dwell—36.5° closed, 23.5° open. Each set operating independently.

Breaker Arm Spring Tension—20-24 ounces.

Condenser—Part No. H-12300 (2 used). Capacity .30-.34 mfd.

Automatic Advance
(High Vacuum—Vacuum Brake Inoperative)

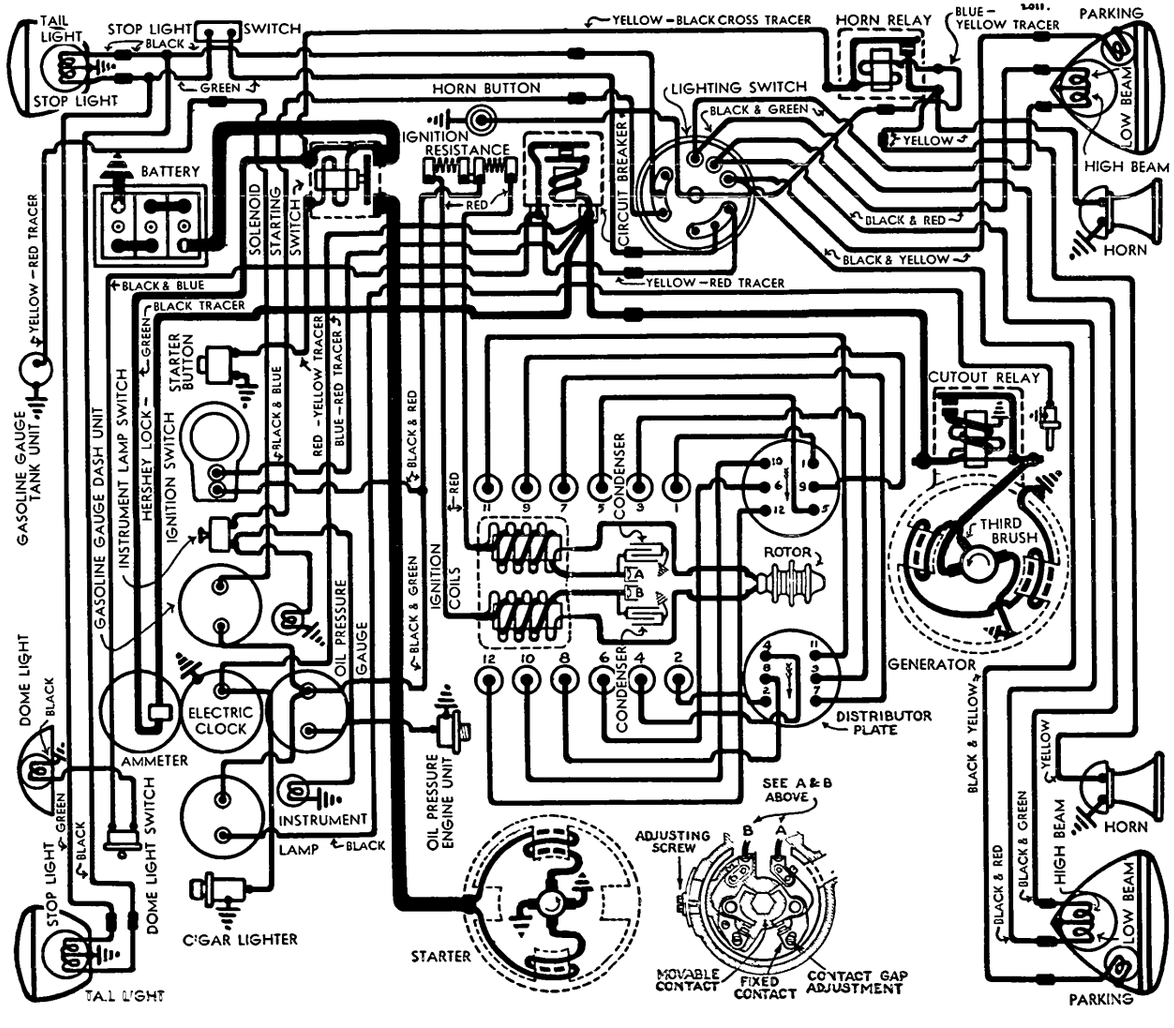
Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
2	300	4	600
3	375	6	750
4	480	8	960
6	720	12	1440
8	950	16	1900

Distributor Removal:—At front of engine. To remove, disconnect vacuum line, take out 3 capscrews in mounting flange.

IGNITION TIMING:—See Vacuum Brake Sec. below.

	Flywheel Degrees	Piston Position
All Engines	4° BTDC	.0058" BTDC.

NOTE—Movable contacts should be synchronized when ignition is set and Timing Fixture V-126 must be used for this purpose. Manufacturer recommends use of this fixture for both synchronization and timing. V-126 fixture (Ford) modified for use on Zephyr by addition of correct timing marks on edge of disc.



Timing (Fixed Set—on V126 Fixture)—Mount ignition unit on fixture, check contact gap and breaker arm spring tension, rotate disc in direction of arrow (counter-clockwise) until hole lines up with locking plunger, clip timing light lead to left hand coil terminal, loosen adjusting screw on side of ignition unit housing, move screw down (away from coil) to bottom of slot, then move screw up slowly until timing light goes out, tighten screw. Check by rotating disc one full revolution, stop when timing mark on outer edge of disc lines up with pointer on fixture. Contacts should open at this point.

Synchronization (Movable Set—on V-126 Fixture) Clip timing light lead to right hand coil, rotate disc counter-clockwise until next mark on edge of disc lines up with pointer. If timing light does not go out at this point, remove adjusting screw and graduated plate on side of housing, turn eccentric adjusting screw in slot clockwise to advance or counter-clockwise to retard spark until movable contacts begin to open and timing light goes out. Readjust breaker point gap (changed by synchronizing adjustment), repeat test.

Timing (On Engine)—With #1 piston on top dead center, loosen adjusting screw on side of ignition unit housing, move screw down to bottom of slot, then move screw up slowly until left hand (fixed) contacts begin to open. Note graduation on plate under screw head in line with reference mark on housing, move screw up exactly one additional graduation, tighten screw. This will provide correct 4° BTDC. setting. No means provided to synchronize contacts on engine (use V-126 fixture).

Motor Gauge—Weidenhoff Adapter #114, Rod #40.

Vacuum Brake Setting:—Vacuum Brake should be adjusted for best performance with particular fuel and operating conditions. To adjust, loosen locknut, back off adjusting screw until engine 'pings' under load, turn up adjusting screw just enough to elimi-

nate ping, tighten locknut. With correct adjustment and no vacuum to release plunger, automatic advance starts at 850 R.P.M. (engine).

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as shown on diagram.

Spark Plugs:—Champion Type J-9. 14 MM. Metric.

Spark Plug Gaps—.025".

CARBURETION:—Carburetor—Stromberg Model EE-1. 31/32" dual, downdraft type. See Carburetion Section for complete adjustment, overhaul and Jet Specifications.

NOTE—Do not adjust carburetor until engine is warmed up and idling at hot or slow idling speed with choke valve wide open.

Idle Adjustment—Manufacturer recommends use of Vacuum Gauge and adjustment of idling screws for highest vacuum reading. If vacuum gauge is not used, set throttle stopscrew for 5 M.P.H. idling speed, turn each idle adjusting screw (in succession) in until engine begins to miss, out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump—Not adjustable.

Fast Idle:—Integral with carburetor and operative with choke valve closed. No adjustment required.

Air Cleaner:—AC. #1526761 oil-wetted type standard. Heavy duty oil-bath type optional.

Fuel Pump:—AC. Type R #1521764 Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—King-Seeley Electric. K-S No. 5766 (dash unit), 5850 (tank unit). Units identified by figure 'G' stamped on edge (dash unit), and by stamped number 'Lincoln H-9275' (tank unit). See article in Carburetion Section.

VALVE TIMING:—To Check Timing—No flywheel marks or other means provided to check timing. If top dead center position for piston #2 established on flywheel, intake opening point for this cylinder will be approximately 6 2/3 teeth before this point with piston .1268" before top dead center.

Motor Gauge—Weidenhoff Adapter #114, Rod #40.

Tappet Clearance:—.0125-.0135" all valves. No adjustment.

Valve Spring Pressure:—32-36 lbs. at 2.13" (valve closed), 62-66 lbs. at 1.84" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts.
Normal Oil Pressure—30 lbs .at 35 M.P.H.

BATTERY:—Ford No. 40-10655-C. 6 volt, 17 plate, 96 ampere hour capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under left front seat.

STARTER:—Ford No. 18-11002. Armature No. 18-11005.
Drive—Inboard Bendix Type L11FX-10.
Cranking Engine—100 R.P.M., 225 amps. at 4.75 vs.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—2 lbs. each.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch:—Part No. H-11450-A. Magnetic type mounted on engine side of dash and controlled by pushbutton on instrument panel.

Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, take out two through bolts on commutator endplate, remove starter from below.

GENERATOR:—Part No. 68-10000-A or B (Std.), 68-10000-HA or HB (Radio). Armature No. 68-10005. Air-cooled. Third brush control type in conjunction with Two Rate Relay (voltage regulator) on 68-10000-HA, HB only.
NOTE—Pulleys used on these generators vary according to service requirements as given below:

Generator	Pulley Diameter
68-10000-A, HA	4.2"
68-10000-B, HB	3.4"

Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand counter-clockwise (down) to increase or clockwise to decrease charging rate. Brush held in position by friction.

Standard Charging Rate Setting—(68-10000-A, B) 18 amperes hot at 6.75 volts reached at 1650 R.P.M. or 27.5 M.P.H. 68-10000-A), 22.2 M.P.H. (68-10000-B). **(68-10000-HA, HB)** 31.6 amperes hot at 7.7 volts reached at 2000 R.P.M. or 33 M.P.H. (68-10000-HA), 27 M.P.H. (68-10000-HB).

Performance Data

Models 68-10000-A, B—Generator Hot

Amperes	Volts	R.P.M.
0	6.2	660
5	6.45	865
10	6.6	1110
14	6.65	1315
18	6.75	1650
20.4	6.8	2775

Models 68-10000-HA HB—Generator Hot

0	6.2	660
5	6.4	790
10	6.55	900
15	6.7	1030
20	6.95	1180
25	7.3	1400
30	7.6	1800
31.6	7.7	2000

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—26-28 ozs.
Field Current—4.4 amperes at 6.45 volts (maximum) at 1300-1500 R.P.M. of generator (68-10000-A, B), 3.65 amperes at 5.6 volts (maximum) at 1050 R.P.M. of generator (68-10000-HA, HB).

Removal:—Generator mounted on bracket between cylinder banks at front of engine. Driven by fan belt in tandem with two water pumps. To remove, take out support bolts in bracket under generator.

Belt Adjustment:—Loosen support bolts, raise generator until total sideplay on belt midway between water pump and generator pulleys is ¾-1", tighten support bolts.

CUTOUT RELAY:—Part No. B-10505. Mounted on generator field frame. Generator field lead (black wire) grounded to relay mounting screw on generator.
Cuts In—7 volts, 10 M.P.H.
Cuts Out—3 ampere maximum discharge.
Contact Gap—.015-.020".
Air Gap—.010-.015" with contacts closed.

RELAY-REGULATOR:—Part No. 68-10505 (68-10000-HA, HB Generators). Cutout relay and voltage regulator (two-rate relay) in case on generator. See article in Equipment Section on these units.

Cutout Relay—Specifications same as B-10505 above.

Regulator—Contacts open at 8.5 volts reducing charging rate to approximately 20% of high rate, and remain open until cutout relay contacts open.

LIGHTING:—Headlamps—Headlamps aimed straight ahead (adjust with lenses removed, check with lenses in place). Upper and lower beams controlled by light switch handle on steering wheel. Bulbs are pre-focused type.

Switches

Lighting—R.B.M. Model H-11654.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Parking	1½	55
Instrument, Dome	6	81
Stop and Tail	21-3	1158

CIRCUIT BREAKER:—R.B.M. Model 1640, Ford Part No H-11624. Vibrating type circuit breaker mounted on dash. Connected in lighting circuits. Begins to operate with load of 52-54 amperes limiting load to 15 amperes.

HORNS:—Sparton Vibrator type twin horns operated by horn relay.

Horn Relay:—R.B.M. Model 10072. Contacts close with terminal voltage of 4.0 volts maximum with relay inverted.

Current Draw—.40-.55 amperes at 6.0 volts.

Coil Resistance—11-14 ohms.

NOTE:—Engine hood hinged at cowl and lifts at forward end. Turn radiator ornament to free latch.

SERIAL NUMBER:—Same as engine number. Stamped on top of clutch housing and on left side of front cross member.

COMPRESSION:—Ratio—6.7-1 Std. No Optl. ratios. **Pressure**—105 lbs. at cranking speed of 100 R.P.M.

VACUUM READING:—18-20" steady reading with engine idling at 5 M.P.H.

IGNITION:—Part No. H-12000 (Complete Ignition Unit). Mounted on front of gear case and driven through tongue-and-slot coupling from camshaft.

Ignition Coil Part No. H-12024. Two coil unit mounted on top of ignition unit (one coil for each bank).

Ignition Current—3.2 amperes idling, 4.2 stopped.

Ignition Resistance—Mounted on lighting circuit breaker. One resistance unit connected in each coil primary circuit. Resistance per unit .325-.375 ohms at 68° F.

Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock.

Distributor Model H-12000. Double breaker, 6 lobe cam, full automatic advance type with Vacuum Brake Control (see Ignition Setting for adjustment). Right hand contacts (movable or adjustable set) control right hand coil and fire spark plugs in right cylinder bank. Left hand contacts (fixed set) control left hand coil and fire plugs in left bank. Contacts open alternately at 37½ and 22½ degree intervals corresponding to 75 and 45 degree engine firing intervals (caused by 75° angle between banks) and must be synchronized (see Ignition Timing).

Breaker Gap—.014-.016" (both sets). Use special two-step feeler to check gap. First step (.014") 'Go', second step (.016") 'No Go'.

Cam Angle or Dwell—36.5° closed, 23.5° open. Each set operating independently.

Breaker Arm Spring Tension—20-24 ounces.

Condenser—Part No. H-12300 (2 used). Capacity .30-.34 mfd.

Automatic Advance
(High Vacuum—Vacuum Brake Inoperative)

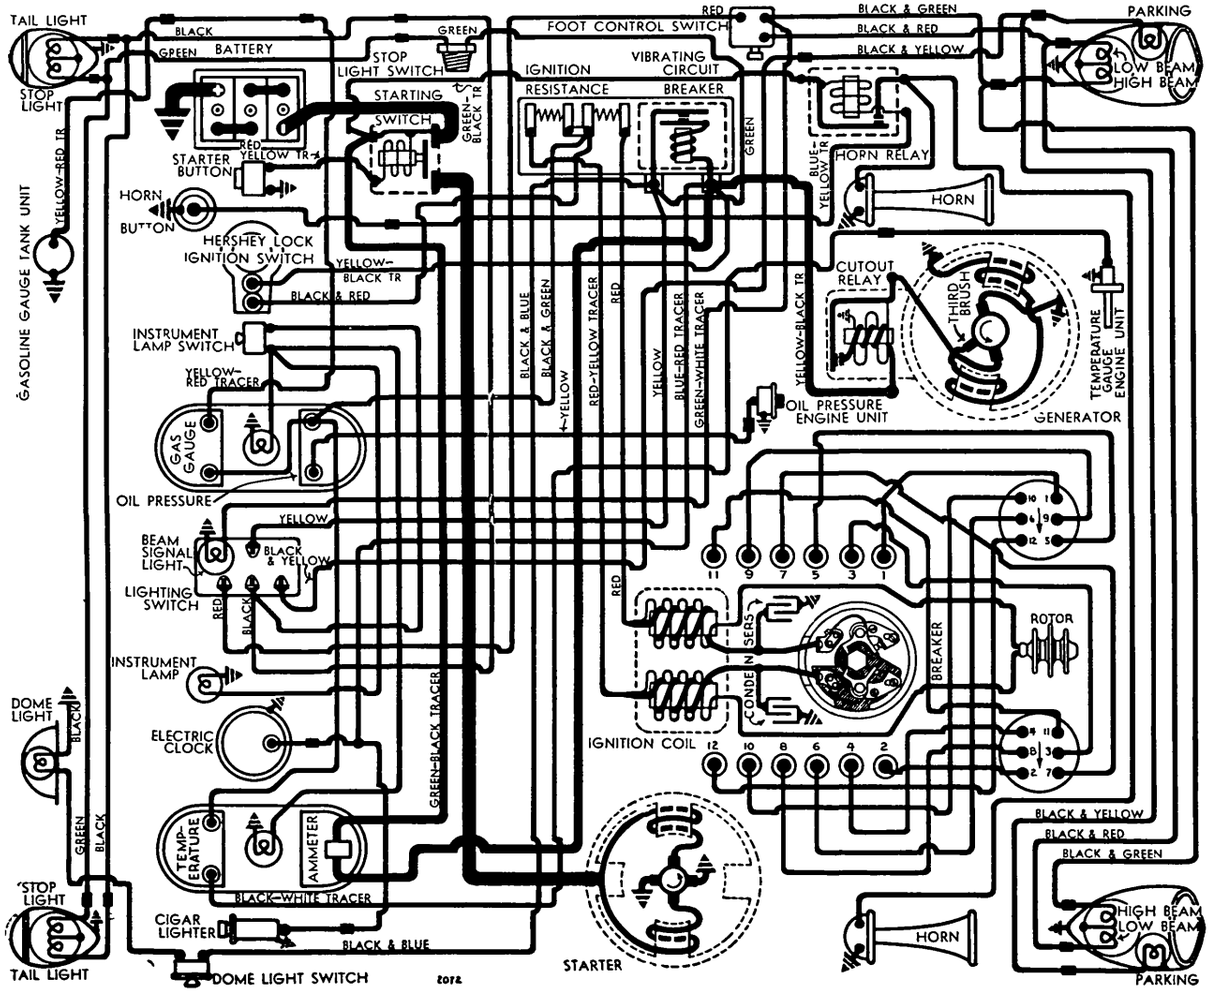
Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	200	0	400
2	300	4	600
3	375	6	750
4	480	8	960
6	720	12	1440
8	950	16	1900

Distributor Removal:—At front of engine. To remove, disconnect vacuum line, take out 3 capscrews in mounting flange.

IGNITION TIMING:—See Vacuum Brake Sec. below.

	Flywheel Degrees	Piston Position
All Engines	4° BTDC	.0058" BTDC.

NOTE—Movable contacts should be synchronized when ignition is set and Timing Fixture V-126 must be used for this purpose. Manufacturer recommends use of this fixture for both synchronization and timing. V-126 fixture (Ford) modified for use on Zephyr by addition of correct timing marks on edge of disc.



Timing (Fixed Set—on V126 Fixture)—Mount ignition unit on fixture, check contact gap and breaker arm spring tension, rotate disc in direction of arrow (counter-clockwise) until hole lines up with locking plunger, clip timing light lead to left hand coil terminal, loosen adjusting screw on side of ignition unit housing, move screw down (away from coil) to bottom of slot, then move screw up slowly until timing light goes out, tighten screw. Check by rotating disc one full revolution, stop when timing mark on outer edge of disc lines up with pointer on fixture. Contacts should open at this point.

Synchronization (Movable Set—on V-126 Fixture) Clip timing light lead to right hand coil, rotate disc counter-clockwise until next mark on edge of disc lines up with pointer. If timing light does not go out at this point, remove adjusting screw and graduated plate on side of housing, turn eccentric adjusting screw in slot clockwise to advance or counter-clockwise to retard spark until movable contacts begin to open and timing light goes out. Readjust breaker point gap (changed by synchronizing adjustment), repeat test.

Timing (On Engine)—With #1 piston on top dead center, loosen adjusting screw on side of ignition unit housing, move screw down to bottom of slot, then move screw up slowly until left hand (fixed) contacts begin to open. Note graduation on plate under screw head in line with reference mark on housing, move screw up exactly one additional graduation, tighten screw. This will provide correct 4° BTDC. setting. No means provided to synchronize contacts on engine (use V-126 fixture).

Motor Gauge—Weidenhoff Adapter #114, Rod #40.

Vacuum Brake Setting:—Vacuum Brake should be adjusted for best performance with particular fuel and operating conditions. To adjust, loosen locknut, back off adjusting screw until engine 'pings' under load, turn up adjusting screw just enough to eliminate ping, tighten locknut. With correct adjustment and no vacuum to release plunger, automatic advance starts at 850 R.P.M. (engine).

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as shown on diagram.

Spark Plugs:—Champion Type J-9. 14 MM. Metric.

Spark Plug Gaps—.028-.030".

CARBURETION:—Carburetor—Stromberg Model EE-1, 31/32" dual, downdraft type.

See article in Carburetion Section for data.

Idle Adjustment—Engine must be warm and idling at hot or slow idling speed. Manufacturer recommends use of Vacuum Gauge and adjustment of idling screws for highest vacuum reading. If vacuum gauge is not used, set throttle stopscrew for 5 M.P.H. idling speed, turn each idle adjusting screw (in succession) in until engine begins to miss, out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump—Not adjustable.

Fast Idle:—Integral with carburetor and operative with choke valve closed. No adjustment required.

Air Cleaner:—AC. #1528239 oil-wetted type Std. Heavy duty oil-bath type optional.

Fuel Pump:—AC. Type R #1523307. Diaphragm type.

See article in Carburetion Equipment Section.

Gasoline Gauge:—King-Seeley Electric. Ford No. HB-9280 (dash unit, first 5500 cars, black markings on dial), HB-9280B (dash unit, after first 5500, brown markings), H9275 (tank unit—no. stamped on case).

See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing:—No flywheel marks or other means provided to check timing. If top dead center position for piston #2 established on flywheel, intake opening point for this cylinder will be approximately 6 2/3 teeth before this point with piston .1268" before top dead center.

Motor Gauge—Weidenhoff Adapter #114, Rod #40.

Tappet Clearance:—.0125-.0135" all valves. No adjustment.

Valve Spring Pressure:—32-36 lbs. at 2.13" (valve closed), 62-66 lbs. at 1.84" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts.

Normal Oil Pressure—30 lbs. at 55 M.P.H.

BATTERY:—Ford. Part No. 78-10655-A. 6 volt, 17 plate, 100 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.3 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under left front seat.

STARTER:—Ford No. 18-11002. Armature No. 18-11005.

Drive—Inboard Bendix No. L11FX-10. Ford No. B-11350.

Cranking Engine—110 R.P.M., 225 amps., 4.75 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—2 lbs. each.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch:—R.B.M. No. 2295, Ford No. H-11450-A. Pushbutton R.B.M. No. 3224. Magnetic type switch mounted on engine side of dash and controlled by pushbutton on instrument panel.

Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, take out two through bolts on commutator endplate, remove starter from below.

GENERATOR:—Part No. 78-10000. Armature 78-10005. Third brush control type. Two-rate Relay (charge regulator) optional equipment. Ventilated by fan on drive pulley.

Maximum Charging Rate—26 amperes maximum (hot), reached at 30 M.P.H.

NOTE—When regulator installed, charging rate must not be set for less than 20 amperes.

Charging Rate Adjustment—Remove commutator cover band, shift third brush counter-clockwise (down) to increase, or clockwise to decrease charging rate. Third brush held in position by friction.

Performance Data

Amperes	Volts	R.P.M.
0	6.2	660
5	6.4	790
10	6.55	900
15	6.7	1030
20	6.95	1180
25	7.3	1400
30	7.6	1800
31.6	7.7	2000

Rotation—Counter-clockwise at commutator end.

Field Current—3.65 amperes at 5.6 volts (maximum) at 1050 R.P.M. of generator.

Removal:—Generator mounted between cylinder banks at front of engine. Driven by Vee belt in tandem with two water pumps. To remove, take out support bolt in bracket under generator.

Belt Adjustment:—Loosen generator support bolt, raise generator until total sideplay on belt midway between generator and water pump pulleys is ¾-1".

RELAY-REGULATOR:—Part No. 68-10505 (Std. Equip.). Cutout Relay and Voltage Regulator (two-rate relay) in case on generator. See special article in Electrical Equipment Section for complete data.

Cutout Relay

Cuts In—7 volts, 10 M.P.H.

Cuts Out—3 ampere maximum discharge.

Contact Gap—.015-.020".

Air Gap—.010-.015" with contacts closed.

Regulator

Regulator—Contacts open at 8.5 volts reducing charging rate to approximately 50% of high rate, and remain open until cutout relay contacts open.

LIGHTING:—Headlamps—Hall, Pre-focused type. Upper and lower beams controlled by Foot Selector switch on toeboard.

Adjustment—Aim headlamps straight ahead with top of beam 33" (lamp bulb height) above floor at 25 feet. Adjusting screws located in reflector flange (lense must be removed). Make final check with lenses in place.

Beam Indicator—Located in switch button. Lighted whenever upper or driving beam is lighted.

Switches

Lighting—R.B.M. No. 2400.

Foot Selector—R.B.M. No. 1092.

Dome Light—R.B.M. No. 1200A.

Compartment Light—R.B.M. No. 2365.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Parking	1½	55
Indicator	1	51
Instrument, Dome	6	81
Stop & Tail	21-3	1158

CIRCUIT BREAKER:—R.B.M. Model 1640, Ford Part No. H-11624. Vibrating type circuit breaker mounted on dash. Connected in lighting circuits. Begins to operate with load of 52-54 amperes limiting load to 15 amperes.

HORNS:—Sparton. Air-Electric type twin horns operated by horn relay. Horn current 11-13 amperes each.

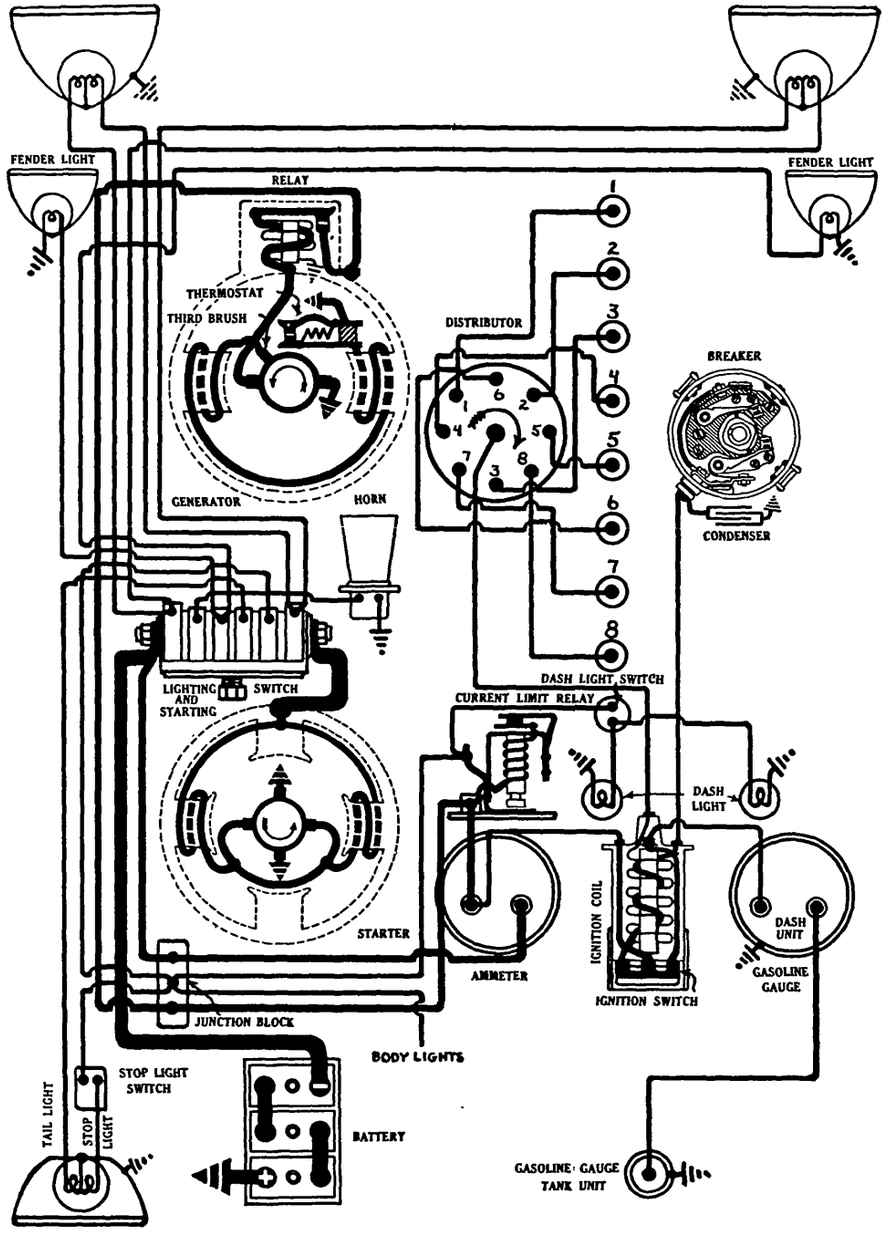
Horn Relay:—R.B.M. Model 10072. Contacts close with terminal voltage of 4.0 volts max. (relay inverted).
Current Draw—.40-.55 amperes at 6.0 volts.
Coil Resistance—11-14 ohms.

MARMON

MODEL 70 (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—National, Type H3-15X, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 120 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Battery is mounted on the left frame member under the driver's seat.

IGNITION:—Coil Model 528-K. The ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 2.5 amperes at 6 volts with engine running and 4.7 amperes at 6 volts with engine stopped.



Distributor Model 652-D. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until gap is .022 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 20 ounces. Distributor is semi-automatic. Maximum manual advance is 25 degrees. Automatic advance begins at 900 R.P.M. of engine. Maximum automatic advance is 20 degrees reached at5100 R.P.M. of engine. Manual advance is controlled by a button on the dash and distributor is designed to operate with the spark control button in the fully advanced position. Pulling out the button provides an auxiliary retard for starting. Breaker has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized to secure this firing interval for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head and can be removed from the right side. To remove distributor, disconnect primary lead and spark control wire and remove distributor head with cables intact. Then take out stop screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one full turn every month or each 750 miles. Every 1000 miles remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam.

Timing:—Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position 7°30′ or two teeth (on the flywheel) before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Place spark control button in the fully advanced position (pushed all the way in toward the dash) and see that distributor is turned counter-clockwise to the full limit of the advance arm slot. Continue to crank engine over until the top dead center mark 'D.C' is two teeth before the indicator on the flywheel case. Then loosen advance arm clamp screw and rotate distributor until the first set of contacts mounted on the base plate begin to open. Tighten the clamp screw and see that the segment in the distributor head directly opposite the rotor is connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 6-2-5-8-3-7-4 clockwise around the distributor head.

Synchronization of Contacts. Full directions for synchronization of contacts and use of the special Delco-Remy tool, Part No. 820738, are given in the Equipment Section. Contacts can be synchronized without special equip-

MARMON

MODEL 70 (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

ment after distributor has been timed to the engine by cranking engine over exactly 90 degrees when piston No. 6 will reach firing position (two teeth on the flywheel before top dead center). If the second set of contacts do not open at this point, loosen the two lock screws on the movable subplate and turn the eccentric adjusting screw until contacts open. Tighten the lock screws and check the contact gap with the breaker arm on the lobe of the cam. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18 MM. Metric. Short. Gaps are .027-.028 inch.

VALVE TIMING:—INLET VALVES: Head diameter, 1 15/32 inches. Stem diameter, .3095 inch. Stem length, 4 57/64 inches. Valve lift, 21/64 inch. Spring pressure, 43 pounds (valve closed) and 80 pounds (valve open). Tappet clearance, .008 inch (hot). Inlet valves open 6 degrees before top dead center and close 40 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 11/32 inches. Stem diameter, .3085 inch. Stem length, 4 57/64 inches. Valve lift, 21/64 inch. Spring pressure, 43 pounds (valve closed) and 80 pounds (valve open). Tappet clearance, .008 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 6 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—Model 714-C. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces. Starter switch is combined with the lighting switch at the lower end of the steering column.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at the left of the engine on the forward side of the flywheel housing. To remove starter, disconnect cable and take out flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 750 miles. The drive end bearing is oilless.

GENERATOR:—Model 949-X. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 162°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the outside of the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting maximum charging rate is 9-12 amperes (hot) reached at 2000 R.P.M. or 30 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
21	8.5	1550	12	7.5	2000

Brush spring tension is 14-18 ounces. Shunt field current is 4-6.1 amperes at 6 volts. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator is mounted by special swinging bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen mounting clamp bolt. Swing generator toward engine and slip off drive belt. Then take out two bolts mounting generator on bracket and lift generator from place.

Fan Belt Adjustment. The fan belt is adjusted by shifting the generator To adjust belt tension, loosen the adjustment clamp bolt and swing generator out from engine until correct belt tension is secured. Tighten the clamp bolt. The belt should have sufficient tension to drive generator and fan without slipping. Any excessive tension will cause wear in the generator bearings.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 750 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 575 R.P.M. or 8 M.P.H. when the generator voltage reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .012-.017 inch with contact closed.

LIGHTING:—Pines 'Finger Tip Control' Switch, Model A-808. Lighting switch is mounted at lower end of steering column. It incorporates the lighting switch, horn button and starting switch in a single unit controlled by a button on the steering wheel. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail light is 6-8 volt, 21-2 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light wire must be connected to the 2 cp. filament. Dome light is 6-8 volt, 3 cp. S.C. Mazda 63.

NOTE:—First cars may be found equipped with a Model 312 switch. This switch is shown on the Model 8-69 (1930) page.

CURRENT LIMIT RELAY:—Model 410-C. This device is a vibrating circuit breaker mounted on the dash. It is connected in the lighting circuits to protect them from overload and short-circuits. The circuit breaker begins to vibrate when the current reaches 25-30 amperes and continues limiting the current to 2-15 amperes. Contact gap is .012-.030 inch. Air gap is .015-.030 inch with contacts closed.

MARMON

MODEL 88 (1931), 8-125 (1932)
DELCO-REMY ELECTRICAL SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on left side of front compartment under carpet.

ENGINE NUMBER:—Stamped on boss on right side of engine near No. 1 exhaust port.

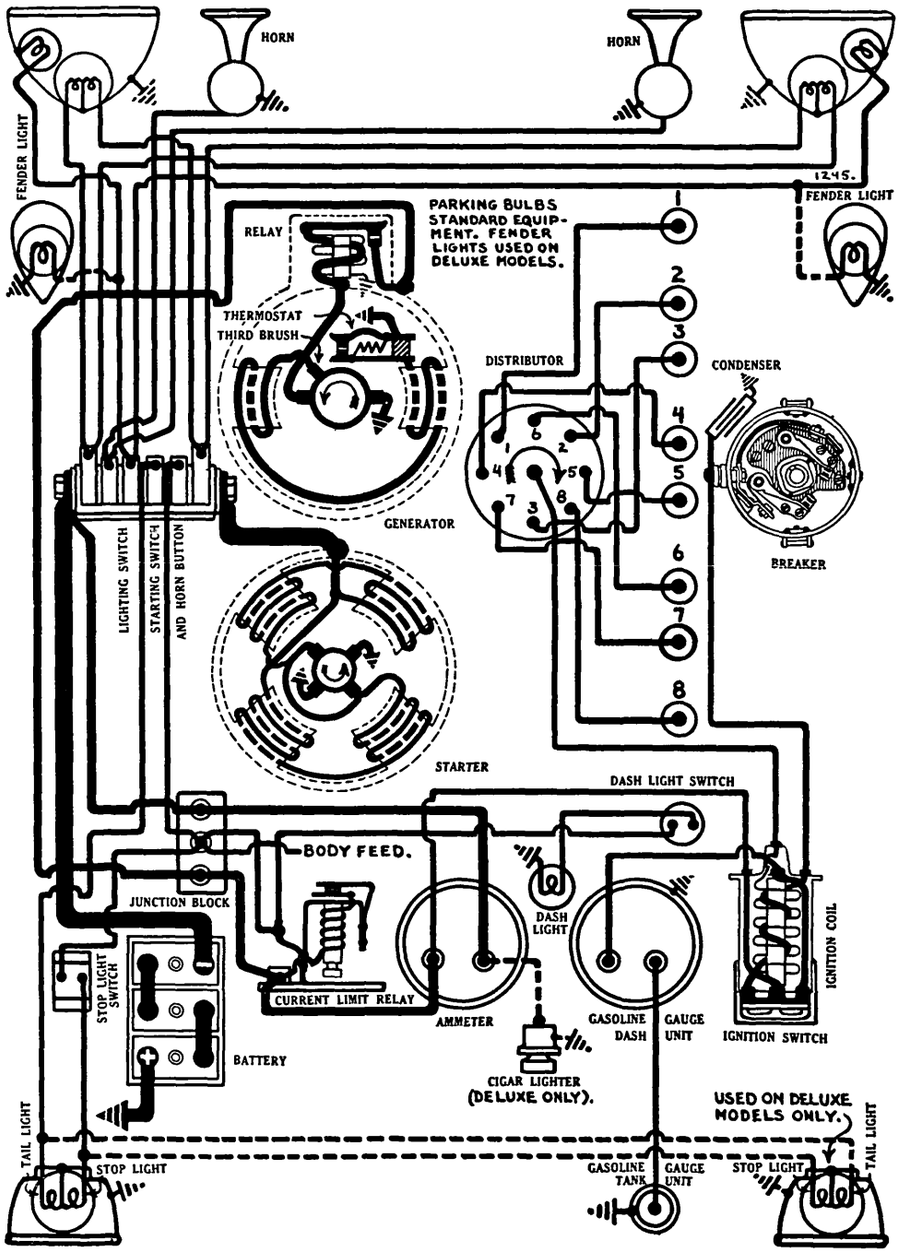
BATTERY:—**National, Type K-3-19XR,** 6 volt, 19 plates, 153 ampere hour capacity (20 hour rate). Positive (+) terminal grounded. Battery mounted on left frame member under front compartment floor boards. Battery size, 7⅛ inches wide, 13 3/16 inches long, 9 5/16 inches high.

IGNITION:—**Coil Model 526-P.** Lock coil type with ignition switch in base. Coil mounted on back of instrument board. Ignition current 2.5 amperes at 6 volts (engine running), 4.7 amperes at 6 volts (engine stopped).

Distributor Model 652-D. Two breaker 4-lobe cam type with semi-automatic advance. Contacts open alternately at 45 degree intervals corresponding to 90 degree firing interval of engine. Contacts must be synchronized (see Timing). Manual advance controlled by button on dash. Ordinary running position with button pushed in, spark fully advanced. Pull out button to retard spark. Breaker gap set at .022 inch. Hold within limits of .018-.024 inch. To set gap, loosen lock screw on stationary contact mounting plate, turn eccentric adjusting screw, tighten lock screw. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). Maximum manual advance 25 degrees (engine).

Cam Angles—Closed 34°. Open 11° (distributor) when synchronized.

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		450	2		900
10		2550	20		5100



Mounting:—Distributor mounted on cylinder head at left side. To remove, disconnect primary lead, take off distributor cap, loosen clamp bolt in advance arm, lift distributor out.

Oiling:—**750 Miles.** Turn down grease cup on side of shaft housing one full turn. Keep cup filled with medium cup grease.

1000 Miles. Take off distributor cap and rotor. Saturate wick oiler in center of shaft with light engine oil, put one drop oil on breaker arm pivot pins, apply thin film vaseline to face of breaker cam.

Timing:—Standard setting 6°40′ or two teeth on flywheel before top dead center with full manual advance. To set timing, first advance manual spark control button (push button in toward dash), see that distributor is rotated counter-clockwise as far as possible, take off cover plate on inspection hole in flywheel housing. With No. 1 piston on compression, turn engine over until a point on the flywheel two teeth before the top dead center mark 'D/C' is directly opposite indicator on housing. Loosen advance arm clamp bolt, rotate distributor until first set of contacts (mounted directly on breaker plate) begin to open (use test lamp), tighten clamp bolt, connect spark plugs as indicated on diagram.

Synchronization of Contacts. Synchronize contacts on rotary spark gap or use Delco-Remy tool, Part No. 820738, and follow complete directions in Equipment Section. It is possible to synchronize contacts as part of timing operation by cranking engine over 90 degrees or 27 flywheel teeth from No. 1 firing position to No. 6 firing position (no flywheel mark provided, so it will be necessary to count teeth). Then loosen lock screws, turn eccentric adjusting screw until second set of contacts (mounted on movable subplate) begin to open, tihten lock screws, check contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

MARMON

MODEL 88 (1931), 8-125 (1932)
DELCO-REMY ELECTRICAL SYSTEM

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion C-7. Set gaps at .025 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Length	Seat Angles	Lift
Intake	1 11/16"	.3417"	6 1/64"	45°	11/32"
Exhaust	1 9/16"	.3407"	6 1/64"	45°	11/32"

	Tappet Clearance Operating	Timing	Spring Pressure
Intake	.008" (hot)		Open—100 pounds
Exhaust	.008" (hot)	.010" (cold	

Timing

Intake valves open at top dead center. Close 50° after lower dead center. Exhaust valves open 50° before lower dead center. Close 10° after top dead center.

To Check Valve Timing. Check tappet clearance No. 1 exhaust valve with engine hot or set at .010 inch with engine cold. With No. 8 piston on compression stroke turn engine over until piston is 10° past top dead center with flywheel mark 'EX/CL' opposite indicator on flywheel housing. No. 1 exhaust valve should close at this point. No. 1 intake valve should open with piston No. 1 on top dead center and flywheel mark 'D/C' at indicator.

STARTER:—Model 718-M. Starter drives through Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces. Starter cranks engine at 125 R.P.M. Starter switch is combined with lighting switch at lower end of steering column.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5.0	65
15 "	Lock	3.15	570

Mounting:—Starter flange mounted on left front face of flywheel housing. To remove, disconnect cable, take out 2 flange mounting cap screws, pull starter forward to clear drive housing, lift out.

Oiling:—750 Miles. Put 4-5 drops light engine oil in commutator end oiler Drive end bearing is oilless.

GENERATOR:—Model 949-F. Third brush regulation, thermostat control. Thermostat operates at 162°F. (contacts open—cuts in resistance) reducing the charging rate approximately 40%. To adjust charging rate, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, tighten locking screw. With standard setting maximum charging rate is 12 amperes (hot) at 7.5 volts reached at 2000 R.P.M. or 38 M.P.H.

Generator Data

Cold Test Amperes	Cold Test Volts	Cold Test R.P.M.	Hot Test Amperes	Hot Test Volts	Hot Test R.P.M.
19-22	8.3-8.7	1550	9-12	7.3-7.6	1800-2000

Generator Model 965-L. Used on cars with free-wheeling. Construction and adjustment same as Model 949-F (above).

Model 965-L Generator Data

Cold Test Amperes	Cold Test Volts	Cold Test R.P.M.	Hot Test Amperes	Hot Test Volts	Hot Test R.P.M.
18-20	8.3-8.5	1300	9-12	7.35-7.65	1300-1500

Brush spring tension 14-18 ounces. Shunt field current 4.0-6.1 amperes. Motoring generator draws 6 amperes at 6 volts.

Mounting:—Generator cradle mounted at left front of engine. Driven by fan belt. To remove, disconnect lead, slack off belt adjustment (at fan), slip off drive belt, loosen one bolt in mounting clamp band, lift generator out.

Oiling:—750 Miles. Put 4-5 drops light engine oil in oiler at each end.

RELAY:—Model 265-B. Relay mounted on generator field frame. Relay contacts close at 600 R.P.M. when generator voltage reaches 6.75-7.5 volts and open with discharge current of 0-2.5 amperes. Contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Pines Finger Tip Control Swith, Model A-808. Switch is combination lighting and starting switch and horn control mounted at lower end of steering column controlled by button on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch. See Equipment Section for complete article on Finger Tip Control.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Fender & Parking Lights	6-8	3	S.C.	63
Dash and Dome Lights	6-8	3	S.C.	63
Stop and Tail Light	6-8	21-2	D.C.	1158

NOTE:—Stop and tail lights are equipped with double filament bulb. Tail light lead must be connected to 2 cp. filament.

CURRENT LIMIT RELAY:—Model 410-C. Vibrating circuit breaker mounted on dash. Begins to operate with current load of 25-30 amperes limiting load to 2-15 amperes with direct short circuit. Contact gap limits .012-.030 inch. Air gap limits .015-.025 inch (contacts closed). Spring tension 5 ounces minimum (measured at brass button with spring scale at right angles to contact arm).

GASOLINE GAUGE:—A.C. electric type (see Carburetion Section).

FUEL PUMP:—A.C. mechanical fuel pump mounted at right of engine (see Carburetion Section).

HORNS:—Sparton vibrator type matched tone twin horns. Current draw 6 amperes each.

MARMON

SIXTEEN CYLINDER MODEL (1931-32-33)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

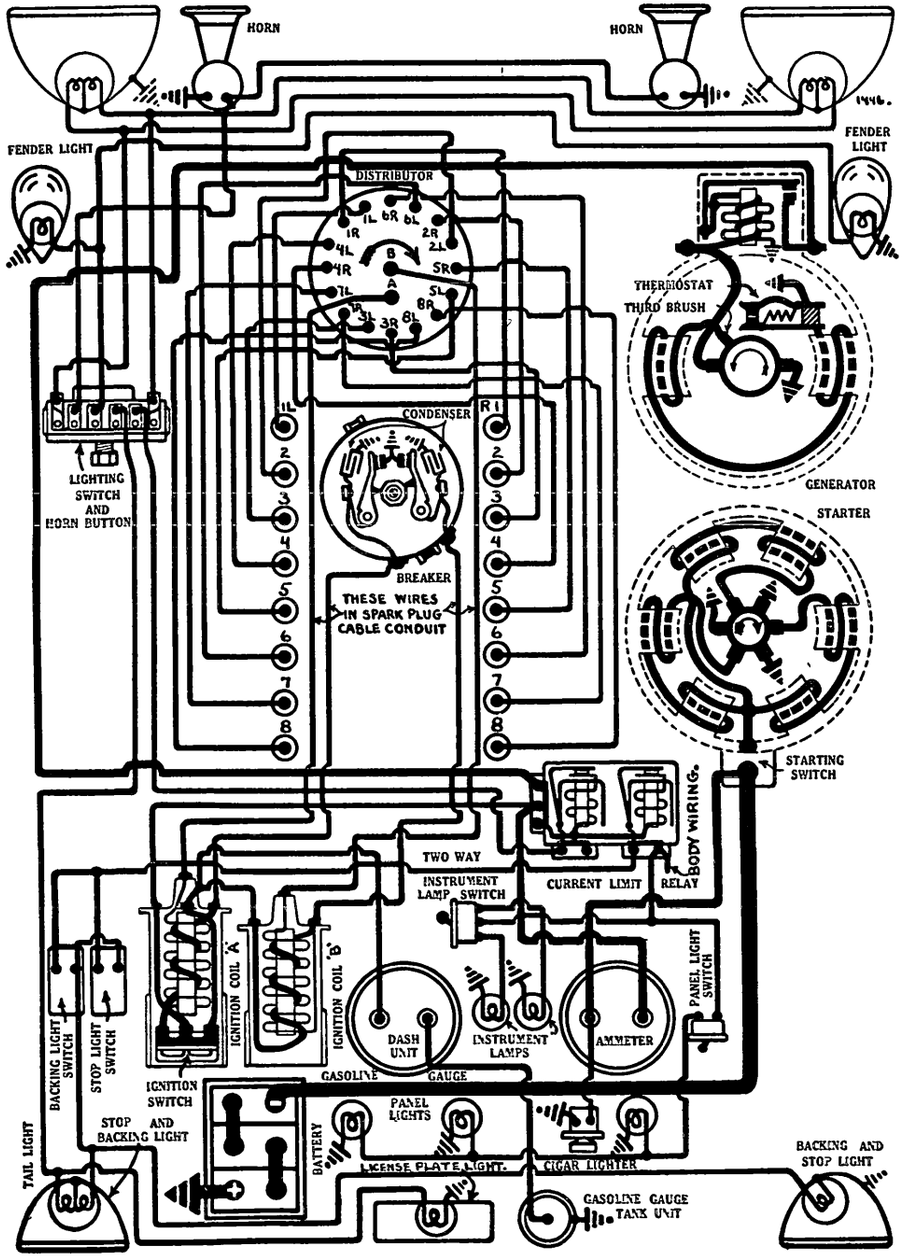
ENGINE:—Sixteen cylinder 45 degree 'V', 'I' or overhead valve type, 3⅛x4″ bore and stroke, 490.8 cubic inch displacement, rated at 62.5 H.P., develops 200 H.P. at 3400 R.P.M. Standard compression ratio 5.75-1. Optional compression ratios are not offered.

BATTERY:—**Exide, Type 3-XCH-21-1,** 6 volt, 21 plate, 167 ampere hour capacity (20 hour rate). Starting capacity 190 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded.
Mounting:—On left hand side of frame under front floor boards.
Dimensions:—Width, 7″. Length, 13 9/16″. Height, 9 5/16″.

IGNITION:—**Coil Models 528-A and 533-S.** Coil Model 533-S (see 'A' on diagram) has an ignition switch built in the base. The Model 528-A coil (see 'B' on the diagram) is a standard ignition coil and is controlled by the ignition switch built in the 'A' coil. The primary lead for the 'B' coil is taken from the accessory terminal on the 'A' coil. Coils are mounted on the back of the instrument board.

Distributor Model 4084. Two-breaker, 8-lobe cam, semi-automatic advance type. Contacts open alternately at 22½° intervals corresponding to the 45° firing intervals of the engine. Contacts must be synchronized (see Timing).
Manual Advance:—15° (engine) maximum.
Breaker Gap:—Set contact gap at .015″. Hold within limits of .015-.020″.
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm
Cam Angles—Closed 27°. Open 18° (distributor) each set independently.

Automatic Advance



Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	4		600
16		1900	32		3800

Mounting:—Distributor is mounted between the cylinder banks at the front of the engine. To remove distributor, disconnect primary leads and manual advance control and take off cable conduits and distributor cap. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one turn every month or each 1000 miles. Every 1000 miles put 8-10 drops of light engine oil in the upper oiler and remove the distributor cap and rotor and oil the breaker arm pivot and put a small bit of vaseline on the face of the breaker cam.

IGNITION TIMING:—Standard setting 6°12′ or 2 teeth on flywheel before top dead center with manual spark control fully advanced. To set timing, advance manual spark control and see that distributor is rotated counter-clockwise to end of advance arm slot, take off cover over inspection hole in flywheel housing at right of engine, turn engine over (using starter) until No. 1L piston (No. 1 of the left hand bank) is approaching top dead center on compression stroke. Then turn engine over slowly (using a large screwdriver to pry wheel around) until flywheel mark 'IGN/L1' (which is two teeth before the top dead center mark 'TDC/L1') is directly under the pointer in the inspection hole. Then loosen taper lockscrew in center of breaker cam and carefully locate cam so that left hand breaker contacts (stationary set mounted directly on breaker plate) are beginning to open, tighten locking screw. Use a test lamp to determine contact opening. The left hand contacts control coil 'A' and fire spark plugs in left hand cylinder block. Ignition is set for right hand block by synchronizing contacts.

Synchronization of Contacts. After setting left hand contacts (above), turn engine over 315 degrees or ⅞ revolution to firing position of No. 1R cylinder (No. 1 of the right hand bank) with the flywheel mark 'IGN/R1' (which is two teeth before the top dead center mark 'TDC/R1') directly under the pointer in the inspection hole. Then loosen lock screws on movable breaker sub-plate (on which right hand contacts are mounted) and

MARMON

SIXTEEN CYLINDER MODEL (1931-32-33)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

turn eccentric adjusting screw until contacts begin to open, tighten lock screws. Use a test lamp to determine contact opening. The right hand contacts control coil 'B' and fire spark plugs in right hand cylinder block. Check contact gap after synchronizing contacts. If outside limits of .015-.020 inch, reset at .018 inch and repeat synchronization.

Firing Order:—Cylinder banks are designated right (R) and left (L) as viewed from the driver's seat. No. 1 cylinder of each bank is nearest the radiator. Firing order is 1L-3R-6L-7R-2L-4R-5L-1R-8L-6R-3L-2R-7L-5R-4L-8R.

Spark Plugs:—18 MM. Metric. Champion Type 8-S. Use Type C-7 for replacement. Set gaps at .021-.022 inch.

VALVE TIMING:—Camshaft Setting. Turn crankshaft so that No. 3L piston is approximately on top dead center with flywheel mark 'EX.OP/1-R' at indicator in inspection hole. With tappet clearance of .014 inch, turn crankshaft in direction of rotation until No. 1R exhaust valve is about to open. With camshaft and crankshaft in this position, the marks '0/0' on camshaft and crankshaft sprockets should be directly opposite and in line with a straightedge laid across the shaft centers. Whenever the chain case cover is removed care should be taken not to lose the spring and thrust button which holds the generator drive coupling in place.

To Check Valve Timing. The exhaust opening point of cylinders Nos. 1R and 1L are marked on the flywheel and should be used for checking the valves. The flywheel mark 'EX.OP./1R', which is the exhaust opening point for cylinder No. 1R, is 140 degrees after the top dead center mark 'T.D.C./R1'. The exhaust opening mark for cylinder No. 1L, 'EX.OP./1L', is 140 degrees after the top dead center mark 'T.D.C./L1', or 45 degrees after the exhaust opening mark for No. 1R. To check valve timing, set tappet clearance No. 1R exhaust valve at .014 inch, turn engine over to approximately firing position of No. 3L cylinder and stop with flywheel mark 'EX.OP/1-R' directly under pointer in inspection hole in right side of flywheel housing. No. 1R exhaust valve should open at this point.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 9/16"	.3095"	5 37/64"	45°	.21/64"
Exhaust	1⅜"	.3085"	5 37/64"	45°	.21/64"

Tappet Clearance		Spring Pressure
Operating	Timing	
Intake .008" (hot)		Closed—35 pounds (outer spring)
		30 pounds (inner spring)
Exhaust .008" (hot)	.014 (cold)	Open—120 pounds

Timing

Intake Valves	Exhaust Valves
Open—6° before top dead center.	Open—40° before lower dead center.
Close—40° after lower dead center.	Close—6° after top dead center.

NOTE:—Double valve springs are used. Coils of inner springs are wrapped in an opposite direction. Cylinder head is counter-bored for valve spring seat and a steel washer used to protect the aluminum head.

CARBURETION:—Stromberg Dual Downdraft Carburetor, Model DDR-3 (see Carburetor Section for complete data).

Fuel Pump:—A.C. Mechanical type mounted on left hand side of crankcase and driven by eccentric on camshaft (see Carburetion Section for complete data).

Gasoline Gauge:—A.C. electric type (see Carburetion Section for complete data).

STARTER:—Model 489. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal. Rotation is clockwise at commutator end. Brush spring tension should be 2¼-2½ pounds.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5	70
19 "	Lock	3	500

Mounting:—Starter is flange mounted on the rear face of the flywheel housing at right of the engine. To remove starter, take up front floor boards disconnect cable and starting pedal linkage and remove three flange mounting screws. Pull starter to the rear to clear drive pinion and lift from place.

GENERATOR:—Model 927-N. Third brush regulation. Rotation is counter-clockwise at commutator end. Maximum charging rate is 10-13 amperes at 7.5 volts (hot) reached at 1600 R.P.M. or 38 M.P.H.

Charging Rate Adjustment. Loosen small round lock screw on endplate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.2-8.62	1400	10-13	7.3-7.7	1600

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—1.8-2.3 amperes at 6 volts across field terminals.

Motoring:—Approximately 5-6 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine on rear face of timing chain case. The water pump is driven by an extension of the generator shaft. To remove the generator, disconnect lead and water pump drive coupling and take out flange mounting cap screws. Then pull generator to the rear to disengage drive coupling and lift from place.

Chain Adjustment. Timing chain is adjusted by shifting the plate between the generator and the front motor support housing. To tighten the chain, loosen the three generator mounting nuts and move the plate away from the engine at the top. Hold in this position and tighten the mounting nuts.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 1000 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Pines Switch, Model A-808. Lighting switch is 'Finger Tip Control' (the starting switch feature is not used) type mounted at lower end of steering column. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Fender Lights	6-8	3	S.C.	63
Instrument Lights	6-8	15	S.C.	87
Stop, Backing, Tail Lights	6-8	21-2	D.C.	1158
Stop-Backing Light	6-8	15	S.C.	87
Dome and Corner Lights	6-8	3	S.C.	63
License Plate Light	6-8	3	S.C.	63

NOTE:—On first cars, parking bulbs were used instead of the separate fender lights, and separate bulbs were used for the tail and stop-backing light (left hand fender). The tail and stop-backing bulbs were 15 cp. D.C. Mazda 88.

CURRENT LIMIT RELAY:—Model 410-E. This device consists of two vibrating circuit breakers mounted on the dash. Circuit breakers begin to vibrate when the current reaches 25-30 amperes and continue limiting the current to 2-15 amperes. Circuit breaker contact gap is .012-.030 inch. Air gap is .015-.025 inch. Plunger spring tension must be 5 ounces minimum.

MARQUETTE

MODEL 30, 34, 35, 36, 36-S, 37 (1929-30)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

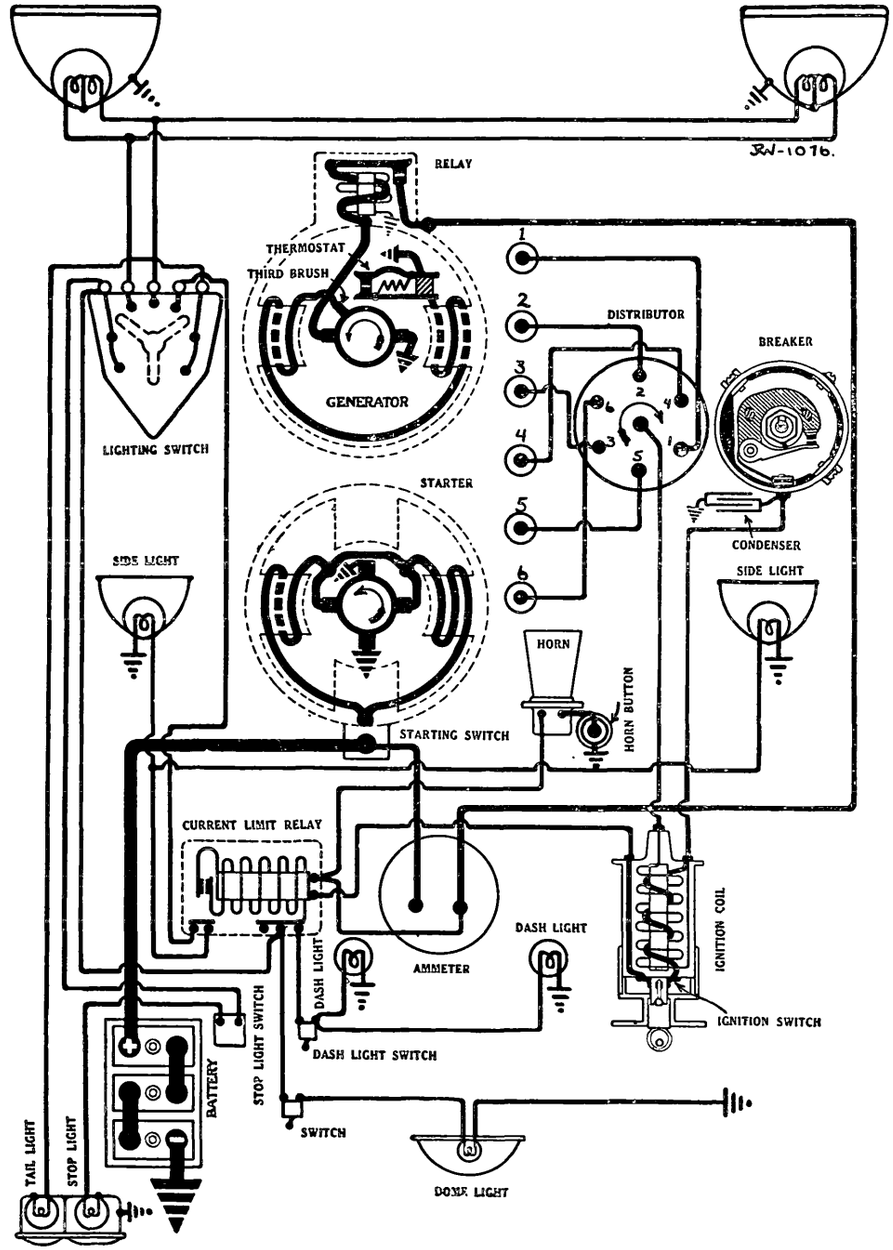
BATTERY:—Exide, Type 3-VXA-13-1, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted on the left frame member under the front floor boards.

IGNITION:—Coil Model 528-Q. Coil is mounted on the back of the instrument board with the ignition switch (which is built in the base of the coil) extending through to the face of the instrument panel. Ignition current is 2 amperes at 6 volts with the engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 639-Y. Breaker contacts separate .018-.025 inch. Set contact gap by loosening lock screw on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 14 degrees (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 23 degrees reached at 3200 R.P.M. Condenser is mounted in a metal case on the side of the distributor shaft under the distributor head.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then disconnect spark control wire and remove manual advance stop screw. Lift the distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one turn every month or each 1000 miles. At the same time remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil and put one drop of oil on the breaker arm pivot pin. Put a small bit of vaseline on the face of the breaker cam.



Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position 7 degrees on the flywheel before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance manual spark control button (push button all the way in toward dash). Remove the cover over the inspection hole in the front of the flywheel case at the left of the engine directly under the starter and continue to crank engine until the flywheel mark 'ADV/7°' is directly opposite the line in the edge of the hole. Then loosen advance arm clamp screw and rotate distributor counter-clockwise until the contacts begin to open. Tighten the clamp screw and connect the segment opposite the rotor to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric, AC Type G-12. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1½ inches. Stem diameter, ⅜ inch. Valve lift, .324 inch. Spring pressure, 40-46 pounds (valve closed—spring length, 2¼ inches), or 65-71 pounds (valve open—spring length, 1 15/16 inches). Tappet clearance, .006 inch (hot). Inlet valves open 5 degrees before top dead center and close 45 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1⅜ inches. Stem diameter, ⅜ inch. Valve lift, .324 inch. Spring pressure, 40-46 pounds (valve closed—spring

MARQUETTE

length, 2¼ inches) or 65-71 pounds (valve open—spring length, 1 15/16 inches). Tappet clearance, .006 inch (hot). Exhaust valves open 45 degrees before lower dead center and close 18 degrees after top dead center.

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—Model 714-N. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at the left of the engine on the forward side of the flywheel housing. To remove starter, disconnect cable and starting pedal linkage and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless.

GENERATOR:—Model 943-K. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 18-20 amperes (cold) reached at 1700 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.3-8.5	1700	9-12	7.3-7.6	2000

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted at left of engine on special hinge bracket and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then remove two bolts extending through end plate flange to bracket and lift generator from place.

Belt Adjustment:—To adjust drive belt, loosen the adjustment clamp bolt and swing generator away from the engine until the proper belt tension is secured and tighten clamp bolt. Do not put too much tension on the belt or it will crowd the generator bearings.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every month or each 1000 miles.

RELAY:—Model 265-G. Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts open .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-B. Lighting switch is mounted at lower end of steering column. Headlights are double filament using the second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side, dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

CURRENT LIMIT RELAY:—Model 410-A. This device is a vibrating circuit breaker connected in the lighting circuits to protect them from overload or short circuits. The circuit breaker begins to vibrate when the current reaches 25-30 amperes and continues limiting the current to 15 amperes. Contact gap is .012-.030 inch. Air gap is .019-.025 inch.

NASH

STANDARD SIX, SERIES 420 (1928-29)
PRODUCTION STARTED APRIL 1928
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—U.S.L. Type 3-HVX-5X6, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 18.4 hours. Battery is mounted under the front floor boards on the left frame member.

IGNITION:—Coil Model IG-4065. Coil is mounted on top of the engine. Ignition current is 1-3 amperes at 6 volts with engine running and 3-4.5 amperes at 6 volts with engine stopped.

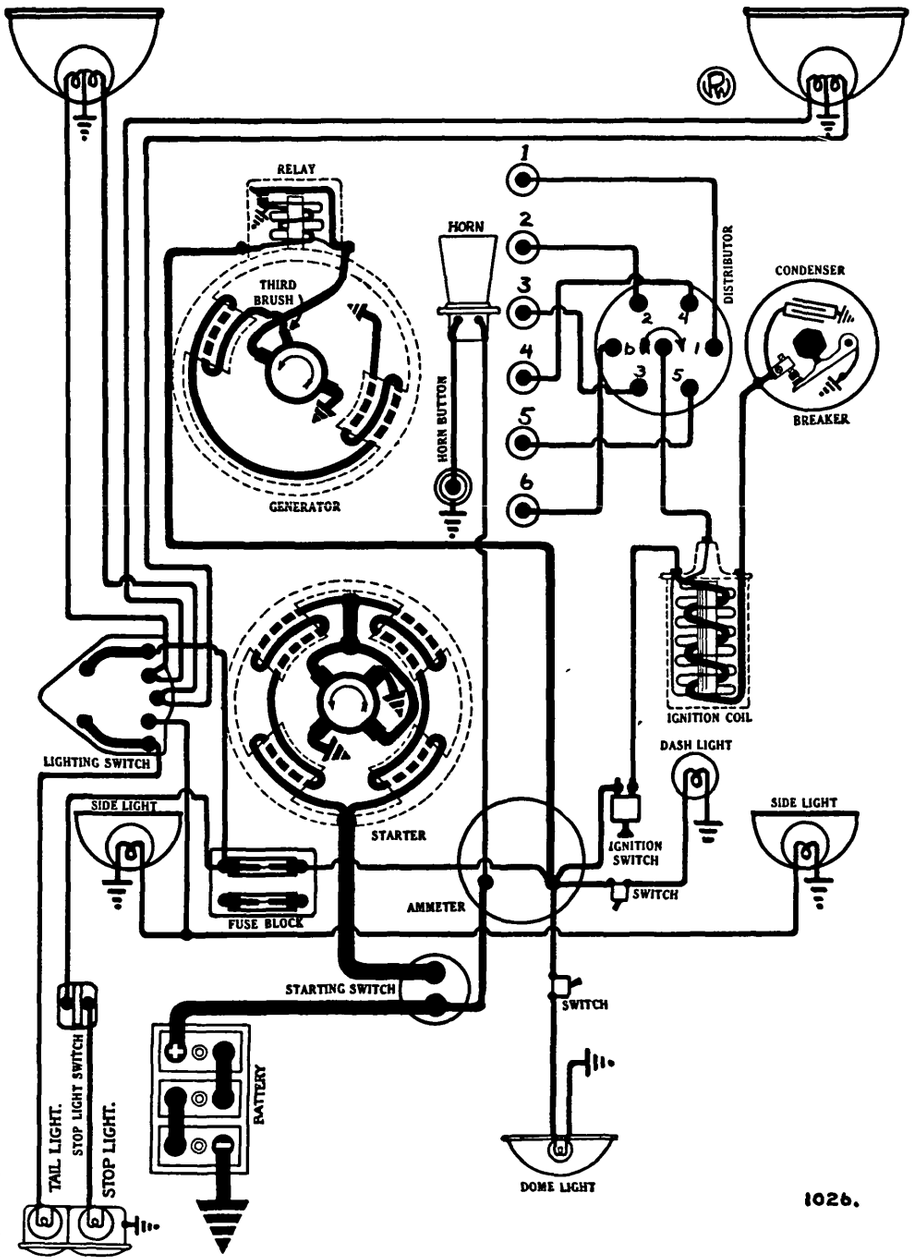
Distributor Model IGB-4015. Breaker contacts separate .020-.024 inch with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is of the automatic type. Automatic advance begins at 600 R.P.M. of the engine. Maximum automatic advance is 28 degrees (engine) reached at 3400 R.P.M. Breaker arm spring tension should be 18-20 ounces.

Mounting:—Distributor is mounted on top of the cylinder block. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then remove set screw and lock nut on side of distributor shaft housing and lift distributor from place.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil every 500 miles. Put one drop of oil on the breaker arm pivot pin and put a small amount of vaseline on the face of the breaker cam every 1000 miles

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position ½ inch (on the flywheel) before top dead center. To check timing, crank engine over until piston No. 1 is coming up on the compression stroke. This is the up stroke with both valves closed. Continue to crank engine until piston reaches a position ½ inch before the notch on the front face of the flywheel reaches the indicator on the rear engine support. Breaker contacts should separate at this point. If they do not, loosen the clamp screw and rotate distributor until contacts open. Tighten the screw after making the adjustment.

Firing Order:—The firing order is 1-5-3-6-2-4.



Spark Plugs:—18 MM. Aircraft Metric. A.C. Type 'G'. Set gaps at .020-.025".

VALVE TIMING:—INLET VALVES:—Head diameter is 1 13/32 inches; stem diameter is .310 inch; stem length is 4 5/16 inches. Tappet clearance is .006 inch (hot). Spring pressure is 65-44 pounds. Valve lift is .3125 inch. Inlet valves open at 5 degrees after top dead center and close at 45 degrees after lower dead center.

EXHAUST VALVES:—Head diameter is 1 13/32 inches; stem diameter is .310 inch; stem length is 4 5/16 inches. Tappet clearance is .006 inch (hot). Spring pressure is 65-44 pounds. Valve lift is .3125 inch. Exhaust valves open at 45 degrees before lower dead center and close at 5 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

To Set Valve Timing:—Camshaft is gear driven. Mesh gears so that marked tooth is meshed with marked space on the other gear.

STARTER:—Model MN-4108, MAC-4213 (after Eng. No. 164332), MAB-4016 (after Eng. No. 186462). Starter drives the engine through a Bendix drive. The

direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model SW-4001.

Starter Data—Model MAC-4213

Torque	R.P.M.	Volts	Amperes
.5 lb. ft.	2500	5.5	100
2.7 "	1400	5.0	200
5.0 "	900	4.5	300
7.7 "	500	4.0	400
10.6 "	160	3.5	500

Model MAB-4016

.6 lb. ft.	1900	5.5	100
2.5 "	1100	5.0	200
6.6 "	700	4.5	300
10.2 "	410	4.0	400
24 "	Lock	4.0	725

Starter brush spring tension is 44-56 ounces (MAB-4016).

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting screws. Pull starter forward and out.

Oiling:—Put 5 or 6 drops of light oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless. It requires no attention.

GENERATOR:—Model GAL-4111. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the commutator cover band and shift the third brush and mounting plate by tapping on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush in held in any position by friction between the mounting stud and the end plate. With standard car setting the maximum charging rate is 17 amperes at 8 volts reached at 2075 R.P.M. or 24 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	675
6	6.9	835
10	7.3	1025
14	7.65	1275
17.2	8.0	2075
14	7.65	2925

Brush spring tension is 22-25 ounces (main brushes), 31-34 ounces (third brush). Generator motoring draws 4.18-4.62 amperes at 6 volts. Shunt field current is 3.89-4.31 amperes at 6 volts.

Mounting:—Generator is flange mounted at the left of the engine on the rear of the front engine cross member. Generator is belt driven from crankshaft. To remove generator, remove belt pulley and bolts in flange mounting. Pull generator to rear and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 500 miles.

RELAY:—Model CB-4014. Relay is mounted on top of the generator. Contacts close at 675 R.P.M. or 9-9.5 miles per hour when the generator voltage reaches 7-7.5 volts. The charging current at closing of contacts is approximately 2 amperes. Contacts open with a discharge current of .5-2.5 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch with contact closed.

LIGHTING:—Briggs and Stratton Switch, Model 40519. Lighting switch is mounted at the base of the steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact) Mazda 1110. Side, dash, tail and dome lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87.

NOTE:—Soreng-Manegold Switch, Model 4210-A, was also used.

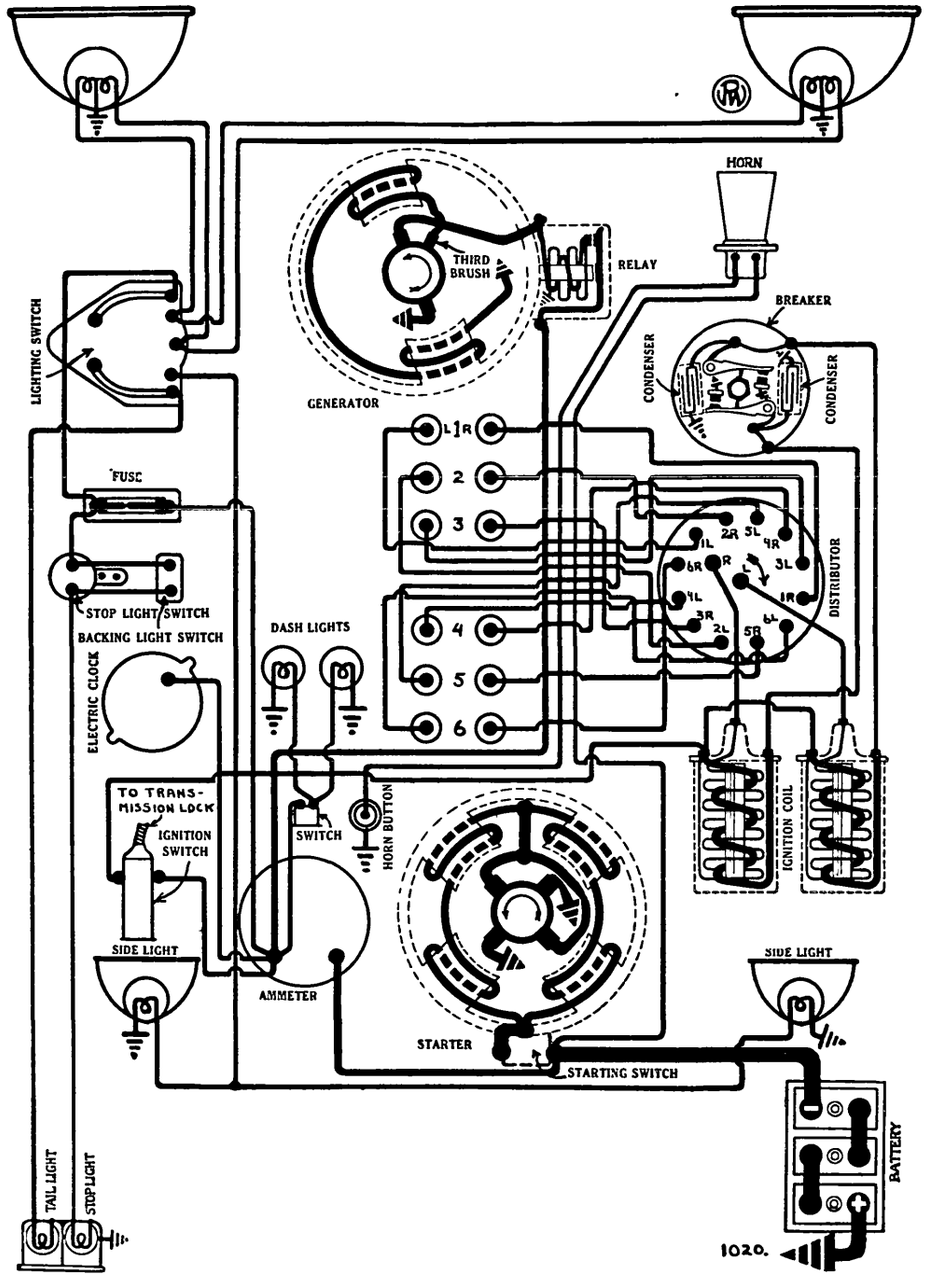
FUSES:—Lighting fuse is mounted on the dash. It is 20 ampere capacity.

NASH

SPECIAL SIX, SERIES 430 (1928-29)
PRODUCTION STARTED APRIL 1928
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—U.S.L., Type 3-HVX-5X6, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 18.4 hours. The battery is mounted under the front seat.

IGNITION:—Coil Model IG-4065. There are two coils used with a dual ignition distributor. The ignition current of each coil is 1-3 amperes at 6 volts with engine running and 3-4.5 amperes at 6 volts with engine stopped. Coils are mounted at the right of the engine. The ignition switch is a Delco-Remy Dual-lock, Model 425-D.



Distributor Model IGE-4002. This is a dual ignition type distributor using a single cam with two sets of breaker contacts which control independent circuits using separate coils and condensers and firing separate sets of spark plugs. It is very important that these contacts be synchronized to open simultaneously so that the full benefit of the dual ignition will be maintained. See Timing. Breaker contacts separate .018-.020 inch with breaker arm on lobe of cam. Breaker arm spring tension is 20 ounces. Distributor is semi-automatic. Manual advance is 33 degrees (engine). Automatic advance begins at 600 R.P.M. Maximum automatic advance is 30 degrees (engine) reached at 2200 R.P.M.

Mounting:—Distributor is mounted at the right of the engine. To remove, disconnect primary lead and manual advance rod. Remove distributor head with high tension cables intact. Remove manual advance stop screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the outside of the distributor and also on the felt wick in the top of the cam and stop-plate assembly (found by removing the rotor) every 500 miles. Put a small bit of vaseline on the breaker cam every 5000 miles or twice a year.

Timing:—Synchronization of Contacts:—Synchronize contacts before setting timing. Two sets of contacts are used on a single six sided cam. They must open at the same instant to fire both spark plugs in each cylinder simultaneously. Connect a six volt lamp in each primary circuit. Crank engine slowly. Both lamps should go out at the same instant. If they do not, contacts must be synchronized. To synchronize contacts, loosen the 3 lock screws and turn the eccentric adjusting screw until contacts separate. Tighten the screws and check the contact gap. It must be within the limits of .018-.020 inch. This is important to secure correct high speed performance of car.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 1 1/10 inches before top dead center with the spark control lever in the fully advanced position. To check timing, crank engine over until piston No. 1 is coming up on the compression stroke. This is the up stroke with both valves closed. Continue to crank engine until piston reaches a position 1 1/10 inches before top dead center when the mark 'IGN' on the vibration damper at the front of the engine will be opposite the pressed steel pointer. Contacts should separate at this point. If the do not, loosen the advance arm clamp screw and rotate distributor until contacts open. Tighten the clamp screw after making the adjustment and make certain that the rotor is opposite the segments connected to the spark plugs in cylinder No. 1 and connect the remaining plugs in order around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—18 MM. Aircraft Metric. A.C. Type 'J'. Set gaps at .023-.025".

VALVE TIMING:—INLET VALVES:—Head diameter is 1½ inches; stem diameter is .3725-.3715 inch; stem length is 4¼ inches. Tappet clearance is .008 inch (hot). Outer spring pressure is 78-45 pounds. Inner spring pressure is 19-15 pounds. Valve lift is .348 inch. Inlet valves open at 15 degrees after top dead center and close at 38 degrees after lower dead center. EXHAUST VALVES:—Head diameter is 1½ inches; stem diameter is .3725-.3715 inch; stem length is 4¼ inches. Tappet clearance is .012 inch (hot). Outer spring pressure is 78-45 pounds. Inner spring pressure is 19-15 pounds. Valve lift is .348 inch. Exhaust valves open at 45 degrees before lower dead center and close at 10 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

To Set Valve Timing:—Camshaft is gear driven. Mesh gears so that marked tooth on crankshaft gear is meshed with marked space on camshaft gear.

STARTER:—**Model MAD-4102.** Starter is connected to the engine through a manual pinion shift interconnected with the starting switch. When the starting pedal is depressed, the starter pinion is meshed with the flywheel and the starting switch is closed. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter switch is Model SW-2677.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3750	5.5	58.2

18	8	1700
14	7.65	2700

Generator motoring, draws 3.5 amperes at 6 volts. Shunt field current is 2.55 amperes at 6 volts. Generator brush spring tension is 24-32 ounces.

Mounting:—Generator is mounted at the front of the engine and is driven by the fan belt. To remove generator, remove the flange mounting screws holding generator in position and lower generator. This will permit removal of the belt. Then lift generator from position.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Model CB-4014. Relay is mounted on the generator. Relay contacts close when the generator voltage reaches 7-7.5 volts reached at 630 R.P.M. or 7-8 miles per hour. The charging current at closing of contacts is 2 amperes. Discharge current at opening of contacts is 0-2.5 amperes. Contact gap is .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch with contacts closed.

LIGHTING:—Briggs and Stratton Switch Model 40153. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact) Mazda 1110. Side, dash, tail and tonneau lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Lighting switch is mounted at the base of the steering column.

FUSES:—Lighting fuse is mounted on the dash. It is 20 ampere capacity. Generator field fuse is 5 ampere capacity.

NASH

SINGLE SIX MODEL 450 (1930)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

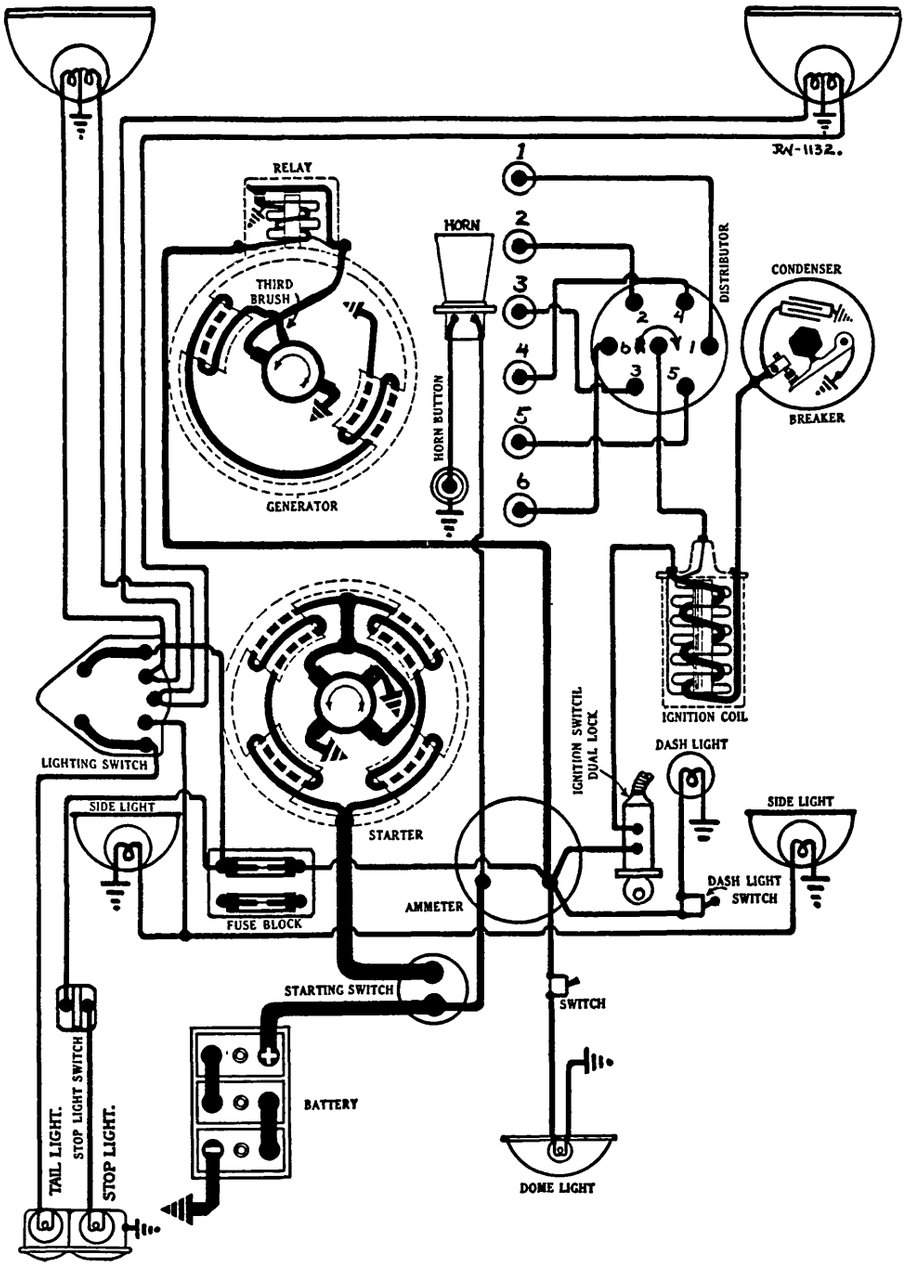
BATTERY:—U.S.L., Type 3-HVX-5X-6A, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 18.4 hours. Battery is mounted on the left frame member under the floor boards of the front compartment.

IGNITION:—Coil Model IG-4065-A. Coil is mounted on the top of the engine. Ignition current is 1-3 amperes at 6 volts with engine running and 3-4.5 amperes at 6 volts with engine stopped. There is a resistance coil in series with the primary. This is Model IGB-2125. The ignition switch is a Delco-Remy Dual-lock, Model 425-E or 425-J (Export).

Distributor Model IGB-4015. Breaker contacts separate .020-.024 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and eturning up stud until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is of the full automatic advance type. Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 28 degrees (engine) reached at 3400 R.P.M. of engine.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then remove set screw and lock nut on side of distributor shaft housing and lift distributor from place.

Oiling:—Fill the oiler on the side of the distributor with light engine oil every 500 miles. Put one drop of oil on the breaker arm pivot pin and a small bit of vaseline on the face of the breaker cam every 1000 miles.



Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position ½ inch (on the flywheel) before top dead center. To check timing, crank engine over until piston No. 1 is coming up on compression stroke (both valves will be closed). Continue to crank engine over until piston reaches a position one half inch before top dead center when the first notch on the flywheel will be at indicator on the housing at the right of the engine. Then loosen the clamp screw and rotate the distributor until the contacts begin to open. Tighten the clamp screw and see that the segment in the distributor head directly opposite the rotor is connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—18 MM. Aircraft Metric. A.C. Type 'G'. Set gaps at .020".

VALVE TIMING:—INLET VALVES:—Head diameter, 1 17/32 inches. Stem diameter, .3095 inch. Stem length, 5 7/32 inches. Valve lift, 5/16 inch. Spring pressure, 45 pounds (valve closed) and 76 pounds (valve open). Tappet clearance, .008 inch (hot). Inlet valves open 5 degrees after top dead center and close 45 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/32 inches. Stem diameter, .3095 inch. Stem length, 5 7/32 inches. Valve lift, 5/16 inch. Spring pressure, 45 pounds (valve closed) and 76 pounds (valve open). Tappet clearance, .008 inch. Exhaust valves open 45 degrees before lower dead center and close 5 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

NASH

SINGLE SIX MODEL 450 (1930)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

To Set Valve Timing:—Camshaft is gear driven. Mesh gears so that marked tooth on crankshaft gear is meshed with marked space on camshaft gear.

STARTER:—Model MAB-4025, 4026. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter switch is Model MAB-3080. Switch is mounted on the starter and is operated through a flexible control from a button on the dash. Brush spring tension is 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4020	5.5	46
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.2 "	420	4.0	400
24 "	Lock	4.0	720

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect starting cable and switch control and take out flange mounting screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 5 or 6 drops of engine oil in the oiler at each end of the starter every month or each 1000 miles of operation.

GENERATOR:—Model GAL-4129. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush and mounting plate by tapping on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direc-rection to decrease the charging rate. The brush is held in position by friction between the mounting stud and the end plate. With standard car setting, the maximum charging rate is 17 amperes at 8 volts reached at 2075 R.P.M. or 24 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	675
6	6.9	835
10	7.3	1025
14	7.65	1275
17.2	8.0	2075
14	7.65	2925

Brush spring tension is 22-25 ounces (main brushes), 31-34 ounces (third brush). Generator motoring draws 4.18-4.62 amperes at 6 volts. Shunt field current is 3.89-4.31 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine on rear face of front engine cross member. Generator is belt driven from the crankshaft. To remove generator, disconnect lead and take off drive pulley and belt. Then take out flange mounting bolts and lift generator from place.

Oiling:—Put 4 or 5 drops of engine oil in each of the generator bearings oilers every two weeks or each 500 miles of operation.

RELAY:—Model CB-4014. Relay is mounted on the generator. Relay contacts close at 675 R.P.M. or 9-9.5 M.P.H. when the generator voltage reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 4210-A. Lighting switch is mounted at base of steering column. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side, dash, dome and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87.

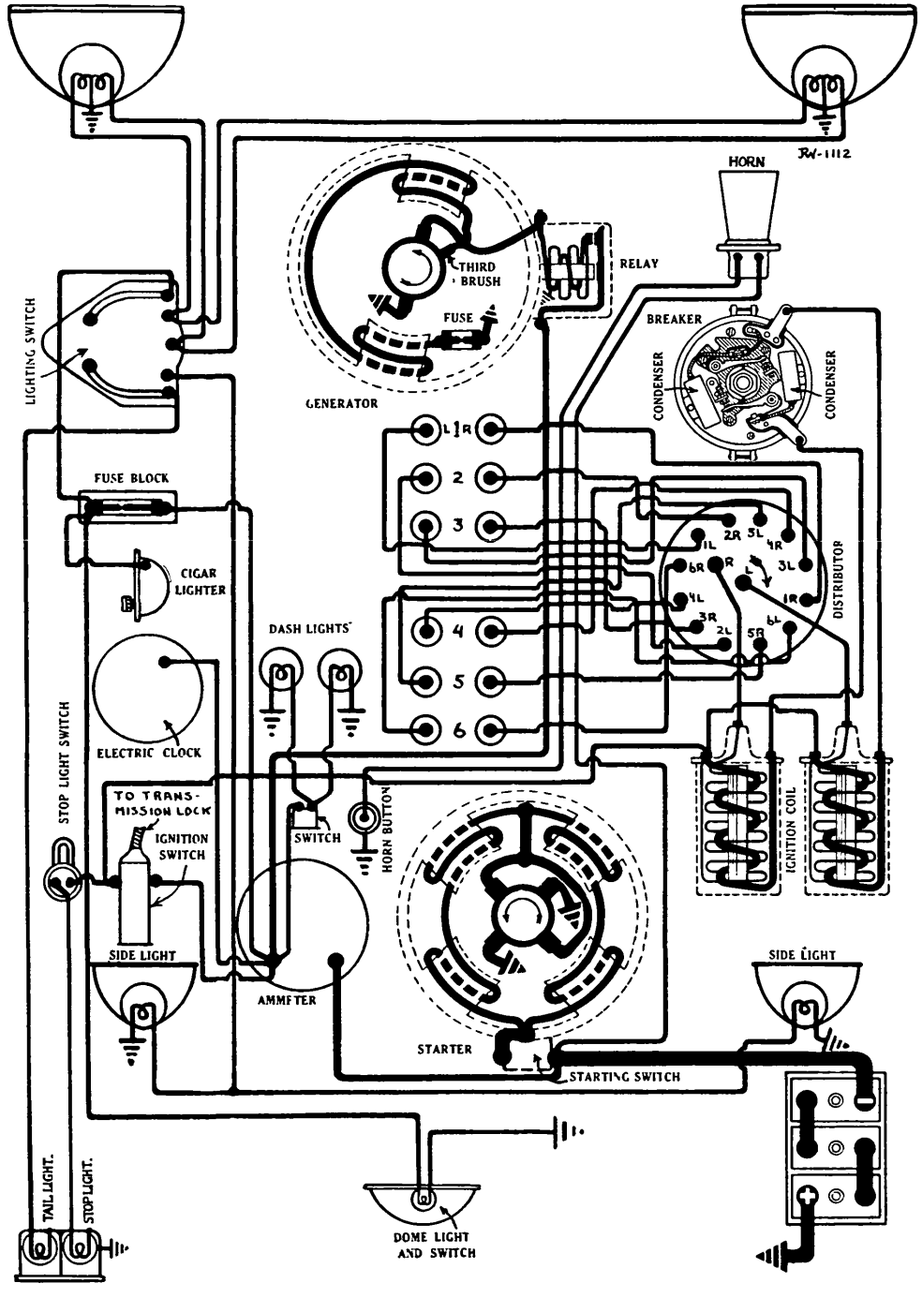
FUSES:—Lighting fuse mounted on fuse block on the dash is 20 ampere capacity. Generator field fuse is 7.5 ampere capacity.

NASH

TWIN IGNITION SIX MODEL 480 (1930)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—U.S.L., Type 3-HVX-5X-6A, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 18.4 hours. Battery is mounted under the right front seat.

IGNITION:—Coil Model IG-4065 (2 used). Coils are mounted at right of engine. Ignition current of each coil is 1-3 amperes at 6 volts with engine running and 3-4.5 amperes at 6 volts with engine stopped. The ammeter will indicate the current drawn by both coils and should register an 8-10 ampere discharge with ignition turned on and engine stopped whenever the breaker contacts are closed. The ignition switch is a Delco-Remy Dual-lock Model 425-D or 425-P.



Distributor Model IGE-4005. Breaker contacts separate .020-.024 inch (new) or .018-.020 inch after 1000 miles. Set contact gap (first set mounted on distributor base plate) by loosening the two lock screws on the stationary contact mounting plate and turning the eccentric adjusting screw until the correct gap is secured with the breaker arm on the lobe of the cam. The second set of contacts (mounted on the movable sub-plate) are adjusted by loosening the lock nut on the stationary contact mounting stud and turning up the stud. Resurface contacts with a fine flat contact file or on a medium hard oilstone. The two sets of contacts operate on a single six sided cam. Each set controls one ignition coil and fires one set of spark plugs. Both sets of contacts should open at the same instant and contacts must be synchronized to secure this result. See Timing. Breaker arm spring tension is 20 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 25 degrees reached at 3000 R.P.M. of engine.

Mounting:—Distributor is mounted at the right of the engine. To remove distributor, disconnect primary leads and manual spark control and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor every 500 miles. At the same time remove the distributor head and rotor and oil the wick oiler in the center of the shaft. Every 5000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. The contacts must be synchronized so as to open at the same instant. If this is not done and one set of contacts opens earlier than the other the full advantage of twin ignition will not be secured. Full directions for synchronizing contacts is given in the Equipment Section. Contacts can be synchronized as a part of the timing process (see next paragraph).

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position 1.1 inches (on the front flywheel) before top dead center with the manual spark control in the fully advanced position and the distributor rotated counter-clockwise to the full limit of the advance arm slot. To set timing, crank engine over until No. 1 piston enters compression stroke (the up stroke with both valves closed). Fully advance the spark control lever. Connect a six volt test lamp in series with each primary circuit to accurately determine when contacts open. Turn on ignition and continue to crank engine over until the mark 'IGN' on the front flywheel is directly opposite the pressed steel pointer on the crankcase. This mark is 1.1 inches before the top dead center position. The two lamps should go out at this point, indicating that the contacts have begun to open. If they do not, loosen the advance arm clamp bolt and

NASH

TWIN IGNITION SIX MODEL 480 (1930)

AUTO-LITE GENERATING. STARTING SYSTEM
AUTO-LITE IGNITION

rotate the distributor until the set of contacts mounted on the stationary breaker plate open. Tighten the clamp bolt. Then loosen the three mounting lock screws on the sub-plate and shift the sub-plate until the second set of contacts begins to open. Tighten the lock screws. The distributor will then be correctly timed to the engine and the two sets of contacts will be correctly synchronized. Check to see that the rotor is directly opposite the segments connected to the spark plugs in cylinder No. 1 and connect the remaining spark plugs in accordance with the diagram.

The synchronization of the contacts can be checked very easily in service by turning on the ignition and noting the ammeter reading with both contacts closed. The ammeter should show a discharge of 8-10 amperes. Then crank engine over slowly and watch ammeter pointer. It should drop to '0' in one movement as the two sets of contacts open. If the pointer first drops to 4-5 amperes and then to '0' the contacts are not synchronized properly.

Firing Order:—The firing order is 1-5-3-6-2-4. Connect spark plugs as shown on the diagram.

Spark Plugs:—18 MM. Aircraft Metric. A.C. Type 'J'. Set gaps at .020".

VALVE TIMING:—INLET VALVES:—Head diameter, 1 21/32 inches. Stem diameter, .3725-.3715 inch. Stem length, 4 7/16 inches. Spring pressure, 40 pounds (valve closed) and 95 pounds (valve open). Valve lift, .353 inch. Tappet clearance, .012 inch (hot). Inlet valves open 15 degrees after top dead center and close 38 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 21/32 inches. Stem diameter, .3725-.3715 inch. Stem length, 4 7/16 inches. Valve lift, .353 inch. Spring pressure, 40 pounds (valve closed) and 95 pounds (valve open). Tappet clearance, .012 inch (hot). Exhaust valves open 45 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Set Valve Timing:—Camshaft is gear driven. Mesh gears so that marked tooth on crankshaft gear is meshed with marked space on camshaft gear.

STARTER:—Model MAD-4107, 4109. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3750	5.5	58.2
.7 "	2355	5.5	100
3.0 "	1260	5.0	200
5.7 "	770	4.5	300
8.85 "	425	4.0	400
20.2 "	Lock	3.6	730

Mounting:—Starter is sleeve mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and take out large pilot mounting screw in flywheel housing directly above starter sleeve. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler at each end of the starter every month or each 1000 miles of operation.

GENERATOR:—Model GAR-4104. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush and mounting plate by tapping on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush is held in position by friction between the mounting stud and the end plate. The maximum charging rate is 17 amperes at 8 volts reached at 1700 R.P.M. or 27 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	750
6	6.9	885
10	7.3	1030
14	7.65	1230
17	8.0	1700
14	7.65	2200

Brush spring tension is 22-25 ounces (main brushes), 31-34 ounces (third brush). Generator motoring draws 5.00-5.65 amperes at 6 volts. Shunt field current is 4.75-5.25 amperes at 6 volts. Generator field fuse is 7.5 ampere capacity.

Mounting:—Generator is cradle mounted at the left of the engine and is belt driven. To remove generator, disconnect lead and slip off drive belt. Then loosen clamp band and slip generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles of operation.

RELAY:—Model CB-4014. Relay is mounted on the generator. Relay contacts close at 750 R.P.M. or 8-9 M.P.H. when the generator voltage reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-C. Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs and use a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side, dash, tail and tonneau lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

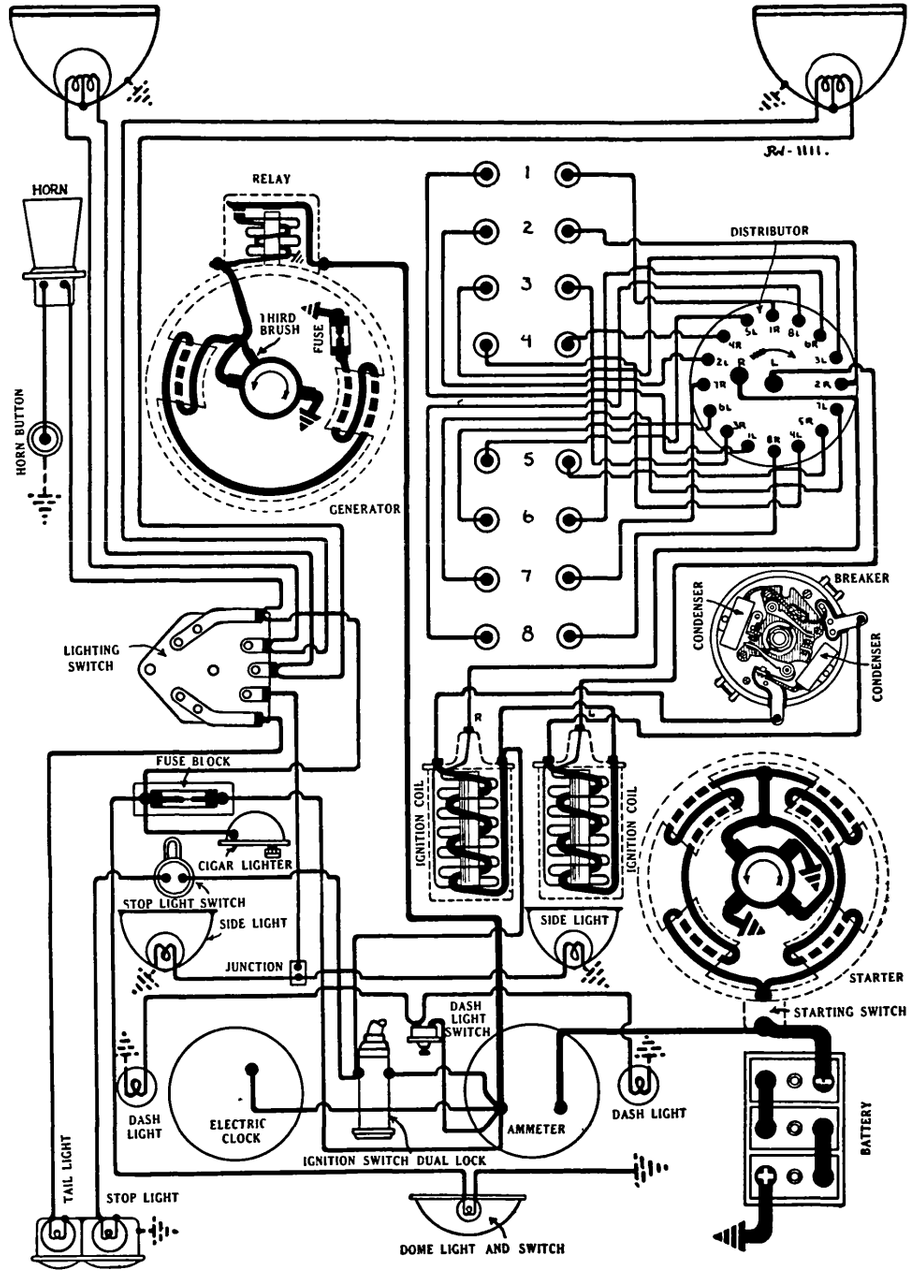
FUSES:—Lighting fuse mounted on the fuse block on the dash is 20 ampere capacity. Generator field fuse is 7.5 ampere capacity.

NASH

TWIN IGNITION EIGHT MODEL 490 (1930)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—U.S.L., Type 3-HVX-7X-6A, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 148.5 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 28.4 hours. Battery is mounted under the right front seat.

IGNITION:—Coil Model CE-4011, 4001 (2 used). Coils are mounted at right of the engine. Ignition current of each coil is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped. The ammeter will indicate the current drawn by both coils and should register 8-10 ampere discharge with ignition turned on and engine stopped whenever the breaker contacts are closed. The ignition switch is a Delco-Remy Dual-lock, Model 425-P or 425-S.



Distributor Model IGK-4001. Breaker contacts separate .015-.019" when new and .013-.017 inch after 1000 miles operation. Set contact gap (first set mounted on stationary breaker plate) by loosening the two lock screws on the stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. The second set of contacts (mounted on movable sub-plate) are adjusted by loosening the lock nut on the stationary contact mounting stud and turning up the stud. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 20 ounces. Each set of contacts controls one ignition coil and fires one set of spark plugs. The contacts should open at the same instant and must be synchronized to secure this result. See Timing. Distributor is semi-automatic. Maximum manual advance is 38 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 16 degrees reached at 2000 R.P.M. of engine.

Mounting:—Distributor is mounted at right of engine. To remove distributor, disconnect primary lead and manual spark control and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor every two weeks or each 500 miles. At the same time remove the distributor head and rotor and oil the wick oiler in the center of the shaft. Every 5000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. The contacts must be synchronized so that they open at the same instant. If this is not done and one set of contacts opens earlier than the other the full advantage of twin ignition will not be secured. The procedure in synchronizing these contacts is identical with directions given in the Equipment Section on the Type IGE distributors. Contacts can be synchronized as part of the timing operation (see next paragraph).

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position 1.1 inches on the front flywheel before top dead center with the manual spark control in the fully advanced position and the distributor rotated counter-clockwise to the full limit of the advance arm slot. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance the spark control lever. Connect a six volt test lamp in series with each primary circuit to accurately determine when the contacts open. Turn on ignition. Continue to crank engine over until the mark 'IGN' on the front flywheel is directly opposite the pressed steel pointer on the crankcase. This mark is 1.1 inches before the top dead center position. The two lamps should go out at this point indicating that both sets f contacts

AUTO-LITE IGNITION

have begun to open. If they do not, loosen the advance arm clamp bolt and rotate the distributor until the first set of contacts (mounted on the breaker plate) begin to open. Tighten the clamp bolt and loosen the three mounting lock screws on the movable sub-plate. Shift the sub-plate until the second set of contacts begin to open. Tighten the lock screws. The distributor will then be correctly timed to the engine and the two sets of contacts will be synchronized. Check to see that the rotor is directly opposite the segments connected to the spark plugs in cylinder No. 1. Connect the remaining spark plugs as indicated on the diagram.

The synchronization of the contacts can be checked readily by turning on the ignition and noting the ammeter reading with the contacts closed. This should be 8-10 amperes discharge. Then slowly turn the engine over and watch the ammeter. The pointer should drop to '0' in one movement as the contacts open. If the pointer first drops to 4-5 amperes and then to '0' as the engine is turned over the contacts are not synchronized properly.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4. Connect spark plugs as shown on the diagram.

Spark Plugs:—18 MM. Aircraft Metric. A.C. Type 'J'. Set gaps at .020".

VALVE TIMING:—INLET VALVES:—Head diameter, 1 23/32 inches. Stem diameter, ⅜ inch. Stem length, 5 9/16 inches. Valve lift, 11/32 inch. Spring pressure, 40 pounds (valve closed) and 95 pounds (valve open). Tappet clearance, .012 inch (hot). Inlet valves open 15 degrees after top dead center and close 38 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 17/32 inches. Stem diameter, ⅜ inch. Stem length, 5 9/16 inches. Valve lift, 11/32 inch. Spring pressure, 40 pounds (valve closed) and 95 pounds (valve open). Tappet clearance, .012 inch (hot). Exhaust valves open 45 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Set Valve Timing:—Camshaft is driven by two sprocket non-adjustable chain drive. Chain must be removed and installed endless. Mesh chain in sprockets with sprocket turned so that punch marks are adjacent and in line with a straightedge across the sprocket centers (punch mark and keyway on camshaft sprocket are in line). If straightedge is not available, count 22 link pins and ½ link between marks on sprockets (inclusive—the mark on camshaft sprocket is between two teeth). Press the sprockets on the shafts at the same time to avoid sidestrain on chain.

STARTER:—Model MAB-4024. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter brush spring tension is 44-56 ounces. Starter switch is Model MAB-4079. Switch is mounted on the starter field frame.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4020	5.5	46
.6 "	1900	5.5	100
3.4 "	1100	5.0	200
6.6 "	700	4.5	300
10.2 "	410	4.0	400
24 "	Lock	4.0	720

Mounting:—Starter is sleeve mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and take out large pilot mounting screw in flywheel case directly above starter sleeve. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler at each end of the starter every month or each 1000 miles of operation.

GENERATOR:—Model GAR-4109, 4110. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover and shift third brush by tapping on the brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush and mounting plate is held in position by friction between the mounting stud and the end plate. With standard car setting the maximum charging rate is 17 amperes at 8 volts reached at 1700 R.P.M. or 35 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	750
6	6.9	885
10	7.3	1030
14	7.65	1230
17	8.0	1700
14	7.65	2200

Brush spring tension is 22-25 ounces (main brushes), 31-34 ounces (third brush). Generator motoring draws 5-5.65 amperes at 6 volts. Shunt field current is 4.75-5.25 amperes at 6 volts. Generator field fuse is 7.5 ampere capacity.

Mounting:—Generator is cradle mounted at the left front of the engine and is driven by the fan belt. To remove generator, disconnect lead and loosen mounting clamp band. Slip off drive belt. Lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles of operation.

RELAY:—Model CB-4014. Relay is mounted on the generator. Relay contacts close at 750 R.P.M. or 7-8 M.P.H. when the generator voltage reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Delco-Remy Switch, Model 486-K. Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs and use a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side, dash, tail and tonneau lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

FUSES:—Lighing fuse mounted on fuse block on dash is 20 ampere capacity. Generator field fuse is 7.5 ampere capacity.

AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On plate on top left frame member near steering gear housing (under engine hood).

ENGINE NUMBER:—On plate on left side of crankcase directly above generator.

BATTERY:—**U.S.L., Type HW-11R-KAW,** 6 volt, 11 plate, 92 ampere hour capacity (5 ampere rate). Starting capacity, 106 amperes for 20 minutes. Negative (—) terminal grounded. Battery mounted under the left front seat. Battery size, 7⅛ inches wide, 9 1/16 inches long, 9⅛ inches high.

IGNITION:—**Coil Model IG-4065. Resistor Unit IGB-2145.** Coil mounted on engine side of dash. Resistance unit connected in coil primary circuit.
Ignition Current—2 amperes (running), 4 amperes (stopped) at 6 volts.
Ignition Switch—Oakes 'Hershey' type co-incidental ignition switch and steering post lock.

Distributor Model IGB-4015, IGB-4015A Export (6-60, 9-60), IGB-4071 (10-60). Single breaker, six lobe, full automatic advance type.
Contact Gap—Set at .020-.024".
Breaker Arm Spring Tension—16-20 ounces.
Cam Angles—Closed 40°. Open 20° (distributor degrees).

Automatic Advance—Models IGB-4015, 4071

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
4	700	8	1400
8	1100	16	2200
14	1700	28	3400

Automatic Advance—Model IGB-4015A

Start	200	0	400
3	600	6	1200
6	1000	12	2000
10	1540	20	3080

Mounting:—Distributor is mounted on the cylinder head and is driven through a spiral gear from the center of the camshaft. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then take out setscrew and locknut on side of cylinder head opposite distributor and lift distributor out.

Oiling:—Fill the oiler on the side of the shaft with light engine oil every 500 miles of operation. Every 1000 miles remove the distributor head and rotor and put one drop of oil on the breaker arm pivot pin and 2 or 3 drops of oil in the oiler in the center of the shaft. At the same time put a small bit of vaseline on the face of the breaker cam.

Timing:—To set timing with No. 1 piston on compression stroke, turn engine over until the first notch on the vibration dampener at the front of the engine (which is marked 'IGN') is directly opposite the timing pointer on the chain case, then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, connect spark plugs as indicated on diagram (No. 1 terminal as designated). Use a test lamp to determine contact opening point.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—18 MM. Metric. AC. Type G-14 (6-60, 9-60), Type G-10 (10-60).
Spark Plug Gaps—Set at .020".

VALVE TIMING:—Valves at right of engine. Camshaft driven by gears (9-60) or by two sprocket non-adjustable roller chain drive (10-60).

Valve Specifications (6-60, 9-60)

Valve Timing (6-60, 9-60)

Intake valves open 5° after top dead center. Intake valves close 45° after lower dead center. Exhaust valves open 45° before lower dead center. Exhaust valves close 5° after top dead center.

To Set Valve Timing (All models). Timing gears and sprockets marked. Mesh gears or mesh sprockets in chain so that marks are directly opposite and in line with a straight edge through the shaft centers (both marks should be between the shaft centers). Chain should be removed and installed endless.

STARTER:—Model MAB-4026. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter switch is Model MAB-3080. Switch is mounted on the starter and is operated through a flexible control from a button on the dash. Starter cranks the engine at 200 R.P.M. drawing 150 amperes at 6 volts. Brush spring tension is 44-56 ounces.

Starter Data

10.2 "	410	4.0	400
24 "	Lock	4.0	720

Startix:—Startix automatic starting switch is optional equipment on these models. In installing Startix or in servicing cars equipped with Startix, refer to complete article in Equipment Section on Startix. On cars with Startix the original starting switch is modified by disconnecting the control cable and blocking the switch lever so that switch contacts are permanently closed. The 'GEN' terminal on the Startix is connected to a terminal underneath the relay on 9-60 cars and to a special terminal on the outside of the relay case on Series 10-60 cars.

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect starting cable and switch control and take out flange mounting screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 5 or 6 drops of engine oil in the oiler at each end of the starter every month or each 1000 miles of operation.

GENERATOR:—Model GAL-4129, GAL-4329 after #R-256306. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate is 17 amperes (cold) at 8.0 volts reached at 1900 R.P.M. or 24 M.P.H.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting stud, counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data

Amperes	Volts	R.P.M.
0	6.4	600
4	6.7	740
8	7.1	900
12	7.4	1120
17	8.0	1900
12	7.4	3200

Brush Spring Tension—22-25 ozs. (main), 31-34 ozs. (third) on GAL-4129, 17-22 ozs. (all brushes) on GAL-4329.
Shunt Field Current—3.89-4.31 amperes at 6.0 volts.
Field Fuse—7½ ampere capacity on brush ring.
Motoring Current—4.18-4.62 amperes at 6.0 volts.

Mounting:—Generator is flange mounted at left of engine on rear face of front engine cross member. Generator is belt driven from the crankshaft. To remove generator, disconnect lead and take off drive pulley and belt. Free brace strap at rear of generator. Then take out flange mounting bolts and lift generator from place.

Belt Adjustment. Fan belt is adjusted by shifting generator. To take up belt, loosen generator flange mounting bolts, pull generator away from engine until correct belt tension is secured, tighten mounting bolts. Belt should be just tight enough to drive fan and generator without slipping.

Oiling:—Put 4 or 5 drops of engine oil in each of the generator bearing oilers every two weeks or each 500 miles of operation.

RELAY:—Model CB-4014, 4021. Mounted on the generator. Relay contacts close at 675 R.P.M. or 9-9.5 M.P.H. when the generator voltage reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch with contacts closed.

LIGHTING:—Soreng Manegold Switch, Model 4210-A. Lighting switch is mounted at lower end of steering column and is controlled by a lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110

STANDARD EIGHT SERIES 9-70 (EARLY 1932)
SERIES 10-70 (1932), SERIAL NUMBERS X-21318 UP
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On plate on left frame member directly forward of car body (under engine hood).

ENGINE NUMBER:—On plate on left side of crankcase directly back of generator.

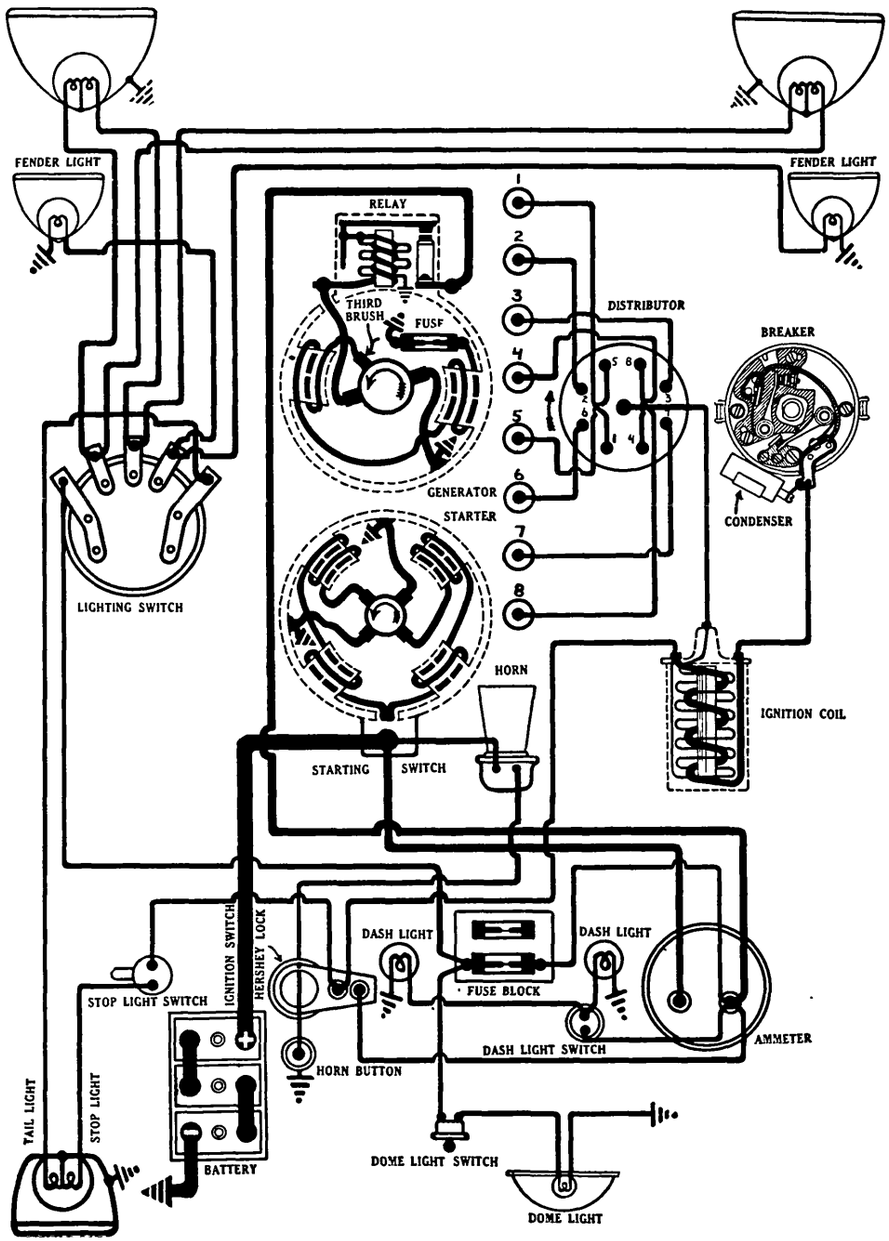
BATTERY:—**U.S.L., Type HW-13A-BV,** 6 volt, 13 plates, 117 ampere hour capacity (5 ampere rate). Starting capacity 127 amperes for 20 minutes. Negative (—) terminal is grounded. Battery mounted under left front seat. Battery size, 7⅛ inches wide, 10 7/32 inches long, 9⅛ inches high.

IGNITION: — Coil Model CE-4001. The ignition coil is mounted on the engine side of the dash under the hood. Ignition current is 2 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' type co-incidental ignition switch and steering post lock.

Distributor Model IGH-4017. Breaker contacts separate .020-.024 inch. Set contact gap by loosening lock screws on stationary contact mounting plate and turning eccentric adjusting screw (first set of contacts mounted on breaker plate) or loosening the lock nut on the stationary contact mounting stud and turning up the stud (second set of contacts mounted on movable sub-plate). Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker has two sets of contacts operating on a four lobe cam Breaker has two sets of contacts operating on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized to secure this firing interval for satisfactory engine performance (see Timing). Breaker arm spring tension is 16-20 ounces. Distributor is full automatic.

Cam Angles—Closed 34.5°. Open 10.5° (distributor) when synchronized.

Automatic Advance



Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	300	0	600
4	700	8	1400
8	1100	16	2200
12	1500	24	3000
14	1700	28	3400

Mounting:—Distributor is mounted on top of the cylinder head and is driven through a bevel gear from the center of the camshaft. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then loosen set screw in side of cylinder head and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the shaft every 500 miles of operation. Remove the distributor head and rotor and put one drop of oil on the breaker pivot pins and 2 or 3 drops in the oiler in the center of the shaft. Every 5000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Auto-Lite Indicator and follow complete directions in Equipment Section. Synchronization should be checked whenever contacts are resurfaced or when ignition timing is checked. This is very important as it affects the timing of four cylinders.

Timing Distributor to Engine. To set timing, turn engine over with No. 1 piston on compression stroke until the first notch (marked 'IGN') on the vibration dampener at the front of the engine is directly opposite the indicator on the chain case, then loosen advance arm clamp bolt, rotate distributor until first set of contacts (mounted on movable breaker sub-plate) begin to open, tighten clamp bolt. Use a test lamp to determine contact opening. Connect spart plugs as indicated on diagram (No. 1 terminal as designated).

CAR SERIAL NUMBER:—On plate on top of right frame member near starter (under engine hood).

ENGINE NUMBER:—On plate on right side flywheel housing directly behind starter.

BATTERY:—**U.S.L., Type HW-13A-BV,** 6 volt, 13 plates, 117 ampere hour capacity (5 ampere rate). Starting capacity 127 amperes for 20 minutes. Positive (+) terminal grounded. Battery mounted under right front seat. Battery size 7⅛ inches wide, 10 7/32 inches long, 9⅛ inches high.

IGNITION:—**Coil Models CE-4001 (first), CE-4402 (later), 2 used.** Mounted on engine side of the dash at the right of the engine under the hood. Ignition current of each coil is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped. The ammeter will indicate the current drawn by both coils and should indicate an 8-10 ampere discharge with the ignition turned on whenever the engine is stopped with the breaker contacts closed. Ignition switch is Oakes 'Hershey' type co-incidental ignition switch and steering post lock.

Distributor Model IGK-4003 ('31), 4004 ('32). Breaker gap .015-.019" (when new) and .013-.017 inch (after 1000 miles of operation). To set gap, loosen lock nut on stationary contact mounting stud, turn up stud, tighten lock nut. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension 20 ounces. Breaker has two sets of contacts operating on an eight lobe cam. Each set of contacts controls one ignition coil and fires one of the spark plugs in each cylinder. Contacts open simultaneously and this simultaneous opening must be maintained by synchronizing contacts to secure full advantage of 'Twin Ignition' (see Timing). Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine).

Cam Angles—Closed 28°. Open 17° (distributor) each set independently.

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		215	0		430
4		605	8		1210
8		1000	16		2000

Mounting:—Distributor is mounted at the right of the engine and is driven through a spiral gear from the camshaft. To remove distributor, disconnect primary leads and manual spark control and remove distributor head with cables intact. Then take out two cap screws in distributor bracket and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor every 500 miles of operation. At the same time remove the distributor head and rotor and put one drop of oil on the breaker arm pivot pins and oil the wick oiler in the center of the shaft. Put a small bit of vaseline on the face of the breaker cam.

Timing:—**Synchronization of Contacts.** Contacts must be synchronized to secure simultaneous opening of both sets. Full directions on synchronization of IGK distributors will be found in the Equipment Section. Contacts may be synchronized as part of the timing operation. See next paragraph.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position 15 degrees (crankshaft) before top dead center with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance the manual spark control lever. Connect a six volt test lamp in series with each primary circuit to accurately determine when contacts open. Turn on ignition and continue to turn engine over until the mark 'IGN' on the front flywheel (which is 15

AUTO-LITE SYSTEM

degrees before top dead center) is directly opposite the indicator on the crankcase. Then loosen the advance arm clamp screw and rotate distributor housing until the lamp goes out indicating that the first set of contacts has opened. Tighten the clamp screw. If both lamps go out at the same instant, the contacts are properly synchronized. However if one lamp goes out first, it will be necessary to loosen the lockscrews on the movable sub-plate and shift the plate until the second set of contacts (mounted on the sub-plate) open at the same instant. Connect the spark plugs as shown on the diagram.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—14 MM. Metric. A.C., Type K-12. Set gaps at .020 inch.

VALVE TIMING:—Overhead valve type engine. Valves in cylinder head operated by rocker arms and pushrods at right of engine. Valve tappet adjustment in end of rocker arm directly over pushrods. Camshaft driven from crankshaft by Diamond roller chain (two sprocket drive—no adjustment necessary).

Valve Specifications—Series 8-80, 9-80

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 21/32"	.372"	5½"	45°	.348"
Exhaust	1 15/32"	.372"	5½"	45°	.348"

Tappet Clearance

Intake .....012" (hot)—see note Exhaust .....012" (hot)—see note

Valve Timing—Series 8-80, 9-80

Intake valves open 15° after top dead center. Intake valves close 38° after lower dead center. Exhaust valves open 45° before lower dead center. Exhaust valves close 10° after top dead center.

To Set Tappet Clearance. All tappet clearance adjustments should be made with the engine hot and idling. To set tappet clearance, see that engine is at normal running temperature (car should be driven for 20 minutes or longer), remove cylinder head valve cover, run engine at idling speed and set tappet clearance by turning adjustment screw up or down after loosening lock nut until a slight pull is necessary to remove feeler gauge.

To Set Valve Timing (All Models)—The chain should be installed endless. Both sprockets must be pulled and installed at the same time with the chain in place. Care must be taken not to move one sprocket on its shaft faster than the other. Special pullers must be used for both sprockets. To set timing, mesh sprockets in chain so that a straightedge laid across the camshaft sprocket in line with the center of the keyway and the punch mark on the sprocket is in line with the punch mark on the crankshaft sprocket (both punch marks must be adjacent or between the shaft centers). The punch mark on the crankshaft gear is approximately 4 teeth counter-clockwise from the keyway on the sprocket.

STARTER:—Model MAB-4033. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. The starting switch is mounted on the starter field frame and is operated through a flexible control by a button on the dash. Brush spring tension is 44-56 ounces.

Starter Data

Brush Spring Tension:—24-36 ounces on each brush.

Field Current:—4.75-5.25 amperes at 6.0 volts across field terminals.

Field Fuse:—7½ ampere capacity fuse under cover on top of generator.

Motoring:—5.00-5.65 amperes at 6.0 volts.

Mounting:—Generator is cradle mounted at the left of the engine and is belt driven from the crankshaft. The water pump is driven by an extension of the generator shaft. To remove generator, disconnect lead and water pump drive coupling and loosen mounting clamp band. Slip off drive belt and lift generator from place.

Belt Adjustment. Fan belt should be adjusted whenever sideplay at a point midway between the generator and fan pulleys is more than 1½ inches. To take up belt, loosen two cap screws on fan bracket, raise bracket, tighten cap screws.

Oiling:—500 Miles. Put 8-10 drops light oil in oiler at each end.

RELAY:—Model CB-4014, 4021. Mounted on the generator. Relay contacts close at 725-750 R.P.M. when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Delco-Remy Switch, Model 486-C. Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs, controlled by lighting switch.

Mounting:—Distributor is mounted at the right of the engine and is driven through spiral gears from the camshaft. To remove distributor, disconnect primary leads and manual spark control and remove distributor head with cables intact. Then take out two cap screws in distributor bracket and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor every 500 miles of operation. At the same time remove the distributor head and rotor and put one drop of oil on the breaker arm pivot pins and oil the wick oiler in the center of the shaft. Put a small bit of vaseline on the face of the breaker cam.

Timing:—**Synchronization of Contacts.** Contacts must be synchronized to secure simultaneous opening of both sets. Full directions on synchronization of IGK distributors will be found in the Equipment Section. Contacts may be synchronized as part of the timing operation. See next paragraph.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position 15 degrees (crankshaft) before top dead center with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke (he up stroke with both valves closed). Fully advance the manual spark control lever. Connect a six volt test lamp in series with each primary circuit to accurately determine when contacts open. Turn on ignition and continue to turn engine over until the mark 'IGN' on the front flywheel (which is 15 degrees before top dead center) is directly opposite the indicator on the

AUTO-LITE SYSTEM

crankcase. Then loosen the advance arm clamp screw and rotate distributor housing until the lamp goes out, indicating that the first set of contacts has opened. Tighten the clamp screw. If both lamps go out at the same instant, the contacts are properly synchronized. However if one lamp goes out first, it will be necessary to loosen the lock screws on the movable sub-plate and shift the plate until the second set of contacts (mounted on the sub-plate) begin to open. Tighten lock screws.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—18 MM. Metric. A.C., Type J-9. Set gaps at .020 inch.

VALVE TIMING:—Overhead valve type engine. Valves in cylinder head operated by rocker arm and pushrods at right of engine. Valve tappet adjustment in end of rocker arm directly over pushrods. Camshaft driven from crankshaft by Diamond roller chain (two sprocket drive—no adjustment necessary).

Valve Specifications—Series 8-90, 9-90

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 11/16"	3/8"	5 17/32"	45°	11/32"
Exhaust	1 17/32"	3/8"	5 17/32"	45°	11/32"

	Tappet Clearance		Spring Pressure
Intake	.012" (hot). See note	Closed	55-65 pounds
Exhaust	.012" (hot). See note	Open	139-149 pounds

Valve Timing—Series 8-90, 9-90

Intake valves open 15° after top dead center. Intake valves close 38° after lower dead center. Exhaust valves open 45° before lower dead center and close 10° after top dead center.

To Set Tappet Clearance. All tappet clearance adjustments should be made with the engine hot and idling. To set tappet clearance, see that the engine is at normal running temperature (car should be driven for 20 minutes or longer), remove cylinder head valve cover, run engine at idling speed, use .012 inch feeler and set clearance by turning adjustment screw up or down after loosening lock nut until a slight pull is necessary to remove feeler.

To Set Valve Timing (All Models)—The chain should be installed endless. Both sprockets must be pulled and installed at the same time with the chain in place. Care must be taken not to remove one sprocket ahead of the other. Special pullers must be used on both sprockets and special tools used to install sprockets. To set timing, mesh sprockets in chain so that a straightedge laid across the camshaft sprocket in line with the center of the keyway and the punch mark on the sprocket is in line with the punch mark on the crankshaft sprocket (both punch marks adjacent or between the shaft centers). The punch mark on the crankshaft sprocket is approximately 4 teeth counter-clockwise from the keyway on the sprocket.

STARTER:—Model MAB-4024. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. The starting switch is mounted on the starter field frame and is operated through a flexible control by a button on the dash. Brush spring tension is 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4020	5.5	46
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.2 "	410	4.0	400
24 "	Lock	4.0	725

Startix:—Startix automatic starting switch is optional equipment on these models. To install Startix or to service cars equipped with Startix, see complete article in Equipment Section on Startix switch. The starting motor switch is modified by disconnecting the control cable and blocking switch lever so that switch contacts are permanently closed.

Mounting:—Starter is sleeve mounted at the right of the engine on the forward side of the flywheel housing. To remove starter, disconnect cables and starting switch control and take out large pilot mounting screw in housing directly above starter sleeve. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the starter every 1000 miles of operation.

GENERATOR:—Model GAR-4205. Rotation counter-clockwise at commutator end. Current regulation by third brush shunt field. To adjust generator output, loosen the commutator cover band and shift the third brush mounting plate by prying on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting plate is held in position by friction between the mounting stud and the end plate. With standard car setting, the maximum charging rate is 12-14 amperes (hot) at 8 volts reached at 1700 R.P.M.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	750
10	7.3	1030
14	7.65	1230
17	8.0	1700

Brush spring tension is 24-36 ounces. Generator motoring draws 5.13-5.67 amperes at 6 volts. Shunt field current is 4.46-4.94 amperes at 6 volts. A 7½ ampere field fuse is connected in the field circuit.

Mounting:—Generator is cradle mounted at the left of the engine and is belt driven from the crankshaft. The water pump is driven by an extension of the generator shaft. To remove generator, disconnect lead and water pump drive coupling and loosen mounting clamp band. Slip off drive belt and lift generator from place.

Belt Adjustment. Adjust fan belt whenever sideplay at a point midway between the generator and fan pulleys is greater than 1½ inches. To take up fan belt, loosen two cap screws on fan bracket and raise fan until belt tension is correct, tighten cap screws. Belt should be just tight enough to drive generator and fan without slipping.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 500 miles of operation.

RELAY:—Model CB-4014, 4021. Mounted on the generator. Relay contacts close at 725-750 R.P.M. when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Delco-Remy Switch, Model 486-K. Lighting switch is mounted at lower end of steering column controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.

Stop and Tail Lights (10-90	6-8	21-2	D.C.	1158

FUSES:—Generator field fuse is 7.5 ampere capacity. Lighting fuse on fuse block on the engine side of the dash is 20 ampere capacity.

NASH

BIG SIX SERIES 1120 (1933)
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On right hand frame side rail under engine hood.

ENGINE NUMBER:—On plate on right hand side of crankcase at rear of engine below valve cover plate.

ENGINE:—Six cylinder, 'L' head type, 3¼x4⅜" bore and stroke, 217.7 cubic inch displacement, rated at 25.35 H.P., develops 75 H.P. at 3200 R.P.M. Standard compression ratio 5.3-1. Optional ratios not offered.

BATTERY:—U.S.L., Type KW-13A, 6 volt, 13 plate, 96 ampere hour capacity (20 hour rate). Starting capacity 106 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to left hand rear top cover bolt on transmission.
Mounting:—In cradle on left hand side of frame under driver's seat.
Dimension:—Width, 7⅛". Length, 9 1/16". Height, 9⅛".

IGNITION:—Coil Model CE-4601. Coil assembled as unit with switch by means of armored cable on primary lead.
Ignition Current:—2 amperes at 6 volts (engine running), 4 amperes at 6 volts (engine stopped).
Ignition Switch:—Electrolock, Type 16-S. Assembled as unit with coil. Switch has special terminal for Startix connection (optional equipment) and two 'on' positions. First 'on' position with key turned approximately ⅛ turn to right should be used on cars with Startix to check timing or whenever automatic cranking is not desired. The second 'on' position with key turned to extreme right is regular running position with ignition on and Startix operative.

Distributor Model IGB-4081 (first 1000 cars), IGB-4081A (450 cars), IGB-4081B (later cars). Single breaker, 6-lobe cam, full automatic advance type.
Breaker Gap:—Set contact gap at .020". Hold within limits of .018-.020".
Breaker Arm Spring Tension:—16-22 ounces measured at tip of breaker arm with spring scale at right angles to back of arm.

Cam Angles—Closed 40°. Open 20° (distributor degrees).

Automatic Advance—Model IGB-4081

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.

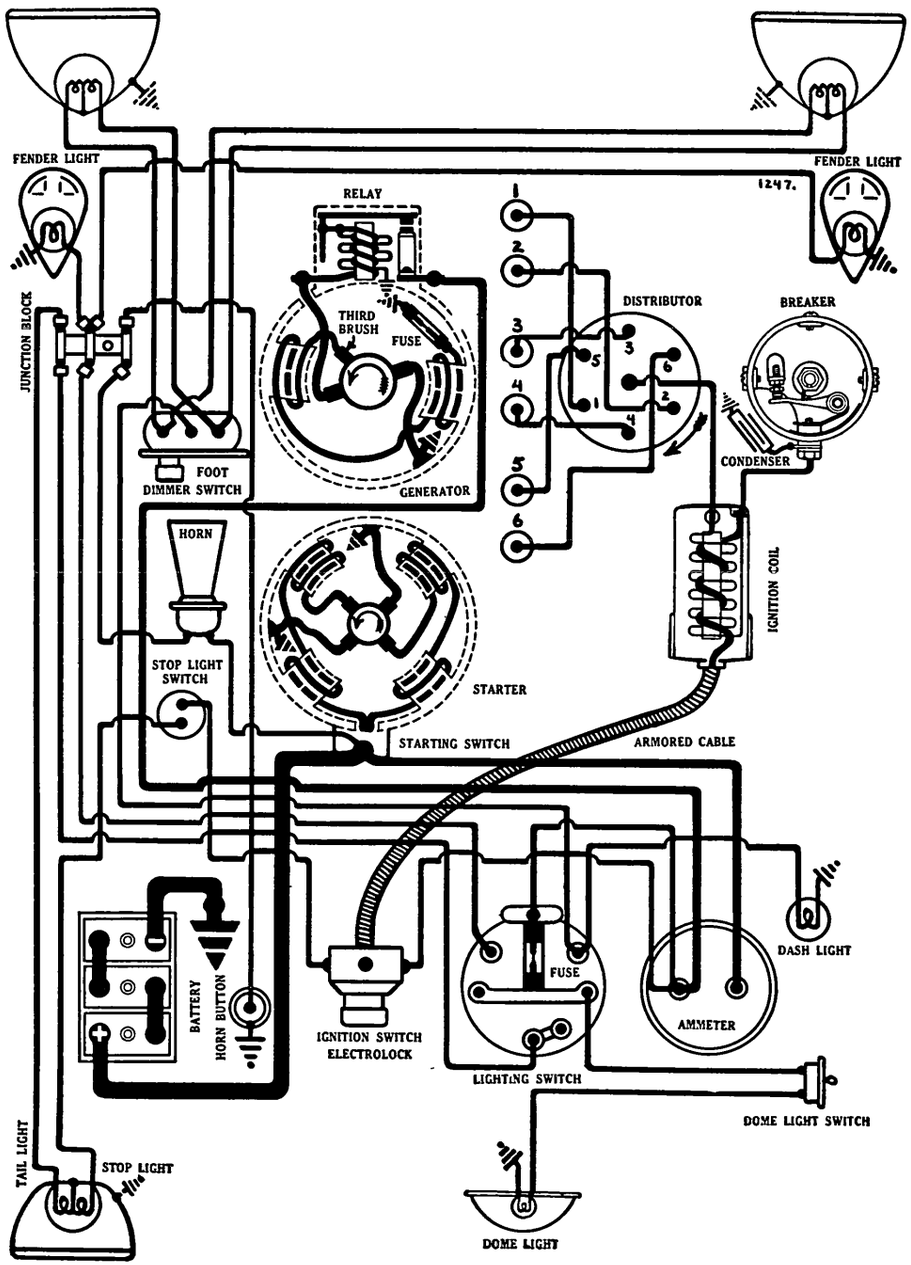
10		1300	20		2600

Automatic Advance—Model IGB-4081A

Start		300	0		600
3		680	6		1360
6		1065	12		2130
10		1600	20		3200



Automatic Advance—Model IGB-4081B

Start		300	0		600
3		710	6		1420
6		1120	12		2240
10		1700	20		3400

Mounting:—Distributor mounted on right hand side of cylinder head. To remove, disconnect primary lead, take off distributor cap, loosen lock nut and back out set screw in side of cylinder head opposite distributor shaft housing, lift distributor out.

Oiling:—1000 Miles. Put a few drops of light engine oil in oiler under distributor cup. Take off distributor cap and rotor, put one drop oil on breaker arm pivot pin, put 2-3 drops oil in wick oiler in center of shaft, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—With No. 1 piston on compression stroke, turn engine over by hand until the 'IGN' mark on the vibrator dampener at the front of the engine is directly under the pointer on the chain case. This 'IGN' mark

NASH

BIG SIX SERIES 1120 (1933)
AUTO-LITE SYSTEM

is the first line on the rim of the dampener, the second line being the top dead center mark. Then loosen lock nut and back off set screw on side of cylinder head slightly, rotate distributor until contacts begin to open, tighten set screw and lock nut. See that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. A.C., Type G-8. Set gaps at .022".

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven from the crankshaft by a double diamond roller chain. Camshaft drive is two-sprocket non-adjustable type. Chain must be installed endless and sprockets are marked. To set timing, mesh sprockets so that marks are adjacent and in line with a straightedge laid across the shaft centers. Special pullers must be used to remove and install sprockets and care should be taken to keep sprockets lined up (to avoid placing side-strain on chain or sprockets) while they are being removed or installed.

Valve Specifications

	Head Diameter	Seat Angle	Width of Seat
Intake	1 21/32"	45°	1/16"
Exhaust	1 17/32"	45°	1/16"

Tappet Clearance

Intake and Exhaust .....008" with engine either hot or cold.

CARBURETION:—Stromberg Downdraft Carburetor, Model EX-22 (see Carburetor Section for complete data). Manifold heat control is automatic, being controlled by thermostatic spring with additional seasonal control operated manually by button on dash. Choke is controlled by button on dash.

Air Cleaner:—Oil-wetted copper mesh type integral with silencer. Remove complete unit at 3000-mile intervals, clean by dipping air cleaner end of unit in pan of gasoline, dry thouoghly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. Mechanical type mounted on right hand side of crankcase and driven by eccentric on camshaft (see Carburetion Section for complete data). Remove glass sediment bowl under pump when necessary, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—Model MAB-4049. Starter drive—Inboard Bendix. Starting switch is mounted on starter field frame and is operated through flexible cable control by button on instrument panel. Starter rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes

10.2 "	420	4.0	400
17.0 "	Lock	3.0	525
24.0 "	Lock	4.0	725

Note on Startix:—Startix Automatic Starting Switch is optional on these cars. When Startix is installed the original starting switch is modified by disconnecting control cable and permanently blocking switch contacts closed. The cut-out relay on generator has a special terminal on the end of the case for the Startix connection (see Equipment Section for complete data and adjustments on Startix).

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect cable, disconnect starting switch control, take out flange mounting screws, pull starter forward to clear Bendix, lift out.

Oiling:—1000 Miles. Put a few drops of light engine oil in oiler at each end.

GENERATOR:—Model GAR-4205-2. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate is 17 amperes (cold) at 8.0 volts reached at 1700 R.P.M.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting stud, counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data—Cold Test

Amperes	Volts	R.P.M.
2	6.4	750
6	6.9	885

14	7.65	2200

Brush Spring Tension:—24-36 ounces on each brush.

Field Current:—4.46-4.94 amperes at 6.0 volts across field terminals.

Field Fuse:—7.5 ampere capacity mounted under cover on top of generator.

Motoring:—5.13-5.67 amperes at 6.0 volts.

Mounting:—Cradle mounted at left front of engine with fan belt drive. Water pump is driven by extension of generator shaft. To remove generator, disconnect lead, disconnect water pump drive coupling, back off belt adjustment and slip off drive belt, loosen mounting clamp band, lift generator out.

Belt Adjustment:—To take up drive belt, loosen two cap screws on fan bracket, lift fan bracket up until sideplay on belt midway between fan and generator pulleys is about one inch when belt is pressed lightly, tighten mounting screws. Adjust belt tension whenever sideplay as measured above exceeds 1½ inches.

Oiling:—1000 Miles. Put a few drops of light engine oil in oiler at each end.

RELAY:—Model CB-4021. Mounted on generator field frame. Contacts close at approximately 750 R.P.M. of generator when generator voltage reaches 7.0-7.5 volts with charging current of approximately 2 amperes and open with discharge current of .5-2.5 amperes. Generator main brush lead is connected to terminal underneath relay case, which is connected to Startix terminal on the end of the case.

Contact Gap:—.025-.035 ". **Air Gap:**—.010-.030" (contacts closed).

LIGHTING:—Delco-Remy Lighting Switch, Model 478-N. Dimmer Switch Model 465-Z. Lighting switch mounted on back of instrument board and controlled by push-pulll button on instrument panel. Double filament headlight bulbs are used for 'depressed beam' dimming and are controlled by foot-operated switch on toeboard. Stop and tail light is fitted with double filament bulb.

Lamp Sizes

NASH

STANDARD EIGHT SERIES 1130 (1933)
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On right hand frame side rail under engine hood.

ENGINE NUMBER:—On plate on right hand side of crankcase at rear of engine below valve cover plate.

ENGINE:—Eight cylinder 'in line', 'L' head type, 3x4⅜" bore and stroke, 247 cubic inch displacement, rated at 28.8 H.P., develops 80 H.P. at 3200 R.P.M. Standard compression ratio 5.1-1. Optional ratios are not offered.

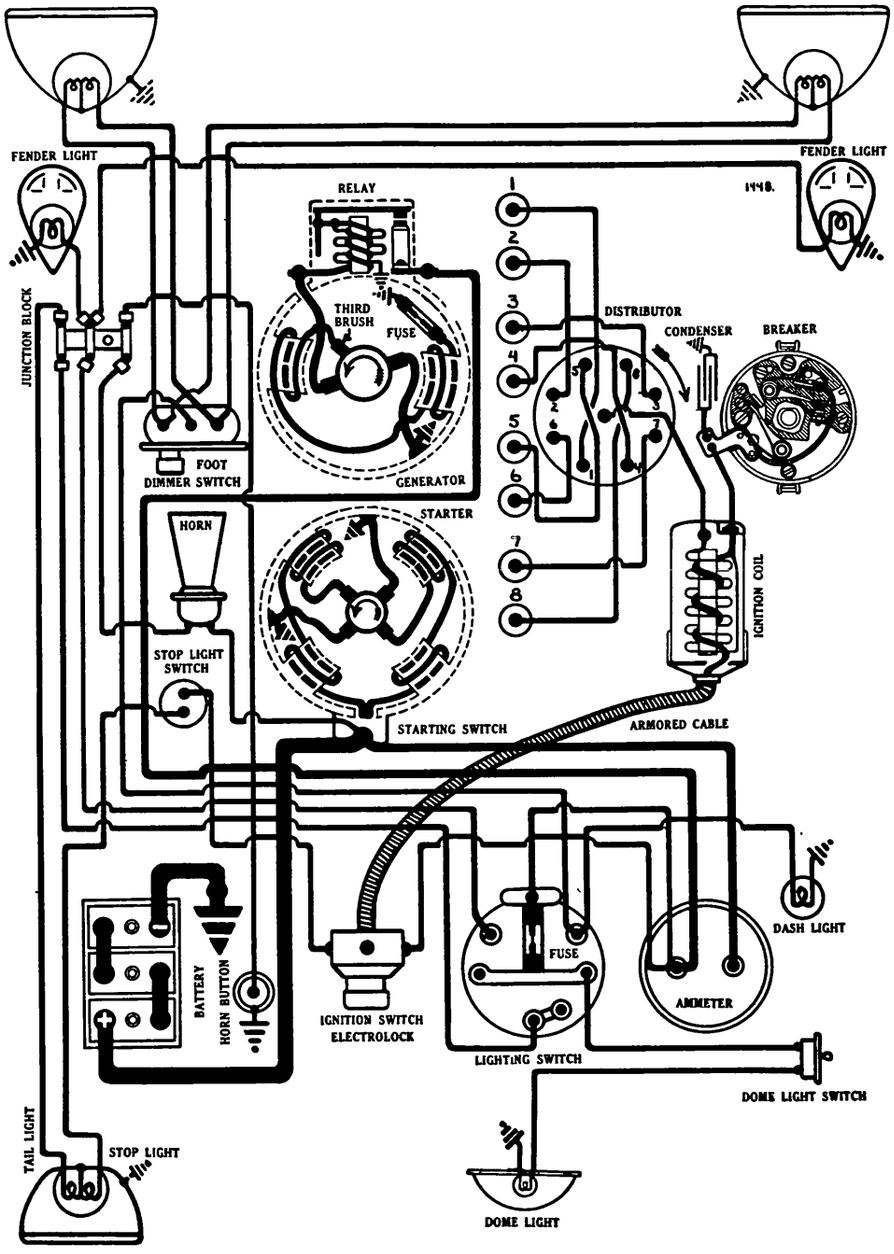
BATTERY:—U.S.L., Type KW-13A, 6 volt, 13 plate, 96 ampere hour capacity (20 hour rate). Starting capacity 106 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to left hand rear top cover bolt on transmission.
Mounting:—In cradle on left hand side of frame under driver's seat.
Dimensions:—Width, 7⅛". Length, 9 1/16". Height, 9⅛".

IGNITION:—Coil Model CE-4601. Coil assembled as unit with switch by means of armored cable on primary lead.
Ignition Current:—2 amperes at 6 volts (engine running), 4 amperes at 6 volts (engine stopped).
Ignition Switch:—Electrolock, Type 16-S. Assembled as unit with coil. Switch has two 'on' positions and special terminal for Startix connection (Startix is optional). First 'on' position with key turned approximately ⅛ turn to right should be used on cars with Startix to check timing or whenever automatic cranking is not desired. The second 'on' position with key turned to extreme right is the regular running position with ignition on and Startix operative.

Distributor Model IGH-4023. Double breaker, 4-lobe cam, full automatic advance type. Contacts open alternately at 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized (see Timing).
Breaker Gap:—Set contact gap at .020". Hold within limits of .020-.022".
Breaker Arm Spring Tension:—16-20 ounces.

Cam Angles—Closed 34.5°. Open 10.5° (distributor) when synchronized.

Automatic Advance



Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	0		600
4		700	8		1400
8		1100	16		2200

Mounting:—Distributor mounted on right hand side of cylinder head. To remove, disconnect breaker lead, take off distributor cap, loosen lock nut and back out set screw in side of cylinder head opposite distributor shaft housing, lift distributor out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler on side of distributor. Take off distributor cap and rotor, put one drop oil on breaker arm pivot pins, put 2-3 drops oil in wick oiler in center of shaft, apply thin film vaseline to face of breaker cam.

IGNITION TIMING:—With No. 1 piston on compression stroke turn engine over by hand until the 'IGN' mark on the vibration dampener at the front of the engine is directly under the pointer on the chain case. This 'IGN' mark is the first line on the dampener, the second line being the top dead center mark. Then loosen lock nut and back out set screw in side of cylinder head slightly, rotate distributor until first or 'fixed' set of contacts (mounted directly on breaker plate) begin to open, tighten set screw and lock nut, see that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated. Then synchronize contacts as directed below.

Synchronization of Contacts—first method. After distributor has been timed to engine (above), turn engine over 90° or ¼ revolution to firing position of piston No. 6 with the No. 6 ignition mark on the vibration dampener directly under the pointer on the chain case. Then loosen two

NASH

STANDARD EIGHT SERIES 1130 (1933)
AUTO-LITE SYSTEM

lock screws on movable sub-plate (carrying second or 'movable' set of contacts), shift plate until contacts begin to open, tighten lock screws, check contact gap.

Synchronization of Contacts—second method. Use special Auto-Lite synchronizing tool and follow complete directions for synchronization of Type IGH distributors as given in Equipment Section.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. A.C. Type G-10. Set gaps at .022 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven from the crankshaft by a double diamond roller chain. Camshaft drive is of two-sprocket non-adjustable type. Sprockets are marked and chain must be installed endless. To set timing, mesh sprockets in chain so that marks are adjacent and in line with a straightedge laid across the shaft centers. Special pullers must be used to remove and install sprockets and care must be used to keep sprockets lined up (to avoid placing side-strain on chain and sprockets) while they are being removed or installed.

Valve Specifications

Start		300	0		600
4		700	8		1400
8		1100	16		2200

Mounting:—Distributor mounted on right hand side of cylinder head. To remove, disconnect breaker lead, take off distributor cap, loosen lock nut and back out set screw in side of cylinder head opposite distributor shaft, lift distributor out.

Oiling:—**1000 Miles.** Put 8-10 drops light engine oil in oiler on side of distributor. Take off distributor cap and rotor, put one drop oil on breaker arm pivot pins, put 2-3 drops oil in wick oiler in center of shaft, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—With No. 1 piston on compression, turn engine over by hand until the 'IGN' mark or first line on the vibration dampener at the front of the engine is directly under the pointer on the chain case (the second line is the top dead center mark). Then loosen lock nut and back out set screw in side of cylinder head opposite distributor, rotate distributor until first or 'fixed' set of contacts (mounted directly on breaker plate) begin to open, tighten set screw and lock nut, see that rotor is directly opposite No. 1 terminal in distributor cap (see diagram), connect spark plugs as indicated. Then synchronize contacts as directed below.

Synchronization of Contacts—first method. After distributor has been timed to engine (above), turn engine over 90° or ¼ revolution to firing position of piston No. 6 with the No. 6 ignition mark on the vibration dampener directly under the pointer on the chain case. Then loosen lock screws on movable sub-plate (carrying second or 'movable' set of contacts), shift plate until contacts begin to open, tighten lock screws, check contact gap.

NASH

SPECIAL EIGHT SERIES 1170 (1933)
AUTO-LITE SYSTEM

Synchronization of Contacts—second method. Use special Auto-Lite synchronizing tool and follow complete directions for synchronization of Type IGH distributors as given in Equipment Section.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. A.C., Type G-10. Set gaps at .022 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven from the crankshaft by a double Diamond roller chain. Camshaft drive is of the two-sprocket non-adjustable type. Sprockets are marked and chain must be removed and installed endless. To set timing, mesh sprockets in chain so that marks are adjacent and in line with a straightedge laid across the shaft centers. Special pullers must be used to remove and install sprockets and care must be used to keep sprockets lined up (to avoid placing side-strain on chain and sprockets) while they are being removed and installed.

Valve Specifications

	Head Diameter	Seat Angle	Width of Seat
Intake	1 13/32"	45°	1/16"
Exhaust	1 11/32"	45°	1/16"

Tappet Clearance

Intake and exhaust.....008" with engine either hot or cold.

CARBURETION:—Stromberg Downdraft Carburetor, Model EE-2 (see Carburetor Section for complete data). Manifold heat control is automatic, being controlled by thermostatic spring with additional seasonal control being operated manually by button on instrument board.

Air Cleaner:—Oil-wetted copper mesh type integral with silencer. Remove complete unit at 3000-mile intervals, clean by dipping air cleaner end of unit in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. mechanical type mounted on right hand side of crankcase and driven by eccentric on camshaft (see Carburetion Section for complete data). Remove glass sediment bowl under pump when necessary, empty water and sediment, clean filter screen located directly above bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—Model MAB-4026. Starter drive—Inboard Bendix. Starting switch is mounted on starter field frame and is controlled through flexible cable by button on instrument panel. Starter rotation is counter-clockwise at commutator end. Brush spring tension is 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4020	5.5	46
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	700	4.5	300
10.2 "	420	4.0	400
17.0 "	Lock	3.0	525
24.0 "	Lock	4.0	720

Note on Startix:—Startix automatic starting switch is optional equipment on these cars. When Startix is installed the original starting switch is modified by disconnecting control cable and permanently blocking switch contacts closed. The cut-out relay on the generator has a special terminal on the end of the case for the Startix connection. See Equipment Section for complete data on Startix.

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect cable and starting switch control, take out flange mounting screws, pull starter forward to clear Bendix, lift out.

Oiling:—1000 Miles. Put 5-6 drops light engine oil in oiler at each end.

GENERATOR:—Model GAL-4329. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate is 17 amperes (cold) at 8.0 volts reached at 1900 R.P.M.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting stud, counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	600	0	6.4	700

17	8.0	1900	12.4	8.0	2150
12	7.4	3200	9.5	7.7	3200

Brush Spring Tension:—17-22 ounces on each brush.

Field Current:—3.89-4.31 amperes at 6.0 volts across field terminals.

Field Fuse:—7½ ampere capacity fuse mounted on generator brush ring.

Motoring:—4.18-4.62 amperes at 6.0 volts.

Mounting:—Flange mounted on left hand rear face of engine front cross member. To remove, disconnect lead, take off drive pulley and fan belt, free brace strap at rear of generator, take out flange mounting bolts, lift generator out.

Belt Adjustment:—To take up fan belt, loosen flange mounting bolts and brace strap, swing generator away from engine until sideplay on belt midway between fan and generator pulleys is about one inch when belt is pressed lightly, tighten mounting bolts. Adjust belt tension whenever sideplay as measured above exceeds 1½ inches.

Oiling:—1000 Miles. Put 4-5 drops light engine oil in oiler at each end.

RELAY:—Model CB-4021. Mounted on generator field frame. Contacts close at 675 R.P.M. when generator voltage reaches 7.0-7.5 volts with charging current of approximately 2 amperes and open with discharge current of .5-2.5 amperes. Generator main brush lead is connected to terminal under relay case, which is connected to the Startix terminal on the end of the case. **Contact Gap:**—.025-.035". **Air Gap:**—.010-.030" with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 4210-A. Delco-Remy Dimmer Switch, Model 465-N. Lighting switch is mounted at lower end of steering column and is controlled by lever on steering wheel. Double filament headlight bulbs are used for 'depressed beam' dimming and are controlled by foot-operated switch on toeboard. Stop and tail light is fitted with a double filament bulb.

NASH

ADVANCED EIGHT SERIES 1180 (1933)
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On right hand frame side rail under engine hood.

ENGINE NUMBER:—On right hand side of crankcase near starting motor.

ENGINE:—Eight cylinder 'in line', overhead valve or 'I' head type, 3⅛x4¼" bore and stroke, 260.8 cubic inch displacement, rated at 31.25 H.P., develops 100 H.P. at 3400 R.P.M. Standard compression ratio 5.25-1. Optional compression ratios are not offered.

BATTERY:—U.S.L., Type KW-15A, 6 volt, 15 plate, 115 ampere hour capacity (20 hour rate). Starting capacity 127 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded.
Mounting:—Under right front seat.
Dimensions:—Width, 7⅛". Length, 10 7/32". Height, 9⅛".

IGNITION:—Coil Model CE-4402 (2 used). Coils are mounted on engine side of dash at right of motor.
Ignition Current:—1-3 amperes at 6 volts (engine running), 3.4-5 amperes at 6 volts (engine stopped) for each coil.
Ignition Switch:—Oakes 'Hershey' type co-incidental ignition switch and steering post lock. On cars equipped with Startix (optional equipment), it will be necessary to disconnect wire on 'IGN' terminal of Startix case when ignition is turned on to check timing or whenever automatic cranking is not desired.

Distributor Model IGK-4004. Double breaker, 8-lobe cam, semi-automatic advance type. Contacts open simultaneously to fire both spark plugs in each cylinder at the same instant (each set of contacts controls one coil and fires one spark plug in each cylinder). Contacts must be synchronized (see Timing). Maximum manual advance is 20° (engine).
Breaker Gap:—Set contact gap at .015". Hold within limits of .013-.017".
Breaker Arm Spring Tension:—20 ounces measured at tip of breaker arm.
Cam Angles—Closed 28°. Open 17° (distributor) each set independently.

Automatic Advance

Start		215	0		430
4		605	8		1210
8		1000	16		2000

NOTE:—If trouble is experienced with distributor caps burning between terminals, the alignment of the rotor and distributor cap terminals should be checked. To do this it will be necessary to cut away a distributor cap so that the position of the rotor terminals with relation to the distributor cap terminals can be checked. The rotor terminals should be directly opposite the distributor cap terminals when the breaker contacts open. To correct incorrect alignment it will be necessary to elongate the two breaker plate mounting screw holes to a maximum length of 13/32" so that the breaker plate may be rotated within the housing to correct the alignment. If necessary the slots in the housing through which the primary terminals pass can be lengthened with a file to allow the rotation of the breaker plate. Distributors now have two lines scratched on the inside of the housing in line with the notch in the breaker plate to indicate the correct position of the plate.

Mounting:—Distributor mounted on right hand side of crankcase. To remove, disconnect primary leads and manual spark control, take off distributor cap, take out hold-down screws in advance arm, lift distributor out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler under distributor. Take off distributor cap and rotor, put one drop oil on breaker arm pivot pins, put 2-3 drops oil in wick oiler in center of shaft, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—With No. 1 piston on compression stroke turn engine over by hand until the 'IGN' mark on the vibration dampener at the front of the engine is directly under the pointer on the chain case. The 'IGN' mark is the first line on the dampener, the second line is the top dead center mark. Then loosen advance arm clamp bolt, rotate distributor until first or

AUTO-LITE SYSTEM

fixed set of contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, connect spark plugs as indicated on diagram.

Synchronization of Contacts—first method. After distributor has been timed to engine (above) and without disturbing position of crankshaft or distributor, loosen lock screws on movable sub-plate, shift plate until second or movable contacts (mounted on the sub-plate) begin to open, tighten lock screws. Recheck timing to make certain that both sets of contacts open at the same instant. This is important to secure full advantage of 'Twin Ignition'.

Synchronization of Contacts—second method. See complete directions on synchronization of Type IGK Distributors in Equipment Section.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. Metric. A.C. Type K-12. Set gaps at .022 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine operates valves through pushrods and rocker arms on cylinder head. Tappet adjustment is located on rocker arms directly above pushrods. Camshaft is chain driven from the crankshaft by double Diamond roller chain. Drive is two-sprocket non-adjustable type and sprockets are marked. Chain must be installed endless and special pullers must be used to remove and install sprockets. To set timing, mesh sprockets in chain so that marks are adjacent and in line with straightedge laid across shaft centers. In removing or installing sprockets care must be taken to keep sprockets lined up so that no side-strain is placed on chain or sprockets.

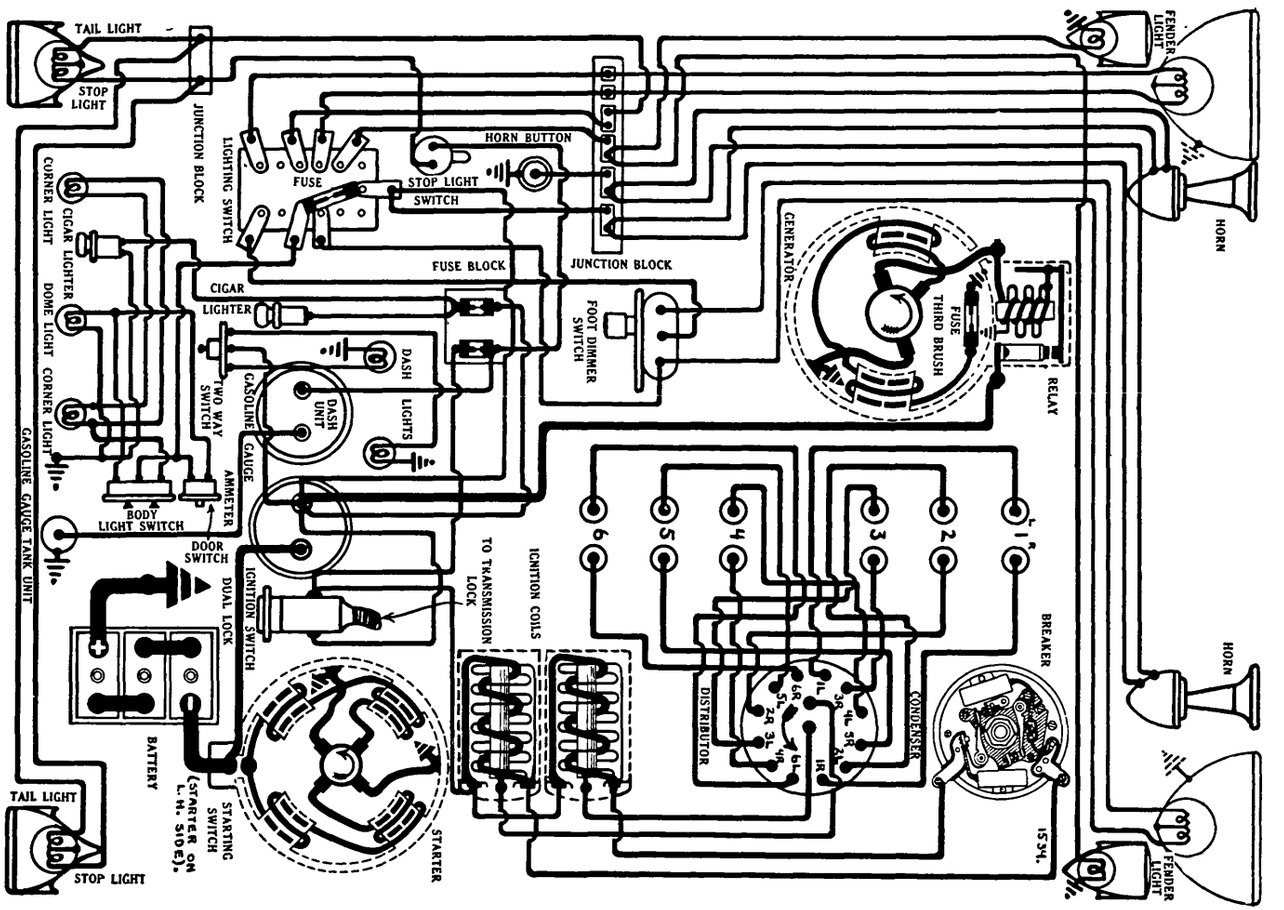
Cam Angles—Closed 35°. Open 25°. Each set independently—double ignition type.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
3	360	6	720
6	520	12	1040
9	680	18	1360
12	840	24	1680
15	1000	30	2000

IGNITION TIMING:—With #1 piston on compression, turn engine over until piston is slightly before top dead center, stop when 'IGN' line on vibration dampener at front of engine lines up with pointer on chain case cover (second line is top dead center point). Loosen advance arm clamp bolt, rotate distributor until fixed contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt. See diagram for spark plug cable connections.
Synchronization:—After timing distributor (above) and without disturbing position of distributor or crankshaft, loosen lock screws on movable subplate (carrying second set of contacts), shift plate (by inserting screwdriver in slot on plate) until second set of contacts begin to open, tighten locking screws. With correct adjustment both sets of contacts should open simultaneously. See Equipment Section for data on Synchronziation.
Motor Gauge—Weidenhoff Adapter #113 (with #152 adapter and X-4615 collar). Rod #37.

Firing Order:—1-5-3-6-2-4. See diagram for distributor connections.



Spark Plugs:—A.C., Type K-12. 14 MM. Metric type.
Spark Plug Gaps—.022" (.030" cars with radio).

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.
Carburetor:—Stromberg Model EX-32, 1¼" plain tube downdraft type.
Fuel Pump:—AC, Type R.
Gasoline Gauge:—Stewart Electric Type.

VALVE TIMING:—To Check Timing—Check camshaft setting. Mesh chain with sprockets turned so that marks are adjacent and in line with straightedge across shaft centers. Remove and install chain 'endless' using special pullers and pushers. Keep sprockets lined up to avoid sidestrain on chain and sprockets.
Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter and X-4615 collar), Rod #37.

Tappet Clearance:—.015" all valves with engine hot and idling.

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—25 pounds.

BATTERY:—U.S.L., Type KW-13A, 6 volt, 13 plate, 96 A.H. capacity (20 hour rate).
Starting Capacity—106 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under right hand front seat.

STARTER:—Model MAB-4053. Armature No. MAB-2057.
Starter Drive—Inboard Bendix.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

Starting Switch:—Type VC-4002. Mounted on starter field frame. Operated by depressing clutch pedal. Controlled by vacuum. See Equipment Section for complete data.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out flange mounting cap screws.

GENERATOR: — Model GAR-4601-3. Armature No. GAR-2214. Third brush control type.

Charging Rate Adjustment—Take off commutator cover band, shift third brush by prying on brush mounting plate, counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.
Maximum Charging Rate—15 amperes (normal), may be increased to 25 amperes (total including ignition) on cars equipped with heater or radio (generator is air-cooled).

Performance Data
Generator cold

Amperes	Volts	R.P.M.
0	6.4	760
4	6.75	920
8	7.05	1115
12	7.35	1300
16	7.7	1560
20	8.0	2300

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ozs. (new brushes).
Field Current—4.46-4.94 amperes at 6.0 volts.
Field Fuse—7½ ampere (under cover on generator).

Motoring Current—4.89-5.41 amperes at 6.0 volts.

Mounting:—Cradle mounted at left front of engine. Fan belt drive. Water pump driven by generator shaft extension. To remove, disconnect water pump drive coupling, slack off belt adjustment, slip off drive belt, loosen mounting clamp band.

Belt Adjustment—Adjust belt when sideplay at point midway between generator and fan pulleys exceeds 1½". To adjust, loosen two cap screws on fan bracket, raise bracket until sideplay is about 1", tighten cap screws.

CUTOUT RELAY:—Model CB-4021. Mounted on generator field frame.
Cuts in—7.0-7.5 volts or 750 R.P.M.
Cuts out—.5-2.5 ampere discharge.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" (contacts closed).

LIGHTING: — Soreng-Manegold Light Switch, Model 5620-A. Delco-Remy Foot Control Switch, Model 465-Z. Foot control switch provides assymetrical passing beam (lower beam right hand headlight, upper beam left hand headlight). Headlights (without lenses) are aimed straight ahead, but lenses cause beams to cross.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-21	1116
Fender, Instrument	3	63
Stop and Tail	21-2	1158
Dome, Corner	3	63

FUSES:—Lighting—20 ampere on lighting switch.
Body and Accessory—Two 20 ampere on fuse block.
Generator Field—7½ ampere (under cover on generator).

SERIAL NUMBER:—First number, B-70,801. On frame on right hand side under engine hood.

COMPRESSION:—Ratio—5,25-1 standard head.
Pressure—125 lbs. at 350 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Mod. CE-4402 (2 used). Coils mounted on dash.
Ignition Current—2 amps. running, 4 amps. stopped.
Ignition Switch—Delco-Remy Dual Lock Model 425-U, V. Co-incidental ignition switch and transmission lock (see Electrical Equipment Section).

Distributor Model IGK-4101. Double breaker, 8 lobe cam, full automatic advance type. Each set of contacts controls one coil and fires one spark plug in each cylinder (Twin Ignition engine). contacts must be synchronized (see Timing).
Breaker Gap—.013-.017" (.015-.019" first 1000 miles with new contacts).
Breaker Arm Spring Tension—20 ounces.
Cam Angles—Closed 28°. Open 17° (distributor). Each set independently—double ignition type.

20	8.0	2300

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ozs. (new brushes).
Field Current—4.46-4.94 amperes at 6.0 volts.
Field Fuse—7½ ampere (under cover on generator).

Motoring Current—4.89-5.41 amperes at 6.0 volts.

Mounting:—Cradle mounted at left front of engine. Fan belt drive. Water pump driven by generator shaft extension. To remove, disconnect water pump drive coupling, slack off belt adjustment, slip off drive belt, loosen mounting clamp band.

Belt Adjustment—Adjust belt when sideplay at point midway between generator and fan pulleys exceeds 1½". To adjust, loosen two cap screws on fan bracket, raise bracket until sideplay is about 1", tighten cap screws.

CUTOUT RELAY:—Model CB-4021. Mounted on generator field frame.
Cuts in—7.0-7.5 volts or 750 R.P.M.
Cuts out—.5-2.5 ampere discharge.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" (contacts closed).

LIGHTING:—Soreng-Manegold Light Switch, Model 5620-A. Delco-Remy Foot Control Switch, Model 465-P. Foot control switch provides assymetrical passing beam (lower beam right hand headlight, upper beam left hand headlight). Headlights (without lenses) are aimed straight ahead, but lenses cause beams to cross.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-21	1116
Fender, Instrument	3	63
Stop and Tail	21-2	1158
Dome, Corner	3	63

FUSES:—Lighting—20 ampere on lighting switch.
Body and Accessory—Two 20 ampere on fuse block.
Generator Field—7½ ampere (under cover on generator).

SERIAL NUMBER:—First number, R-294725. On right hand frame side rail under engine hood.

COMPRESSION:—**Ratio**—5.25-1. No optional ratios.
Pressure—125 lbs. at 350 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

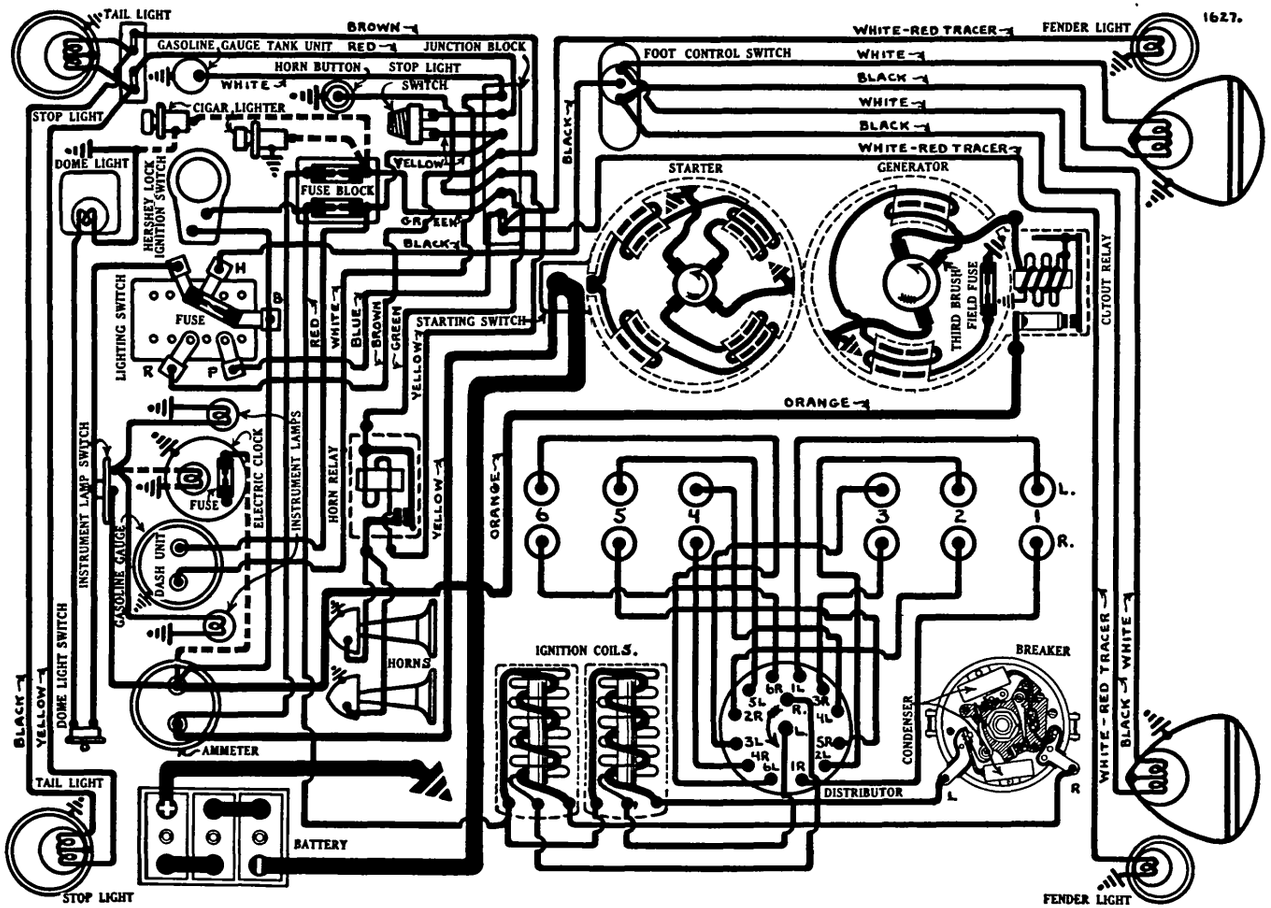
IGNITION:—**Coil Model CE-4402 (2 used).** Coils are mounted on the dash.
Ignition Current—2 amperes (running), 4 amperes (stopped) for each coil.
Ignition Switch—Oakes Hershey type co-incidental ignition switch and steering post lock.

Distributor Model IGE-4012. Double breaker, 6 lobe cam, full automatic advance type. Contacts open simultaneously to fire both spark plugs in each cylinder at the same instant. Each set of contacts controls one coil and fires one spark plug in each cylinder. Contacts must be synchronized—see Timing.
Breaker Gap—Set at .020". Limits .018-.020" (.020-.024" for first 1000 miles with new contacts).
Breaker Arm Spring Tension—16-20 ounces.
Cam Angles—Closed 35°. Open 25° (distributor). Each set operates independently and controls one coil.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
3	360	6	720
6	520	12	1040
9	680	18	1360
12	840	24	1680
15	1000	30	2000

Removal:—Distributor mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.



IGNITION TIMING:—**Stationary Contacts**—With #1 piston on compression, turn engine over until first line on vibration dampener at front of engine lines up with pointer on chain case cover. This line is the 'IGN' mark and the second line indicates top dead center. Loosen advance arm clamp bolt, rotate distributor until fixed contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt. Then check synchronization of movable contacts.
Synchronization (Movable Contacts).—Movable contacts (mounted on sub-plate) should open at the same instant as the fixed set (see above). After timing stationary contacts, and without disturbing position of crankshaft or distributor, loosen lockscrews on movable sub-plate carrying the second set of contacts, shift plate by prying with a screwdriver inserted in the slot in the edge of the plate until contacts begin to open, tighten lockscrews. See Equipment Section for complete article on Synchronization of IGE type distributors.
Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter and X-4615 collar). Rod #37.

Firing Order:—1-5-3-6-2-4. Spark plug cables are not connected in this order on distributor cap (see diagram).

Spark Plugs:—A.C., Type K-12. 14 MM. Metric. Type K-7 used on cars with overdrive.
Spark Plug Gaps—Set at .025" (.030" on cars with radio).

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.
Carburetor:—Stromberg, Model EX-32, 1¼" downdraft type.
Fuel Pump:—A.C., Type R-1521454 diaphragm type.
Gasoline Gauge:—Stewart Electric type.

VALVE TIMING:—**To Check Timing**—Check camshaft setting. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Chain should be removed and installed 'endless.'

Use special pullers and pushers, keep sprockets lined up to avoid sidestrain on chain and sprockets. **Motor Gauge**—Weidenhoff Adapter #113 (with No. 152 Adapter plus No. X-4615 Collar), Rod #37.

Tappet Clearance:—.015" all valves with engine hot. Set clearance with engine idling.

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—25 pounds.

BATTERY:—U.S.L., Type KW-13A, 6 volt, 13 plate, 96 A.H. capacity (20 hour rate).
Starting Capacity—106 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal is grounded to frame and to transmission cover bolt.
Location—Under right front seat.

STARTER:—Model MAB-4053. Armature MAB-2057.
Starter Drive—Inboard Bendix Type LCD11FX-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE—Lock torque figures correct without switch

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting screws.

Starting Switch:—Model VC-4002. Vacuum control type. Mounted on starter field frame and operated by clutch pedal. See Equipment Section for complete article and adjustment.

GENERATOR:—Model GAR-4601-5. Armature GAR-2214. Air-cooled, third brush control type.

Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.

Maximum Charging Rate—17 amperes (hot) at 8.0 volts reached at 2400 R.P.M.

Performance Data

Cold			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
20	8.5	1660	19.2	8.4	2600
22.4	8.8	2300			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ounces.
Field Current—4.46-4.94 amperes at 6.0 volts.
Field Fuse—7½ ampere under cover on generator.
Motoring Current—4.89-5.41 amperes at 6.0 volts.

Removal:—Generator cradle mounted at left front of engine with fan belt drive. Water pump driven by extension of generator shaft. To remove, disconnect water pump drive coupling, slack off belt adjustment, loosen mounting clamp band, lift generator out.

Belt Adjustment:—Adjust belt when sideplay at point midway between generator and fan pulley exceeds 1½". To adjust, loosen two capscrews on fan bracket, raise bracket up (bracket pivots on one screw) until sideplay on belt is approximately 1", tighten screws.

CUTOUT RELAY:—Model CB-4021. Mounted on generator. See complete article on Relays in Equipment Section.

Cuts In—6.75-7.5 volts or 750 R.P.M.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.025-.035".

Air Gap—.010-.030" with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model A-5620-A. R.B.M. Foot Control Switch. Foot operated control switch used to control upper and lower headlamp beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

	Candlepower	Mazda No.
Headlamps	32-21	2320
Fender, Instrument	3	63
Stop and Tail	21-3	1158
Dome	6	81

FUSES:—Lighting—20 ampere on back of lighting switch.

Body & Accessory—Two 20-ampere on fuse block mounted on steering column brace in back of instrument panel.

Generator Field—7½ ampere under cover on generator field frame.

HORNS:—Sparton Vibrator type twin horns. Operated by horn relay.

Horn Relay:—R.B.M., Type 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with 4 volts across winding with relay in inverted position.

SERIAL NUMBER:—First number, C-1001. On plate on right frame side member under engine hood and on caution plate on left front door corner post.

COMPRESSION:—**Ratio**—5.58-1. No optional ratios. **Pressure**—125 lbs. at 350 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model IG-4626.** Mounted on cowl. **Ignition Current**—2½ amperes idling, 4 stopped. **Ignition Switch**—Part of coil assembly (Electrolock type connected to coil by armored cable). **Distributor Models IGB-4328 (1935), IGB-4328-A (1936).** Single breaker, 6 lobe cam full automatic advance type. **Breaker Gap**—Set at .020". Limits .018-.020". **Cam Angles**—Closed 40°. Open 20° (distributor). **Breaker Arm Spring Tension**—16-20 ounces. **Condenser**—Part No. IGB-1025. Capacity .20-.25 mfds.

Automatic Advance—IGB-4328

2	500	4	1000
4	700	8	1400
6	900	12	1800
7	1000	14	2000

Automatic Advance—IGB-4328-A

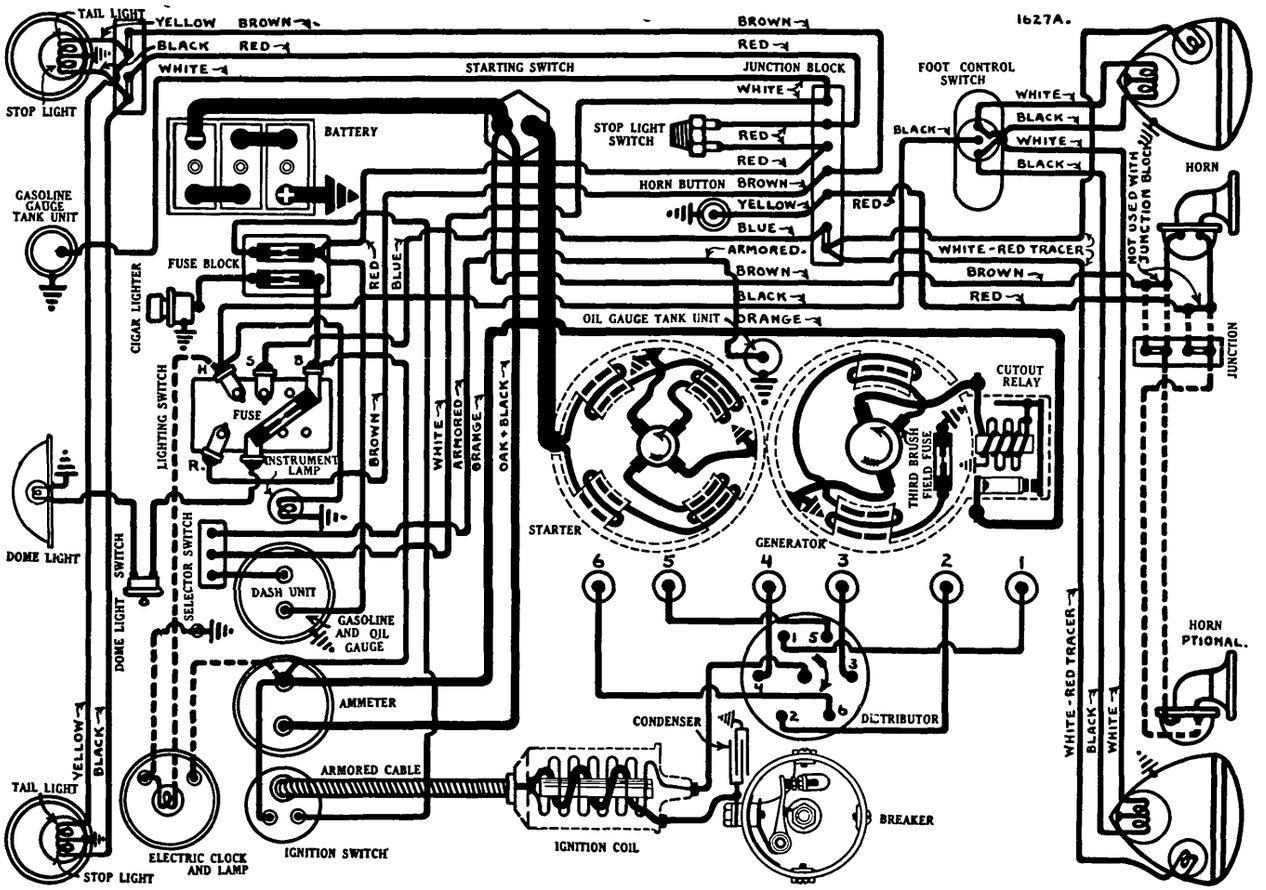
Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
3	390	6	790
7	500	14	1000
10	800	20	1600
12	1000	24	2000

Removal:—Distributor mounted on right side of cylinder head. To remove, loosen locknut and take out mounting setscrew on side of cylinder head opposite distributor.

IGNITION TIMING:— Flywheel Degs. Piston Pos.
First Cars (see note) 10° BTDC. .0415" BTDC.
Later Cars At TDC. .0000" TDC.

NOTE—On all cars with a red plate reading "Caution—Set IGN. on DC." on the side of the distributor housing, the later ignition setting must be used regardless of the location of the 'IGN' line on the vibration dampener. On late cars the IGN. and DC. lines on the vibration dampener coincide.

Timing (first cars without 'Caution' Plate)—With #1 piston on compression, turn engine over until piston is 10° before top dead center, stop when 'IGN' line on vibration dampener at front of engine lines up with pointer on chain case cover. The 'IGN' mark is the first line, the second line indicates top dead center for pistons #1 and 6. Loosen locknut and setscrew on side of cylinder head, rotate distributor until contacts begin to open, tighten setscrew and locknut.



Timing (later cars with Caution Plate)—With #1 piston on compression, turn engine over until piston reaches top dead center, stop when 'DC' line on vibration dampener at front of engine lines up with pointer on chain case cover (if the dampener also marked 'IGN' at point 10° before 'DC' line, the 'IGN' line should be disregarded and the ignition set at the second or 'DC' line; on late cars the two lines coincide). Loosen locknut and set screw on side of cylinder head, rotate distributor until contacts begin to open, tighten setscrew and locknut.

Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter and X-4615 collar). Rod #37.

Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—A.C., Type G-8. 18 MM. Metric.

Spark Plug Gaps—Set at .025" (.030" on cars with radio). In some cases performance has been improved by setting the gaps at .020" in the field.

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EX-22, 1¼" downdraft type.

Fuel Pump:—A.C., Type R-1521454. Diaphragm type.
Gasoline Gauge:—Combination gasoline and oil gauge. Oil reading obtained by pressing button below and to left of instrument cluster. Operative only with ignition 'on'.

VALVE TIMING:—To Check Timing—Check camshaft setting. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Install chain 'endless' with camshaft sprocket off engine.

Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter plus #X-4615 Collar), Rod #37.

Tappet Clearance:—.015" all valves with engine hot or cold.

LUBRICATION:—Crankcase Capacity—7 qts.
Normal Oil Pressure—25 lbs. (10 lbs. Idling).

BATTERY:—U.S.L., Type KW-13A, 6 volts, 13 plate, 96 A.H. capacity (20 hour rate).
Starting Capacity—106 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal is grounded to frame and to transmission cover bolt.
Location—On left side under driver's seat.

STARTER:—Model MAB-4068. Armature MAB-2057.
Starter Drive—Inboard Bendix type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—31-42 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.0	100
3.4 "	1100	4.5	200
6.6 "	695	4.0	300
10.15 "	420	3.5	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

Starting Switch:—Model SW-4001. Mounted at left of engine. Operated by depressing clutch pedal.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting capscrews.

GENERATOR:—Model GAR-4618-2. Armature No. GAR-2155. Air-cooled. Third brush control type.
Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.
Maximum Charging Rate—18 amperes (cold), 16 amperes (hot), 8.0 volts, 2300 R.P.M.

Performance Data

Cold			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	800	0	6.4	800
4	6.8	940	4	6.85	960
8	7.15	1125	8	7.25	1160
12	7.5	1380	12	7.65	1500
16	7.85	1740	16	8.0	2300
18	8.0	2250			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ozs. (new brushes).
Field Current—3.7-4.1 amperes at 6.0 volts.
Field Fuse—5 ampere on generator frame.
Motoring Current—4.94-5.46 amperes at 6.0 volts.
Removal:—Generator cradle mounted at left front of engine with fan belt drive. Water pump impellor mounted on generator shaft. To remove, drain radiator, take out water pump mounting bolts or remove water pump cover screws. Slack off belt adjustment. Loosen mounting clamp band, lift out generator and water pump.

Belt Adjustment:—Adjust when slack or sideplay of belt midway between generator and fan pulleys exceeds 1½". To adjust, loosen two capscrews on fan bracket, lift bracket up (pivots on one screw) until sideplay is approximately 1", tighten capscrews.

CUTOUT RELAY:—Model CB-4014. Mounted on generator. See Equipment Section for complete article on this unit.
Cuts In—6.75-7.5 volts, 800 R.P.M.
Cuts Out—.5-2.5 ampere discharge current.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 5820-A. R.B.M. Foot Control Switch. Foot operated control switch used to control headlamp upper and lower beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320C
Parking, Instrument	3	63
Stop and Tail	21-3	1158
Dome	3	64 (DC.)

FUSES:—Lighting—20 ampere on back of switch.
Generator Field—5 ampere on generator frame.
Accessory—One or two 20-ampere fuses on fuse block mounted on steering column support in back of instrument panel.

SERIAL NUMBER:—First number, B-75010. On right frame side rail under hood.

COMPRESSION:—**Ratio**—5.25-1. No optional ratios.
Pressure—110 lbs. at 350 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model CE-4402 (2 used).** Coils are mounted on dash.
Ignition Current—2 amperes (running), 4 amperes (stopped) for each coil.
Ignition Switch—Oakes Hershey type co-incidental ignition switch and steering post lock.

Distributor Model IGK-4101. Double breaker, 4 lobe cam, full automatic advance type. Contacts open simultaneously to fire both spark plugs in each cylinder at the same instant. Each set of contacts controls one coil and fires one spark plug in each cylinder. Contacts must be synchronized (see Timing).

Breaker Gap—.015". Limits .013-.017" (.015-.019" first 1000 miles with new contacts).

Breaker Arm Spring Tension—20 ounces.
Cam Angles—Closed 28°. Open 17° (distributor). Each set operates independently and controls one coil.

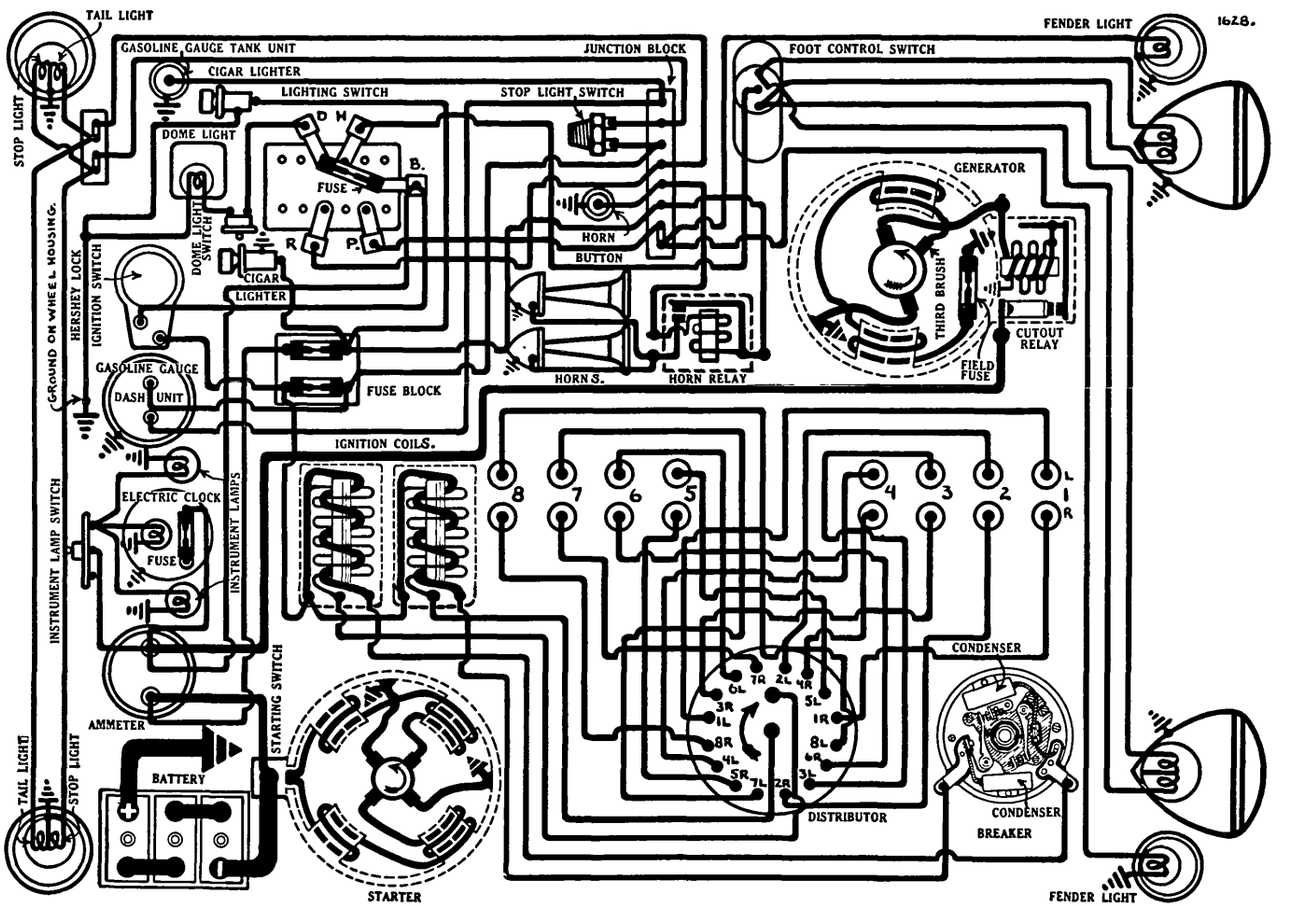
Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
3	360	6	720
6	520	12	1040
9	680	18	1360
12	840	24	1680
15	1000	30	2000

Removal:—Distributor mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—**Stationary Contacts**—With #1 piston on compression, turn engine over until first line on vibration dampener at front of engine lines up with pointer on chain case cover. This line is the 'IGN' mark and the second line indicates top dead center. Loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt. Then check synchronization of movable contacts.

Synchronization (Movable Contacts)—Movable contacts (mounted on sub-plate) should open at the same instant as the stationary set (see above). After timing stationary contacts, and without disturbing position of crankshaft or distributor, loosen lockscrews on sub-plate carrying the second set of contacts, shift plate by prying with a screwdriver inserted in the slot in the edge of the plate until contacts begin to open, tighten lockscrews. See Equipment Section for complete article on synchronization of IGK type distributors



Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter and X-4615 collar). Rod #37.

Firing Order:—1-6-2-5-8-3-7-4. Spark plugs not connected in this order on distributor cap (see diagram).

Spark Plugs:—A.C., Type K-12. 14 MM. Metric. Type K-7 used on cars with overdrive.

Spark Plug Gaps—Set at .025" (.030" on cars with radio).

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.
Carburetor:—Stromberg, Model EE-22 1¼" dual, or Model EE-1 1" dual, downdraft type.
Fuel Pump:—A.C., Type R-1521457 diaphragm type.
Gasoline Gauge:—Stewart Electric type.

VALVE TIMING:—To Check Timing—Check camshaft setting. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Chain should be removed and installed 'endless'. Use special pullers and pushers, keep sprockets lined up to avoid sidestrain on chain and sprockets.

Motor Gauge—Weidenhoff Adapter #113 (with #152 adapter plus No. X-4615 Collar). (Rod #37.

Tappet Clearance:—.015" with engine hot. Set clearance with engine idling.

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—25 pounds.

BATTERY:—U.S.L., Type KW-15A. 6 volt, 15 plate, 115 A.H. capacity (20 hour rate).
Starting Capacity—127 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal is grounded to frame and to transmission cover bolt.
Location—Under right front seat.

STARTER:—Model MAB-4054, MAB-4057 (Export). Armature No. MAB-2047.
Starter Drive—Inboard Bendix Type LCD11FX-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE—Lock torque figures correct without switch.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting screws.

Starting Switch:—Model VC-4003, 4002 (Exp.). Vacuum type. Mounted on starter field frame and operated by clutch pedal. See Equipment Section for complete data and adjustment.

GENERATOR:—Model GAR-4601-5. Armature GAR-2214. Air-cooled, third brush control type.
Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.
Maximum Charging Rate—17 amperes (hot) at 8.0 volts reached at 2400 R.P.M.

Performance Data

Cold			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
20	8.5	1660	19.2	8.4	2600
22.4	8.8	2300			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ounces.
Field Current—4.46-4.94 amperes at 6.0 volts.
Field Fuse—7½ ampere under cover on generator.
Motoring Current—4.89-5.41 amperes at 6.0 volts.

Removal:—Generator cradle mounted at left front of engine with fan belt drive. Water pump driven by extension of generator shaft. To remove, disconnect water pump drive coupling, slack off belt adjustment, loosen mounting clamp band, lift generator out.

Belt Adjustment: — Adjust belt when sideplay at point midway between generator and fan pulley exceeds 1½". To adjust, loosen two capscrews on fan bracket, raise bracket up (bracket pivots on one screw) until sideplay on belt is approximately 1", tighten screws.

CUTOUT RELAY:—Model CB-4021. Mounted on generator. See complete article on Relays in Eqiupment Section.
Cuts In—6.75-7.5 volts or 750 R.P.M.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model A-5620-A. R.B.M. Foot Control Switch. Foot operated control switch used to control upper and lower headlamp beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

	Candlepower	Mazda No.
Headlamps	32-21	2320
Fender, Instrument	3	63
Stop and Tail	21-3	1158
Dome	6	81

FUSES: — Lighting — 20 ampere on back of lighting switch.
Body & Accessory—Two 20-ampere on fuse block mounted on steering column brace in back of instrument panel.
Generator Field—7½ ampere under cover on generator field frame.

HORNS: — Sparton Vibrator type twin horns. Operated by horn relay.

Horn Relay:—R.B.M., Type 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with 4 volts across winding with relay in inverted position.

SERIAL NUMBER:—First number—R-303301. On right hand frame side rail under engine hood.

COMPRESSION:—Ratio—5.25-1 Cast-iron head.
Pressure—125 lbs. at 350 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model CE-4402-A (2 used). Coils are mounted on dash.
Ignition Current—2 amperes (running), 4 amperes (stopped) for each coil.

Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock.

Distributor Model IGE-4012-A, IGE-4012-B (after serial number R-303971 and R-303920 excepting cars R-303058 to 304077 inclusive). Double breaker, 6 lobe cam, full automatic advance type. Contacts open simultaneously to fire both spark plugs in each cylinder at the same instant. Each set of contacts controls one coil and fires one spark plug in each cylinder. Contacts must be synchronized—see Timing.
Breaker Gap—Set at .020". Limits .018-.020".
Cam Angles—Closed 35°. Open 25° (distributor). Each set operates independently and controls one coil.
Breaker Arm Spring Tension—16-20 ounces.
Condenser—Part No. IG-2671. Capacity .20-.25 mfds.

Automatic Advance—IGE-4012-A

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
3	360	6	720
6	520	12	1040
9	680	18	1360

Automatic Advance—IGE-4012-B

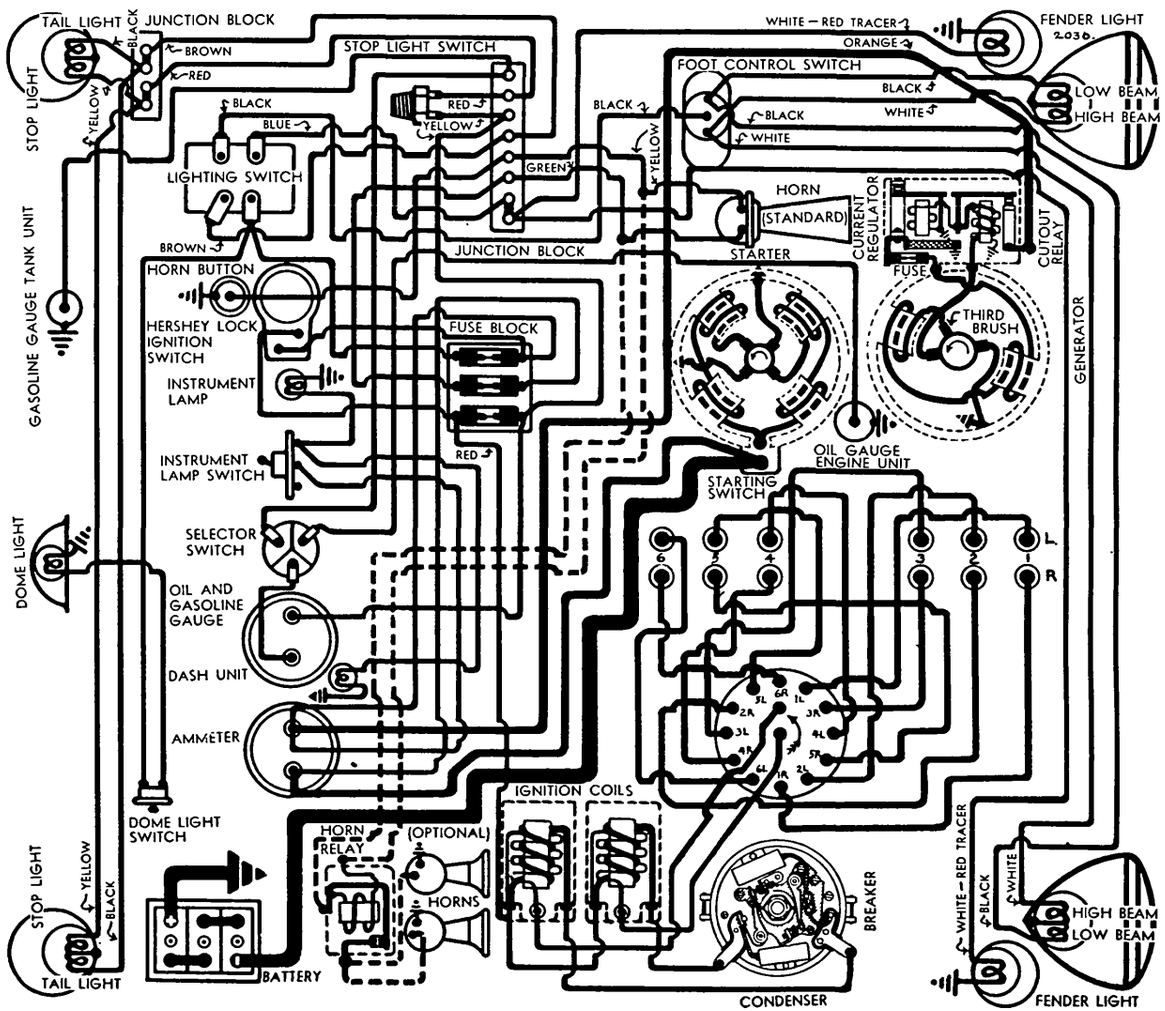
Start	200	0	400
3	475	6	950
6	740	12	1480
9	1000	18	2000

Distributor Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Stationary Contacts—With #1 piston on compression, turn engine over until 'IGN' mark on vibration dampener at front of engine lines up with pointer on chain case cover. The second line indicates top dead center. Loosen advance arm clamp bolt, rotate distributor until fixed contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt. Then check synchronization of movable contacts.

Synchronization (Movable Contacts)—Movable contacts (mounted on sub-plate) should open at the same instant as the fixed set (see above). After timing stationary contacts, and without disturbing position of crankshaft or distributor, loosen lockscrews on movable sub-plate carrying the second set of contacts, shift plate by prying with a screwdriver inserted in the slot in the edge of the plate until contacts begin to open, tighten lockscrews. See Equipment Section for complete article on Synchronization of IGE type distributors.
Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter plus No. X4615 Collar), Rod #37.

Firing Order:—1-5-3-6-2-4. Spark plug cables are not connected in this order on distributor cap (see diagram).



Spark Plugs:—AC. Type K-12 14 MM. Metric. Type K-7 used on cars with overdrive.
Spark Plug Gaps—Set at .025" (.030" on cars with radio).

CARBURETION:—Carburetor—Stromberg Model EX-32, 1¼" downdraft type with manual choke control. See Carburetion Section for adjustment, overhaul and Jet Specifications.
NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at hot or slow idling speed.
Idle Adjustment—With engine hot and choke valve fully released, set throttle stopscrew to idle engine at 5-7 M.P.H., turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed if necessary.
Accelerating Pump Setting—Pump lever has two holes for pump link engagement. Change for seasonal requirements:
Outer Hole—(Max. stroke)—Winter temperatures.
Inner Hole—(Min. stroke)—Summer temperatures.

Air Cleaner:—AC. #1525945 oil-wetted type standard, heavy duty oil-bath type optional.

Fuel Pump:—AC. Type W #1522153. Diaphragm type. See article in Carburetion Section for complete data.

Gasoline Gauge:—Stewart Electric type, combination oil and gasoline gauge.

VALVE TIMING:—To Check Timing—No means provided for checking timing other than Camshaft Setting. Remove chain case cover at front of engine. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across shaft centers. Remove and install chain 'endless'. Use special gear pullers and pushers, keep sprockets lined up so as to avoid side-strain on chain or sprockets.
Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter plus No. X4615 Collar), Rod #37.

Tappet Clearance:—.015" all valves with engine hot, running at idling speed.

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—25 lbs. (10 lbs. idling).

BATTERY:—U.S.L. Type KL-1-13. 6 volt, 13 plate, 100 ampere hour (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.1 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under right front seat.

STARTER:—Model MAB-4077. Armature MAB-2057.
Drive—Inboard Bendix Type LCD11FX-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ounces (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting screws.

Starting Switch:—Model VC-4002. Vacuum control type. Mounted on starter field frame and operated by clutch pedal. See article in Equipment Section for complete data.
Starting switch cable adjustment—Starting switch should make contact just after clutch is released. To check, engage transmission gears, depress clutch pedal, note when starter engages. If clutch is not completely released (car will tend to move) or if pedal travel is excessive, adjust by loosening two clamp bolts on clutch throwout shaft lever to which switch cable is attached and move clamp in (for later engagement) or out (for earlier engagement) of starter.

GENERATOR (First cars):—Model GAR-4601-5. Armature GAR-2214. Third brush control type. Air cooled.
Charging Rate Adjustment—Take off commutator band. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate. Brush held in position by friction.
Standard Charging Rate Setting—20 amperes (cold), 16 amperes (hot), 2300 R.P.M.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
20	8.5	1660	19.2	8.4	2600
22.4	8.8	2300			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ounces.
Field Current—4.46-4.94 amperes at 6.0 volts.
Motoring Current—4.89-5.41 amperes at 6.0 volts.
Field Fuse—7½ amperes. Under cover on generator.

Removal:—Generator cradle mounted at left front of engine with fan belt drive. Water pump driven by extension of generator shaft. To remove, disconnect water pump drive coupling, slack off belt adjustment, loosen mounting clamp band, lift generator out.

Belt Adjustment:—Adjust belt when sideplay at point midway between generator and fan pulley exceeds 1½". To adjust, loosen two capscrews on fan bracket, raise bracket up (bracket pivots on one screw) until sideplay on belt is approximately 1", tighten screws.

GENERATOR (Later cars):—Model GBR-4602-4. Armature GAR-2214. Third brush control in conjunction with Current Regulator (two-rate charging control). Air cooled.
Charging Rate Adjustment—Use test meters to check generator output. Short out current regulator by conencting jumper wire from 'F' terminal on generator to ground. Take off commutator band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate until output is 26 amperes at 8.0 volts with generator at room temperature. Third brush held in position by friction. Remove jumper.
Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Cold — Regulator Inoperative — Hot

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	720	0	6.4	780
4	6.65	820	4	6.7	900
8	6.9	920	8	6.95	1060
12	7.1	1050	12	7.2	1250
16	7.4	1200	16	7.5	1440
20	7.6	1400	20	7.8	1840
26	8.0	2400	23	8.0	2800

Field Current—4.13-4.57 amperes at 6.0 volts.
Motoring Current—5.84-6.46 amperes at 6.0 volts.
Field Fuse—5 ampere in knurled cup on side of regulator case.
Rotation, Brush Spring Tension, Removal and Belt Adjustment same as for generator on first cars. See above.

CUTOUT RELAY:—Model CB-4014 (Used on GAR-4601-5 generator). Mounted on generator. See article in Equipment Section for complete data.
Cuts In—6.75-7.5 volts, 750 R.P.M.
Cuts Out—.5-2.5 amperes discharge current.
Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

RELAY-REGULATOR:—Model TC-4313-A (used on GBR-4602-4 generator). Mounted on generator. Consists of Cutout Relay and Current Regulator (two-rate charging control). See Equipment Section article for complete data.

Cutout Relay

Cuts In—6.5-7.25 volts, 750 R.P.M.
Cuts Out—.5-2.5 ampere discharge current.
Contact Gap—.015-.045" (with upper or ground contacts closed—ground contacts must be open with main contacts closed).
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Corcoran-Brown, Pre-focused type. Upper and lower beams controlled by foot selector switch.

Switches

Lighting—Soreng-Manegold Model A-5820-A.
Foot Selector—H. A. Douglas. Nash Part No. 46939.
Stop Light—Motometer Hydraulic #58012. Nash Part No. 47601.

Bulb Specifications

Position	Candlepower	Mazda No
Headlamps	32-32	2331
Stop and Tail	21-3	1158
Fender, Instrument	3	63
Dome	6	81

FUSES:—Lighting—20 ampere on fuse block mounted on steering column brace in back of instrument panel.
Horn—20 (single horn), 30 ampere (dual horns) on fuse block as above.
Stop Light and Gasoline Gauge—20 ampere on fuse block as above.
Generator Field—7½ ampere on generator frame (GAR). 5 ampere in knurled cup on regulator case (GBR).

HORNS:—Sparton Model B-6366 Std. Single horn. Dual horns Nash Part Nos. 47607-A (long), 47608-A (short), operated by horn relay. All horns vibrator type.

Horn Relay:—R.B.M. Type 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with 4 volts across winding with relay in inverted position.

SERIAL NUMBER:—First number—C-1001. On plate on right frame side member under engine hood and on caution plate on left front door corner post.

COMPRESSION:—Ratio—5.58-1 Cast-iron head.
Pressure—125 lbs. at 350 R.P.M.

VACUUM READING:—Gauge should show steady read-reading of 18-20" with engine idling.

IGNITION:—Coil Model IG-4626-A. Mounted on cowl.
Ignition Current—2½ amperes idling, 4 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 6708. Conected to coil by armored cable.
Ignition Lock—Briggs & Stratton Model 50184, Mitchell No. 6760.

Distributor Model IGB-4328-B. Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set at .020". Limits .018-.020".
Cam Angle or Dwell—Closed 40°. Open 20° (distributor degrees).
Breaker Arm Spring Tension—16-20 ounces.
Condenser—Part No. IGB-1025. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
3	390	6	790
7	500	14	1000
10	800	20	1600
12	1000	24	2000

Distributor Removal:—Mounted on right side of cylinder head. To remove, loosen locknut and take out mounting setscrew on side of cylinder head opposite distributor.

IGNITION TIMING:— **Flywheel Deg.** **Piston Position**
All engines ..... at TDC ..... 0000" TDC
Timing—With #1 piston on compression, turn engine over until piston reaches top dead center, stop when 'IGN-DC' mark on vibration dampener at front of engine lines up with pointer on chain case cover. Loosen locknut and setscrew on side of cylinder head, rotate distributor until contacts begin to open, tighten setscrew and locknut.
NOTE—Manufacturer recommends Timing Light for this operation.
Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter plus No. X4615 Collar), Rod #37.

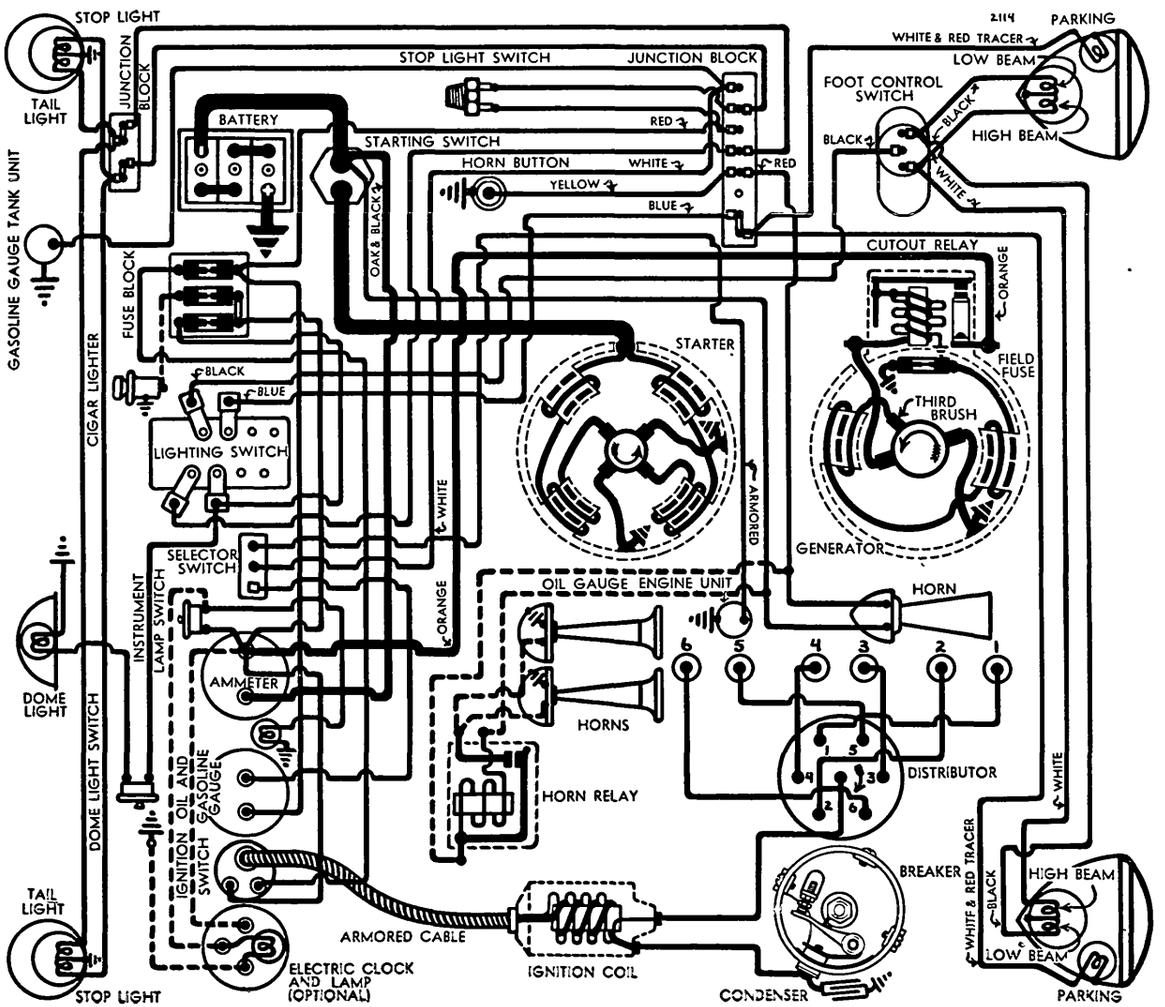
Firing Order:—1-5-3-6-2-4. (see diagram).

Spark Plugs:—AC. Type G-8. 18 MM. Metric.
Spark Plug Gaps—Set at .025". (.030" on cars with radio). In some cases performance has been improved by setting the gaps at .020" in the field.

CARBURETION:—Carburetor—Stromberg Model AX-2, downdraft type. See Carburetion Section for complete adjustment, overhaul, and Jet Specifications.
NOTE—Do not adjust carburetor until engine is thoroughly warmed up and choke valve is wide open.
Idle Adjustment—Adjust throttle stopscrew so that idle speed is 5-7 M.P.H. Turn idle adjusting screw in until engine begins to hesitate or miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:
#1—Inner hole (Min. stroke)—Extremely hot temperatures.
#2—Center hole (Med. stroke)—Normal summer temperatures.
#3—Outer hole (Max. stroke)—Winter temperatures.

Air Cleaner:—AC. #152967 oil-wetted type standard. Heavy duty oil-bath type optional.



Fuel Pump:—AC. Type W #1522152, Type R #1522133 (RHD), diaphragm types. See article in Carburetion Section.

VALVE TIMING:—To Check Timing—No means provided for checking timing other than Camshaft Setting. Remove chain case cover at front of engine. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Install chain 'endless' with camshaft sprocket off engine.
Motor Gauge—Weidenhoff Adapter #113 (with #152 Adapter plus No. X4615 Collar), Rod #37.

Tappet Clearance:—.015" all valves. Engine hot or cold.

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—25 lbs. (10 lbs. idling).

BATTERY:—U.S.L. Type KL-1-13. 6 volt, 13 plate, 100 ampere hour capacity (20 hour rtae).
Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.1 minutes.

Grounded Terminal—Positive (+) terminal is grounded to frame and to transmission cover bolt.

Location—On left side under drivers' seat.

STARTER:—Model MAB-4076. Armature MAB-2057.

Drive—Inboard Bendix Type LCD11FX-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.2 "	Lock	3.0	575
22.5 "	Lock	4.0	775

NOTE—Lock torque figures correct without switch.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting capscrews.

Starting Switch:—Type SW-4005. Mounted at left of engine. Operated by depressing clutch pedal.

GENERATOR:—Model GAR-4618-2. Armature GAR-2155. (First cars). Model GAR-4634-2. Armature GAR-2214 (Later cars). Air cooled. Third brush control type.

Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.

Maximum Charging Rate—18 amperes (cold), 16 amperes (hot), 8.0 volts, 2300 R.P.M.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	800	0	6.4	800
4	6.8	940	4	6.85	960
8	7.15	1125	8	7.25	1160
12	7.5	1380	12	7.65	1500
16	7.85	1740	16	8.0	2300
18	8.0	2250			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-36 ozs. (new brushes).

Field Current—3.7-4.1 amperes at 6.0 volts.

Motoring Current—4.94-5.46 amperes at 6.0 volts.

Field Fuse—5 ampere on generator field frame.

Removal:—Generator cradle mounted at left front of engine with fan belt drive. Water pump impellor mounted on generator shaft. To remove, drain radiator, take out water pump mounting bolts or remove water pump cover screws. Slack off belt adjustment. Loosen mounting clamp band, lift out water pump and generator.

Belt Adjustment:—Adjust when slack or sideplay of belt midway between generator and fan pulleys exceeds 1½". To adjust, loosen two capscrews on fan bracket, lift bracket up (pivots on one screw) until sideplay is approximately 1", tighten capscrews.

CUTOUT RELAY:—Model CB-4014. Mounted on generator. See Equipment Section article for complete data on this unit.

Cuts In—6.75-7.5 volts, 800 R.P.M.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.025-.035".

Air Gap—.010-.030" with contacts closed.

LIGHTING:—Headlamps—Corcoran-Brown, Pre-fo-fused type. Foot selector switch controls upper and lower beams.

Switches

Lighting—Soreng-Manegold Model A-5820-A.

Foot Selector—H. A. Douglas.

Stop Light—Motometer Hydraulic #58012. Nash Part No. 47601.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Stop and Tail	21-3	1158
Parking, Instrument	3	63
Dome	6	81

FUSES:—Lighting—20 ampere on fuse block on back of instrument panel.

Stop Light and Gasoline Gauge—20 ampere on fuse block as above.

Generator Field—5 ampere on generator frame.

SERIAL NUMBER:—First number B-77325. On right front side rail under engine hood.

COMPRESSION:—**Ratio**—5.25-1 Cast-iron head. **Pressure**—110 lbs. at 350 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model CE-4402-A (2 used).** Coils are mounted on dash.

Ignition Current—2 amperes (running), 4 amperes stopped.

Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock.

Distributor Model IGK-4101. Double breaker, 8 lobe cam, full automatic advance type. Contacts open simultaneously to fire both spark plugs in each cylinder at the same instant. Each set of contacts controls one coil and fires one spark plug in each cylinder. Contacts must be synchronized (see Timing).

Breaker Gap—.015". Limits .013-.017" (.015-.019" first 1000 miles with new contacts).

Cam Angle or Dwell—Closed 28°. Open 17° (distributor). Each set operates independently and controls one coil.

Breaker Arm Spring Tension—20 ounces.
Condenser—Part No. IG-2671. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Enigine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
3	360	6	720
6	520	12	1040
9	680	18	1360
12	840	24	1680
15	1000	30	2000

Distributor Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—**Stationary Contacts**—With #1 piston on compression, turn engine over until first line on vibration dampener at front of engine lines up with pointer on chain case cover. This line is the 'IGN' mark and the second line indicates top dead center. Loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt. Then check synchronization of movable contacts.

Synchronization (Movable Contacts)—Movable contacts (mounted on sub-plate) should open at the same instant as the stationary set (see above). After timing stationary contacts, and without disturbing position of crankshaft or distributor, loosen lockscrews on sub-plate carrying the second set of contacts, shift plate by prying with a screwdriver inserted in the slot in the edge of the plate until contacts begin to open, tighten lockscrews. See Equipment Section for complete article on synchronization of IGK type distributors.

Motor Gauge—Weidenhoff Adapter #113, Rod # 31.

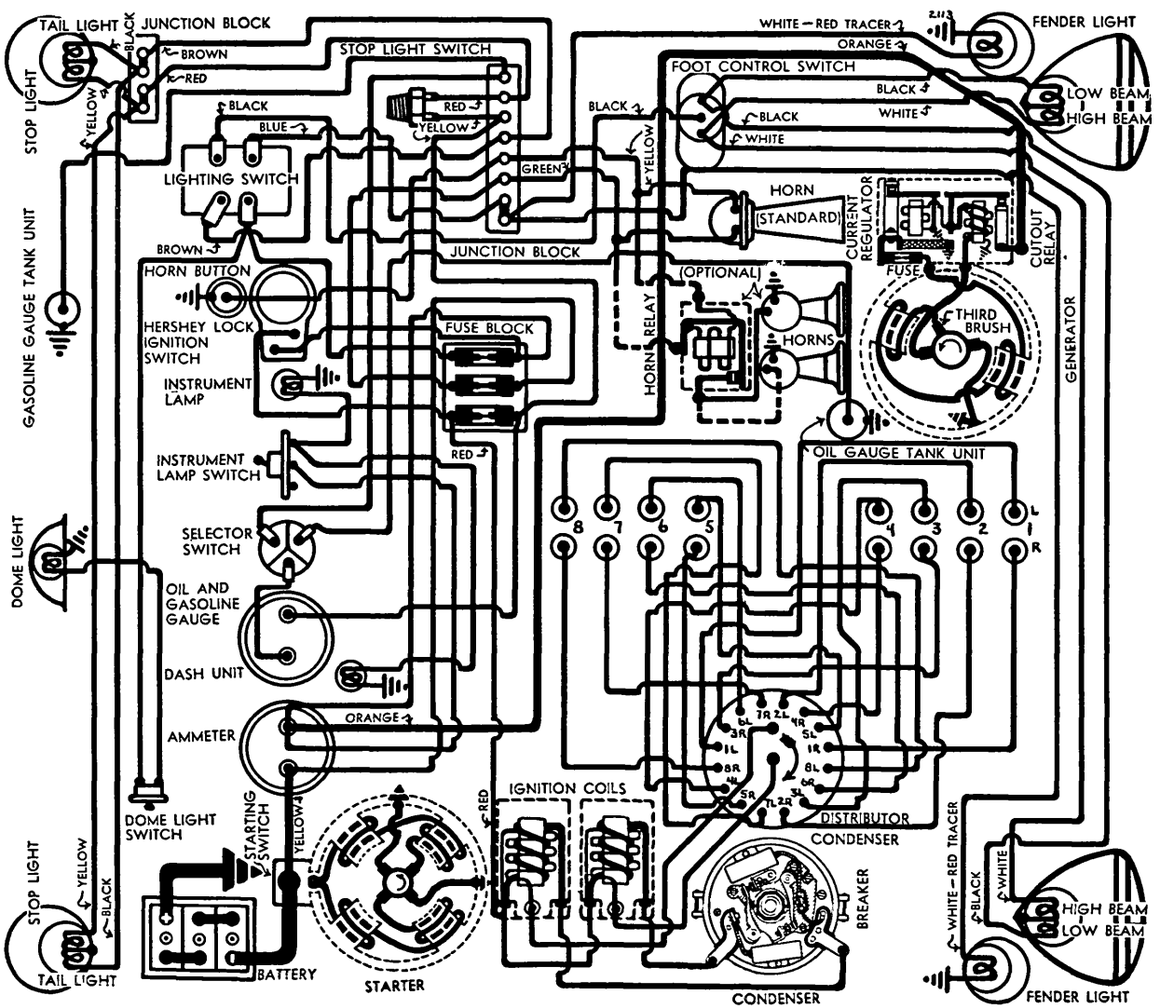
Firing Order:—1-6-2-5-8-3-7-4. Spark plugs not connected in this order on distributor cap (see diagram).

Spark Plugs:—AC. Type K-12. 14 MM. Metric. Type K-7 used on cars with overdrive.

Spark Plug Gaps—Set at .025" (.030" on cars with radio).

CARBURETION:—**Carburetor**—Stromberg Model EE-1. 1" dual, downdraft type with manual choke control. NOTE—Do not adjust carburetor until engine is hot and engine will idle at slow idling speed with choke valve wide open.

Idle Adjustment—With engine hot and choke valve wide open, set throttle stopscrew to idle engine at 5-7 M.P.H. Turn both idling adjusting screws in simultaneously until engine begins to lag or miss, then turn screws out until engine begins to roll, finally turn screws out until engines fires smoothly. Readjust throttle stopscrew for correct idling speed if necessary.



Accelerating Pump Setting—Pump lever has two holes for pump link engagement. Change for seasonal requirements:—
Outer Hole (Max. stroke)—Winter temperatures.
Inner Hole—(Min. stroke)—Summer temperatures.

Air Cleaner:—AC. #1525949 oil-wetted type standard. Heavy duty oil-bath type optional.

Fuel Pump:—AC. Type W #1522154. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—Stewart Electric. Combination oil and gasoline gauge.

VALVE TIMING:—**To Check Valve Timing**—No means provided for checking timing other than Camshaft Setting. Remove chain case cover at front of engine. Sprockets are marked. Mesh chain with

sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. Remove and install chain 'endless.' Use special gear pullers and pushers, keep sprockets lined up so as to avoid sidestrain on chain or sprockets.

Motor Gauge—Weidenhoff Adapter #113, Rod #31.

Tappet Clearance:—.015" all valves with engine hot, running at idling speed.

LUBRICATION:—Crankcase Capacity—7 quarts.

Normal Oil Pressure—25 lbs.

BATTERY:—U.S.L. Type KW-15-A. 6 volt, 15 plate, 116 ampere hour capacity (20 hour rate).

Starting Capacity—140 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.0 minutes.

Grounded Terminal—Positive (+) terminal is grounded to frame and to transmission cover bolt.

Location—Under right front seat.

STARTER:—Model MAB-4054, MAB-4057 (Export).

Armature No. MAB-2047.

Drive—Inboard Bendix Type LCD11FX-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—44-56 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE—Lock torque figures correct without switch.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting screws.

Starting Switch:—Model VC-4003, VC-4002 (Export). Vacuum control type, mounted on starter field frame and operated by clutch pedal. See Equipment Section for complete article.

Starting Switch Cable Adjustment—Starting switch should make contact just after clutch is released. To check, engage transmission gears, depress clutch pedal, note when starter engages. If clutch is not entirely released (car will tend to move), or if pedal travel is excessive, adjust by loosening two clamp bolts on clutch throw-out shaft lever to which switch cable is attached and move cable clamp in (for later engagement) or out (for earlier engagement of starter).

GENERATOR:—Model GBR-4602-4. Armature GAR-2214. Third brush control in conjunction with Current Regulator (two rate charging control). Air-cooled.

Charging Rate Adjustment—Use test meters to check generator output. Short out current regulator by connecting jumper wire from 'F' terminal on generator to ground. Take off commutator band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate until output is 26 amperes at 8.0 volts with generator at room temperature. Third brush held in position by friction. Remove jumper.

Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Cold — Regulator Inoperative — Hot					
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	720	0	6.4	780
4	6.65	820	4	6.7	900
8	6.9	920	8	6.95	1060
12	7.1	1050	12	7.2	1250
16	7.4	1200	16	7.5	1440
20	7.6	1400	20	7.8	1840
26	8.0	2400	23	8.0	2800

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-36 ounces.

Field Current—4.13-4.57 amperes at 6.0 volts.

Motoring Current—5.84-6.46 amperes at 6.0 volts.

Field Fuse—5 ampere in cup on side of regulator case.

Removal:—Generator cradle mounted at left front of engine with fan belt drive. Water pump driven by extension of generator shaft. To remove, disconnect water pump drive coupling, slack off belt adjustment, loosen mounting clamp band, lift generator out.

Belt Adjustment:—Adjust when sideplay at point midway between generator and fan pulley exceeds 1½". To adjust, loosen two capscrews on fan bracket, raise bracket up (bracket pivots on one screw) until sideplay on belt is approximately 1", tighten screws.

RELAY-REGULATOR:—Model TC-4313-A.

Mounted on generator. Consists of Cutout Relay and Current Regulator (two-rate charging control). See article in Equipment Section for complete data.

Cutout Relay

Cuts In—6.5-7.25 volts, 750 R.P.M.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.015-.045" (with upper or ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.

Contacts Close—1.2-1.4 volts below opening point.

Contact Gap—.005" minimum.

Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Corcoran-Brown, Pre-fo-fused type. Upper and lower beams controlled by foot selector switch.

Switches

Lighting—Soreng-Manegold Model A-5820-A.

Foot Selector—H. A. Douglas.

Stop Light—Motometer Hydraulic #58012. Nash Part No. 47601.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Stop and Tail	21-3	1158
Fender, Instrument	3	63
Dome	6	81

FUSES:—Lighting—20 ampere on fuse block mounted on steering column brace in back of instrument panel.

Horn—20 ampere (single), 30 ampere (dual horns) on fuse block as above.

Stop Light and Gasoline Gauge—20 ampere on fuse block as above.

Generator Field—5 ampere in cup on side of regulator case.

HORNS:—Single horn, Sparton, std. Dual horns optl. operated by horn relay. All horns vibrator type.

Horn Relay:—R.B.M. Type 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with 4 volts across winding with relay in inverted position.

SERIAL NUMBER:—First number R-309311. Stamped on plate on right hand frame side rail under engine hood.

COMPRESSION:—Ratio—5.67-1 Std. No Optl. ratios.
Pressure—Approx. 100 lbs. at 125 R.P.M. (cranking speed). Must be equal for all cylinders within 10 lbs.

VACUUM READING:—18-20" steady reading with engine idling at 7 M.P.H.

IGNITION:—Coil Model CE-4402-A. Two coils used. Mounted on dash.

Coil Draw—2 amperes idling, 4 stopped (each).

Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock.

DISTRIBUTOR:—Model IGE-4012-B. Double breaker, 6 lobe cam, full automatic advance type. Contacts open simultaneously to fire both spark plugs in each cylinder at the same instant and must be synchronized. See Timing.

Breaker Gap—Set at .020" and alike for both sets.

Cam Angle or Dwell—Closed 35°. Open 25° for each set (operate independently).

Breaker Arm Spring Tension—16-20 ounces.

Condenser—No. IG-2671 (2 used). Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
3	475	6	950
6	740	12	1480
9	1000	18	2000

Removal:—Distributor mounted on right hand side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING—Time stationary contacts first and then synchronize movable contacts. Both sets open simultaneously.

Timing (Stationary Contacts)—With #1 piston on compression, turn engine over until 'DC.IGN' mark on vibration dampener at front of engine lines up with pointer on chain case cover. Loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt.

Synchronization (Movable Contacts)—Without disturbing position of crankshaft or distributor, loosen lockscrews on movable sub-plate (carrying the second set of contacts), shift plate by prying with screwdriver inserted in notch in edge of plate until this set of contacts open, tighten sub-plate lockscrews. See article in Electrical Equipment Section for complete synchronizing data on IGE distributors.

Synchronization (Other Methods)—Set contacts to open simultaneously at regular 60 degree (distributor) intervals.

Motor Gauge—Weidenhoff Adapter #113, Rod #37.

Firing Order:—1-5-3-6-2-4. See diagram for order in which spark plug cables for both plugs in each cylinder should be connected.

Spark Plugs:—AC. Type K-12 (Std.), K-7 (Cars with Overdrive), 14 MM. Metric type.
NOTE—These types discontinued by AC. Use No. 47 (Std.), No. 45 (Overdrive cars).

Spark Plug Gap—.025" (.030" on cars with radio).

CARBURETION:—Carburetor—Stromberg Mod. EX-32, 1¼" downdraft type with manual choke control.

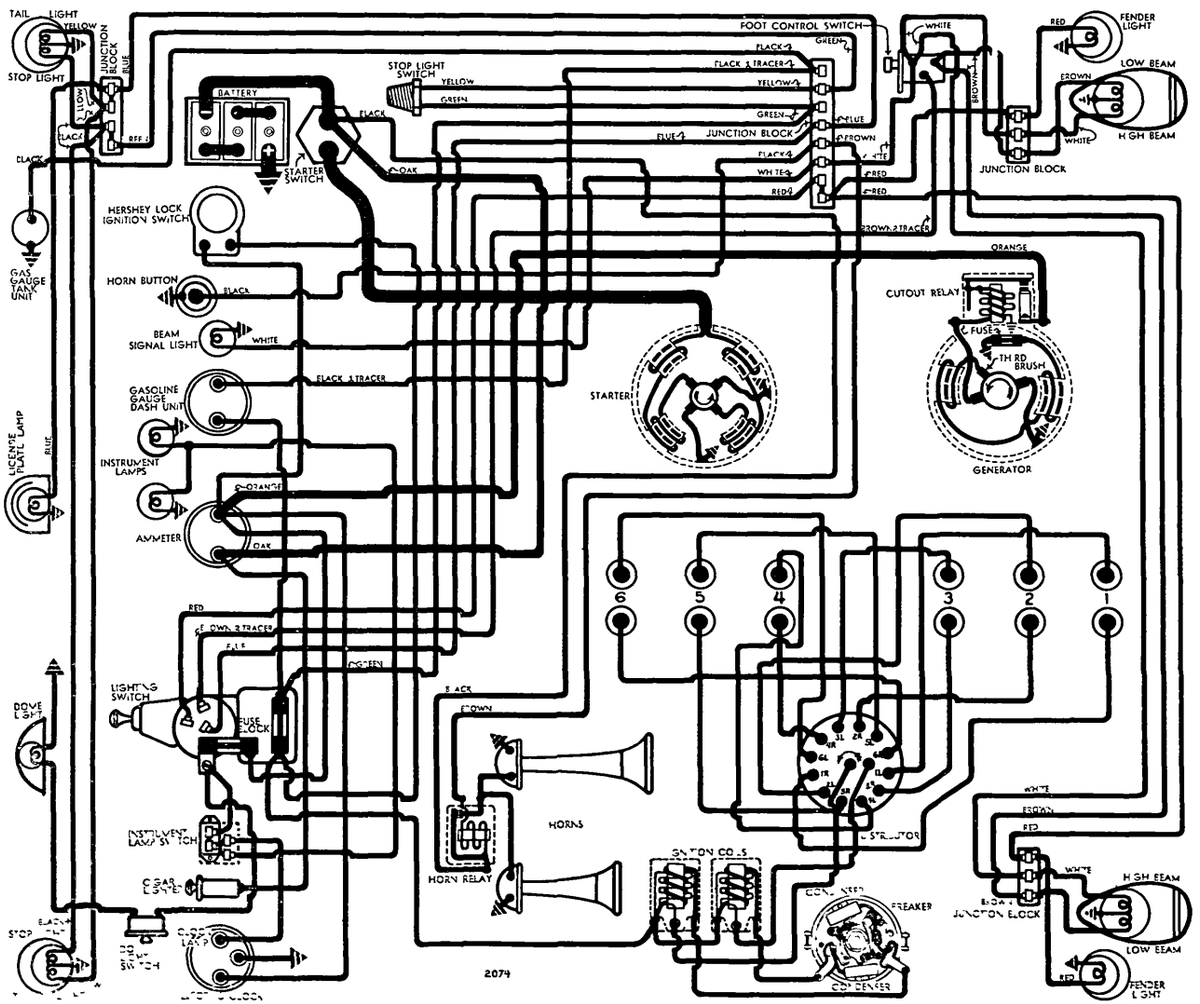
See article in Carburetion Section for data.

Idle Adjustment—Warm up engine. Set throttle lever stopscrew so that engine idles at 7 M.P.H. Turn idle adjusting screw in until engine begins to miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Engage pump link in correct hole in throttle lever for seasonal requirements as follows:
Inner Hole (Min. stroke)—Summer temperatures.
Outer Hole (Max. stroke)—Winter temperatures.

Air Cleaner:—AC. #1528143 oil-wetted type standard, #1528278 Heavy Duty oil-bath type optional.

Fuel Pump:—AC. Type W #1523237 Diaphragm type Std., Type AD #1523238 combination fuel-and-vacuum type Optl.



See Article in Carburetion Equipment Section.

Gasoline Gauge:—Motometer Electric type.

See Article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—No flywheel marks or other means provided to check valve timing except camshaft setting. Remove chain case cover, turn engine until mark on crankshaft sprocket is toward camshaft and in line with straightedge across shaft centers. Camshaft sprocket mark should be toward crankshaft and on same center line (with intake valve opening).

Tappet Clearance:—.008" Int., .015" Exh. with engine hot and idling.

LUBRICATION:—Crankcase Capacity—7 quarts.

Normal Oil Pressure—25-35 lbs.

BATTERY:—U.S.L. Type KL-1-13. 6 volt, 13 plate, 100 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.1 minutes.

Grounded Terminal—Positive (+) terminal grounded to transmission cover bolt.

Location—On left side under drivers seat.

STARTER:—Model MAB-4076. Armature MAB-2057.

Drive—Inboard Bendix Type LCD11FX-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—125 R.P.M., 150-160 amperes, 5.2 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.2 "	Lock	3.0	575
22.5 "	Lock	4.0	750

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Model SW-4005. Mounted at left of engine. Operated by depressing clutch pedal fully. No adjustment required.

GENERATOR (STD.):—Model GCM-4803-4. Armature GCJ-2030. Third brush control type. Ventilated by fan on drive pulley.

Maximum Charging Rate—22 amperes (cold), 18 amperes (hot), 8.0 volts, 2650 R.P.M.

Charging Rate Adjustment—Remove commutator cover band, shift third brush counter-clockwise to increase or clockwise to decrease charging rate. Brush held in position by friction. Do not exceed maximum charging rate as indicated above.

Cold		**Performance Data**	Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	775	0	6.4	830
4	6.7	900	4	6.75	985
8	7.0	1075	8	7.1	1190
12	7.3	1200	12	7.5	1480
16	7.6	1420	16	7.8	1970
20	7.85	1900	18	8.0	2700
22	8.0	2650			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—27-53 ozs. (new brushes).

Field Current—3.50-3.89 amperes at 6.0 volts.

Motoring Current—5.75-6.25 amperes at 6.0 volts.

Field Fuse—5 ampere (under cover on generator frame).

GENERATOR (WITH RADIO):—Mod. GCO-4802. Armature GCO-2031-F. Two brush, straight shunt type with external voltage and current regulation. Ventilated by fan on drive pulley.

NOTE—See diagram for Nash Model 3780 (following) for wiring of this generator and the regulator used with it.

Maximum Charging Rate—28 amperes (cold), 8.0 volts, 1850 R.P.M., and above, with load or discharged battery (Current Regulator Setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Charging Rate Adjustment—No adjustment on generator. See Regulator Section below for Voltage and Current Regulator settings.

Cold		**Performance Data**	Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	825	0	6.4	900
4	6.6	940	4	6.6	1025
8	6.85	1050	8	6.85	1160
12	7.1	1175	12	7.1	1310
16	7.3	1300	16	7.3	1475
20	7.55	1450	20	7.55	1660
24	7.8	1610	24	7.8	1880
28	8.0	1850	28	8.0	2200

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—27-53 ozs. (new brushes).

Field Current—1.47-1.63 amperes at 6.0 volts.

Motoring Current—3.94-4.36 amperes at 6.0 volts.

Removal (All Models):—Generator cradle mounted at left side of engine with fan belt drive. Water pump driven by generator shaft extension. To remove, disconnect water pump, loosen fan belt, remove generator clamp band, lift generator out.

Belt Adjustment (All Models):—Adjust whenever belt deflection is more than 1½" (when pressed lightly midway between generator and fan pulleys). To adjust, loosen two capscrews on fan bracket, lift fan up (one screw hole slotted) until belt deflection is approximately 1", tighten screws.

CUTOUT RELAY:—Model CB-4014 (With GCM-4803-4 generator). Mounted on generator. See article in Electrical Equipment Section for complete data.

Cuts In—6.75-7.5 volts.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.025-.035".

Air Gap—.010-.030" with contacts closed.

REGULATOR:—Model VRB-4002-D Voltage-Current Type (With GCO-4802 Generator). Consists of Cutout Relay, Vibrating Voltage Regulator and Vibrating Current Regulator in case on dash.

NOTE—Regulator cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum.

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.4-7.9 volts hot.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads). Connect voltmeter between 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 M.P.H. car speed until voltage is constant. Voltage should be within 7.3-7.9 volts (High limit cold, low limit hot). If outside these limits, Regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.060" Min., .062" Max. contacts just opening.

Current Regulator

Setting—Not to exceed rating marked on cover.

To Check—Connect ammeter and voltmeter as directed for Voltage Regulator test. Operate generator at 30 M.P.H. car speed, add load (use bank of headlamp bulbs or turn on car lights and discharge battery) so that generator will charge at peak rate and bring Current Regulator into action. Charging current should not exceed 28 amperes. If more than slight excess noted, Regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap & Air Gap—Same as for Voltage Regulator.

LIGHTING:—Headlamps—Corcoran-Brown, pre-focused type. Upper and lower beams controlled by foot selector switch on toeboard. Lower beam deflected slightly to one side (special 2331 type bulb).

Headlamp Beam Indicator—Red marker on instrument panel below speedometer dial. Lighted whenever driving or upper headlamp beams are lighted.

Switches

Lighting—Douglas.

Foot Selector—Douglas.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Park, Dash, License	3	63
Indicator	1	51
Stop-Tail	21-3	1158
Dome	6	81

FUSES:—Lighting—20 amp. on back of lighting switch.

Accessory—20 amp. on fuse block attached to lighting switch. Protects stop light and gasoline gauge circuits.

Generator Field—5 amp. (GCM-4803-4 only). Under cover on generator field frame.

HORNS:—Sparton Vibrator type, twin horns operated by horn relay.

Horn Relay:—R.B.M. Model 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with 4 volts across windings when in inverted position.

SERIAL NUMBER:—First number B-80031. Stamped on plate on right hand frame side rail under engine hood.

COMPRESSION:—Ratio—5.64-1 Std. No Optl. ratios.

Pressure—Approx. 100 lbs. at 125 R.P.M. (cranking speed). Must be equal for all cylinders within 10 lbs.

VACUUM READING:—18-20" steady reading with engine idling at 7 M.P.H.

IGNITION:—Coil Model CE-4402-A. Two coils used. Mounted on dash.

Coil Draw—2 amperes idling, 4 stopped (each).

Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock.

Ignition Lock—Briggs & Stratton #45922.

Key Series—N1201-N1400.

DISTRIBUTOR:—Model IGK-4101. Double breaker, 8 lobe cam, full automatic advance type. Contacts open simultaneously to fire both spark plugs in each cylinder at same instant and must be synchronized. See Timing.

Breaker Gap—Set at .017" and alike for both sets.

Cam Angle or Dwell—Closed 28°. Open 17° for each set (operate independently).

Breaker Arm Spring Tension—18-20 ounces.

Condenser—No. IG-2671 (2 used). Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
3	360	6	720
6	515	12	1030
9	680	18	1360
12	840	24	1680
15	1000	30	2000

Removal:—Distributor mounted on right hand side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Time stationary contacts first and then synchronize movable contacts. Both sets open simultaneously.

Timing (Stationary Contacts)—With #1 piston on compression, turn engine over until 'DC.IGN' mark on vibration dampener at front of engine lines up with pointer on chain case cover. Loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt.

Synchronization (Movable Contacts)—Without disturbing position of crankshaft or distributor, loosen lockscrews on movable sub-plate (carrying the second set of contacts), shift plate by prying with screwdriver inserted in notch in edge of plate until this set of contacts open, tighten sub-plate lockscrews. See article in Electrical Equipment Section for complete synchronizing data on IGK distributors.

Synchronization (other methods)—Set contacts to open simultaneously at regular 45° (distributor) intervals.

Motor Gauge—Weidenhoff Adapter #113, Rod #37.

Firing Order:—1-6-2-5-8-3-7-4. See diagram for order in which spark plug cables for both plugs in each cylinder should be connected.

Spark Plugs:—AC Type K-12 (Std), K-7 (Cars with Overdrive), 14 MM. Metric type.

NOTE—These types discontinued by AC. Use No. 47 (Std.), No. 45 (Overdrive cars).

Spark Plug Gap—.025" (.030" on cars with radio).

CARBURETION:—Carburetor—Stromberg Model EE-1. 1" Dual, Downdraft type with manual choke control.

See article in Carburetion Section for data.

Idle Adjustment—Warm up engine. Set throttle lever stop screw so that engine idles at 7 M.P.H. Turn both idle adjusting screws (simultaneously and equally) in until engine begins to miss, then out until engine begins to roll, finally turn screws in until engine fires evenly. Readjust throttle stop-screw for correct idling speed.

Accelerating Pump Setting—Engage pump link in correct hole in throttle lever for seasonal requirements as follows:

Inner Hole (Min. stroke)—Summer temperatures.
Outer Hole (Max. stroke)—Winter temperatures.

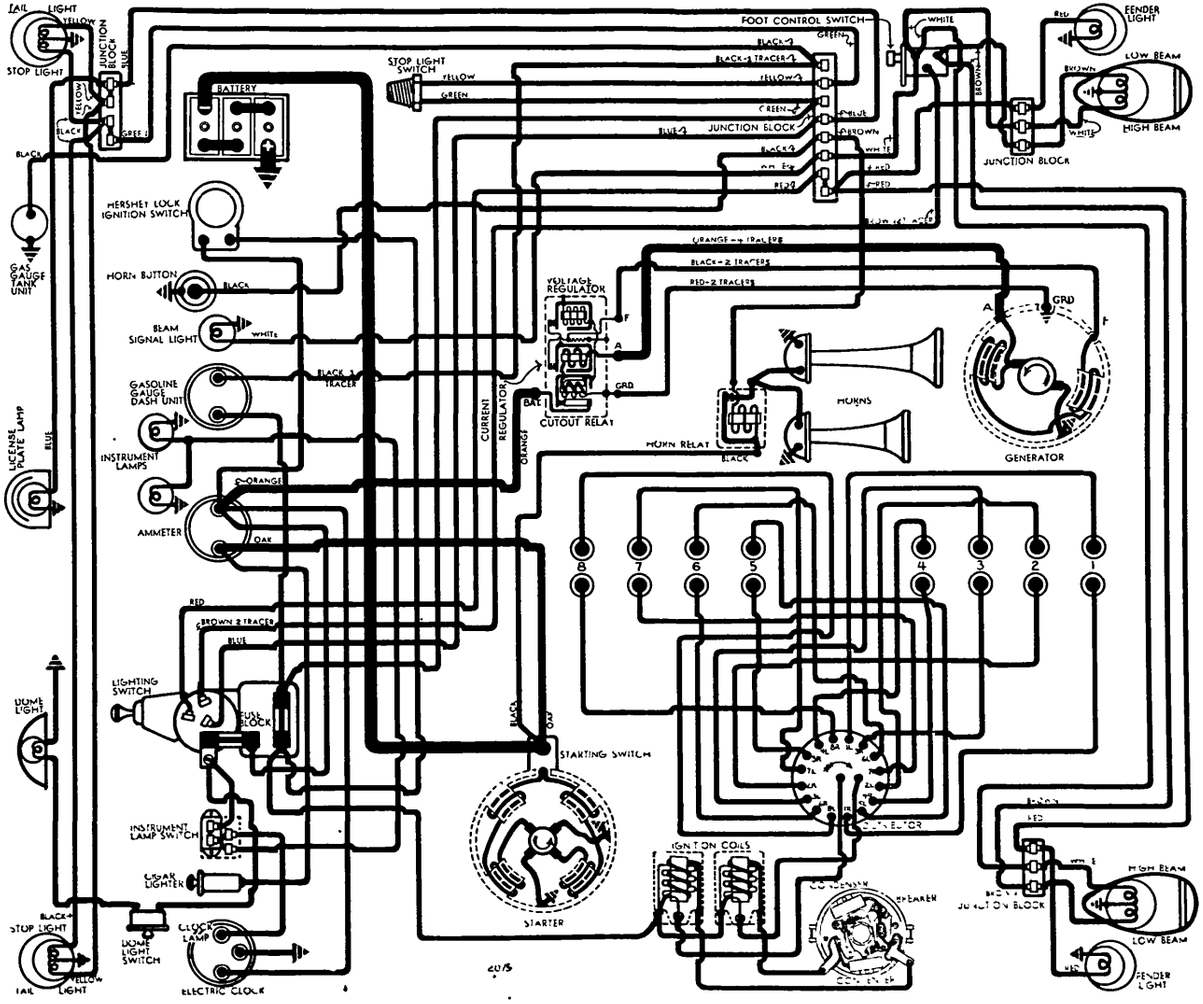
Air Cleaner:—Burgess oil-wetted type standard, AC #1528280 Heavy Duty oil-bath type optional.

Fuel Pump:—AC. Type AD, #1523236 Diaphragm type, combination fuel-and vacuum pump.

See article in Carburetion Equipment Section.

Gasoline Gauge:—Motometer Electric type.

See article in Carburetion Equipment Section.



VALVE TIMING:—To Check Timing—No flywheel marks or other means provided to check valve timing except camshaft setting. Remove chain case cover, turn engine until mark on crankshaft sprocket is toward camshaft and in line with straightedge across shaft centers. Camshaft sprocket mark should be toward crankshaft and on same center line (with intake valve opening).

Motor Gauge—Weidenhoff Adapter #113, Rod #37.

Tappet Clearance:—.008" Int., .015" Exh. with engine hot and idling.

LUBRICATION:—Crankcase Capacity—7 quarts.

Normal Oil Pressure—25-35 lbs.

BATTERY:—U.S.L. Type KW-15A. 6 volt, 15 plate, 116 ampere hour capacity (20 hour rate).

Starting Capacity—140 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.0 minutes.

Grounded Terminal—Positive (+) terminal grounded to transmission cover bolt.

Location—On left side under drivers seat.

STARTER:—Model MAB-4054. Armature MAB-2047.

Drive—Inboard Bendix Type LCD11FX-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—44-56 ozs. (new brushes).

Cranking Engine—125 R.P.M., approximately 150 amperes, 5.15 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE—Lock torque figures correct without switch.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Model VC-4003. Vacuum control type. Mounted on starter field frame. Operated by clutch pedal.

See article in Electrical Equipment Section.

Adjustment—Check setting whenever clutch adjusted. Switch should make contact just after clutch is released. To check, engage transmission gears, depress clutch pedal, note when starter engages. If clutch not entirely disengaged (car will tend to move) or if pedal travel excessive, adjust by loosening two clamp bolts on clutch throw-out shaft lever (at left side of clutch housing) to which cable is attached, move cable clamp in (for later engagement) or out (for earlier engagement). Switch lever should have ⅛" free movement.

GENERATOR:—Model GCO-4802. Armature GCO-2031F Two brush, straight shunt type with external voltage and current regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—28.0 amperes (cold), 8.0 volts, 1850 R.P.M., and above, with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Charging Rate Adjustment—No adjustment on generator. See Regulator Section below for Voltage and Current Regulator settings.

Cold Performance Data			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	825	0	6.4	900
4	6.6	940	4	6.6	1025
8	6.85	1050	8	6.85	1160
12	7.1	1175	12	7.1	1310
16	7.3	1300	16	7.3	1475
20	7.55	1450	20	7.55	1660
24	7.8	1610	24	7.8	1880
28	8.0	1850	28	8.0	2200

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—27-53 ozs. (new brushes).

Field Current—1.47-1.63 amperes at 6.0 volts.

Motoring Current—3.94-4.36 amperes at 6.0 volts.

Removal:—Generator cradle mounted at left side of engine with fan belt drive. Water pump driven by generator shaft extension. To remove, disconnect water pump, loosen fan belt, remove generator clamp band, lift generator out.

Belt Adjustment:—Adjust whenever belt deflection is more than 1½" (when pressed lightly midway between generator and fan pulleys). To adjust, loosen two capscrews on fan bracket, lift fan up (one screw hole slotted) until belt deflection is approximately 1", tighten screws.

REGULATOR:—Model VRB-4002-D Voltage-Current Type. Consists of Cutout Relay, Vibrating Voltage Regulator, and Vibrating Current Regulator in case on dash.

NOTE—Regulator cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum.

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.4-7.9 volts hot.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads). Connect voltmeter between 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 M.P.H. car speed until voltage is constant. Voltage should then be within 7.3-7.9 volts (high limit cold, low limit hot). If outside these limits, Regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.060" Min., .062" Max. contacts just opening.

Current Regulator

Setting—Not to exceed rating marked on cover.

To Check—Connect ammeter and voltmeter as directed for Voltage Regulator test. Operate generator at 30 M.P.H. car speed, add load (use bank of headlamp bulbs or turn on car lights and discharge battery) so that generator will charge at peak rate and bring Current Regulator into action. Charging current should not exceed 28 amperes. If more than slight excess noted, Regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap & Air Gap—Same as for Voltage Regulator.

LIGHTING:—Headlamps—Corcoran-Brown, pre-focused type. Upper and lower beams controlled by foot selector switch on toeboard. Lower beam deflected slightly to one side (special 2331 type bulb).

Headlamp Beam Indicator—Red marker on instrument panel below speedometer dial. Lighted whenever driving or upper headlamp beams are lighted.

Switches

Lighting—Douglas.

Foot Selector—Douglas.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Park, Dash, License	3	63
Indicator	1	51
Stop-Tail	21-3	1158
Dome	6	81

FUSES:—Lighting—20 amp. on back of lighting switch.

Accessory—20 amp. on fuse block attached to lighting switch. Protects stop light and gasoline gauge circuits.

HORNS:—Sparton Vibrator type, twin horns operated by horn relay.

Horn Relay:—R.B.M. Model 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with 4 volts across windings when in inverted position.

SERIAL NUMBER:—First number L-50781. Stamped on plate on right frame side rail under engine hood.

COMPRESSION:—Ratio—5.61-1 Std., 5.88-1 Optl.
Pressure—Approximately 100 lbs. at cranking speed of 125 R.P.M. Must be equal for all cylinders within 10 lbs.

VACUUM READING:—Steady reading of 18-20" with engine idling at 7 M.P.H.

IGNITION:—Coil Model IG-4407. Mounted on dash.
Resistor Unit—Mounted on distributor terminal. Connected in coil primary circuit.
Coil Draw—2.5 amperes idling, 4.0 stopped.

Ignition Switch:—Oakes Hershey type co-incidental ignition switch and steering post lock.
Ignition Lock—Briggs & Stratton No. 80207.

Distributor:—Model IGW-4010. Single breaker, 6 lobe cam, full automatic advance type.
Cam Angle or Dwell—35° (closed), 25° (open).
Breaker Gap—Set at .020".
Breaker Arm Spring Tension—16-20 ounces.
Condenser—Part No. IGB-1025 Cap. .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	275	0	550
3	360	6	720
6	425	12	850
9	700	18	1400
12	1000	24	2000

Removal:—Distributor mounted on cylinder head on right side. To remove, loosen locknut and take out setscrew on side of cylinder head opposite distributor shaft.

IGNITION TIMING:— **Flywheel Degrees** **Piston Pos.**
All Engines ..... At TDC ..... 0000" TDC.
Timing—With #1 piston on compression, turn engine over until 'DC.IGN' mark on vibration dampener at front of engine lines up with pointer on chain case cover. Loosen locknut and back off setscrew on side of cylinder head slightly, rotate distributor until contacts begin to open, tighten setscrew and locknut.
NOTE—Timing light recom. for setting ignition.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Firing Order:—1-5-3-6-2-4. See diagram.

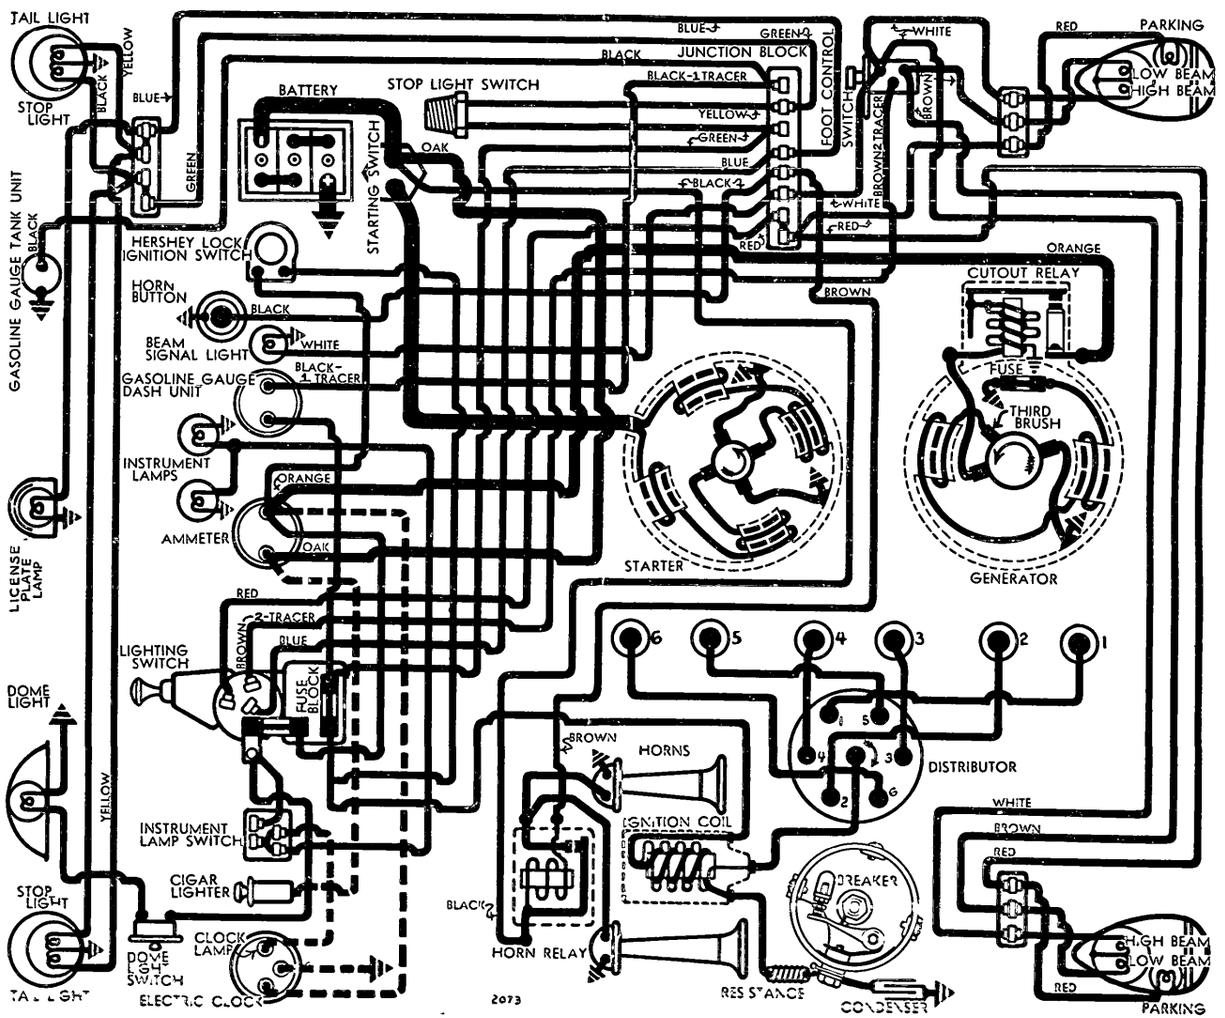
Spark Plugs:—AC. Type G-8. 18 MM. Metric type.
NOTE—G-8 discontinued by AC. Use No. 85.
Spark Plug Gaps—.025" (.030" cars with radio).

CARBURETION:—Carburetor—Stromberg Model AX-2, 1¼" downdraft type.
See Article in Carburetion Section for data.
Idle Adjustment—Warm up engine. Set throttle lever stopscrew so that engine idles at 7 M.P.H. Turn idle adjusting screw in until engine begins to miss, out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle lever stopscrew for correct idling speed.
Accelerating Pump Setting—Engage pump link in proper hole in throttle valve lever for seasonal requirements as follows:
Inner Hole (Min. stroke)—Extremely hot weather.
Center Hole (Med. stroke)—Norm. summer weather.
Outer Hole (Max. stroke)—Winter temperatures.

Air Cleaner:—Burgess oil-wetted type standard, AC #1528279 Heavy Duty Oil-bath type optional.

Fuel Pump:—AC Type W #1523233 Diaphragm type std., Type AD #1523234 combination fuel-and-vacuum type optl.
See Article in Carburetion Equipment Section.

Gasoline Gauge:—Motometer Electric. Dash unit No. NG-8241D. Tank unit NG-8230T.
See Article in Carburetion Equipment Section.



VALVE TIMING:—To Check Timing—No means provided to check timing other than Camshaft Setting. Remove chain case cover at front of engine, turn engine over until crankshaft sprocket mark is toward camshaft and in line with straightedge across shaft center. Camshaft sprocket mark should be on same center-line and toward crankshaft sprocket.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Tappet Clearance:—.015" all valves, hot or cold.

LUBRICATION:—Crankcase Capacity—6 quarts.
Normal Oil Pressure—25-35 lbs.

BATTERY:—U.S.L. Type KL-1-13. 6 volt, 13 plate, 100 ampere hour capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.1 minutes.
Grounded Terminal—Positive (+) term. grounded to transmission cover bolt.
Location—On left side under drivers seat.

STARTER:—Model MAB-4076. Armature MAB-2057.
Drive—Inboard Bendix Type LCD11FX-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—125 R.P.M., 150-160 amperes, 5.2 volts.

Performance Data

Torque	R P M.	Volts	Amperes
0 ft lbs.	3700	5 5	60
6 "	1910	5 5	100
3 4 "	1100	5 0	200
6 6 "	695	4 5	300
10 15 "	420	4 0	400
15 2 "	Lock.	3 0	575
22 5 "	Lock	4 0	750

Removal:—Starter flange mounted on left front face of flywheel housing To remove, take out flange mounting screws

Starting Switch:—Model SW-4005 Mounted at left of engine. Operated by depressing clutch pedal fully. No adjustment required.

GENERATOR (STD.):—Model GCM-4803-4. Armature GCJ-2030. Third brush control type. Ventilated by fan on drive pulley

Maximum Charging Rate—22 amperes (cold), 18 amperes (hot), 8 0 volts, 2650 R P M.

Charging Rate Adjustment—Remove commutator cover band, shift third brush counter-clockwise to increase or clockwise to decrease charging rate Brush held in position by friction. Do not exceed maximum charging rate as indicated above.

Performance Data

Cold Amps.	Cold Volts	Cold R P M	Hot Amps.	Hot Volts	Hot R P M.
0	6 4	775	0	6 4	830
4	6 7	900	4	6 75	985

20	7.85	1900	18	8 0	2700
22	8.0	2650			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—27-53 ozs. (new brushes).

Field Current—3 50-3 89 amperes at 6 0 volts.

Motoring Current—5 75-6 25 amperes at 6 0 volts

Field Fuse—5 ampere (under cover on generator frame).

GENERATOR (WITH RADIO):—Model GCO-4802. Armature GCO-2031-F. Two brush, straight shunt type with external voltage and current regulation. Ventilated by fan on drive pulley.

NOTE—See diagram for Nash Model 3780 (preceding) for wiring of this generator and the regulator used with it.

Maximum Charging Rate—28 amperes (cold), 8 0 volt, 1850 R P M, and above, with load or discharged battery (Current Regulator Setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition

Charging Rate Adjustment—No adjustment on generator. See Regulator Section below for Voltage and Current Regulator settings.

Performance Data

Cold Amps	Cold Volts	Cold R P M	Hot Amps	Hot Volts	Hot R P M
0	6 4	825	0	6 4	900
4	6 6	940	4	6 6	1025
8	6 85	1050	8	6 85	1160
12	7 1	1175	12	7 1	1310

20	7 55	1450	20	7 55	1660
24	7 8	1610	24	7 8	1880
28	8 0	1850	28	8 0	2200

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—27-53 ozs (new brushes).

Field Current—1 47-1 63 amperes at 6 0 volts.

Motoring Current—3 94-4 36 amperes at 6 0 volts

Removal (All Models):—Generator cradle mounted at left side of engine with fan belt drive Water pump driven by generator shaft extension To remove, disconnect water pump, loosen fan belt, remove generator clamp band, lift generator off

Belt Adjustment (All Models):—Adjust whenever belt deflection is more than 1½" (when pressed lightly midway between generator and fan pulleys) To adjust, loosen two capscrews on fan bracket lift fan up (one screw hole slotted) until belt deflection is approximately 1", tighten screws

CUTOUT RELAY:—Model CB-4014 (With GCM-4803-4 generator). Mounted on generator See article in Electrical Equipment Section for complete data

Cuts In—6 75-7 5 volts

Cuts Out—5-2 5 ampere discharge current

Contact Gap—025-035".

Air Gap—.010-.030" with contacts closed

REGULATOR:—Model VRB-4002-D Voltage-Current Type (With GCO-4802 Generator). Consists of Cut-out Relay, Vibrating Voltage Regulator, and Vibrating Current Regulator in case on dash

NOTE—Regulator cover is sealed Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments

See Article in Electrical Equipment Section.

Cutout Relay

Cuts In—6 5 volts Min, 7 25 volts Max Cold

Cuts Out—5 ampere Min, 3 0 amperes Max Cold

Contact Gap—015" minimum.

Air Gap—034" Min, 038" Max. with contacts open Measure at hinge end of core.

Voltage Regulator

Setting—7.4-7 9 volts hot

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads). Connect voltmeter between 'B' and 'GD' terminals Operate generator, charging fully charged battery, at speed equivalent to 30 M P H car speed until voltage is constant. Voltage should then be within 7 3-7 9 volts (high limit cold, low limit hot). If outside these limits, Regulator is defective

To Adjust—Change regulator armature spring tension by bending lower spring hanger See Electrical Equipment Section for complete instructions.

Contact Gap—010" Min, .020" Max. with armature against stop pin

Air Gap—060" Min, 062" Max contacts just opening.

Current Regulator

Setting—Not to exceed rating marked on cover.

To Check—Connect ammeter and voltmeter as directed for Voltage Regulator test Operate generator at 30 M P H car speed, add load (use bank of headlamp bulbs or turn on car lights and discharge battery) so that generator will charge at peak rate and bring Current Regulator into action Charging current should not exceed 28 amperes If more than slight excess is noted, Regulator is defective

To Adjust—Change regulator armature spring tension by bending lower spring hanger See Electrical Equipment Section for complete instructions

Contact Gap & Air Gap—Same as for Voltage Regulator

LIGHTING:—Headlamps—Corcoran-Brown, pre-focused type Upper and lower beams controlled by foot selector switch on toeboard Lower beam deflected slightly to one side (special 2331 type bulb)

Headlamp Beam Indicator—Red marker on instrument panel below speedometer dial Lighted whenever driving or upper headlamp beams are lighted

Switches

Lighting—Douglas

Foot Selector—Douglas.

Bulb Specifications

Position	Candlepower	Mazda No
Headlamps	32-32	2331
Park, Dash, License	3	63

Stop-Tail	21-3	1158
Dome	6	81

FUSES:—Lighting—20 amp on back of lighting switch.

Accessory—20 amp on fuse block attached to lighting switch Protects stop light and gasoline gauge circuits

Generator Field—5 amp (GCM-4803-4 only) Under cover on generator field frame

HORNS:—Sparton Vibrator type, twin horns operated by horn relay

Horn Relay:—R B M Model 10072 Current draw 4-55 amperes at 6 0 volts Coil resistance 11-14 ohms. Contacts must close with 4 volts across windings when inverted position.

OAKLAND

MODEL 212 ALL AMERICAN SIX (1929), SERIAL NOS. 227000 UP
PRODUCTION STARTED OCTOBER 1928
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

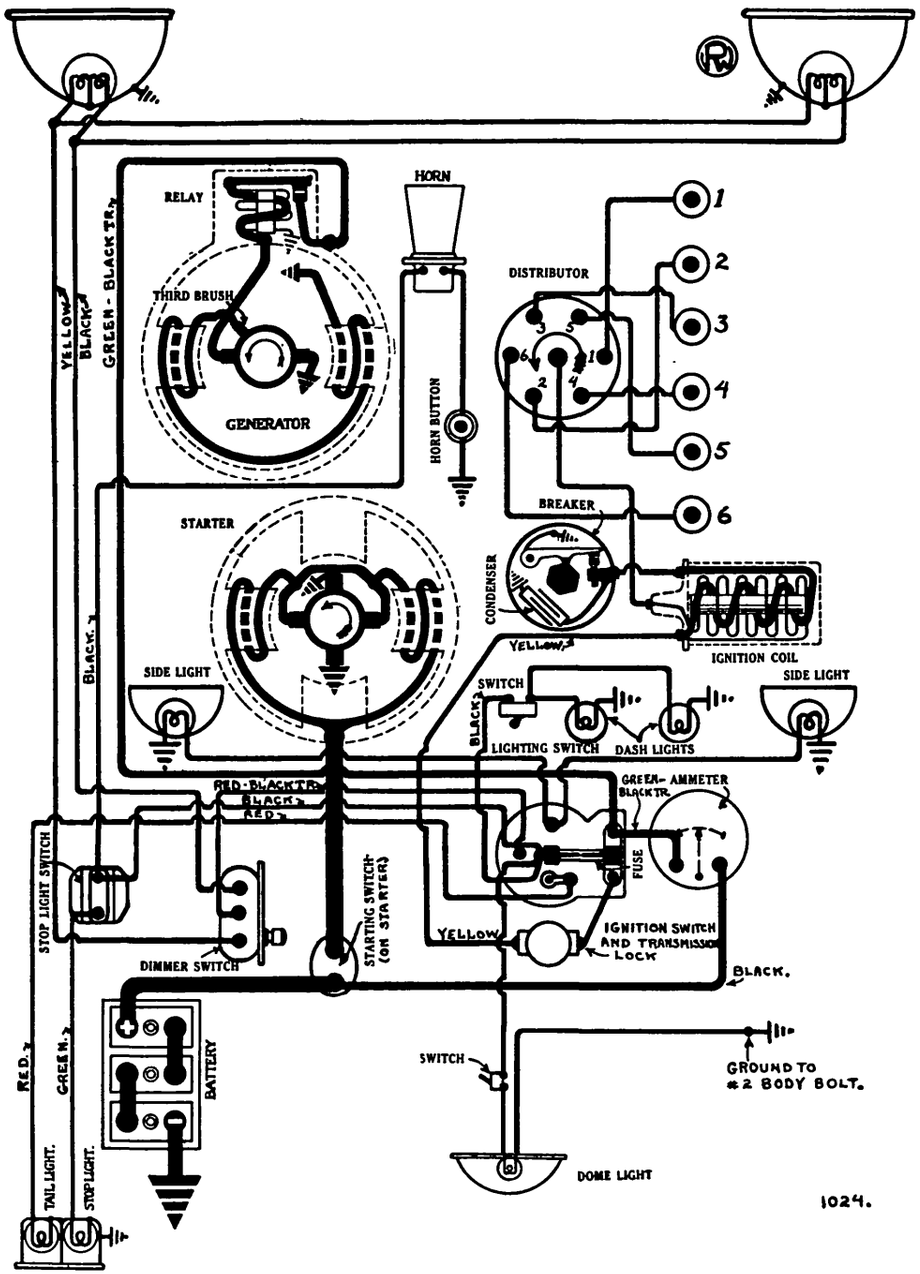
BATTERY:—Willard and U.S.L. Types WSB-15 and XY-15X6, 6 volt, 15 plates. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 119 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20.8 hours. Battery is mounted under the front floor boards on the left hand side.

IGNITION:Coil Model 528-C. Distributor Model 640-K. Breaker contacts separate .018-.024 inch with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Adjust contact gap by loosening lock screw on stationary contact plate and shifting plate by turning eccentric adjusting screw until proper contact is secured. Breaker arm spring tension is 17-21 ounces. Distributor is full automatic. Maximum automatic advance is 21-23 degrees. The ignition switch is a Delco-Remy Dual-lock Model 425-K or M.

Mounting:—Coil is mounted on the dash. Distributor is mounted at the left of the engine. To remove distributor, disconnect primary lead and remove head with cables intact. Loosen the mounting screw on side of distributor shaft and lift distributor from place.

Oiling:—Fill grease cup on side of distributor with medium cup grease and turn down one turn every 500 miles. Put a small bit of vaseline on the breaker cam every 1000 miles.

Timing:—Breaker contacts separate when piston entering power stroke reaches a position 4 degrees (measured on the flywheel) before top dead center. To check timing, crank engine over until piston No. 1 is coming up on the compression stroke. This is the up stroke with both valves closed. Continue to crank engine until piston reaches a position 4 degrees (measured on the flywheel) before top dead center when the mark '1&6 Ign' on the flywheel is opposite the indicator. Breaker contacts should separate at this point. If they do not, loosen the clamp screw on side of distributor mounting and rotate distributor until contacts open. Tighten the clamp screw. Make certain that the rotor is opposite the segment connected to he spark plug in cylinder No. 1 and connect the remaining plugs in order around the distributor head.



Firing Order:—The firing order is 1-5-3-6-2-4. No. 1 cylinder nearest the radiator.

Spark Plugs:—Spark plugs are ⅞ inch Standard. Gaps are .022 inch.

VALVE TIMING:—INLET VALVES:—Head diameter is 1⅝ inches; stem diameter is 5/16 inch; stem length is 5 1/16 inches. Tappet clearance is .007-.009 inch. Spring pressure is 40-50 pounds. Valve lift is 9/32 inch. Inlet valves open at 5 degrees after top dead center and close at 40 degrees after lower dead center.

EXHAUST VALVES:—Head diameter is 1½ inches; stem diameter is 5/16 inch; stem length is 5 1/16 inches. Tappet clearance is .007-.009 inch. Spring pressure is 40-50 pounds. Valve lift is 9/32 inch. Exhaust valves open at 45 degrees before lower dead center and close at 5 degrees after top dead center. Valve stem guides are removable. Oversize valves are not made.

Valve Setting:—Camshaft drive is by a two-sprocket non-adjustable chain drive. Assemble chain with the camshaft sprocket and crankshaft sprocket turned so that the punch marks on the two sprockets are together and in line with a straight edge laid across the two shaft centers.

OAKLAND

MODEL 212 ALL AMERICAN SIX (1929), SERIAL NOS. 227000 UP
PRODUCTION STARTED OCTOBER 1928
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

STARTER:—Model 714-F. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 100-175 R.P.M. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light oil in the commutator end oiler every 1000 miles. The drive end bearing is oilless. It requires no attention.

GENERATOR:—Model 949-N. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, charging rate is 14 amperes (hot) or 17 amperes (cold) reached at 1400 R.P.M. or approximately 20 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
15-17	7.95-8.15	1400	11-14	7.55-7.85	1700-1800

Generator, motoring draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 16-18 ounces.

Mounting:—Generator is mounted at left front of engine by special swinging bracket and is driven by fan belt. To remove generator, disconnect lead and loosen nut on special adjustment bracket and swing generator toward engine block. Slip off belt. Then remove two bolts in bracket under generator and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the oilers every 500 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 7-10 miles per hour or 575 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap between the relay armature and coil core is .014-.021 inch with contacts closed.

LIGHTING:—Clum Lighting Switch. Switch is mounted on the dash. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact) Mazda 1110. Dash, tail and side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87.

Switches:—Lighting switch is Model 10741 (5192). Dimmer switch is Delco-Remy Model 465-B. Stop light switch is Clum Model 8828 or 9100.

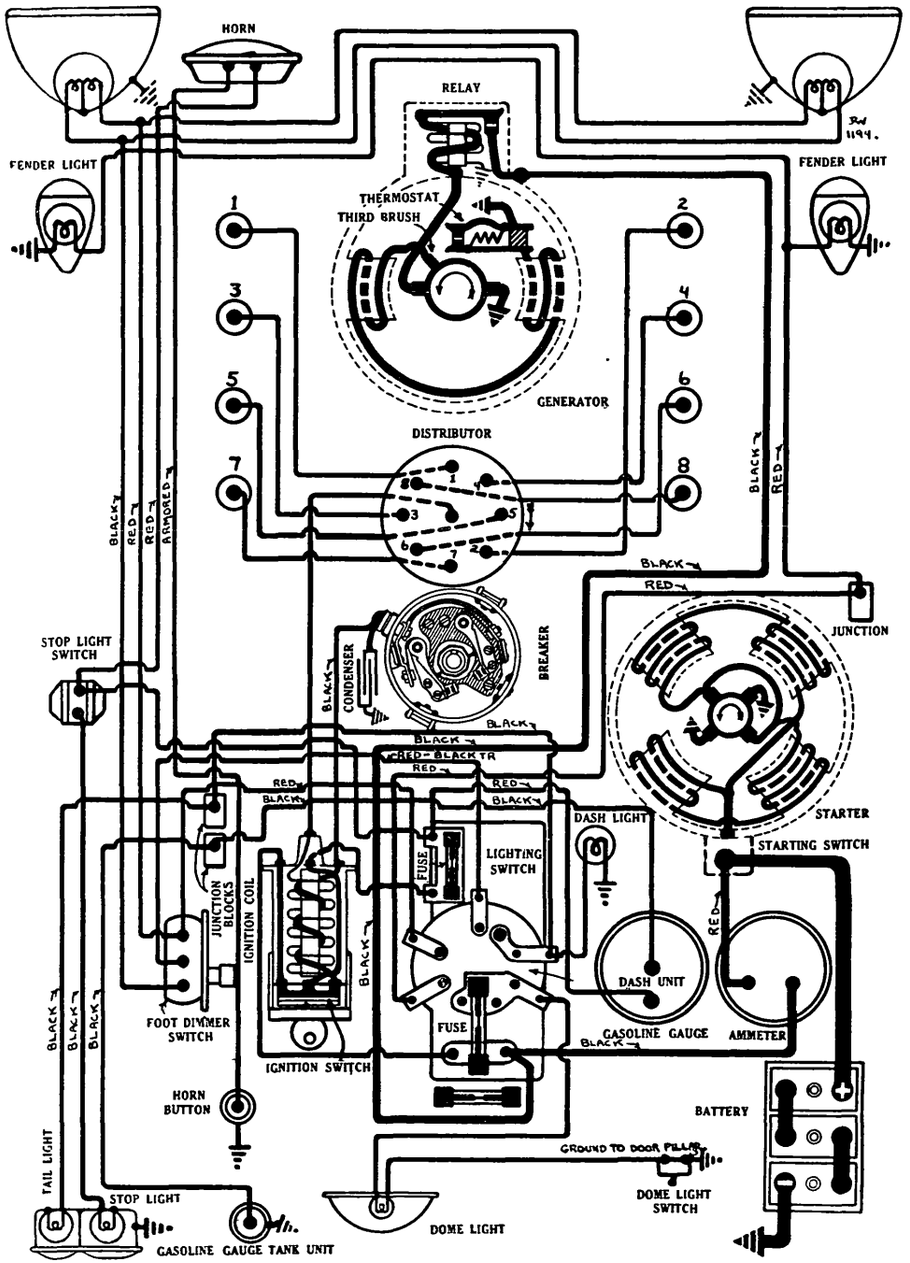
FUSE:—Lighting fuse on back of switch is 20 amperes.

OAKLAND

EIGHT MODEL 0/8 (1930) SERIAL NUMBERS 273500-08 UP
MODEL 301 (1931) SERIAL NUMBERS 296,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Various batteries are used. These are 6 volt, 100 ampere hour. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on the right frame member under the floor boards of the front compartment.

IGNITION:—Coil Model 526-R. The ignition switch is built in the base of the coil. Coil is mounted on the rear of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1.5 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.



Distributor Model 660-A (1931). Breaker contact gap .018-.024". Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until gap is .022 inch with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. There are two sets of contacts operating on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. The contacts must be synchronized to secure this firing interval for satisfactory engine performance. See Timing. Distributor is full automatic. Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 27 degrees reached at 2800 R.P.M. of the engine.

Distributor Model 661-B (1931). Breaker contact gap .016". Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until gap is .016 inch with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. There are two sets of contacts operating on a single eight sided cam. Contacts open simultaneously. The contacts must be synchronized to secure this simultaneous break for satisfactory engine performance. See Timing. Distributor is full automatic. Automatic advance begins at 700 R.P.M. of engine. Maximum automatic advance is 18-20 degrees reached at 2800 R.P.M. of the engine.

Mounting:—Distributor is mounted vertically at the rear of the engine between the cylinder banks. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then loosen advance arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with No. 3 grease and turn down one turn every two weeks or each 500 miles. Every 1000 miles remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil and put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts (1930). Contacts synchronized by using special Delco-Remy tool, Part No. 1838182, and following complete directions in the Equipment Section. It is possible to synchronize the contacts without special equipment after the distributor has been timed to the engine by cranking the engine over 270 degrees when piston No. 2 will reach firing position when the flywheel mark '2&8/IGN' will be directly opposite the indicator in the peephole in the flywheel housing at the left of the engine. Loosen the two lock screws on the movable breaker plate and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the breaker gap with the breaker arm on the lobe of the cam. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

OAKLAND

EIGHT MODEL 0/8 (1930) SERIAL NUMBERS 273500-08 UP
MODEL 301 (1931) SERIAL NUMBERS 296,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Synchronization of Contacts (1931). Must be synchronized so that the both sets open at the same instant. This can be done very easily after the distributor has been timed to engine by blocking open the first set of contacts and cranking the engine over 270 degrees when piston No. 2 will reach firing position when the flywheel mark '2&8/IGN' will be directly opposite the indicator in the peephole in the flywheel housing at the left of the engine. Loosen the two lock screws on the movable breaker plate and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the breaker gap with the breaker arm on the lobe of the cam.

Timing Distributor to Engine. Breaker contacts begin to separate when piston entering power stroke reaches a position 7° ('30), 10° ('31) on flywheel) before top dead center. To set timing, crank engine over until No. 1 piston enters compression stroke (the up stroke with both valves closed). Turn engine over and stop when the flywheel mark '1&7/IGN' is directly opposite the indicator in the inspection hole in the left side of the flywheel housing (visible after taking up toeboard). Then loosen the advance arm clamp screw and rotate the distributor until the contacts begin to open. Tighten the clamp screw and see that the segment in the distributor head directly opposite the rotor is connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs as shown on diagram (all models).

NOTE:—The upper clamp screw and indicator arm are used to make slight changes in the distributor setting. The normal setting is when the indicator is directly opposite the '0' mark on the scale. This is changed by loosening the clamp screw and shifting the arm.

Firing Order:—The firing order is 1-4-5-2-7-6-3-8 with cylinders numbered as shown on the diagram. This firing order is IL-2R-3L-1R-4L-3R-2L-4R with cylinder No. 1 nearest the radiator and cylinder banks right and left as viewed from the driver's seat.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-12. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1½ inches. Stem diameter, 11/32 inch. Stem length, 5 13/16 inch. Valve lift, 5/16 inch. Spring pressure, 100 pounds. Tappet clearance, .011-.013 inch (hot). Inlet valves open at top dead center and close 40 degrees after lower dead center. The flywheel is marked at point of inlet opening for cylinders Nos. 1 and 2.

EXHAUST VALVES:—Head diameter, 1⅜ inches. Stem diameter, 11/32 inch. Stem length, 5 13/16 inches. Valve lift, 5/16 inch. Spring pressure, 100 pounds. Tappet clearance, .011-.013 (hot). Exhaust valves open 45 degrees before lower dead center and close 15 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .015". This valve should open with piston on top dead center when flywheel mark 'DC/1-7' lines up with indicator on housing. Reset tappet clearance at .012" with engine hot.

To Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—Model 726-H (726-J—R.H. Drive). Starter is connected to the engine through a manual pinion shift. The first movement of the starting pedal compresses two coil springs within a sleeve. These springs force the starter drive pinion in mesh with the engine flywheel gear. The further movement of the starting pedal closes the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove starting pedal control rod. Then take out two flange mounting cap screws and nut on flange bolt. Pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the starter bearing oiler every month or each 1000 miles.

GENERATOR:—Model 959-J. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 9-12 amperes (hot) reached at 1800-2000 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.0	1450	9-12	7.35-7.65	1800-2000

Brush spring tension is 14-18 ounces. Shunt field current is 4-6.1 amperes. Generator motoring draws 5.5-6 amperes at 6 volts.

Mounting:—Generator is flange mounted at front of engine between cylinder banks and is driven by the fan belt. To remove generator, disconnect lead and remove three flange mounting cap screws. Then lower generator and slip off drive belt. The generator and fan can then be lifted from place.

Belt Adjustment. The generator drive belt tension is adjusted by shifting the generator. To take up drive belt, loosen the two flange mounting screws and tilt the generator to the left around the left hand screw as a pivot. Tighten the mounting screws. The belt tension should be just sufficient to drive the generator and fan without slipping.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles of operation.

RELAY:—**Model 265-G.** Relay is mounted on the generator. Relay contacts close when the generator voltage reach 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Clum Switch Model 9067 ('30), 9191 ('31). Switch mounted on instrument panel. Double filament headlights using a second 21 cp. filament instead of dimmers are standard equipment. Headlights are controlled by a dimmer switch mounted on the toeboard. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

Switches:—Dimmer switch is Delco-Remy Model 465-J.

FUSES:—Lighting fuse mounted on back of switch is 20 ampere capacity. A spare fuse is mounted on the switch. The small fuse at the top of the switch (in the gasoline gauge circuit) is 20 ampere capacity.

OLDSMOBILE

MODEL F-29 (1929), F-30 (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

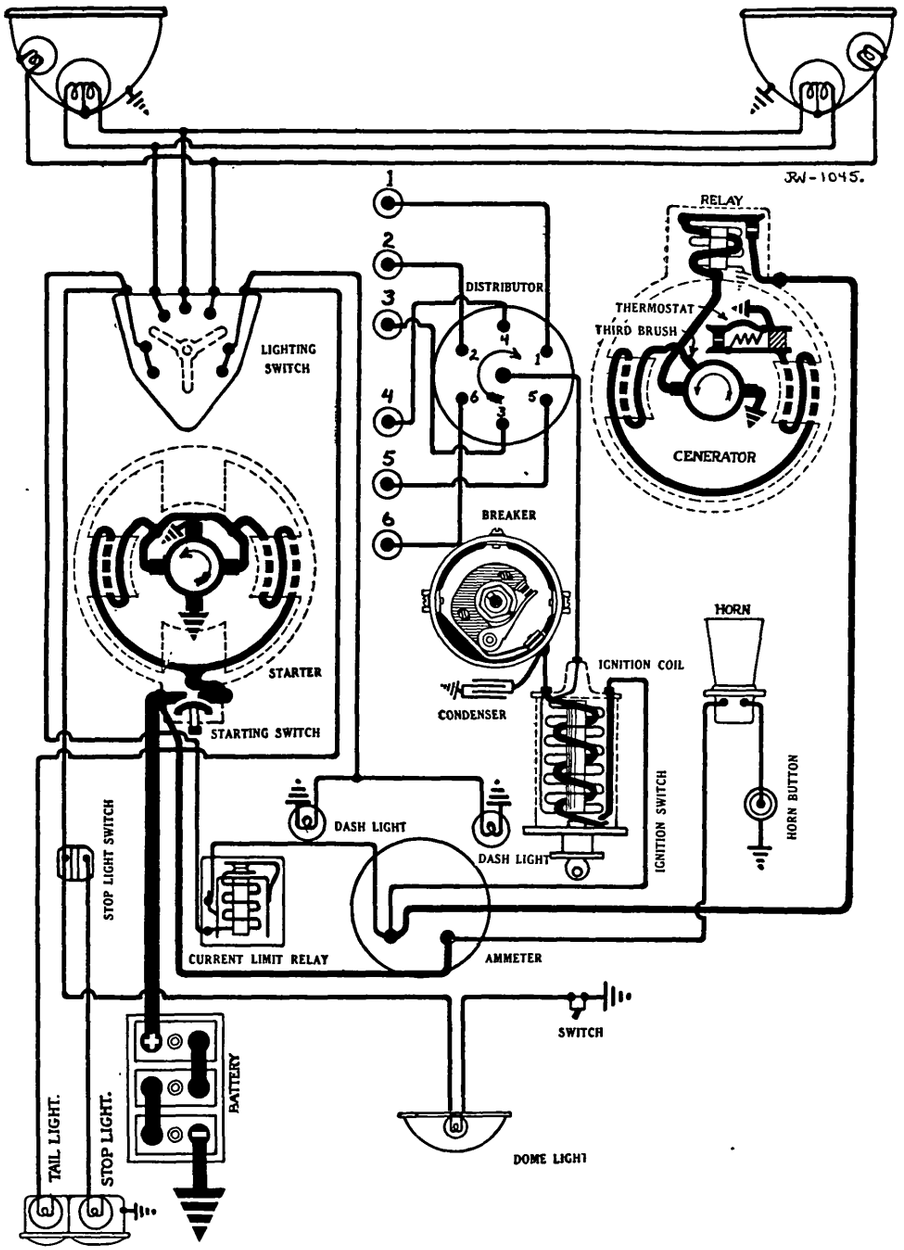
BATTERY:—Willard, Type WSB-13, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted under the driver's seat.

IGNITION:—Coil Model 528-Z (1929), 528-P (1930). Coil is mounted on the dash with the ignition switch in the base of the coil extending through to the face of the instrument board. Ignition current is 1.8 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.

Distributor Model 639-G. Breaker contacts separate .022 inch. Set contact gap by loosening lock screw on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until correct gap is obtained with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is full automatic. Automatic advance begins at 400 R.P.M. (engine). Maximum automatic advance is 24 degrees reached at 2800 R.P.M.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then loosen advance arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the shaft and turn down one half turn every month or each 1000 miles. At the same time, remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil and put a small amount of vaseline on the face of the breaker cam.



Timing:—Breaker contacts begin to open when piston entering power stroke reaches a position 8 degrees or .020-.030 inch before top dead center with breaker assembly fully retarded. No flywheel marks are provided for setting ignition. A timing gauge can be used or ignition can be set at top dead center (No. 1 piston entering power stroke) as follows: With No. 1 piston on top dead center, loosen advance arm clamp screw, rotate distributor until contacts begin to open, tighten clamp screw, then loosen hold-down screw and rotate distributor against rotation (counter-clockwise) an amount equivalent to 8° of crankcase rotation as indicated on graduated scale on distributor mounting bracket. Tighten hold-down screw and connect spark plugs as indicated on diagram.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are Metric A.C. Type G. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 17/32 inches. Stem diameter, 11/32 inch. Stem length, 5⅜ inches (over all). Valve lift (with .010 inch lash), .320 inch. Spring pressure, 68 pounds compressed to 1 15/16 inches. Tappet clearance, .008 inch (hot) running and .010 inch when setting camshaft. Inlet valves open at top dead center (with .010 inch clearance) and close 50 degrees after lower dead center. The flywheel is marked '0' at top dead center position for pistons Nos. 1 & 6 (1929 only).

EXHAUST VALVES:—Head diameter, 1 13/32 inches. Stem diameter, ⅜ inch. Stem length, 5⅜ inches (over all). Valve lift, .320 inch. Spring pressure, 68 pounds compressed to 1 15/16 inches. Tappet clearance, .008 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Oversize

OLDSMOBILE

MODEL F-29 (1929), F-30 (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

valves are not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open with piston on top dead center entering power stroke. On 1929 cars flywheel is marked '0' at this point. Reset tappet clearance at .008" (hot).

To Set Valve Timing:—Mesh chain with marks on sprockets lined up with a straightedge.

STARTER:—Model 714-H. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 125 R.P.M. drawing 130 amperes at 5.5 volts. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove starter pedal link pin. Then remove flange mounting cap screws, pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless.

GENERATOR:—Models 949-W, 957-A. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 170°F. cutting the resistance across the thermostat contacts in series with the field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 19-21 amperes (cold) reached at 1450 R.P.M. or approximately 25 M.P.H.

Generator Data—Model 949-W

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	1450	9-12	7.35-7.65	1800-2000

Generator Data—Model 957-A

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.3-8.5	1300	9-12	7.35-7.65	1800-2000

NOTE:—Generator Model 949-W is used for domestic production. Model 957-A is used for export. These models are identical except performance as as listed.

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and remove inspection cover on front of chain case. Then remove flange mounting cap screws and slide generator to the rear. Tie up the timing chain to prevent it slipping off camshaft sprocket and throwing the engine out of time.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles. The drive end bearing is oiled by splash from the chain case.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 650 R.P.M. or 12 M.P.H. when the generator voltage reaches 7-7.5 volts and open at 575 R.P.M. or 9.5 M.P.H. with a discharge current of 1-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-B. Lighting switch is mounted at the lower end of the steering column. Double filament headlights are used instead of dimming. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights (in headlights) are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash, tail, side and dome lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

CURRENT LIMIT RELAY:—Model 410-C. This device is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits. It begins to vibrate when the current reaches 20-30 amperes and continues limiting the current to 2-15 amperes. Contact gap is .012-.030 inch. Air gap is .019-.025 inch.

ACCESSORIES:—Horn is Klaxon Model 18-B. Stop light switch is Delco-Remy Model 466-G.

OLDSMOBILE

MODEL F-31 (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

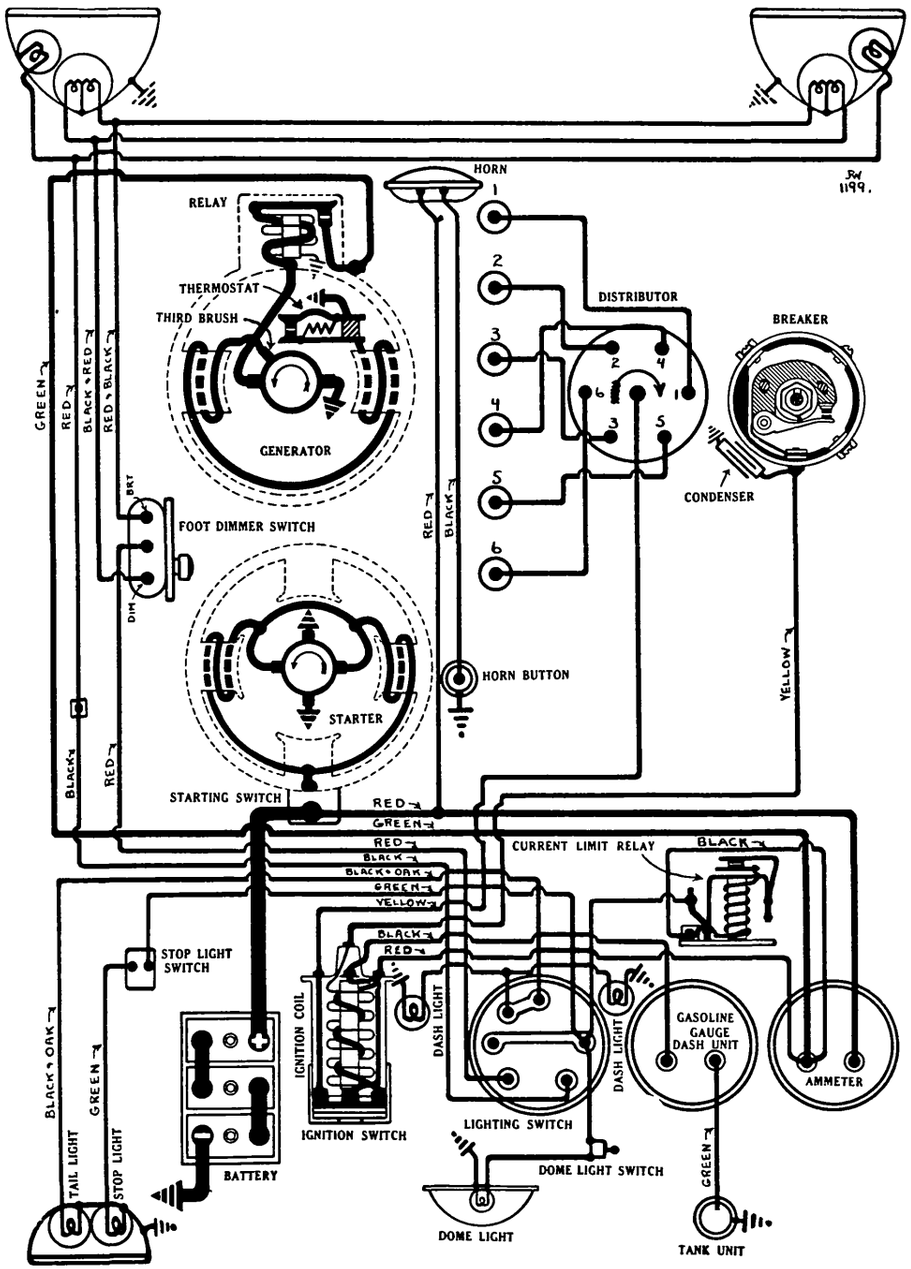
BATTERY:—Willard, Type WS-I-13, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted under the front compartment floor boards on the left side.

IGNITION:—Coil Model 533-U. The ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is .5-2.5 amperes at 6 volts with engine running and 4.5 amperes at 6 volts with engine stopped.

Distributor Model 639-G. Breaker contacts separate .022 inch. Set contact gap by loosening lock screw on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until correct gap is obtained with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is full automatic. Automatic advance begins at 400 R.P.M. (engine). Maximum automatic advance is 24 degrees reached at 2800 R.P.M.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then take off two nuts on distributor housing and lift distributor from place.

Oiling:—Fill the grease cup on the side of the shaft and turn down one half turn every two weeks or each 500 miles. At the same time, remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil and put a smallamount of vaseline on the face of the breaker cam.



Timing:—Breaker contacts begin to separate when the piston entering power reaches top dead center with breaker assembly in the fully retarded position. To set timing, crank engine over until piston No. 1 enters compression stroke and stop when piston reaches top dead center (a '0' mark may be found on the flywheel which should register with the indicator in the peephole in the left front side of the flywheel housing. Then loosen advance arm clamp screw, rotate distributor until contacts begin to open, tighten clamp screw, connect spark plugs as indicated on diagram.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are Metric A.C. Type G-12. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 17/32 inches. Stem diameter, 11/32 inch. Stem length, 5⅜ inches (over all). Valve lift (with .010 inch lash), .320 inch. Spring pressure, 40 pounds (spring length, 2¼ inches) and 87 pounds (spring length, 1 15/16 inches). Tappet clearance, .007-.009 inch (hot) running and .010 inch when setting camshaft. Inlet valves open at top dead center (with .010 inch clearance) and close 50 degrees after lower dead center. The flywheel is marked '0' at the top dead center position. This mark may not be found on all cars.

EXHAUST VALVES:—Head diameter, 1 13/32 inches. Stem diameter, ⅜ inch. Stem length, 5⅜ inches (over all). Valve lift, .320 inch. Spring pressure, 40 pounds (spring length, 2¼ inches) and 87 pounds (spring length, 1 15/16 inches). Tappet clearance, .009-.011 inch (hot). Exhaust

MODEL F-31 (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

valves open 40 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Oversize valves are not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open with piston on top dead center entering power stroke. On cars with flywheel marked '0' this mark should register with indicator in peephole in left front side of flywheel housing. Reset tappet clearance at .007-.009" (hot).

To Set Valve Timing:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—Model 714-H. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 125 R.P.M. drawing 130 amperes at 5.5 volts. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove starter pedal link pin. Then remove flange mounting cap screws, pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless.

GENERATOR:—Model 955-R. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 170°F. cutting the resistance across the thermostat contacts in series with the field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 9-12 amperes (hot) reached at 2000 R.P.M. of the generator.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	1550	9-12	7.35-7.65	1800-2000

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted on pivot mounting bracket at the left of the engine and is driven by the fan belt. To remove generator, disconnect lead and loosen pivot bolt. Swing generator toward engine and slip off drive belt. Then take out pivot bolt and lift generator from place.

Belt Adjustment. To take up drive belt, loosen pivot bolt and swing generator away from the engine. Tighten pivot bolt. The belt should be just tight enough to drive the generator and fan shaft without slipping.

Oiling:—Put 8 or 10 drops of light engine oil in the generator oilers every two weeks or each 500 miles of operation.

RELAY:—Model 265-G. Relay is mounted on the generator. Relay contacts close at 650 R.P.M. or 12M.P.H. when the generator voltage reaches 6.75-7.5 volts and open at 575 R.P.M. or 9.5 M.P.H. with a discharge current of 1-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 478-F. Lighting switch is mounted at the lower end of the steering column. Double filament headlights are used instead of dimming. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights (in headlights) are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

Dimmer switch mounted on toe board is Delco-Remy Model 465-J. Stop light switch is Model 466-A.

CURRENT LIMIT RELAY:—Model 410-C. This device is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits. It begins to vibrate when the current reaches 25-30 amperes and continues limiting the current to 2-15 amperes. Contact gap is .012-.030 inch. Air gap is .015-.025 inch.

SIX MODEL F-32 (1932), SERIAL NUMBERS 10,001 UP
PRODUCTION STARTED DECEMBER, 1931
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on right door sill under floor mat.

ENGINE NUMBER:—On car serial number plate. This series F-302,001 up

BATTERY:—**Delco, Type 13-C,** 6 volt, 13 plate, 86 ampere hour capacity (20 hour rate). Negative (—) terminal grounded. Battery mounted on left frame member under front compartment floor boards.

IGNITION:—**Coil Model 534-W.** Lock coil type with ignition switch in base. Coil mounted on back of instrument board with ignition switch at lower center of instrument panel. Ignition current .5-2.5 amperes (engine running), 4.5 amperes (engine stopped).

Distributor Model 632-P. Single breaker arm, 6-lobe cam type with full automatic advance. Breaker gap set at .022 inch. Hold within limits of .018-.024 inch. To set gap, loosen lock screw on crescent shaped stationary contact plate, turn eccentric adjusting screw, tighten lock screw. Breaker arm spring tension. 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface).

Cam Angles—Closed 36°. Open 24° (distributor degrees).

Automatic Advance

Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	300	3	600
5.75	600	11.5	1200
14	1500	28	3000

Mounting:—Distributor mounted on cylinder head. Remove from right side. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

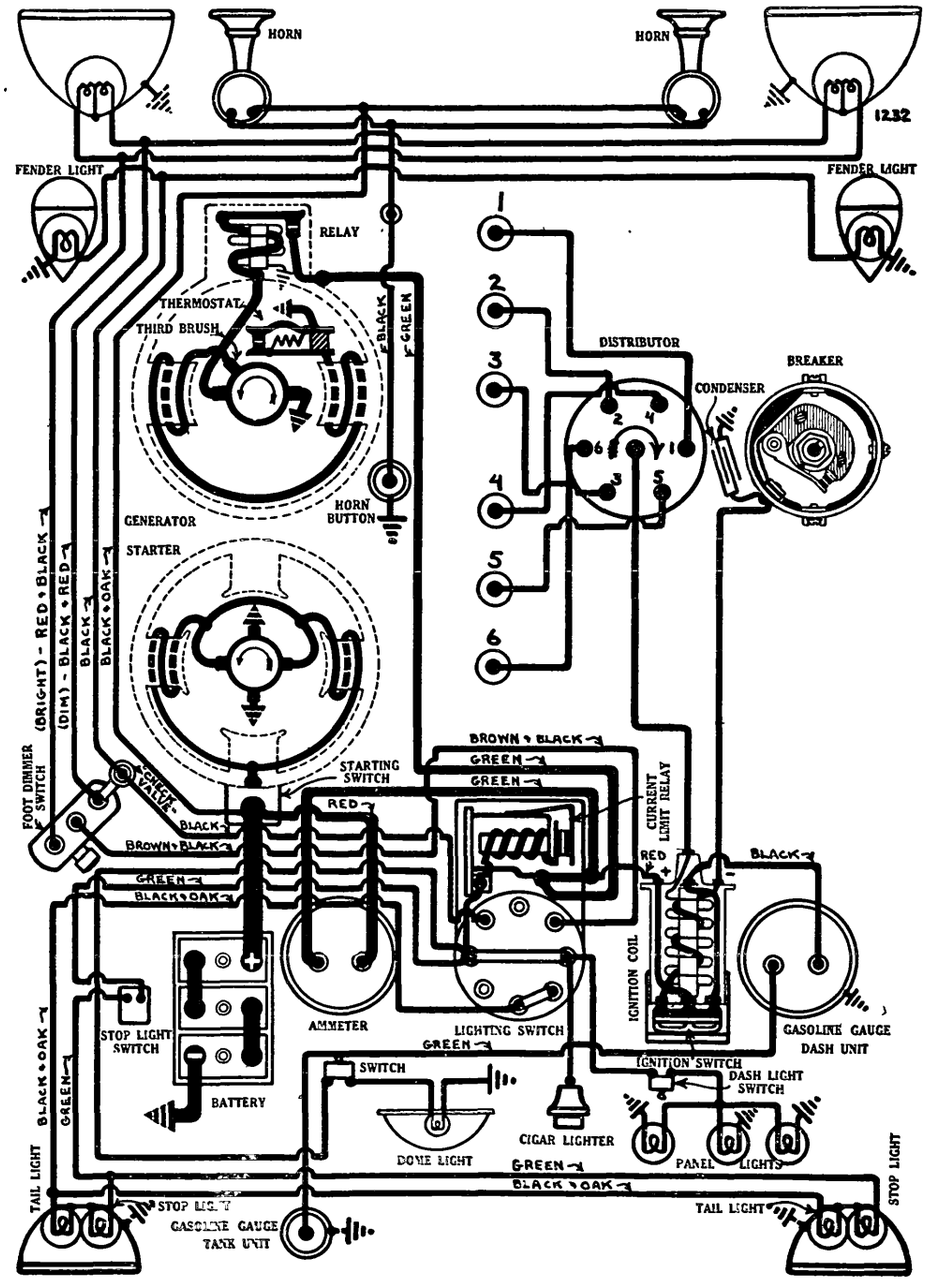
Oiling:—**500 Miles.** Turn down grease cup under distributor one full turn. Keep cup filled with No. 2½ cup grease.

1000 Miles. Take of distributor cap and rotor. Fill wick oiler in center of shaft with light engine oil. Put one drop of oil on breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

Timing:—Standard setting 7° (on flywheel) or .020" (piston travel) before top dead center. To set timing, with No. 1 piston on compression turn engine over until the first mark on the rim of the vibration dampener at the front of the engine is directly opposite the pointer on the chain case, loosen advance arm clamp screw, rotate distributor until contacts begin to open, tighten clamp screw, connect spark plugs as indicated on diagram (No. 1 terminal as designated). The second mark on the vibration dampener is the top dead center mark for pistons Nos. 1 and 6.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. A.C. Type G-9. Set gap at .025 inch.



VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Stem Length	Seat Angle	Lift
Intake	1⅝"	11/32"	5⅜"	30°	.320"

OLDSMOBILE

SIX MODEL F-32 (1932), SERIAL NUMBERS 10,001 UP
PRODUCTION STARTED DECEMBER, 1931
DELCO-REMY SYSTEM

Timing

Intake valves open at top dead center. Close 50° after lower dead center. Exhaust valves open 40° before lower dead center and close 10° after top dead center. These figures are correct with .010" tappet clearance or lash.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". With No. 6 piston on compression, turn engine over until piston reaches top dead center with the second (or last) mark on the vibration dampener on the front of the crankshaft directly opposite pointer on chain case. No. 1 intake valve should begin to open at this point.

To Set Valve Timing. Camshaft sprocket and crankshaft sprocket are marked. To set timing, turn crankshaft and camshaft until marks are directly opposite and in line with straightedge across shaft centers. Mesh chain.

STARTER:—Model 734-B. Manual pinion engagement connected to the starting switch pedal (switch mounted on starter field frame). Starter drives through overrunning clutch. Rotation counter-clockwise at commutator end. Brush spring tension, 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
12 "	Lock	3.63	475

Mounting:—Starter flange mounted on left front face of flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take out 2 flange mounting bolts, pull starter forward to clear housing, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in commutator end oiler. Drive end bearing is oilless.

GENERATOR:—Model 953-H. Third brush regulation, thermostat control. Thermostat operates at 200°F. (contacts open—cuts in resistance) reducing output approximately 40%. To adjust charging rate, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, tighten lock screw. Rotation counter-clockwise at commutator end. Maximum charging rate, 19-21 amperes (cold) at 8.3-8.5 volts reached at 1550 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	1550	9-12	7.35-7.65	1800-2000

Brush spring tension, 14-18 ounces. Shunt field current, 4.0-6.1 amperes at 6 volts. Motoring generator draws 5.5 amperes at 6 volts.

Mounting:—Generator cradle mounted at left front of engine. Driven by fan belt. Water pump driven by extension of generator shaft. To remove, disconnect lead, disconnect water pump drive coupling, take out two bolts in mounting clamp band, lift generator out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler at each end of generator.

RELAY:—Model 265-G. Relay mounted on generator. Relay contacts close at 825 R.P.M. of generator or 10 M.P.H. with generator voltage of 6.75-7.5 volts and open with discharge current of 0-2.5 amperes. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 478-J (with current limit relay). Lighting switch mounted on back of instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated switch on toeboard. Instrument panel lights controlled by switch under instrument board. Lighting switch positions:

1. Button pushed in—all lights off.
2. Button halfway out—Parking (fender) lights on. Tail lights on.
3. Button pulled out—Headlights on. Tail lights on. Fender lights are on when headlights 'dimmed' by foot switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking (fender) Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome Light	6-8	3	S.C.	63

Dimmer Switch:—Model 465-K. Dimmer switch incorporates special 'check valve' in fender light circuit. Valve consists of special alloy washer under terminal on fender light lead on busbar connected to 'dim' terminal of dimmer switch. Fender lamps are lighted whenever headlights are 'dim'. Fender light terminal also connected to terminal on lighting switch. Fender lamps are lighted whenever lighting switch button is in 'park' position. The valve prevents headlight 'dim' bulbs being lighted with the switch in this position. Stop light switch is Model 474-W.

CURRENT LIMIT RELAY:—Mounted as part of lighting switch assembly. Consists of vibrating circuit breaker. Circuit breaker begins to operate when current load reaches 25-30 amperes, limiting load to 15 amperes with direct short-circuit. Contact gap limits, .012-.030 inch. Air gap limits, .015-.025 inch (contacts closed). Spring tension, 5 ounces minimum (measured at brass button with spring scale at right angles to arm).

GASOLINE GAUGE:—A.C. electric type (see Carburetion Section).

FUEL PUMP:—A.C. Type 'B' mechanical fuel pump mounted at right of engine (see Carburetion Section).

HORNS:—Klaxon Model K-26-B twin horns (matched tone), Type 1385 (low note), Type 1386 (high note). Current draw (Type 1385), 6.0-8.5 amperes at 6 volts; (Type 1386), 5.0-6.5 amperes at 6 volts.

OLDSMOBILE

EIGHT MODEL L-32 (1932), SERIAL NUMBERS 1,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on right door sill under floor mat.

ENGINE NUMBER:—Stamped on car serial number plate. This series 1,001 up.

BATTERY:—**Delco, Type 13-E,** 6 volt, 13 plate, 100 ampere hour capacity (20 hour rate). Negative (—) terminal grounded. Battery mounted on left frame member under front compartment floor boards.

IGNITION:—**Coil Model 534-W.** Lock coil type with ignition switch in base. Coil mounted on back of instrument board with ignition switch at lower center of instrument panel. Ignition current .5-2.5 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped).

Distributor Model 660-T. Two-breaker arm, 4-lobe cam type with full automatic advance. Contacts open alternately at 45 degree intervals corresponding to 90 degree firing interval of engine. Contacts must be synchronized (see Timing). Breaker gap set at .022 inch. Hold within limits of .018-.024 inch. To set gap, loosen lock screw on stationary contact plate, turn eccentric adjusting screw, tighten lock screw. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface).

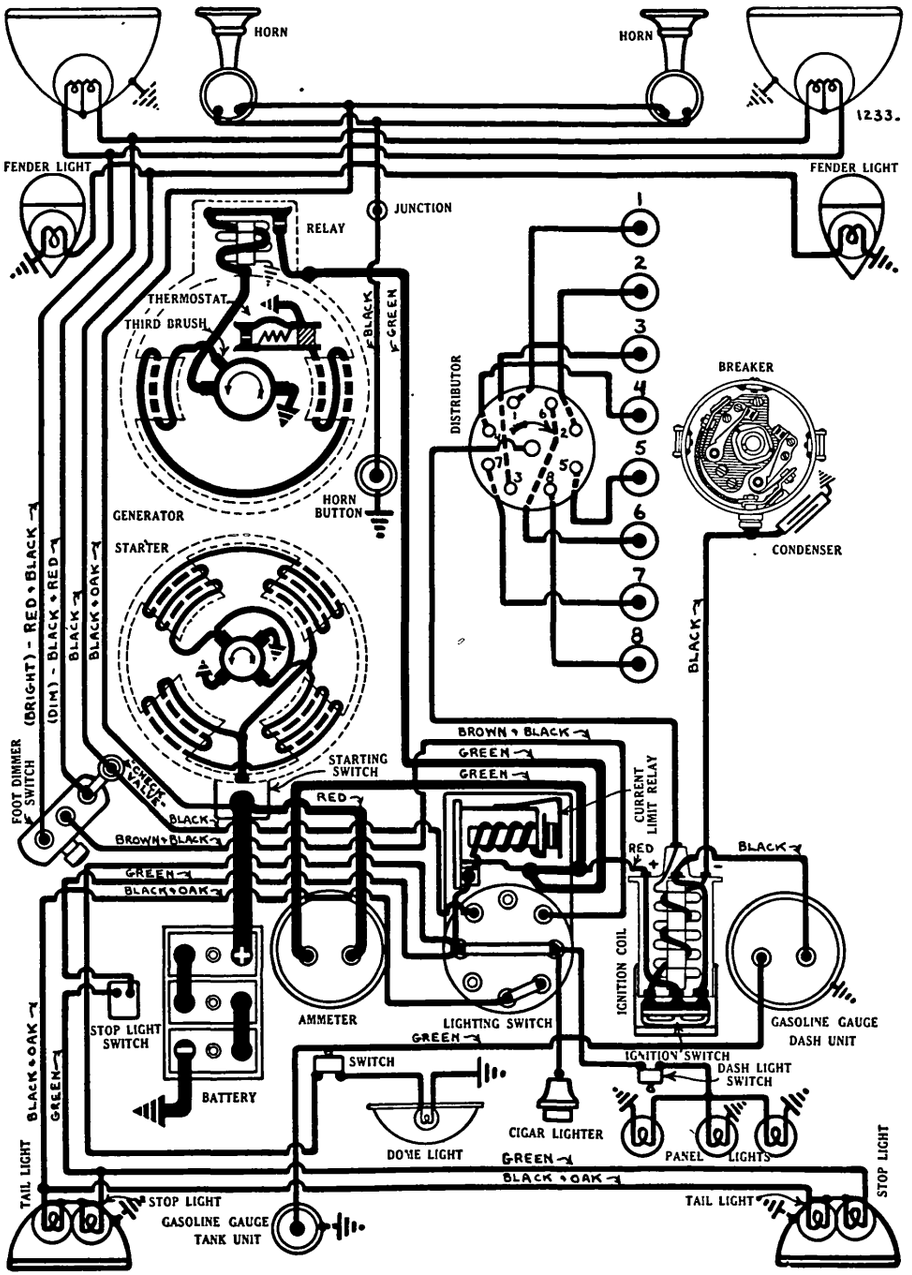
Cam Angles—Closed 34°. Open 11° (distributor) when synchronized.

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start	.....	300	4	.....	600
7.75	.....	800	15.5	.....	1600
13	.....	1350	26	.....	2700

Mounting:—Distributor mounted on cylinder head. Remove from right side. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—**500 Miles.** Turn down grease cup on side of shaft housing one full turn. Keep filled with No. 2½ cup grease.

1000 Miles. Take off distributor cap and rotor. Fill wick oiler in center of shaft with light engine oil, put one drop oil on breaker arm pivot pins, apply thin film vaseline to face of breaker cam.



Timing:—Standard setting 7° (on flywheel) or .020" (piston travel) before top dead center. To set timing, with No. 1 piston on compression stroke, turn engine over until the first mark on the rim of the vibration dampener at the front of the engine is directly opposite the pointer on the chain case, loosen hold-down screw in advance arm, center pointer on quadrant, tighten hold-down screw, loosen advance arm clamp screw, rotate distributor until first set of contacts (mounted directly on breaker plate) begin to open, tighten clamp screw, connect spark plugs as indicated on diagram (No. 1 terminal as designated).

Synchronization of Contacts. No marks provided on flywheel for synchronization of contacts on engine. Use special tool, Oldsmobile Part No. HMJ-185, and follow complete directions in Equipment Section. Contacts can also be synchronized on a rotary spark gap or with a timing gauge if adaptors are available so that timing gauge can be mounted in No. 6 cylinder. In this case turn crankshaft to firing position of No. 6 piston (.020" before top dead center), loosen lock screws on movable sub-plate, turn eccentric adjusting screw until second set of contacts open, tighten lock screws.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. A.C. Type G-9. Set gaps at .025 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

OLDSMOBILE

EIGHT MODEL L-32 (1932), SERIAL NUMBERS 1,001 UP
DELCO-REMY SYSTEM

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 9/16"	11/32"	5 9/32"	30°	300"
Exhaust	1 7/16"	3/8"	5 9/32"	30°	300"

Intake	.007-.009" (hot)	.010"	Closed .....43 pounds (2¼ inches)
Exhaust	.009-.011" (hot)		

Timing

Intake valves open at top dead center. Close 42° after lower dead center. Exhaust valves open 40° before lower dead center. Close 10° after top dead center. These figures are correct with tappet clearance or lash of .010".

To Check Valve Timing. Set tappet clearance of No. 1 intake valve at .010 inch. With No. 6 piston on compression stroke, turn engine over until piston No. 6 reaches top dead center with the second or top dead center mark on the vibration dampener at the front of the engine directly opposite the pointer on the chain case. No. 1 intake valve should begin to open at this point.

To Set Valve Timing. Camshaft sprocket and crankshaft sprocket are marked. To set timing, turn crankshaft and camshaft until marks are directly opposite and in line with straightedge across shaft centers. Mesh chain.

STARTER:—Model 725-R. Manual pinion engagement connected to starting switch pedal (switch mounted on starter field frame). Starter drives through overrunning clutch. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5.0	60
15 "	Lock	3.0	600

Mounting:—Starter flange mounted on left front face of flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take out 2 flange mounting bolts, pull starter forward to clear housing, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in commutator end oiler. Drive end bearing is oilless.

GENERATOR:—Model 953-H. Third brush regulation, thermostat control. Thermostat operates at 200°F. (contacts open—cuts in resistance) reducing output approximately 40%. To adjust charging rate, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, tighten lock screw. Rotation counter-clockwise at commutator end. Maximum charging rate, 19-21 amperes (cold) at 8.3-8.5 volts reached at 1550 R.P.M.

Generator Data

Dome Light	6-8	3	S.C.	63

Dimmer Switch:—Model 465-K. Dimmer switch incorporates special 'check valve' in fender light circuit. Valve consists of special alloy washer under terminal on fender light lead on busbar connected to 'Dim' terminal of dimmer switch. Fender lamps are lighted whenever headlights are 'dim'. Fender light terminal also connected to terminal on lighting switch. Fender lamps are lighted whenever lighting switch button is in 'park' position. The valve prevents headlight 'dim' bulbs being lighted with the switch in this position. Stop light switch is Model 474-W.

CURRENT LIMIT RELAY:—Mounted as part of lighting switch assembly. Consists of vibrating circuit breaker. Circuit breaker begins to operate when current load reaches 25-30 amperes, limiting load to 15 amperes with direct short-circuit. Contact gap limits, .012-.030 inch. Air gap limits, .015-.025 inch (contacts closed). Spring tension, 5 ounces minimum (measured at brass button with spring scale at right angles to arm).

GASOLINE GAUGE:—A.C. electric type (see Carburetion Section).

FUEL PUMP:—A.C. Type 'B' mechanical fuel pump mounted at right of engine (see Carburetion Section).

HORNS:—Klaxon Model K-26-B twin horns (matched tone), Type 1385 (low note), Type 1386 (high note). Current draw (Type 1385), 6.0-8.5 amperes at 6 volts; (Type 1386), 5.0-6.5 amperes at 6 volts.

OLDSMOBILE

SIX CYLINDER MODEL F-33 (1933), SERIAL NUMBERS 24,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On plate on right hand side of front compartment floor in front of right front seat (sedans) or under right front seat (coupes).

ENGINE NUMBER:—On car serial number plate.

ENGINE:—Six cylinder, 'L' head type, 3⅜x4⅛" bore and stroke, 221.4 cubic inch displacement, rated at 27.34 H.P., develops 80 H.P. at 3200 R.P.M. Standard compression ratio 5.3-1. Standard compression pressure 104-107 pounds at 1000 R.P.M.

BATTERY:—Delco, Type 13-L-CU (domestic cars), 13-LF (export), 6 volt, 13 plate, 86 ampere hour capacity (20 hour rate). Starting capacity 102 amperes for 20 minutes.

Grounded Terminal:—Negative (—) terminal grounded to frame.

Mounting:—On left hand side of frame under driver's seat.

Dimensions:—Width, 7". Length, 9 1/16". Height, 8⅝".

IGNITION:—Coil Model 534-T, 534-S (Canadian). Lock coil with ignition switch.

Ignition Current:—.2-2.5 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped).

Ignition Switch:—Gasoline gauge and stop lamp connected to auxiliary terminal on coil and controlled by ignition switch (operative only with switch turned 'on').

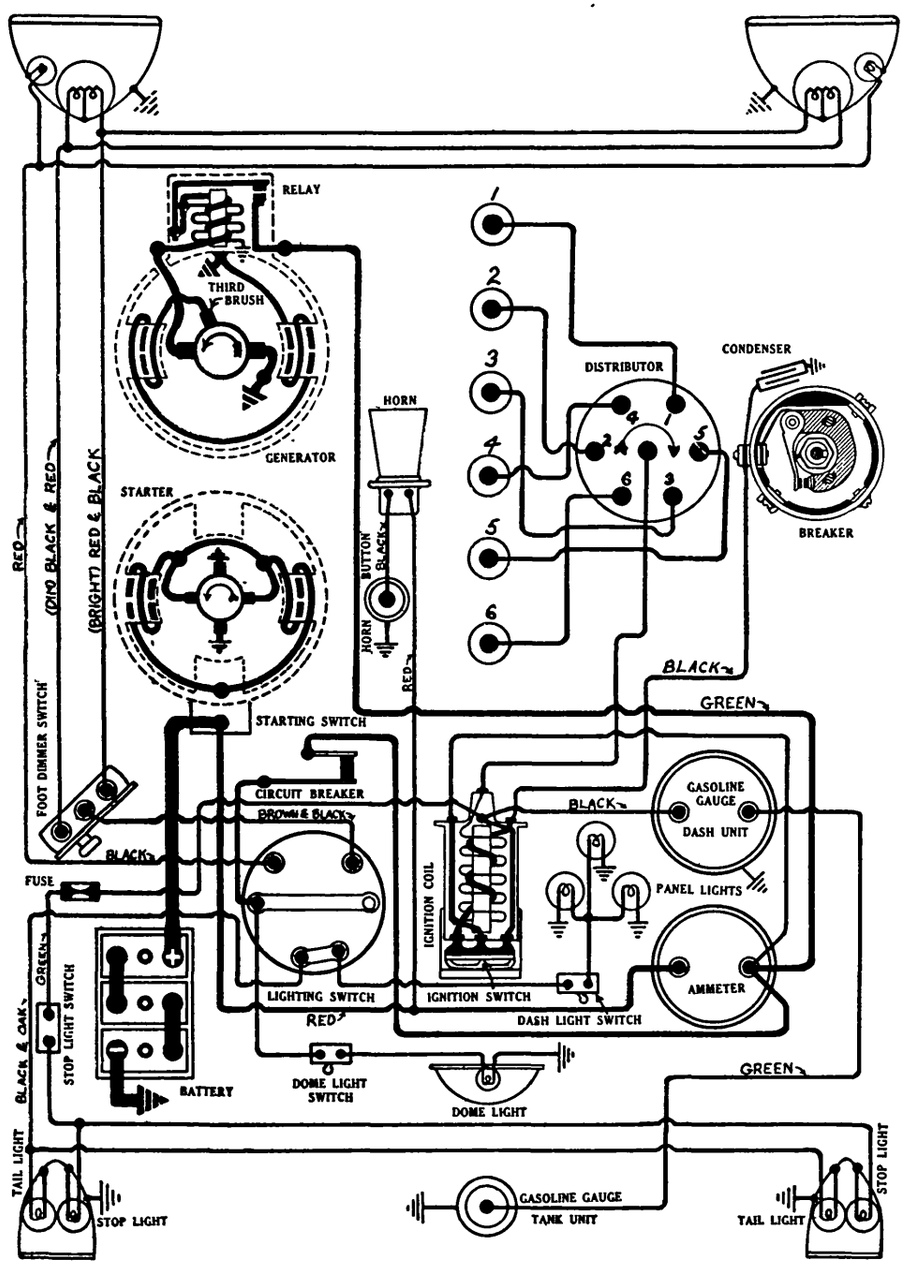
Distributor Model 632-P. Single breaker, 6 lobe cam, full automatic advance type. Contact gap adjusted by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw.

Breaker Gap:—Set contact gap at .022". Hold within limits of .018-.024".

Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.

Cam Angles—Closed 36°. Open 24° (distributor degrees).

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		300	3		600
5.75		600	11.5		1200
14		1500	28		3000



Mounting:—On top of cylinder head on right side. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance plate, lift distributor out.

Oiling:—500 Miles. Turn down grease cup on side of shaft housing one full turn. Keep cup filled with No. 2½ grease.

1000 Miles. Take off distributor cap and rotor, fill wick oiler in center of shaft with light engine oil, put one drop of oil on breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting, 3½° (flywheel) or .0046" (piston travel) before top dead center.

To Set Ignition Timing. First loosen hold-down screw in advance plate, center pointer of plate on scale (pointer should be opposite '0' or center division of scale), tighten hold-down screw. With No. 1 piston on compression stroke, turn engine over by hand until piston reaches firing position with the first line on the vibration dampener at the front of the engine directly under the pointer on the chain case. Then loosen clamp bolt in advance plate, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated.

OLDSMOBILE

SIX CYLINDER MODEL F-33 (1933), SERIAL NUMBERS 24,001 UP
DELCO-REMY SYSTEM

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. A.C. Type G-9. Set gaps at .025 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven by two-sprocket non-adjustable chain drive from the crankshaft. Sprockets are marked. To set timing, mesh sprockets in chain so that marks are adjacent and in line with a straightedge laid across the shaft centers.

To Check Valve Timing. With No. 1 piston on top dead center entering power stroke set tappet clearance of No. 1 intake valve at .010". Turn engine over one complete revolution and stop with piston on top dead center when the second mark on the vibration dampener at the front of the engine is directly under the pointer on the chain case. No. 1 intake valve should begin to open at this point. Reset tappet clearance at .007-.009" with engine warm.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1⅝"	11/32"	5⅜"	30°	.320"
Exhaust	1½"	⅜"	5⅜"	30°	.320"

Tappet Clearance

	Operating	Timing
Intake	.008" (hot)	.010"
Exhaust	.010" (hot)	.010"

Valve Springs

Closed	43 pounds —2¼"
Open	96 pounds—1 29/32"

Timing—.010" lash

Intake Valves	Exhaust Vales
Open—At top dead center	Open 40° before lower dead center
Close—50° after lower dead center.	Close—10° after top dead center

CARBURETION:—Stromberg Downdraft Carburetor, Model EC-22 with Fast Idle and Stromberg Automatic Choke. See Carburetor Section for complete data. Manifold heat control is automatic.

Air Cleaner:—A.C. oil-wetted wire mesh type integral with silencer. Remove complete unit at 2500 mile intervals, clean by dipping wire mesh end of unit in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. Mechanical Fuel Pump mounted on right side of crankcase and driven by eccentric on camshaft. Remove glass sediment bowl under pump occasionally, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—A.C. electric type (see Carburetion Section).

STARTER:—Model 734-K. Starter drive—Overrunning clutch and mechanical pinion shift connected to starting switch pedal (switch mounted on starter field frame). Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
12 "	Lock	3.63	475

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take out flange mounting bolts, pull starter forward to clear pinion housing, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in commutator end oiler. Drive end bearing at outer end of pinion housing is oilless.

GENERATOR:—Model 953-S. Third brush regulation, thermostat control. Thermostat contacts open at 200°F. reducing the charging rate approximately 40%. Generator rotation counter-clockwise at commutator end. Maximum charging rate is 19-21 amperes (cold) at 8.5 volts reached at 1800 R.P.M.

Charging Rate Adjustment. Loosen small lock screw on commutator end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten lock screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	1800	9-12	7.35-7.65	1800-2000

Brush Spring Tension:—14-18 ounces on each brush.

Field Current:—4-6.1 amperes at 6 volts across field terminals.

Motoring:—Approximately 5.5 amperes at 6 volts.

Mounting:—Pivot mounting at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine, slip off drive belt, take out two bolts forming bracket hinge, lift generator out.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt, swing generator away from engine until correct belt tension is secured, tighten adjustment clamp bolt and mounting bolts. Belt tension should be just sufficient to drive generator and fan without slipping.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler at each end.

RELAY:—Model 265-G. Mounted on generator field frame. Contacts close at 825 R.P.M. or 10 M.P.H. with generator voltage of 6.75-7.5 volts and open with 0-2.5 ampere discharge current.
Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch Model 478-Y. Dimmer Switch Model 465-W. Lighting switch mounted on back of instrument board controlled by push-pull button on instrument panel. Lighting system Guide 'Tilt-Ray' with depressed beam dimming swing double filament headlight bulbs controlled by foot operated dimmer switch on toeboard. Stop light switch is Delco-Remy Model 474-K.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21	D.C.	1116
Parking Bulbs	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Tail Light	6-8	15	S.C.	87
Stop Light	6-8	15	S.C.	87
Dome Light	6-8	6	S.C.	81

CIRCUIT BREAKER:—The circuit breaker mounted on the lighting switch bracket consists of a thermostatic arm through which the lighting current is taken to the switch. An excessive current flow due to a ground or short-circuit will cause the thermostatic arm to open the circuit breaker contacts thus protecting the lighting circuits from damage. This circuit breaker differs from previous designs in that there is no coil and the contacts are opened directly by the thermostatic arm.

FUSES:—15 ampere capacity fuse assembled in connector in stop light cable.

HORN:—Klaxon Model K-18-C. Vibrator type horn mounted under engine hood. Current drawn by horn 5.5-6.5 amperes at 6 volts.

OLDSMOBILE

EIGHT CYLINDER MODEL L-33 (1933), SERIAL NUMBERS 7001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On plate on right hand side of front compartment floor in front of right front seat (sedans) or under seat (5 passenger coupes).

ENGINE NUMBER:—On car serial number plate.

ENGINE:—Eight cylinder, 'L' head type, 3x4½" bore and stroke, 240.3 cubic inch displacement, rated at 28.8 H.P., develops 90 H.P. at 3350 R.P.M. Standard compression ratio 5.5-1. Standard compression pressure 111-114 pounds at 1000 R.P.M.

BATTERY:—Delco, Type 13J-CU (Domestic), Type 13-JF (Export), 6 volt, 13 plate, 98 ampere hour capacity (20 hour rate). Starting capacity 117 amperes for 20 minutes.

Grounded Terminal:—Negative (—) terminal grounded to frame.

Mounting:—On left hand side of frame under driver's seat.

Dimensions:—Width, 7". Length, 9 1/16". Height, 9⅛".

IGNITION:—Coil Model 534-T, 534-S (Canadian). Lock coil with ignition switch.

Ignition Current:—.5-2.5 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped).

Ignition Switch:—Gasoline gauge and stop lamp connected to auxiliary terminal on coil and controlled by ignition switch (operative only with switch turned 'on').

Distributor Model 662-K. Two breaker, 4 lobe cam, full automatic advance type. Contacts open alternately at 45° intervals corresponding to 90° firing interval of engine. Breaker contacts must be synchronized (see Timing). Contact gap adjusted by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw.

Breaker Gap:—Set contact gap at .022". Hold within limits of .018-.024".

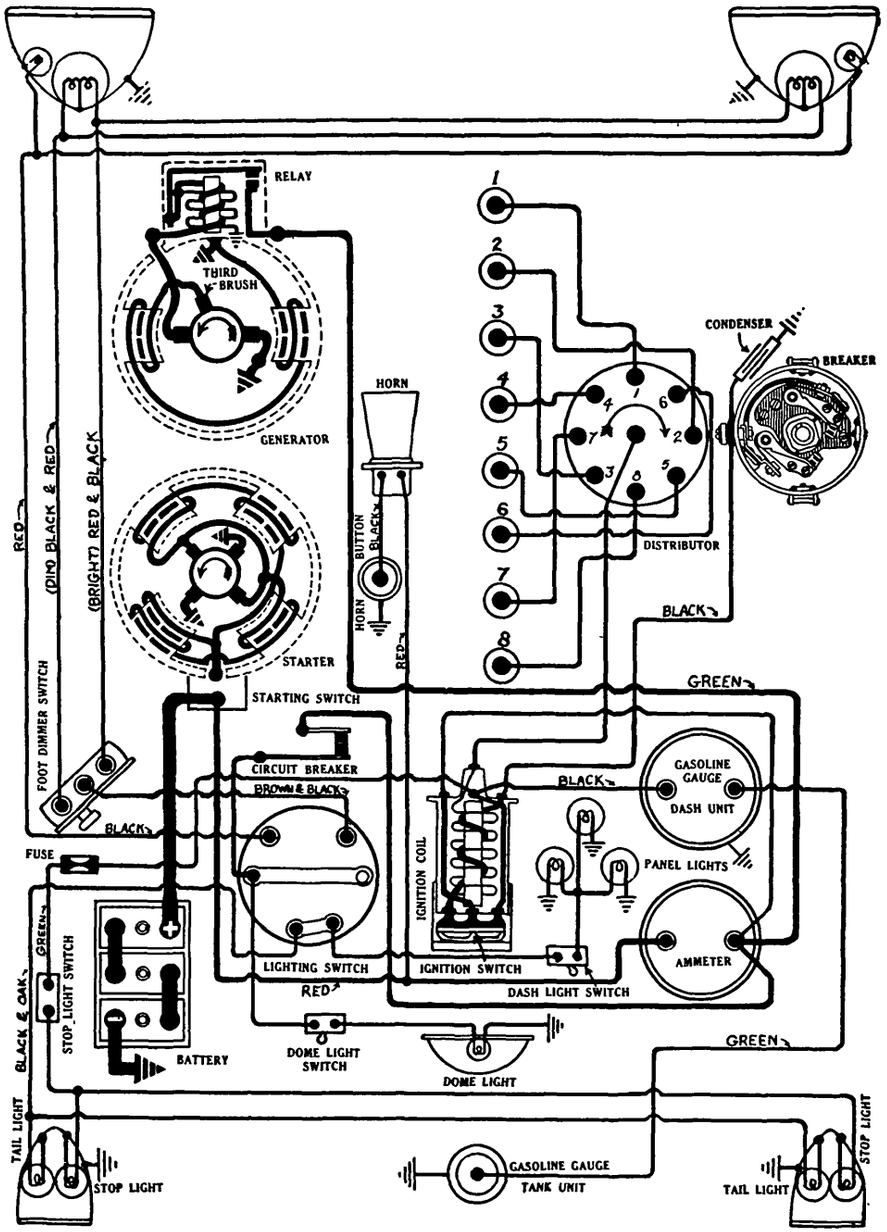
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.

Cam Angles—Closed 34°. Open 11° (distributor) when synchronized.

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	4		600
7.75		800	15.5		1600
13		1350	26		2700

Mounting:—Distributor mounted on right hand side of cylinder head. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.



Oiling:—500 Miles. Turn down grease cup on side of shaft housing one full turn. Keep cup filled with No. 2½ cup grease.

1000 Miles. Take off distributor cap and rotor, fill wick oiler in center of shaft with light engine oil, put one drop of oil on breaker arm pivot pins, aply thin film of vaseline to face of breaker cam.

IGNITION SETTING:—Standard setting 3½° (flywheel) or .0048" (piston travel) before top dead center.

To Set Ignition Timing. First loosen hold-down screw in advance plate, center pointer of plate on scale (pointer be directly opposite '0' or center division of scale), tighten hold-down screw. With No. 1 piston on compression stroke, turn engine over by hand until piston reaches firing position with the first line on the vibration dampener at the front of the engine directly under the pointer on the chain case. Then loosen clamp bolt in advance plate, rotate distributor until first or 'fixed' set of contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 segment in distributor cap (see diagram), connect spark plugs as indicated. The second or 'movable' set of contacts must be synchronized.

Synchronization of Contacts. No marks are provided to time the second set of contacts to the engine directly and they must be synchronized by

OLDSMOBILE

EIGHT CYLINDER MODEL L-33 (1933), SERIAL NUMBERS 7001 UP
DELCO-REMY SYSTEM

means of the special synchronizing tool, Oldsmobile Part No. HM-J-185, or Delco-Remy tool, Part No. 1838182 (see Equipment Section for complete data on synchronization of contacts). Contacts can also be synchronized on a rotary spark gap or directly on the engine if a timing gauge is used with special adaptors so that gauge may be mounted on No. 6 cylinder.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. A.C. Type G-9. Set gaps at .025 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven by two-sprocket non-adjustable chain drive from the crankshaft. Sprockets are marked. To set timing, mesh sprockets in chain so that marks on sprockets are adjacent and in line with straightedge laid across shaft centers.

To Check Valve Timing. With No. 1 piston on top dead center entering power stroke, set tappet clearance of No. 1 intake valve at .010". Turn engine over one complete revolution and stop with piston on top dead center when the second mark on the vibration dampener at the front of the engine is directly under the pointer on the chain case. No. 1 intake valve should begin to open at this point. Reset tappet clearance at .007-.009" with engine warm.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 9/16"	11/32"	5 9/32"	30°	.300"
Exhaust	1 7/16"	3/8"	5 9/32"	30°	.300"

Tappet Clearance	Operating	Timing
Intake	.008" (hot)	.010"
Exhaust	.010" (hot)	.010"

Valve Springs

Closed ..... 43 pounds—2¼"
Open ..... 96 pounds—1 29/32"

Timing—.010" lash

Intake Valves	Exhaust Valves
Open—At top dead center	Open—40° before lower dead center
Close—42° after lower dead center	Close—10° after top dead center

NOTE:—Valve stem clearance in guide should be .00125-.00325" (intake), .00225-.00425" (exhaust).

CARBURETION:—Stromberg Downdraft Carburetor, Model EE-22 with Fast Idle and Stromberg Automatic Choke. See Carburetor Section for complete data on this equipment. Manifold heat control is automatic.

Air Cleaner:—A.C. oil-wetted wire mesh type integral with silencer. Remove complete unit at 2500 miles intervals, clean by dipping wire mesh end of unit in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. Mechanical Fuel Pump mounted on right hand side of crankcase and driven by eccentric on camshaft. Remove glass sediment bowl under pump occasionally, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—A.C. electric type (see Carburetion Section).

STARTER:—Model 725-Y. Starter drive—overrunning clutch and mechanical pinion shift connected to starting switch pedal (switch mounted on starter field frame). Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces. Starter draws 150 amperes cranking engine.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5.0	60
15 "	Lock	3.0	600

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take out flange mounting bolts, pull starter forward to clear pinion housing, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in commutator end oiler. Drive end bearing at outer end of pinion housing is oilless.

GENERATOR:—Model 953-S. Third brush regulation, thermostat control. Thermostat contacts open at 200°F. reducing the charging rate approximately 40%. Generator rotation counter-clockwise at commutator end. Maximum charging rate is 19-21 amperes (cold) at 8.5 volts reached at 1800 R.P.M.

Charging Rate Adjustment. Loosen small lock screw on commutator end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten lock screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.35-8.5	1800	9-12	7.35-7.65	1800-2000

Brush Spring Tension:—14-18 ounces on each brush.

Field Current:—4-6.1 amperes at 6 volts across field terminals.

Motoring:—Approximately 5.5 amperes at 6 volts.

Mounting:—Pivot mounting at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine, slip off drive belt, take out two bolts forming bracket hinge, lift generator out.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt, swing generator away from engine until correct belt tension is secured, tighten adjustment clamp bolt and mounting bolts. Belt tension should be just sufficient to drive generator and fan without slipping.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler at each end.

RELAY:—Model 265-G. Mounted on generator field frame. Contacts close at 825 R.P.M. or 10 M.P.H. with generator voltage of 6.75-7.5 volts and open with 0-2.5 ampere discharge current.

Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch Model 478-Y. Dimmer Switch Model 465-W. Lighting switch mounted on back of instrument board controlled by push-pull button on instrument panel. Lighting system Guide 'Tilt-Ray' with depressed beam dimming swing double filament headlight bulbs controlled by foot operated dimmer switch on toeboard. Stop light switch is Delco-Remy Model 474-K.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21	D.C.	1116

Tail Light	6-8	15	S.C.	87
Stop Light	6-8	15	S.C.	87
Dome Light	6-8	6	S.C.	81

CIRCUIT BREAKER:—The circuit breaker mounted on the lighting switch bracket consists of a thermostatic arm through which the lighting current is taken to the switch. An excessive current flow due to a ground or short-circuit will cause the thermostatic arm to open the circuit breaker contacts thus protecting the lighting circuits from damage. This circuit breaker differs from previous designs in that there is no coil and the contacts are opened directly by the thermostatic arm.

FUSES:15 ampere capacity fuse assembled in connector in stop light cable.

HORN:—Klaxon Model K-18-C. Vibrator type horn mounted under engine hood Current drawn by horn 5.5-6.5 amperes at 6 volts.

SERIAL NUMBER:—First number, 51,001. On plate on right hand side front compartment floor in front of seat (sedans) or under seat (coupes).

COMPRESSION:—Ratio—5.7-1 standard head.
Pressure—114 lbs. at 1000 R.P.M. or approximately 95-100 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 534-N. Lock coil type.
Ignition Current—0-2 amperes (idling), 4 amperes (stopped).
Distributor Model 622-S. Single breaker, 6 lobe cam, full automatic advance type. Distributor fitted with manual adjustment (10° advance and retard from center '0' position). Adjustment should be placed at '0' point on scale in checking and setting timing.
Breaker Gap—Set gap at .022". Limits, .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Manual Advance—20° engine (adjustment only).
Cam Angles (Distributor Degrees) — Closed 36°. Open 24°.

Automatic Advance

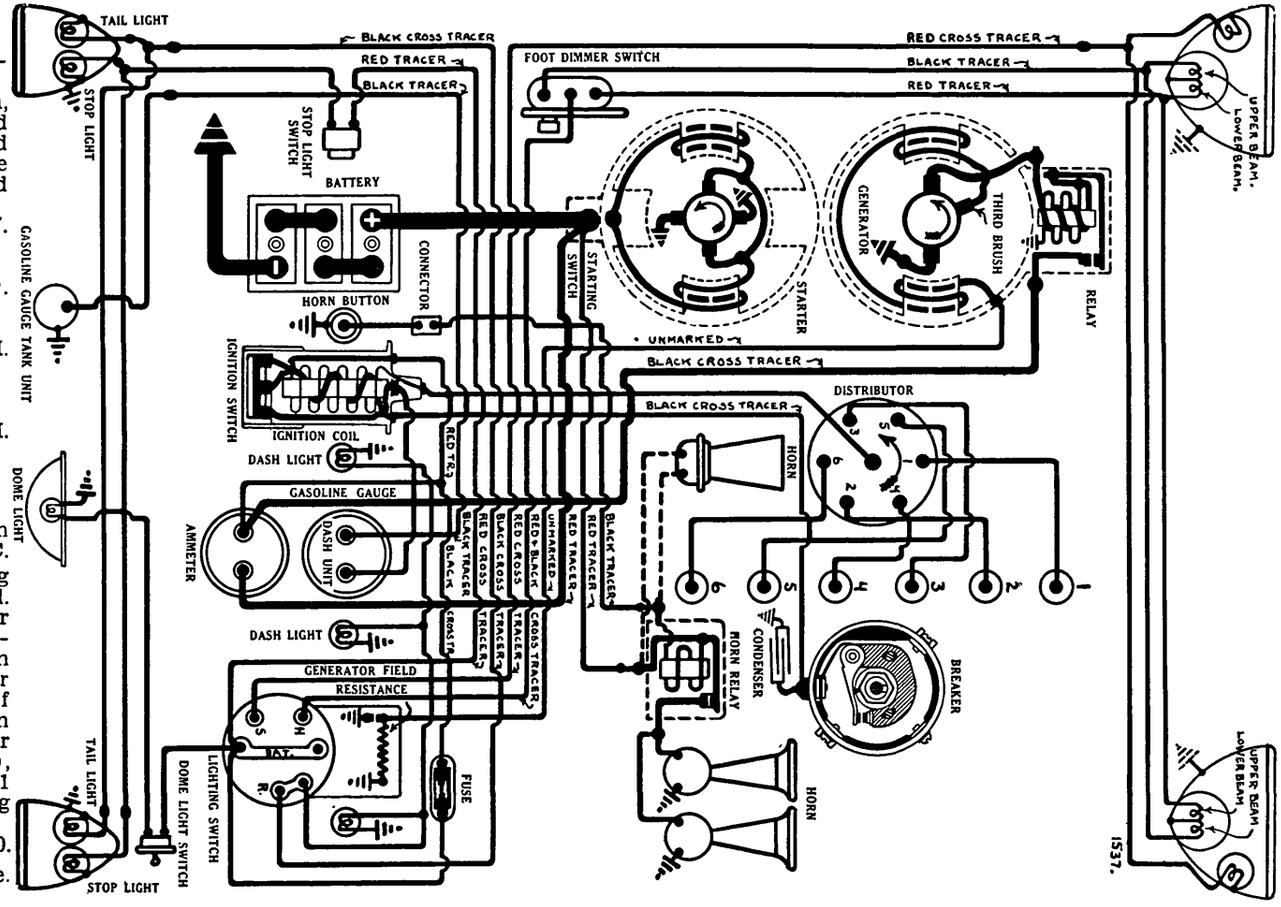
IGNITION TIMING:— Flywheel Degs. Piston Position
All engines ..... At TDC. ..... .0000" TDC.
Timing (using Timing Light):—Connect timing light between distributor terminal and ground. Turn on ignition, loosen hold-down screw, center pointer on scale ('0' center mark), tighten hold-down screw, turn engine over with #1 piston on compression, stop with piston at top dead center when mark on vibration dampener at front of engine lines up with pointer on chain case, loosen clamp bolt in advance arm, rotate distributor until timing lamp just lights (contact opening), tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Spark Plugs:—A.C., Type G-9. 18 MM. Metric type.
Spark Plug Gap—.025".



CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke (optional equipment), Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EX-22 (Std.), EX-23 (optional), 1¼" plain tube, downdraft type.
Automatic Choke — Stromberg (optional equipment).

Fuel Pump:—A.C., Type V Combination fuel and vacuum pump (Std.), Type T fuel pump (optl.).

Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .012". This valve should open with #1 piston on top dead center when mark (TDC. Line) on vibration dampener at front of

engine lines up with pointer on chain case. Reset tappet clearance at .008" (cold).
Motor Gauge—Weidenhoff Adapter #104, Rod #40.
Tappet Clearance—.008" Int., .010" Exh. cold. Running clearance.
Valve Spring Pressure:—43 lbs. at 2¼" (valve closed). 96 lbs. at 1 29/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. (refill).
Normal Oil Pressure—30-35 lbs. (normal driving speeds).

BATTERY:—Delco, Type 15-RW, 6 volt, 15 plate, 94 A.H. capacity (20 hour rate).
Starting Capacity—115 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Left hand side under driver's seat.

STARTER:—Model 734-K. Armature No. 823881.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Starter Drive—Manual pinion shift type.
Cranking Engine—150 amperes, 5.25 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out flange mounting cap screws.

GENERATOR:—Model 935-F. Armature No. 1854856. Third brush regulation, lighting switch control. Field resistance on lighting switch is shorted out by switch when lamps are turned on, increasig generator output. See 'Lamp Control' generators in Equipment Section.
Charging Rate Adjustment—Ground field terminal on generator to frame. Use test ammeter to check output, shift third brush counter-clockwise to increase, or clockwise to decrease charging rate. Tighten locking screw after making adjustment.
Standard Charging Rate—17-19 amperes (cold), 8.4 volts, 2500 R.P.M. or 34 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	17-20	8.2-8.5	2400
Hot	13-15	7.7-8.0	3000

Rotation—Counter-clockwise at commutator end.
Shunt Field Current—2.3-2.6 amperes at 6.0 volts.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Mounting:—Pivot mounted at left front of engine. Driven by fan belt. To remove, take out two pivot bolts, one calmp bolt.
Belt Adjustment—Loosen mounting bolts and clamp bolt, pull generator out (away from engine), tighten clamp bolt before slacking off on generator, tighten pivot bolts.

CUT-OUT RELAY:—Model 265-H. Mounted on generator field frame.
Cuts in—6.75-7.5 volts or 12½ M.P.H.
Cuts out—0-2.0 ampere discharge current.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

LIGHTING:—Switch Model 478-V. Foot Control Switch Model 465-W. Foot control switch used to control headlights (driving or upper beams, and passing or lower or 'depressed' beams). Headlight bulbs are pre-focused type.

Bulb Specifications

Lamps	Candlepower	Mazda No.
Headlights	32-21	2320-C
Dome Lamp	6	81
All others	3	63

FUSES:—20 ampere capacity cartridge type assembled in ammeter-to-light switch lead on back of instrument board.

HORNS:—Klaxon, Model K-33D or K-26L matched set, twin horns. Vibrator type. Horns are operated by Horn Relay.
Horn Relay Model 268-L. Horn relay requires .25 amperes to close contacts. Current draw, .8 amps.
Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

SERIAL NUMBER:—First number, 18,001. On plate on right hand side front compartment floor in front of seat (sedans) or under seat (coupes).

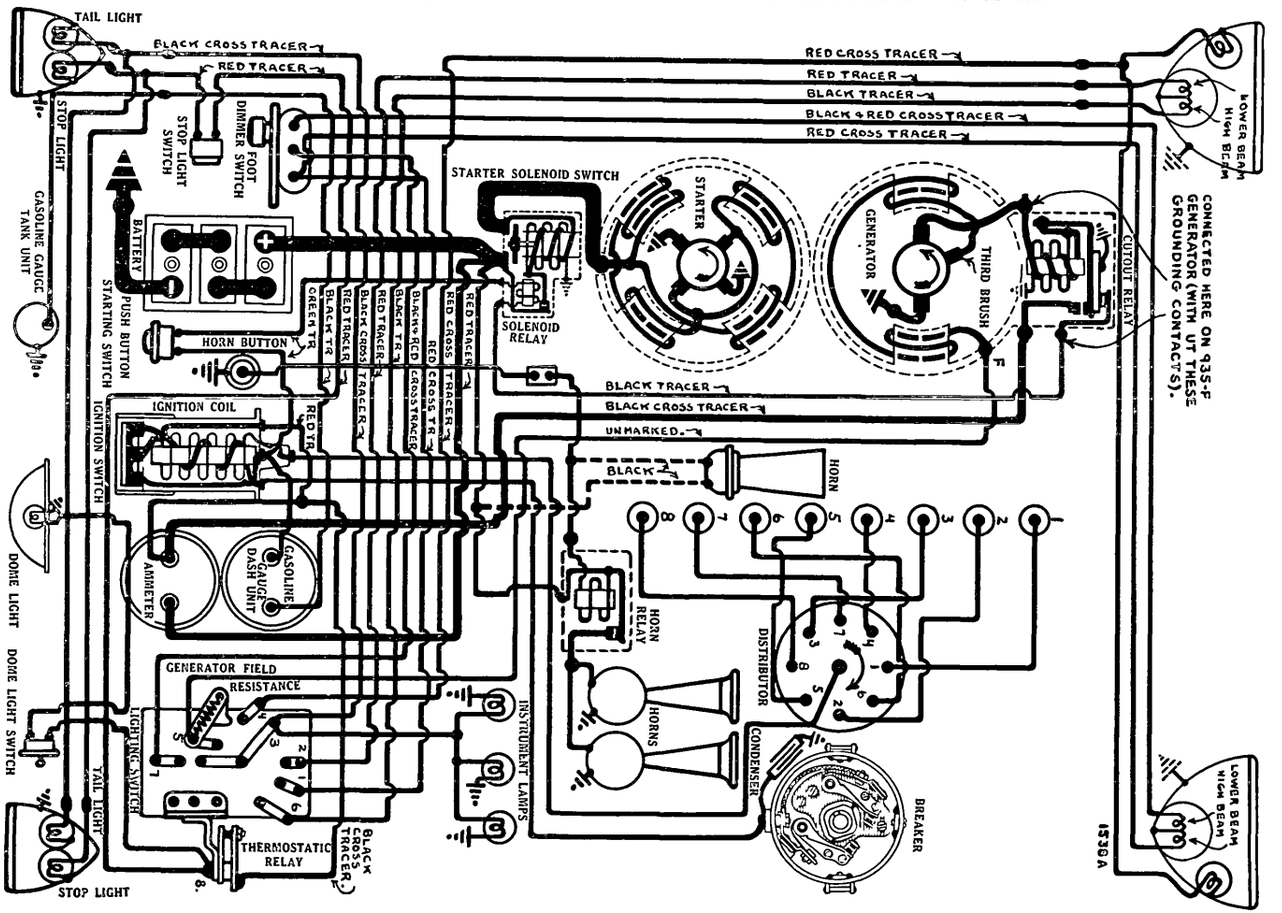
COMPRESSION:—Ratio—5.7-1 standard head.
Pressure—114 lbs. at 1000 R.P.M. or approximately 95-100 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 534-N. Lock coil type.
Ignition Current—2.5 amperes (idling), 4.5 amperes (stopped).
NOTE:—Coil has extra accessory terminal for starter solenoid switch and gasoline gauge control.
Distributor Model 662-N. Double breaker, 4 lobe cam, full automatic advance type. Contacts open alternately at regular 45° intervals, corresponding to 90° firing interval of engine. Contacts must be synchronized (see Timing).
Breaker Gap—Set gap at .022". Limits, .018-.024".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles (Distributor Degrees)—Closed 34°. Open 11°. Both sets together when properly synchronized.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	4	600
13½	1630	27	3260



IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....See Timing ..... .005" BTDC.
Timing (using Timing Light)—Stationary Contacts:—On cars after Serial No. 18081 stationary contacts fire even cylinders and distributor must be synchronigzed before timing distributor to engine. On cars before Serial No. 18081 distributor can be synchronized before or after timing, as desired. Connect timing light between distributor terminal and ground. Turn on ignition. Crank engine with #1 piston on compression, stop with piston .005" before top dead center when first mark (IGN line) on vibration dampener at front of engine lines up with pointer on chain case, loosen advance arm clamp bolt, rotate distributor until timing lamp just lights, indicating contacts are opening, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).
Synchronization—Movable Contacts:—No flywheel marks provided. Use special synchronizing tool, Oldsmobile Part #HM-J-185, Delco-Remy Part #1838182, follow complete directions in Equipment Section. Contact opening—regular 45—45—45 (distributor degrees.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).
Spark Plugs:—A.C., Type G-9. 18 MM. Metric type.
Spark Plug Gaps—.025".

CARBURETION: — (Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.
Carburetor:—Stromberg, Model EE-1, dual, 1" plain tube, downdraft type.
Automatic Choke—Stromberg, Model H.
Fuel Pump:—A.C., Type V combination fuel and vacuum pump (std.), Type T fuel pump (optl.).
Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .012". This valve should open with #1 piston on top dead center when second mark (TDC. Line) on vibration dampener at front of engine lines up with pointer on chain case. Reset tappet clearance at .008" (cold).
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Tappet Clearance—.008" Int., .010" Exh. cold. Running clearance.
Valve Spring Pressure:—43 lbs. at 2¼" (valve closed). 96 lbs. at 1 29/32" (valve open).

LUBRICATION:—Crankcase Capacity—7 qts. (refill).
Normal Oil Pressure—30-35 lbs.

BATTERY:—Delco, Type 17-GW, 6 volt, 17 plate, 107 A.H. capacity (20 hour rate).
Starting Capacity—131 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—On left hand side under driver's seat.

STARTER:—Model 727-H. Armature No. 823881. Solenoid operated manual pinion shift type.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—150 amperes, 5.25 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
15 "	Lock	3.0	600

Starting Switch:—Solenoid Switch, Type 1514. Push-button Switch Type 1385. Starting switch and pinion shift operated by solenoid on starter field frame. Solenoid circuit controlled through solenoid relay by pushbutton on instrument panel. Operative only with ignition 'on'. See Equipment Section 'Starter Controls'.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out flange mounting cap screws.

GENERATOR:—Model 935-F. Armature No. 1854856. Model 935-M. Armature No. 1853593. Third brush regulation, lighting switch control. Field resistance on lighting switch is shorted out by switch when lamps are turned on, increasing charging rate. See 'Lamp Control Generators' in Equipment Section.

Charging Rate Adjustment:—Ground field terminal on generator to frame. Use test ammeter to check output, shift third brush counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw after making adjustment.

Maximum Charging Rate—19 amperes (cold), 8.4 volts, 2500 R.P.M. or 34 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	17-20	8.2-8.5	2400
Hot	13-15	7.7-8.0	3000

Rotation—Counter-clockwise at commutator end.
Field Current—2.3-2.6 amperes at 6.0 volts.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Mounting:—Pivot mounted at left front of engine. Driven by fan belt. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, pull generator away from engine, tighten clamp bolt before slacking off on generator, tighten pivot bolts.

CUT-OUT RELAY:—Model 265-H (used on 935-F Generator).
Cuts in—6.75-7.5 volts or 12½ M.P.H.
Cuts out—0-2.5 ampere discharge.
Relay Contact Gap—.015-.025" (contacs closed).
Air Gap—.012-.017" (contacts closed).

Model 265-T (used on 935-M Generator). This model has extra set of contacts above armature for starter solenoid relay circuit control (see diagram). All data same as 265-H.

LIGHTING:—Switch Model 478-R. Foot Control Switch Model 465-W. Foot control switch operative with lighting switch in 'Country' position, provides asymetrical passing beam (right hand headlight beam depressed—headlights aimed so that beams cross). Headlight bulbs are Pre-focused type.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-21	2320-C
Dome	6	81
All others	3	63

THERMOSTATIC RELAY:—New type thermostatic arm current limit relay (no winding). Mounted on lighting switch, protects lighting circuits. Contacts open with current load of 30 amperes.

HORNS:—Klaxon, Model K-33D matched set, blended tone. Type K-26-L (optional). Vibrator type. Horns operated by horn relay.

Horn Relay Model 266-T, 268-L:—Horn relay requires .25 amperes to close contacts. Current draw, .8 amperes.
Contact Gap:—.015-.025".
Air Gap:—.012-.017" (contacts closed).

SERIAL NUMBER:—First number, F103001. On frame siderail.

COMPRESSION:—**Ratio**—6.2-1. No optional ratios. **Pressure**—146 lbs. at 1000 R.P.M. or 111 lbs. plus or minus 5 lbs. at 100 R.P.M. (cranking speed).

VACUUM READING:—Gauge should show steady reading of 17" with engine idling at 350 R.P.M. or 6 M.P.H.

IGNITION:—**Coil Model 536-E.** On engine side of dash. **Ignition Current**—2 amperes (idling), 4.5 (stopped). **Ignition Switch**—Model 431-R (switch and cable). Connected to ignition coil by armored cable.

Distributor Model 622-Y. Single breaker, 6 lobe cam, full automatic advance type. **Breaker Gap**—Set at .022". Limits, .018-.024". **Breaker Arm Spring Tension**—17-21 ounces. **Cam Angles**—Closed 36°. Open 24° (distributor). **Manual Advance**—20° (engine). Consists of manual adjustment at distributor (10° advance and retard from center '0' position). Set at '0' when checking or setting timing.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	2	800
2.5	500	5	1000
10.5	1350	21	2700

Removal—On left hand side of crankcase. Take out hold-down screw in advance arm, lift out.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines ..... 2° BTDC. ..... .002" BTDC.

Timing (using Synchroscope)—Use 'IGN' mark on flywheel lining-up mark with pointed end of inspection hole cover screw (left hand front face flywheel housing). See Equipment Section. This method recommended by manufacturer.

Timing (using Timing Light)—Connect timing light between distributor terminal and ground, turn on ignition, remove cover plate on inspection hole in left hand front face of flywheel housing. With #1 piston on compression, turn engine over until mark 'IGN' lines up with pointed end of cover screw, loosen hold-down screw in advance arm, center pointer on scale (arrow opposite '0' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts opening), tighten clamp bolt, check spark plug connections.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—A.C., Type G-9. 18 MM. Metric. **Spark Plug Gap**—.025". Limits .020-.025".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Automatic Choke (optional), Fuel Pump, and Gasoline Gauge.

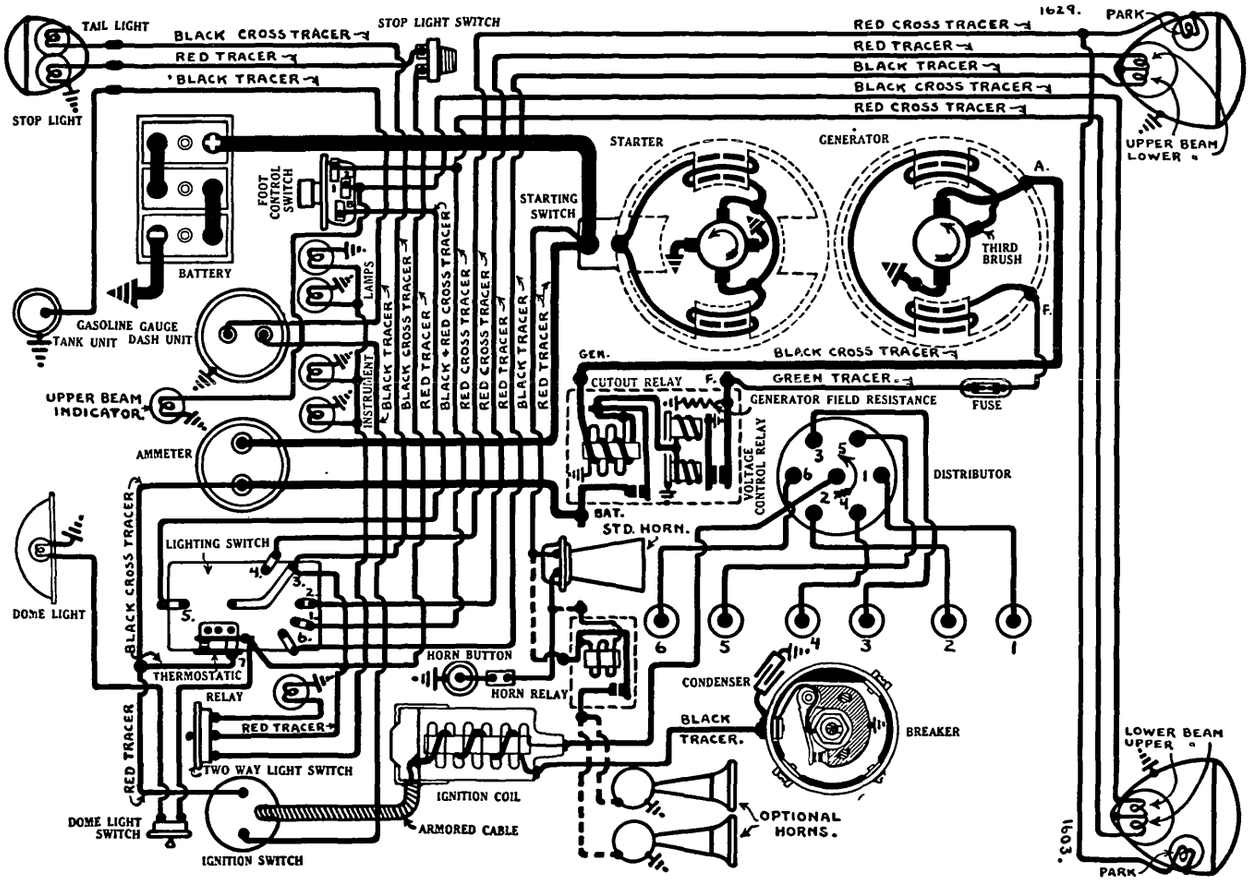
Carburetor:—Stromberg, Model EX-22, 1¼" downdraft type. Fast idle used on carburetors with automatic choke.

Automatic Choke—Delco-Remy, Model 492-A.

Fuel Pump:—A.C., Type T-1521792 (Std.). Type 1521785 fuel and vacuum pump optional.

Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—**To Check Timing**—#1 intake valve should open when a point approximately 2 teeth before dead center mark 'TDC/' on flywheel lines up with indicator, with piston .0163" BTDC.



Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Tappet Clearance:—.008 Int., .010" Exh., engine hot.

Valve Spring Pressure:—43 lbs. at 2 9/32" (valve closed). 116 lbs. at 1 15/16" (valve open).

LUBRICATION:—**Crankcase Capacity**—6 qts. (refill).

Normal Oil Pressure—27 lbs. (25-30) at all speeds.

BATTERY:—Delco, Type 15-T, 6 volt, 15 plate, 94 A.H. capacity (20 hour rate).

Starting Capacity—115 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Under left hand front seat.

STARTER:—Model 734-K. Armature No. 823881.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—100 R.P.M., 190 amps., 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Removal—On left hand front face of flywheel housing. Take out flange cap screws.

GENERATOR:—Model 935-X. Armature No. 1854856. Air-cooled, third brush control with Voltage Control Relay (two-step charging rate). See article on Voltage Control Relay in Equipment Section.
Charging Rate Adjustment—Use ammeter connected in charging line at 'Bat' terminal of control unit, and voltmeter connected between same terminal and ground (generator frame). Short out Voltage Control Relay by connecting jumper wire from generator field (F) terminal to ground. Loosen lock screw on commutator end plate, shift third brush by hand, counter-clockwise to increase, or clockwise to decrease charging rate. Maximum charging rate must not exceed 22 amperes at 8.6 volts (generator cold). Tighten lock screw and remove jumper wire.

Performance Data

	Amperes	Volts	R.P.M.
Cold	17-20	8.2-8.5	2400
Hot	13-15	7.7-8.0	3000

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Field Current—2.3-2.6 amperes at 6.0 volts.
Field Fuse—6 ampere capacity cartridge type in wiring harness directly below control unit.

Removal:—Pivot mounted at left front of engine with fan belt drive. Take out two pivot bolts and one clamp screw.

Belt Adjustment—Loosen pivot bolts and clamp screw, shift generator until belt deflection midway between fan and generator pulleys is ¾" (check with straightedge across pulleys, press lightly in on belt).

CONTROL UNIT:—Model 5585. On engine side of dash. Consists of Cutout Relay and Voltage Control Relay in a single case. See complete articles in Equipment Section.

Cutout Relay

Cuts in—6.4-6.8 volts, 9.5 M.P.H.
Cuts out—3 amperes maximum discharge at 6.3 volts.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

Voltage Control Relay

Contacts Open—8.35-8.65 volts (70°F.), 7.8-8.15 volts (150°F.).
Contacts Close—7.3-7.7 volts (70°F), 6.6-7.05 volts (150°F).
Contact Gap—.008-.013".
Contact Spring Tension—.7-.9 ounces.
Air Gap—.028-.040" between armature and core (armature down against lower stop). .028-.040" armature travel (between armature and lower stop).

LIGHTING:—Model 479-U, 479-T (export). Foot Control Switch Model 471-Z. Control switch on toeboard provides assymetrical passing beam (lower beam right hand headlamp, upper beam left hand headlamp). Headlight beams are crossed. Headlamp bulbs are pre-focused type. Headlight beam indicator bulb at bottom of speedometer is lighted with main driving beam (upper beam) in use.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking	1½	55
Instrument, Compt., Beam	1	51
Tail	3	63
Stop	15	87
Dome	6	81

CURRENT LIMIT RELAY:—Thermostatic arm type (no winding) on back of lighting switch. Non-adjustable. Operates when current reaches 24-27 amperes, limits current to 18 amperes with direct short-circuit.

FUSES:—Generator Field—6 ampere in harness under Control Unit.

HORNS:—Klaxon, Model K-26-L (Std.), K-33-D twin horns (Optional). Vibrator type. Horn relay used with Model K-33-D.

Horn Relay:—Model 268-L. Relay requires .25 amperes to close contacts. Current draw, .8 amperes.

Contact Gap—.015-.025".

Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—First number, L44001. On frame side rail.

COMPRESSION:—**Ratio**—6.2-1. No optional ratios. **Pressure**—152 lbs. at 1000 R.P.M. or 121 lbs. plus or minus 5 lbs. at cranking speed (100 R.P.M.).

VACUUM READING:—Gauge should show steady reading of 17″ with engine idling at 300 R.P.M. or 6 M.P.H.

IGNITION:—**Coil Model 536-E.** On engine side of dash. **Ignition Current**—2.0 amps. (idling), 4.5 (stopped). **Ignition Switch**—Model 431-R (switch and cable). Connected to ignition coil by armored cable.

Distributor Model 662-R. Double breaker, 4 lobe cam, full automatic advance type. Contacts open alternately at 45° intervals corresponding to 90° firing interval of engine and must be synchronized (see Note and Timing).

Breaker Gap—Set at .022″. Limits .018-.024″.

Breaker Arm Spring Tension—19-23 ounces.

Cam Angles—Closed 34°. Open 11° (distributor). Both sets together when properly synchronized.

Manual Advance—20° (engine). Consists of manual adjustment at distributor (10° advance and retard from center '0' position). Set at '0' when checking or setting timing.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	1	600
4.5	600	9	1200
12	2200	24	4400

Removal:—On cylinder head. Take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines.....3° BTDC. .....004″ BTDC.

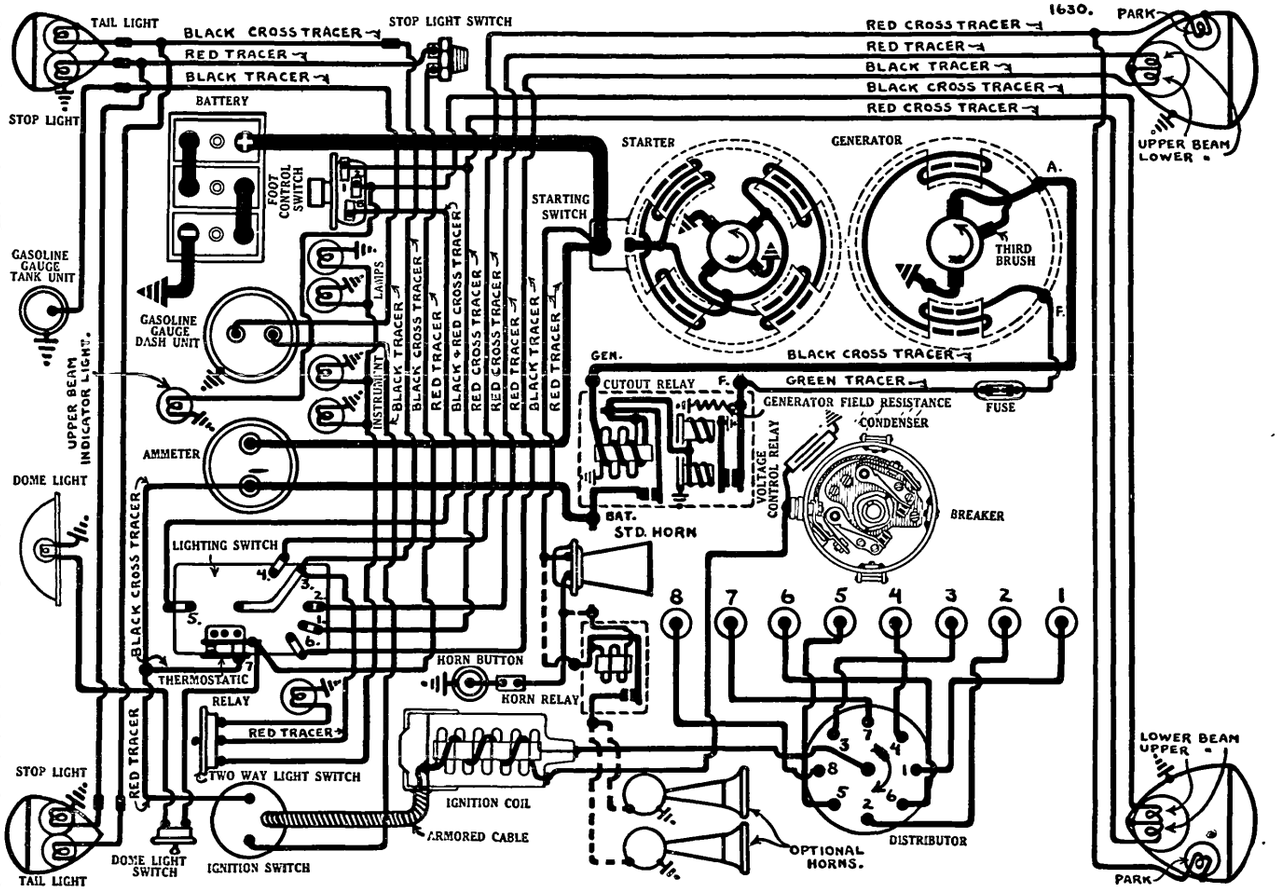
NOTE—Movable points fire cylinders 1-2-7-8 and distributor should be synchronized before timing is set, unless engine is timed at #6 firing position first (stationary points) and then synchronized at #1 firing position (movable points).

Synchronization—Use Delco-Remy tool, Part No. 1838182. See Equipment Section for instructions.

Timing (using Synchroscope)—This method recommended by manufacturer. Use 'IGN' mark for cylinder #1 or second 'IGN' mark for cylinder #6, lining up mark with pointed end of inspection hole cover screw (left hand front face of flywheel housing). See Equipment Section.

Timing (using Timing Light)—Connect timing light between distributor terminal and ground, turn on ignition, remove inspection hole cover plate on left hand front face of flywheel housing. With #6 piston on compression (if distributor not previously synchronized), turn engine over until flywheel mark 'IGN' lines up with pointed end of cover screw, loosen hold-down screw in advance arm, center pointer on scale (arrow opposite '0'), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until timing lamp lights (stationary points opening), tighten clamp bolt. Then synchronize by turning engine over 1¾ revolutions to firing position of piston #1, stop when 'IGN' mark lines up with pointer, loosen lock screws on sub-plate carrying movable points, turn eccentric adjusting screw until points open (timing lamp lights), tighten lockscrews.

Motor Gauge—Weidenhoff Adapter #104, Rod #2.



Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—A.C., Type G-9. 18 MM. Metric type. **Spark Plug Gap**—.025″″. Limits .020-.025″.

CARBURETION:—See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EE-1, 1″ dual, downdraft type with fast idle and 'throttle-cracking' device (for starting).

Automatic Choke—Delco-Remy, Model 498-G.

Fuel Pump:—A.C., Type T-1521791 Std., or 1521784 Optl. fuel and vacuum pump.

Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Timing—Check tappet clearance #1 intake valve. This valve should open with #1 piston on top dead center when flywheel mark 'TDC.#1' lines up with pointed end of inspection hole cover screw (left front face of housing).
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.008" Int., .010" Exh., engine hot.

Valve Spring Pressure:—43 lbs. at 2 9/32" (valve closed), 116 lbs. at 1 15/16" (valve open).

LUBRICATION:—Crankcase Capactiy—7 qts. (refill).
Normal Oil Pressure—27 lbs. (25-30) at all speeds.

BATTERY:—Delco, Type 17-K, 6 volt, 17 plate, 107 A.H. capacity (20 hour rate).
Starting Capacity—131 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Under left front seat.

STARTER:—Model 725-Y. Armature No. 823881.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—100 R.P.M., 200 amps., 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	6000	5.0	60
15 "	Lock	3.0	600

Removal:—On left hand front face of flywheel housing. Take out flange cap screws.

GENERATOR:—Model 935-X. Armature No. 1854856. Air-cooled, third brush control with Voltage Control Relay (two-step charging rate). See article on Voltage Control Relay in Equipment Section.
Charging Rate Adjustment—Use ammeter connected in charging line at 'Bat' terminal of control unit, and voltmeter connected between same terminal and ground (generator frame). Short out Voltage Control Relay by connecting jumper wire from generator field (F) terminal to ground. Loosen lock screw on commutator end plate, shift third brush by hand, counter-clockwise to increase, or clockwise to decrease charging rate. Maximum charging rate must not exceed 22 amperes at 8.6 volts (generator cold). Tighten lock screw and remove jumper wire.

Performance Data

	Amperes	Volts	R.P.M.
Cold	17-20	8.2-8.5	2400
Hot	13-15	7.7-8.0	3000

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Field Current—2.3-2.6 amperes at 6.0 volts.
Field Fuse—6 ampere capacity cartridge type in wiring harness directly below control unit.

Removal:—Pivot mounted at left front of engine with fan belt drive. Take out two pivot bolts and one clamp screw.

Belt Adjustment—Loosen pivot bolts and clamp screw, shift generator until belt deflection midway between fan and generator pulleys is ¾" (check with straightedge across pulleys, press lightly in on belt).

CONTROL UNIT:—Model 5585. On engine side of dash. Consists of Cutout Relay and Voltage Control Relay in a single case. See complete articles in Equipment Section.

Cutout Relay

Cuts In—6.4-6.8 volts, 9.5 M.P.H.
Cuts Out—3 amperes max. discharge at 6.3 volts.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

Voltage Control Relay

Contacts Open—8.35-8.65 volts (70°F).
Contacts Close—7.3-7.7 volts (70°F).
Contact Gap—.008-.013".
Contact Spring Tension—.7-.9 ounces.
Air Gap—.028-.040" between armature and core (armature down against lower stop). .028-.040" armature travel (between armature and lower stop).

LIGHTING:—Model 479-U, 479-T (export). Foot Control Switch Model 471-Z. Control switch on toeboard provides assymetrical passing beam (lower beam right hand headlamp, upper beam left hand headlamp). Headlight beams are crossed. Headlamp bulbs are pre-focused type. Headlight beam indicator bulb at bottom of speedometer is lighted with main driving beam (upper beam) in use.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking	1½	55
Instrument, Compt., Beam	1	51
Tail	3	63
Stop	15	87
Dome	6	81

CURRENT LIMIT RELAY:—Thermostatic arm type (no winding) on back of lighting switch. Non-adjustable. Operates when current reaches 24-27 amperes, limits current to 18 amperes with direct short-circuit.

FUSES:—Generator Field—6 ampere in harness under control unit.

HORNS:—Klaxon, Model K-26-L (Std.), K-33-D twin horns (Optional). Vibrator type. Horn relay used with Model K-33-D.
Horn Relay:—Model 268-L. Relay requires .25 amperes at 2 volts (min.) to close contacts. Current draw, .8 amperes.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—First number—F200,001. On left hand frame side member.

COMPRESSION:—Ratio 6.0-1. Pressure 146 lbs. at 1000 R.P.M. or 106-116 lbs. at cranking speed of 100 R.P.M.

VACUUM READING:—Gauge should show steady reading of 17" of HG. minimum with engine idling at 350 R.P.M. or 6 M.P.H.

IGNITION:—**Coil Model 536-E.** Mounted on engine side of dash.

Coil draw—2.0 amperes idling, 4.5 stopped.

Ignition Switch:—**Delco-Remy Model 435-B**—Switch and cable assembly connected to coil by armored cable.

Ignition Lock—Briggs & Stratton.

Distributor Model 647-C—Single breaker, 6 lobe cam, full automatic advance with auxiliary vacuum spark control.

Breaker Gap—.020". Limits .018-.024".

Cam Angle or Dwell—36° (closed), 24° (open).

Breaker Arm Spring Tension—17-21 ozs.

Condenser—Part No. 1858571. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	2	500
3.75	400	7.5	800
13.5	1450	27	2900

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port in carburetor above throttle) except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	5-7"
15° Max.	15.5-18.5"

Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—For all engines as follows:

Flywheel Degrees	Piston Position
0° at TDC	.000" TDC.

Timing (Using Synchroscope)—This method recommended. Clip Synchroscope lead to #1 spark plug, direct light on flywheel through inspection hole in left front face of housing. Idle engine at 350 R.P.M. or 6-7 M.P.H. Loosen hold-down screw in advance arm, center pointer on scale (arrow at 'O' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until timing mark (steel ball insert) on flywheel lines up with pointed end of inspection hole cover screw, tighten clamp bolt.

Timing (Without Synchroscope)—Use timing light connected between distributor terminal and ground, turn on ignition to check contact opening. With #1 piston on compression, turn engine over until piston reaches top dead center, stop when steel ball insert on flywheel lines up with pointed end of inspection hole cover screw in left front face of housing. Loosen hold-down screw in advance arm, center pointer on scale (arrow at 'O' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts opening), tighten clamp bolt.

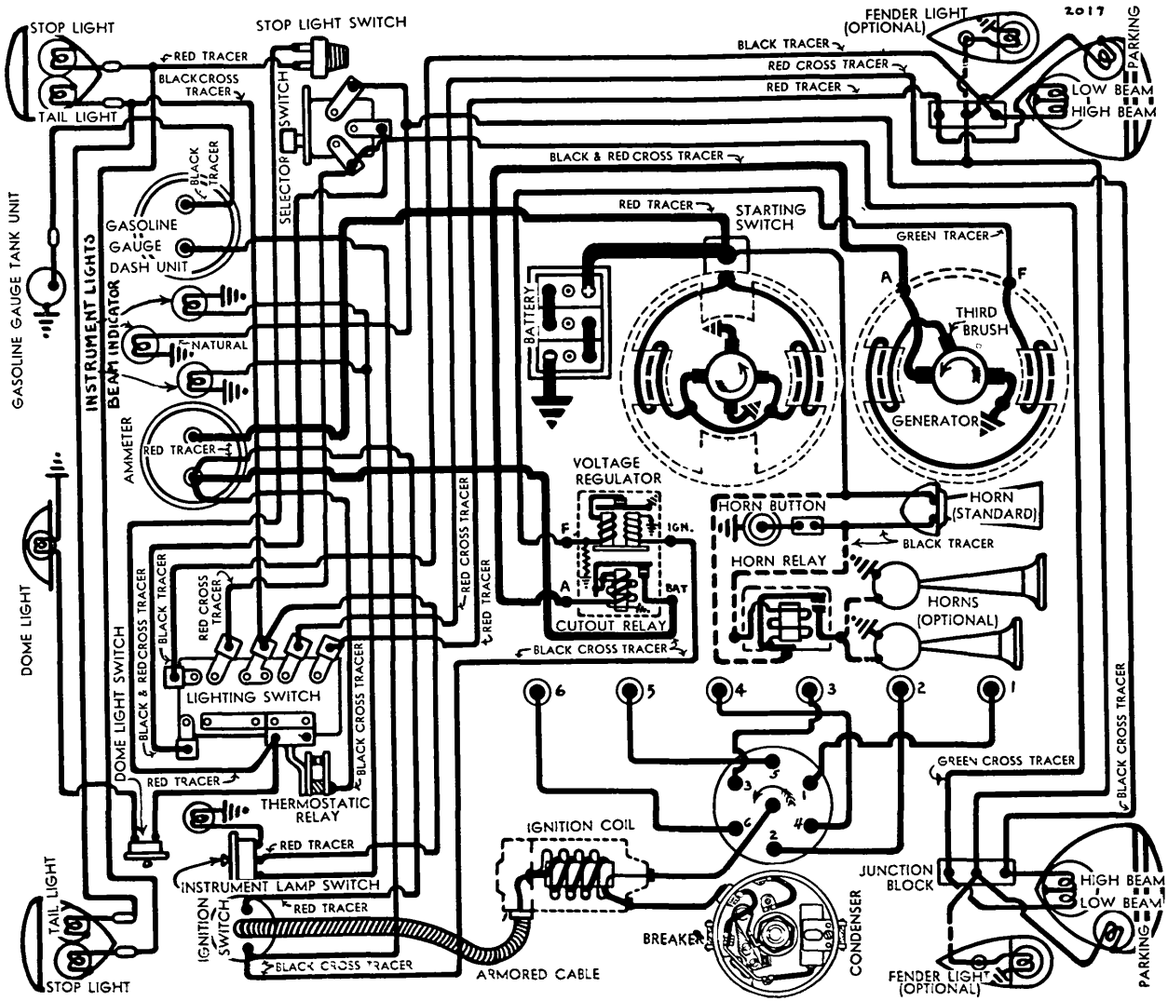
Timing (Motor Gauge)—Weidenhoff #104 Adapter, #40 Rod.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type G-9, 18 MM. Metric type.

Spark Plug Gaps—.030-.033".

CARBURETION:—**Carburetor**—Carter Model 327-S (Before F-217-745), 339-S (F-217,746 to F-274,031 and F-275,111 up), 342-S (F-274-032 to F-275,110). 1¼" downdraft type. See Carburetion Section for complete adjustment, overhaul, and Jet Specifications.



NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idles at hot or slow idle speed.

Idle Adjustment—Adjust throttle stopscrew so that idling speed is 350 R.P.M. or 6 M.P.H. Turn idle adjusting screw in until engine begins to roll, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be ¾-1¼ turn open of the screw from the seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever under dust cover at top of engine has three holes for pump link engagement. Change for seasonal requirements:
Outer Hole—Normal temperature ranges.
Inner Hole (Min. stroke)—Extremely hot weather.
Upper hole (Max. stroke)—Extremely cold weather.

Fast Idle:—Integral with carburetor. No adjustment. See article on Carter Fast Idle in Carburetion Section.

Accelerator Linkage Adjustment:—Must be maintained to provide correct 'throttle cracking' action for starting. To adjust, remove starting cable at starting switch to prevent cranking, place .090"

feeler between throttle stopscrew and carburetor casting, fully depress starting pedal, loosen adjusting screw on throttle cross shaft lever and adjust cross shaft so that lever contacts pin on starter shift lever.

Automatic Choke:—Carter Climatic Control. See article in Carburetor Section for servicing directions.

Air Cleaner:—AC. #1525989 oil-wetted type standard, #1525991 heavy duty oil-bath type optional.

Fuel Pump:—AC. Type T #1522189 standard. Combination fuel-and-vacuum Type AA #1522249 optional. See articles in Carburetion Section.

Gasoline Gauge:—AC. Electric. #1515313 (dash unit), #1515428 (tank unit). See article in Carburetion Section.

VALVE TIMING:—Tappet Clearance—.008" Int., .010" Exh., with engine warm.

Valve Spring Pressure—43 lbs. at 2 9/32" (valve closed), 116 lbs. at 1 15/16" (valve open).

To Check Valve Timing—Check tappet clearance #1 intake valve. This valve should open with piston 5° or .0163" before top dead center when point on flywheel approximately 2 teeth before top dead center mark (steel ball insert) lines up with pointer in inspection hole in left front face of housing.

Using Motor Gauge—Weidenhoff #104 Adapter, #40 Rod.

LUBRICATION:—Crankcase Capacity—6 qts. refill.

Normal Oil Pressure—25-30 lbs.

BATTERY:—Delco, Type 15-T. 6 volt, 15 plate, 94 ampere hour capacity (20 hour rate).

Starting Capacity—115 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.3 minutes.

Grounded Terminal—Negative (—) terminal.

Location—Left side under drivers seat.

STARTER:—Model 738-S. Armature No. 823881.

Drive—Overrunning clutch and manual pinion shift operated by starting pedal.

Cranking Engine—100 R.P.M., 190 amperes at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ozs. each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	5000	5.0	65
12 ft. lbs	Lock	3.63	475

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange capscrews.

Starting Switch:—Part No. 820052. Mounted on starter. Operated by starting pedal.

GENERATOR:—Model 936-T. Armature No. 1854856. Fixed third brush control type with external vibrating voltage regulator. Ventilated by fan on drive pulley.

NOTE—Third brush is clamped in position for maximum safe output and must not be disturbed.

Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data below and special article in Equipment Section for procedure and settings. Do not operate generator on open-circuit.

Maximum Charging Rate—As given in table below. Reached at car speed of 34-36 M.P.H. To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22-26	8.7-9.1	3300
Hot	18-21	8.2-8.7	3500

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Field Current—2.3-2.6 amperes at 6.0 volts.

Removal:—Generator pivot mounted on left front of engine. To remove, take out two pivot bolts and clamp bolt.

Belt Adjustment:—Loosen clamp bolts and pivot bolt, swing generator out until deflection of belt is ¾" midway between generator and crankshaft pulleys when pressed lightly.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5588. Mounted on left side of dash. Consists of Cut-out Relay and vibrating type voltage regulator. See article in Equipment Section for complete data on these units.

Cutout Relay

Cuts In—6.5-7.25 volts, 838 R.P.M., 9½ M.P.H.

Cuts Out—3 amperes max. at 6.3 volts.

Contact Gap—.018-.025".

Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.

Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.

NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open-circuit.

Contact Gap—.015-.025".

Contact Spring Tension—2.7-3.5 ounces.

Air Gap—.060-.070" between armature and center of core with armature down and fibre bumper touching stop; .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, pre-focused, cross-beam type with special non-interchangeable lenses. Headlamps aimed straight ahead with lenses removed. Special assymetrical 'Passing' beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in driving or third position.

Headlamp Beam Indicator—Located at top of speedometer dial. Lighted whenever driving or upper headlamp beams are lighted.

Switches

Lighting—Delco-Remy Model 479-K, 479-H Export.

Foot Beam Selector—Delco-Remy Model 471-Z.

Instrument Lamp—Delco-Remy Model 1404.

Stop Lamp—Hydraulic type on brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	T-2320-L
Parking	1½	55.
Instrument, Tail	3	63.
Beam Indicator; Frt. Compt.	1	51.
Stop	15	87.
Dome	6	81.

NOTE—Headlamps are Pre-focused 'Long-Life' type.

THERMOSTATIC RELAY:—Mounted on lighting switch (part of assembly). Non-adjustable. Operates with load of 24-27 amperes limiting current to 18 amps.

HORNS:—Klaxon Model K-26-L Type 1602 Std., Model K-33-D, Type 1951 (low note), 1952 (high note) blended tone twin horns operated by horn relay Optl. All horns are vibrator type.

Horn Type	Current at 6 Volts	Air Gap
K-26-L, 1602	6.5-8.5	.025-.029"
K-33-D, 1951	12-14	.045-.050"
K-33-D, 1952	11-13	.036-.040"

NOTE—Twin horns are stamped 'L' (low note—long horn), 'S' (high note—short horn), on motor shell.

Horn Relay:—Model 268-L. Requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.

Contact Gap—.015-.025". **Spring Tension**—6-8 ozs.

Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—First number—L100,001. On left hand frame side member.

COMPRESSION:—Ratio 6.2-1. Pressure 152 lbs. at 1000 R.P.M. or 116-126 lbs. at cranking speed of 100 R.P.M.

VACUUM READING:—Gauge should show steady reading of 17" of HG. minimum with engine idling at 300 R.P.M. or 6 M.P.H.

IGNITION:—**Coil Model 536-E.** Mounted on engine side of dash.

Coil Draw—2.0 amperes idling, 4.5 stopped.

Ignition Switch Delco-Remy Model 435-B:—Switch and cable assembly connected to coil by armored cable.

Ignition Lock—Briggs & Stratton.

Distributor Model 663-K:—Single breaker, 8 lobe cam, full automatic advance type with vacuum spark control.

Breaker Gap—.015". Limits .0125-.0175".

Cam Angle or Dwell—31° (closed), 14° (open).

Breaker Arm Spring Tension—19-23 ounces.

Condenser—Part No. 1837231. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	4.5	600
4	400	8	800
15	1900	30	3800

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port in carburetor above throttle) except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	5-7"
11° Max.	13-16"

Distributor Removal:—Mounted on top of engine. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—For all engines as follows:

Flywheel Degrees	Piston Position
2° BTDC.	.002" BTDC.

Timing (Using Synchroscope)—This method recommended. Clip Synchroscope lead to #6 spark plug, direct light on flywheel through inspection hole in left front face of housing. Idle engine at 300 R.P.M. or 6-7 M.P.H. Loosen hold-down screw in advance arm, center pointer on scale (arrow at '0' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until timing mark (steel ball) on flywheel lines up with pointed end of inspection hole cover screw, tighten clamp bolt.

Timing (Without Synchroscope)—Use timing light connected btween distributor terminal and ground, turn on ignition to check contact opening. With #6 piston on compression, turn engine over until piston reaches 2° before top dead center, stop when steel ball on flywheel lines up with pointed end of inspection hole cover screw in left front face of housing. Loosen hold-down screw in advance arm, center pointer on scale (arrow at '0' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts opening), tighten clamp bolt.

Timing (Motor Gauge)—Weidenhoff #104 Adapter, #40 Rod.

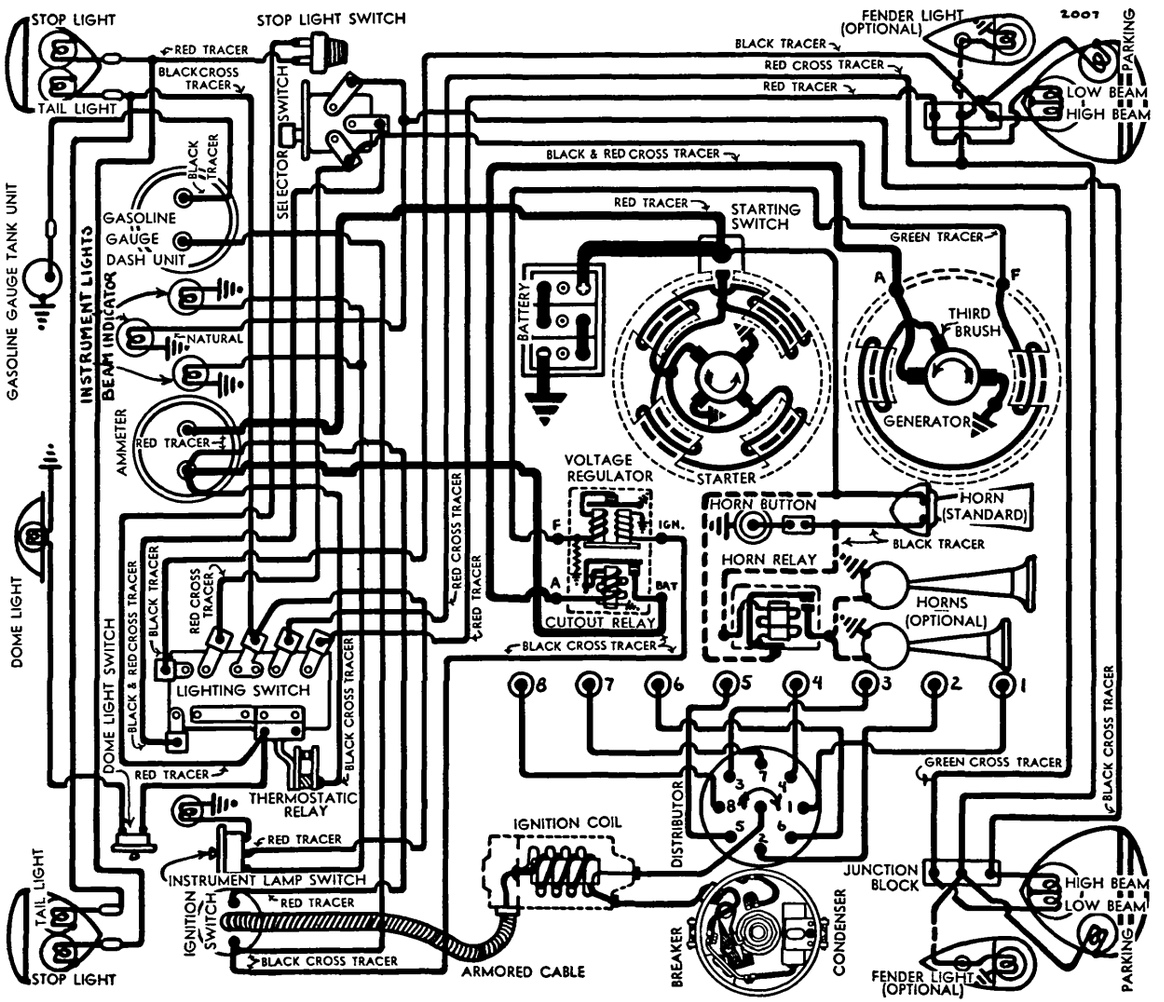
Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—AC. Type G-9. 18MM. Metric type.

Spark Plug Gaps—.030-.033".

CARBURETION:—**Carburetor**—Carter Models 328-S (before Serial No. L-127334) 341-S (after Serial No. L-127335). Dual downdraft type. See Carburetion Section for complete adjustment, overhaul, and Jet Specifications.

NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idles at hot or slow idle speed.



Idle Adjustment—Adjust throttle stopscrew so that engine idles at 300 R.P.M. or 6 M.P.H. Turn idle adjusting screw for each carburetor barrel (in succession) in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever under dust cover at top of carburetor has two holes for pump link engagement. Change for seasonal requirements:
Outer Hole (Max. stroke)—Cold weather.
Inner Hole (Min. stroke)—Hot weather.

Fast Idle:—Integral with carburetor. Adjustable.

Adjustment—With fast idle screw resting against high lobe of fast idle cam (choke valve closed) and with correct slow idle setting (see above), adjust fast idle screw to give .030" clearance between throttle stopscrew and carburetor body.

Accelerator Linkage Adjustment:—Must be maintained to provide correct 'throttle cracking' action for starting. To adjust, remove starting cable at starting switch to prevent cranking, place .090" feeler between throttle stopscrew and carburetor cast-

ing, fully depress starting pedal, loosen adjusting screw on throttle cross shaft lever and adjust cross shaft so that lever contacts pin on starter shift lever.

Automatic Choke:—Carter Climatic Control. See article in Carburetion Section for servicing directions.

Air Cleaner:—AC. #1525990 standard oil-wetted type, #1525992 heavy duty oil-bath type optional.

Fuel Pump:—AC. Type T #1522188 standard, Combination fuel-and-vacuum Type AA #1522250 optional. See articles in Carburetion Section.

Gasoline Gauge:—AC. Electric. #1515313 (dash unit), #1515428 (tank unit). See article in Carburetion Section.

VALVE TIMING:—Tappet Clearance—.008" Int., .010" Exh., with engine warm.

Valve Spring Pressure—43 lbs. at 2 9/32" (valve closed), 116 lbs. at 1 15/16" (valve open).

To Check Valve Timing—Check tappet clearance #6 intake valve. This valve should open with piston on top dead center (.000") when flywheel mark 'TDC/' lines up with pointed end of inspection hole cover screw (left front face of housing).

Motor Gauge—Weidenhoff #104 Adapter, #40 Rod.

NOTE—Steel ball insert in flywheel not TDC.

LUBRICATION:—Crankcase Capacity—7 qts. (refill).

Normal Oil Pressure—25-30 lbs.

BATTERY:—Delco, Type 17-K. 6 volt, 17 plate, 110 ampere hour capacity (20 hour rate).

Starting Capacity—131 amperes for 20 minutes.

0° F. Capacity—300 amperes for 4.4 minutes.

Delco, Type 17-J (Special Equipment). 6 volt, 17 plate, 125 ampere hours (20 hour rate).

Grounded Terminal—Negative (—) terminal.

Location—Left side under drivers seat.

STARTER:—Model 727-Z. Armature No. 823881.

Drive—Overrunning clutch and manual pinion shift operated by starting pedal.

Cranking Engine—100 R.P.M., 200 amps at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ozs. each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	6000	5.0	60
15 ft. lbs	Lock	3.0	600

Removal—Starter flange mounted on left front face of flywheel housing. To remove, take out flange screws.

Starting Switch:—Part No. 820052. Mounted on starter. Operated by starting pedal.

GENERATOR:—Model 936-T. Armature No. 1854856. Fixed third brush control type with external vibrating voltage regulator. Ventilated by fan on drive pulley.

NOTE—Third brush is clamped in position for maximum safe output and must not be disturbed.

Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data below and special article in Equipment Section for procedure and settings. Do not operate generator on open-circuit.

Maximum Charging Rate—As given in table below. Reached at car speed of 34-36 M.P.H. To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22-26	8.7-9.1	3300
Hot	18-21	8.2-8.7	3500

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third).

Field Current—2.3-2.6 amperes at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine. To remove, take out two pivot bolts and clamp bolt.

Belt Adjustment:—Loosen clamp bolts and pivot bolt, swing generator out until deflection of belt is 1" midway between generator and crankshaft pulleys when pressed lightly.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5588. Mounted on left side of dash. Consists of Cut-out Relay and vibrating type voltage regulator. See article in Equipment Section for complete data on these units.

Cutout Relay

Cuts In—6.5-7.25 volts, 800 R.P.M., 9.5 M.P.H.

Cuts Out—3 amperes max. at 6.3 volts.

Contact Gap—.018-.025".

Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.

Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.

NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open-circuit.

Contact Gap—.015-.025".

Contact Spring Tension—2.7-3.5 ounces.

Air Gap—.060-.070" between armature and center of core with armature down and fibre bumper touching stop; .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, pre-focused, cross-beam type with special non-interchangeable lenses. Headlamps aimed straight ahead with lenses removed. Special assymetrical 'Passing' beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in driving or third position.

Headlamp Beam Indicator—Located at top of speedometer dial. Lighted whenever driving or upper headlamp beams are lighted.

Switches

Lighting—Delco-Remy Model 479-K, 479-H Export.

Foot Beam Selector—Delco-Remy Model 471-Z.

Instrument Lamp—Delco-Remy Model 1404.

Stop Lamp—Hydraulic type on brake master cyl.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	T-2320-L
Parking, Ins't., Tail	3	63
Beam Indicator, Front Comp.	1	51
Stop	15	87
Dome	6	81

NOTE—Headlamps are Pre-focused 'Long-Life' type.

THERMOSTATIC RELAY:—Mounted on lighting switch (part of assembly. Non-adjustable. Operates with load of 24-27 amperes limiting current to 18 amps.

HORNS:—Klaxon Model K-26-L Type 1602 Std., Model K-33-D, Type 1551 (low note), 1552 (high note) blended tone twin horns operated by horn relay Optl. All horns are vibrator type.

Horn Type	Current at 6 Volts	Air Gap
K-26-L, 1602	6.5-8.5	.025-.029"
K-33-D, 1651	12-14	.045-.050"
K-33-D, 1652	11-13	.036-.040"

NOTE—Twin horns are stamped 'L' (low note—long horn), 'S' (high not—short horn), on motor shell.

Horn Relay:—Model 268-L. Requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.

Contact Gap—.015-.025". **Spring Tension**—6-8 ozs.

Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—First number F-372001. Located beneath generator on left front cross-member brace.

COMPRESSION:—Ratio—6.1-1. **Pressure**—135 lbs. at 400 R.P.M.

VACUUM READING:—Steady reading of 18" (min.) with engine idling at 6 M.P.H. or 400 R.P.M.

IGNITION:—Coil Model 540-P. Mounted on engine side of dash. High tension terminal color (black).

Ignition Switch:—Delco-Remy 435-M. Switch and cable assembly connected to coil by armored cable.

Ignition Lock—Briggs & Stratton. #45792 (cylinder), #80184 (case). **Key Series**—8000-9499.

Distributor Model 647-F.—Single breaker, 6 lobe cam, full automatic advance with auxiliary vacuum spark control.

Breaker Gap—.020". Limits .018-.024".

Cam Angle or Dwell—36° (closed), 24° (open).

Breaker Arm Spring Tension—17-21 ounces.

Condenser—Part No. 1865972. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	200	2.0	400
3.0	400	6.0	800
14.0	1900	28.0	3800

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port in carburetor above throttle) except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	5-7"
20° Maximum	15.5-18.5"

Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING:—Standard setting as shown:

	Flywheel Degrees	Piston Position
All Engines	0° at TDC	.000" TDC.

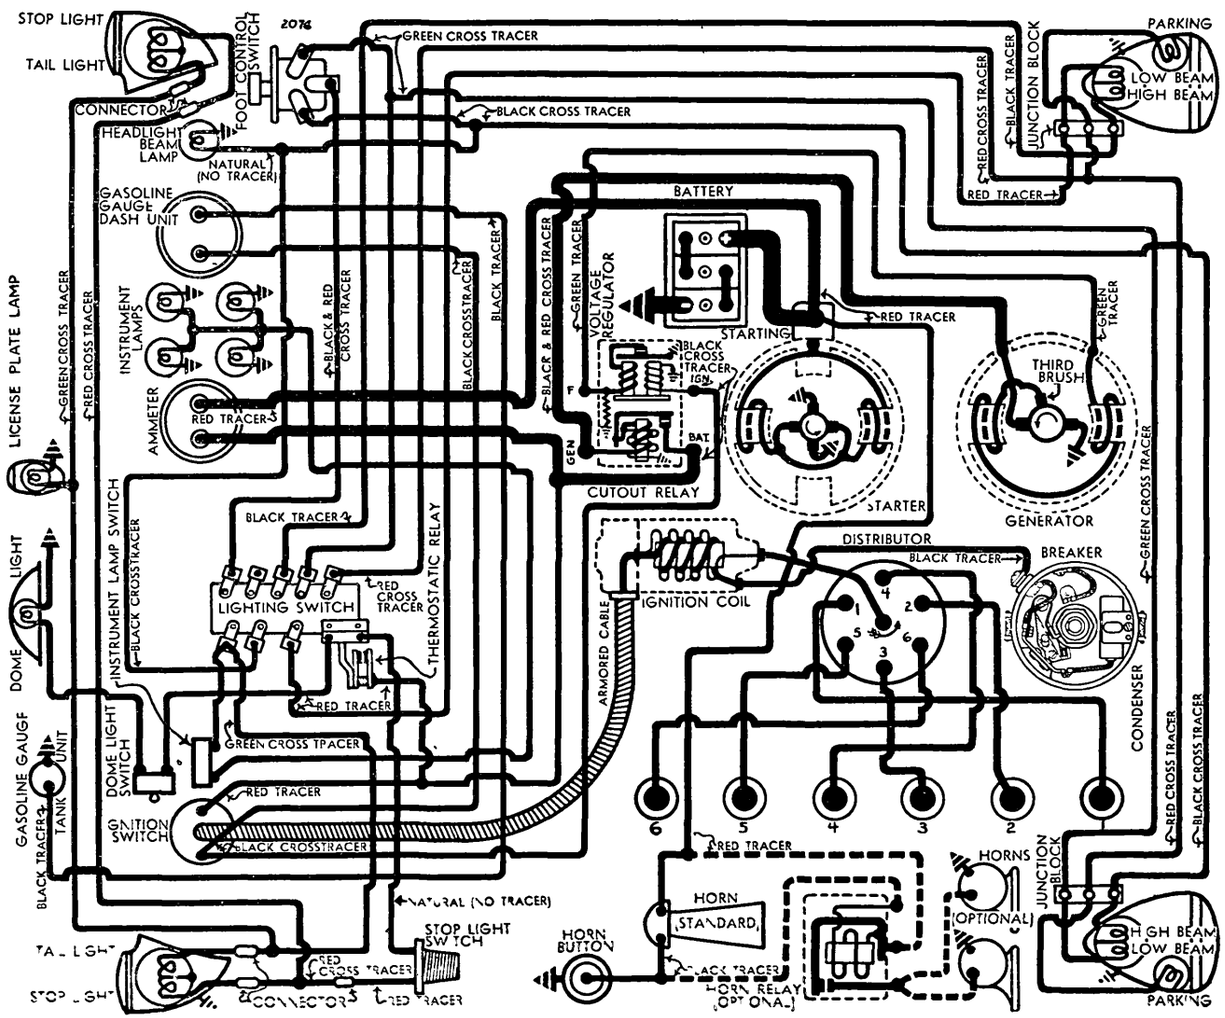
Timing (Using Synchroscope)—This method recommended. Clip Synchroscope lead to #1 spark plug, direct light on flywheel through inspection hole in left front face of housing. Idle engine at 350 R.P.M. or 6-7 M.P.H. Loosen hold-down screw in advance arm (back of distributor), center pointer on scale (arrow at '0' mark), tighten hold-down screw, loosen distributor clamp bolt, rotate distributor until timing mark (steel ball insert) on flywheel appears to be directly in line with pointer on housing, tighten clamp bolt.

Timing (Using Timing Light)—Use timing light connected between distributor terminal and ground, turn on ignition to check contact opening. With #1 piston on compression, turn engine over until piston reaches top dead center, stop when steel ball insert on flywheel lines up with pointer on left front face of housing. Loosen hold-down screw in advance arm (back of distributor), center pointer on scale (arrow at '0' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts opening), tighten clamp bolt.

Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type K-9, 14 M.M. Metric type.
NOTE—K-9 discontinued by AC. Use No. 46.
Spark Plug Gap—.040".



CARBURETION:—Carburetor—Carter Mod. 351-S, 1¼" downdraft type with Carter Climatic Control.
See Article in Carburetion Section.
NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idles at hot or slow idle speed.

Idle Adjustment—Adjust throttle stopscrew so that idling speed is 350 R.P.M. or 6 M.P.H. Turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be ¾-1¼ turns open of the screw from the seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever under dust cover at top of carburetor has three holes for pump link engagement. Change for requirements listed below:
Outer Hole—Normal temp. or std. gasoline.
Inner Hole—High temp. or hi-test gasoline.
Upper hole—Low temp. or low-test gasoline.

Fast Idle:—Adjustable.
See Article in Carburetion Equipment Section.

Accelerator Linkage Adjustment:—Must be maintained to provide correct 'throttle cracking' action for starting. To adjust, remove starting cable at starting switch (to prevent cranking), fully depress starter shift lever, loosen locknut on eccentric adjusting pin on starter shift lever, with offset screwdriver adjust pin to give .070" clearance (Tool No. J-668 gauge to measure this opening) between throttle adjusting screw and fast idle cam (with cam in slow or hot idle position), tighten locknut. If adjustment made with cam in fast idle position, clearance should be .030".

Automatic Choke:—Carter Climatic Control.
See Article in Carburetion Equipment Section.

Air Cleaner:—AC. #1528162 oil-wetted type standard. #1528096 heavy duty oil-bath type optional.

Fuel Pump:—AC. Type AH #1523228 standard. Combination fuel-and-vacuum Type AJ #1523227 optl. **See Article in Carburetion Equipment Section.**

Gasoline Gauge:—AC. Electric. #1515323 (dash unit), #1515451 (tank unit).
See Article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Check tappet clearance #1 intake valve. This valve should open with piston 5° or .0163" before top dead center when a point on the flywheel approximately 2 teeth before top dead center mark (steel ball insert) lines up with pointer in inspection hole in left front face of housing.
Motor Gauge—Weidenhoff Adapter #104, Rod #40.

Tappet Clearance:—.008" Int., .011" Exh., warm.
NOTE—To remove hood side panel, disconnect headlamp wires at block, remove 2 screws at rear of panel, one screw at radiator and bolt nut at rear of lamp. Lift panel out. After installing refocus headlamp.

Valve Spring Pressure:—46 lbs. at 2 9/32" (valve closed), 94 lbs. at 1 31/32" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. refill.
Normal Oil Pressure—25-30 lbs.

BATTERY:—Delco, Type 15-T. 6 volt, 15 plate, 94 ampere hour capacity (20 hour rate).
Starting Capacity—115 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.3 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Left side under driver's seat.

STARTER:—Model 739-G. Armature No. 823881.
Drive—Overrunning clutch and manual pinion shift operated by starter pedal.
Cranking Engine—100 R.P.M., 190 amps., 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs. each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.—	5000	5.0	65
12 ft. lbs.—	Lock	3.63	475

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange capscrews.

Starting Switch:—Part No. 820052. Mounted on starter. Operated by starting pedal.

GENERATOR:—Model 936-T. Armature No. 1854856. Fixed third brush control type with external vibrating voltage regulator. Ventilated by fan on drive pulley.
NOTE—Third brush is clamped in position for maximum safe output and must not be disturbed.
Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data below.
NOTE—Do not operate generator on open circuit.
Maximum Charging Rate—As given in table below. Reached at car speed of 30-35 M.P.H. To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22	8.0	3000
Hot	20	8.0	3500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Field Current—2.3-2.6 amperes at 6 volts.

Removal:—Generator pivot mounted on left front of engine. To remove, take out two pivot bolts and clamp bolt.

Belt Adjustment:—Loosen clamp bolt and pivot bolts, swing generator out until deflection of belt is ¾" midway between generator and crankshaft pulleys when pressed lightly.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5814. Mounted on engine side of dash. Consists of Cutout Relay and vibrating type Voltage Regulator.
See Article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5-7.0 volts, 838 R.P.M., 9½ M.P.H.
Cuts Out—3 amperes max. at 6.3 volts.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.
Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.
NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open-circuit.
Contact Gap—.015-.025".
Contact Spring Tension—2.7-3.5 ounces.
Air Gap—.060-.070" between armature and center of core with armature down and fibre bumper touching stop; .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, prefocused, cross-beam type with special non-interchangeable lenses. Special asymetrical 'Passing' beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in driving or third position.
NOTE—Headlamps must be refocused whenever Hood side panel is removed.
Headlamp Beam Indicator—Located at top of speedometer dial. Lighted whenever driving or upper headlamp beams are lighted.

Switches

Lighting—Delco-Remy Model 480-P, 479-H Export.
Foot Beam Selector—471-T, M (Exp.).
Dash Lamp—1416.
Stop Lamp—Hydraulic type on brake master cyl.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	T-2320-L
Parking, Instrument Panel	1½	T-55
Stop-Tail	21-3	T-1154
Dome	6	T-81
Rear License	3	T-63
Glove Comp., Beam Ind.	1	T-51

THERMOSTATIC RELAY:—Model 1866467. Mounted on lighting switch (part of assembly) may be replaced separately. Non-adjustable. Operates with load of 24-27 amperes limiting current to 18 amperes.

HORNS:—Klaxon Model K-26-H, Type 2251 standard, K-33-S, Type 2067 (low note), 2068 (high note), blended tone twin horns with horn relay optional.

Horn Type	Current at 6 Volts	Air Gap
K-26-H, 2251	6.5-8.5	.025-.029"
K-33-S, 2067 (low)	11-13	.042-.046"
K-33-S, 2068 (high)	10-12	.032-.036"

Horn Relay:—Delco-Remy Model 271-A. Points close at 2.7-4.0 volts.
Contact Gap—.015-.030".
Air Gap—.010-.025".

SERIAL NUMBER:—First number L-146,001. Located beneath generator on left front cross-member brace.

COMPRESSION:—Ratio 6.2-1. Pressure—140 lbs. at 400 R.P.M.

VACUUM READING:—Steady reading of 18" min. with engine idling at 6 M.P.H. or 400 R.P.M.

IGNITION:—Coil Model 539-P. Mounted on engine side of dash. High tension terminal color (brown).

Ignition Switch:—Delco-Remy Model 435-M. Switch and cable assembly connected to coil by armored cable.

Ignition Lock—Briggs & Stratton. #45792 (cylinder), #45791 (case). **Key Series**—8000-9499.

Distributor Mod. 663-W. Single breaker, 8 lobe cam, full automatic advance with auxiliary vacuum spark control.

NOTE—Distributor rotation now counter-clockwise (reversed from 1936 model).

Breaker Gap—.015". Limits .0125-.0175".

Cam Angle or Dwell—31° (closed), 14° (open).

Breaker Arm Spring Tension—19-23 ounces.

Condenser—Part No. 1865972. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	2.5	600
3.5	500	7.0	1000
15.0	2000	30.0	4000

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port in carburetor above throttle) except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	5-7"
15° Maximum	14-17"

Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING:—For all engines as follows:

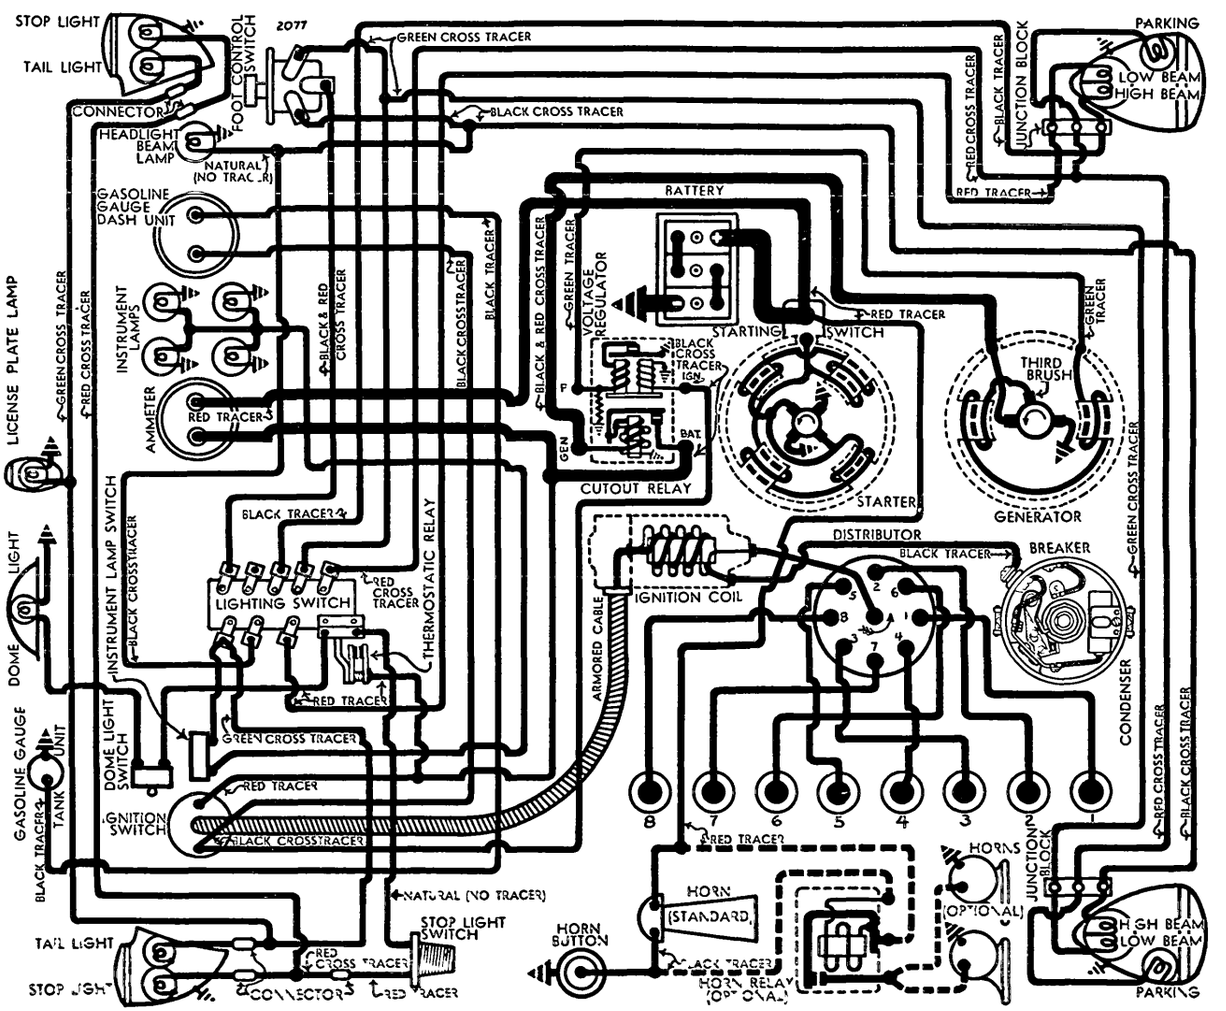
Flywheel Degrees	Piston Position
2° BTDC.	.002" BTDC.

Timing (Using Synchroscope)—This method recommended. Clip Synchroscope lead to #6 spark plug, direct light on flywheel through inspection hole in left front face of housing. Idle engine at 300 R.P.M. or 6-7 M.P.H. Loosen hold-down screw in advance arm, center pointer on scale (arrow at '0' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until timing mark (steel ball) on flywheel lines up with pointed end of inspection hole cover screw, tighten clamp bolt.

Timing (Without Synchroscope)—Use timing light connected between distributor terminal and ground, turn on ignition to check contact opening. With #6 piston on compression, turn engine over until piston reaches 2° before top dead center, stop when steel ball on flywheel lines up with pointed end of inspection hole cover screw in left front face of housing. Loosen hold-down screw in advance arm, center pointer on scale (arrow at '0' mark), tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts opening), tighten clamp bolt.

Motor Gauge—Weidenhoff Adapter #114, Rod #40.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.



Spark Plugs:—AC. Type K-9. 14 MM. Metric type.
NOTE—K-9 discontinued by AC. Use No. 46.
Spark Plug Gap—.030".

CARBURETION:—Carburetors—Carter Models 345-S (first cars), 367-S (later cars). Dual downdraft types with Carter Climatic Control.
NOTE—Metering rod on first carburetor (345-S) changed.
See Article in Carburetion Section.
Idle Adjustment—With engine hot, choke valve wide open and engine idling at hot or slow idling speed, adjust throttle stopscrew so that engine idles at 350 R.P.M. (min.). Turn idle adjusting screw for each carburetor barrel (in succession) in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.
Accelerating Pump Setting—Pump lever under cover (integral with air horn—see article in Carburetion Section for dismantling instructions) has two holes for pump link engagement. Change for seasonal requirements as follows:
Upper Hole (Max. stroke)—Cold weather.
Lower Hole (Min. stroke)—Hot weather.

Fast Idle:—Integral. Adjustable. See article on Carter Carburetors in Carburetion Section.

Accelerator Linkage Adjustment:—Must be maintained to provide correct 'throttle cracking' action for starting. To adjust, remove starting cable at starting switch (to prevent cranking), fully depress starter shift lever, loosen locknut on eccentric adjusting pin on starter shift lever, with offset screwdriver adjust pin to give .070" clearance (Tool No. J-668 gauge to measure this opening) between throttle adjusting screw and carburetor casting (with throttle adjusting screw about to seat on high point of cam), tighten locknut.

NOTE—Make this adjustment after Idle Adjustment (above).

Automatic Chok :—Carter Climatic Control. **See Article in Carburetion Equipment Section.**

Air Cleaner:—AC. #1528262 standard oil-wetted type, #1528156 heavy duty oil-bath type optional.

Fuel Pump:—AC. Type AH #1523228 standard. Combination fuel-and-vacuum pump Type AJ #1523227 optional.

Gasoline Gauge:—AC Electric. #1515323 (dash unit), #1515451 (tank unit). **See Article in Carburetion Equipment Section.**

VALVE TIMING:—To Check Timing—Check tappet clearance (.008") #1 intake valve. This valve should open with piston on top dead center (.000") when 'TDC/' mark on flywheel (not steel ball) lines up with pointed end of inspection hole cover screw located on left front face of flywheel housing.
Motor Gauge—Weidenhoff Adapter #114, Rod #40.

Tappet Clearance—.008" Int., .011" Exh., warm.
NOTE—To remove hood side panel, disconnect headlamp wires at block, remove 2 screws at rear of panel, one screw at radiator and bolt nut at rear of lamp. Lift panel out. After installing refocus headlamp.

Valve Spring Pressure:—46 lbs. at 2 9/32" (valve closed), 94 lbs. at 1 31/32" (valve open).

LUBRICATION:—Crankcase Capacity—7 qts. (refill).
Normal Oil Pressure—25-30 lbs.

BATTERY:—Delco, Type 17-K. 17 plate, 100 ampere hour capacity (20 hour rate).
Starting Capacity—131 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.4 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Left side under drivers seat.

STARTER:—Model 729-J. Armature No. 823881.
Drive—Overunning clutch and manual pinion shift operated by starting pedal.
Cranking Engine—100 R.P.M., approximately 200 amperes at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	60
15 ft. lbs.	Lock	3.0	600

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange capscrews.

Starting Switch:—Part No. 820052. Mounted on starter. Operated by starting pedal.

GENERATOR:—Model 936-T. Armature No. 1854856. Fixed third brush control type with external vibrating voltage regulator. Ventilated by fan on drive pulley.
NOTE—Third brush is clamped in position for maximum safe output and must not be disturbed.
Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data below.
NOTE—Do not operate generator on open circuit.
Maximum Charging Rate—As given in table below. Reached at car speed of 30-35 M.P.H. To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22	8.0	3000
Hot	20	8.0	3500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Field Current—2.3-2.6 amperes at 6.0 volts.

Removal:—Generator pivot mounted on left front of engine. To remove, take out two pivot bolts and clamp bolt.

Belt Adjustment:—Loosen clamp bolt and pivot bolts, swing generator out until deflection of belt is ¾" midway between generator and crankshaft pulleys when pressed lightly.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5814. Mounted on engine side of dash. Consists of Cutout Relay and vibrating type Voltage Regulator. **See Article in Electrical Equipment Section.**

Cutout Relay

Cuts In—6.5-7.0 volts, 838 R.P.M., 9½ M.P.H.
Cuts Out—3 amperes max. at 6.3 volts.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.
Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.
NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open-circuit.
Contact Gap—.015-.025".
Contact Spring Tension—2.7-3.5 ounces.
Air Gap—.060-.070" between armature and center of core with armature down and fibre bumper touching stop; .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, pre-focused, cross-beam type with special non-interchangeable lenses. Special asymetrical 'Passing' beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in driving or third position.
NOTE—Headlamps must be refocused whenever hood side panel is removed.
Headlamp Beam Indicator—Located at top of speedometer dial. Lighted whenever driving or upper headlamp beams are lighted.

Switches

Lighting—Delco-Remy Model 480-P, 479-H Export.
Foot Beam Selector—471-T, M (Exp.).
Dash Lamp—1416.
Stop Lamp—Hydraulic type on brake master cyl.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	T-2320-L
Parking, Instrument Panel	1½	T-55
Stop, Tail	21-3	T-1154
Dome	6	T-81
Rear License	3	T-63
Glove Comp., Beam Ind.	1	T-51

THERMOSTATIC RELAY:—Model 1866467. Mounted on lighting switch (part of assembly) may be replaced separately. Non-adjustable. Operates with load of 24-27 amperes limiting current to 18 amperes.

HORNS:—Klaxon Model K-26-H, Type 2251 standard, K-33S, Type 2067 (low note), 2068 (high note), blended tone twin horns with horn relay optional.

Horn Type	Current at 6 volts	Air Gap
K-26-H, 2251	6.5-8.5	.025-.029"
K-33-S, 2067 (low)	11-13	.042-.046"
K-33-S, 2068 (high)	10-12	.032-.036"

Horn Relay:—Delco-Remy Model 271-A. Points close at 2.7-4.0 volts.
Contact Gap—.015-.030".
Air Gap—.010-.025".

PACKARD

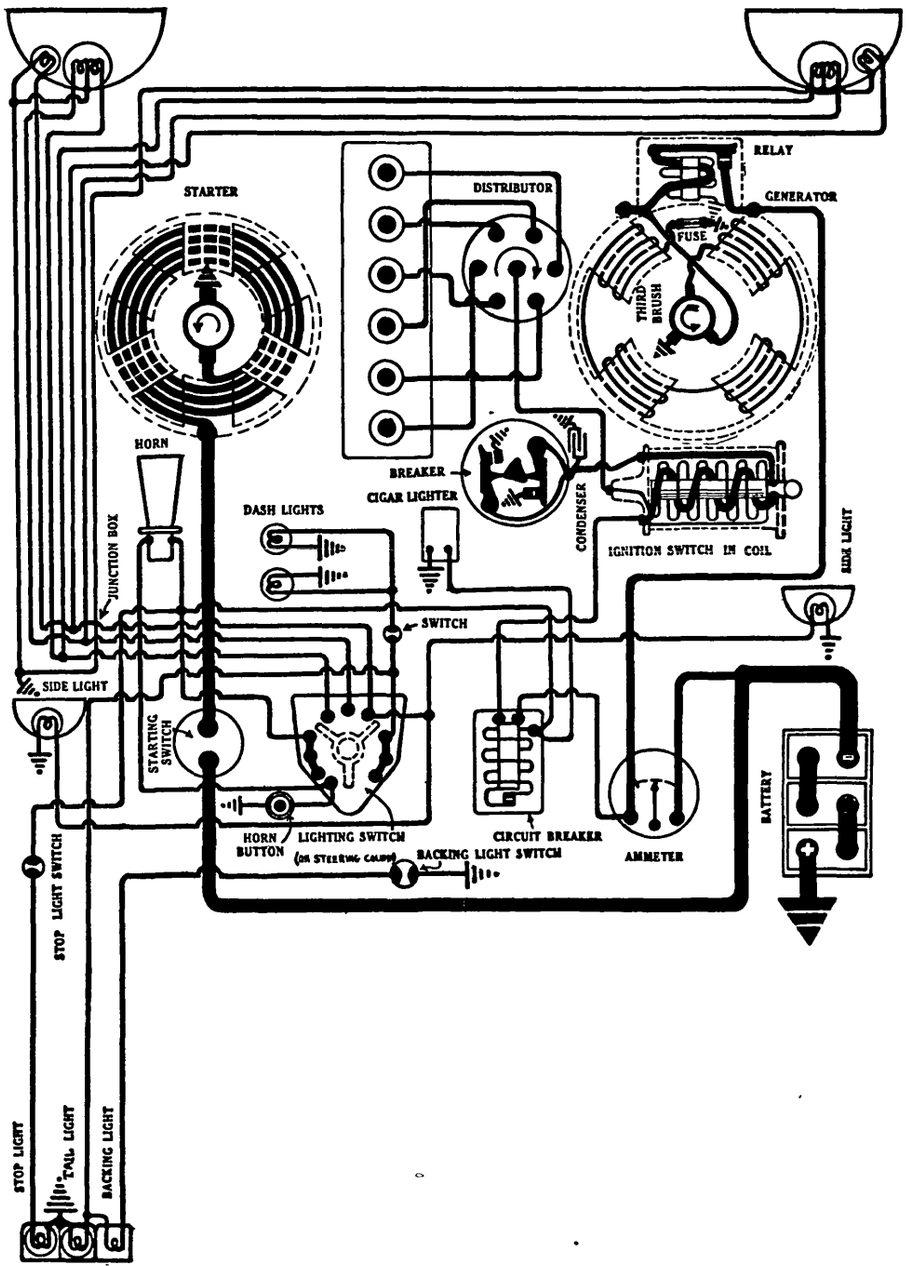
MODELS 526-533 (1928)
OWEN-DYNETO GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite. Type A-613-SH. Starting capacity (20 minute rate) is 130 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22½ hours. The positive (+) terminal is grounded. Battery is mounted in special compartment built in right front fender.

IGNITION:—Coil Model 552-A. Distributor Model 656-J. Breaker contacts separate .020-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 40 degrees (engine). Automatic advance starts at 600 R.P.M. and reaches a maximum of 20 degrees (engin) at 2000 R.P.M. of the crankshaft. Breaker has two sets of contacts operating on a three sided cam opening alternately at intervals of 60 degrees corresponding to 120 degrees of crankshaft rotation. This firing interval must be accurately set (see Timing). Breaker arm spring tension is 17-21 ounces.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and manual advance rod. Then remove advance stop screw and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head and turn down two turns every two weeks or each 500 miles. Place a small bit of vaseline on the face of the breaker cam every 1000 miles.



Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 21/32 inch before top dead center (on the flywheel) with the spark control lever in the fully advanced position. With piston No. 1 in this position flywheel mark 'S/' (viewed through starter hole with starter off engine) will register with indicator in housing. To set timing with piston No. 1 in firing position, first make certain that manual spark control lever is in the fully advanced position. If breaker contacts are not beginning to separate, loosen advance arm clamp screw and rotate distributor until contacts on stationary breaker begin to separate. Tighten the clamp screw. Use special Delco-Remy Part No. 820751 to check second set of breaker contacts mounted on movable plate. Place the synchronizing gauge on the cam placing the clamp on the flat side of the cam with slot in shaft toward left side of gauge. Turn shaft in clockwise direction until graduations on left scale are near slot in distributor housing. Continue to turn shaft and note reading on scale opposite the edge of the slot when stationary set of contacts separate. Continue to rotate shaft until same reading on the other scale is opposite the slot in the distributor. In second set of contacts are not separating, loosen two lockscrews on mounting plate and turn eccentric adjusting screw until contacts separate. Tighten the two lockscrews. Use a test lamp or the dash ammeter to note instant the contacts separate. The contact gap must be kept within the limit of .020-.024 inch This must be checked after setting timing.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞ inch Special, Type Z. Gaps .025 inch.

VALVE TIMING:—Exhaust valves close and inlet valves open at top dead center. To check valve timing, set tappet clearance of No. 1 valves at .004 inch (hot). Crank engine over until piston No. 1 reaches top dead center with the flywheel mark 'UDC Cyl. 1 & 6' opposite the indicator. The exhaust valve in cylinder No. 1 should close and the inlet valve open at this point.

To Set Valve Timing:—Two teeth on both camshaft and crankshaft sprockets are marked. Mesh chain with sprockets turned so that marked

PACKARD

MODELS 526-533 (1928)
OWEN-DYNETO GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

teeth are directly opposite (a straightedge across the shaft centers will bisect the marks). Chain is adjusted by shifting the generator.

STARTER:—Model DI-850. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter is a six pole, two brush machine having one field coil which is so constructed that it winds around three sides of each pole alternating from one to the next so that each pole is surrounded by a "U" shaped section of the coil.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4500	6	60
25 "	Lock	3.5	650

Mounting:—Starter is mounted at left of engine by a standard sleeve mounting. To remove starter, disconnect starter cable and remove large pilot mounting screw. Slide starter forward and lift from place.

Oiling:—Starter bearings are fitted with oilless bushings. They require no attention.

GENERATOR:—Model CD-777 & 800. Generator is a four pole straight shunt field generator with third brush control. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, turn the slotted screw on generator frame to shift third brush. Turn the screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. With standard car setting, the maximum charging rate is 16 amperes at 8 volts reached at 1000 R.P.M.

Generator Data (cold)

Amperes	Volts	R.P.M.
0	6.4	450
9	7.2	750
16	8	1000
7	7	3500

Motoring generator draws 7 amperes at 6 volts. Shunt field current is 4 amperes at 6 volts. Brush spring tension is 3 lbs. A five ampere field fuse is located on the commutator end plate of the generator. The generator drive end bearing is located in the engine.

Mounting:—Generator is mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and remove 3 flange mounting cap screws. Pry generator to the rear being careful not to disturb plate between generator and chain case which carries generator bearing and drive sprocket. If this is removed the timing of the valves will be disturbed. The generator must not be run on the test stand without bolting a special bearing on the drive end. This can be secured from the Owen-Dyneto Corporation and is their part No. 22196.

Oiling:—Drive end bearing of the generator is oiled by splash from the chain case. Put 4 or 5 drops of light engine oil in the commutator end bearing every month or each 1000 miles.

RELAY:—Type 20058. Relay is mounted on top of the generator. Relay closes at 385-400 R.P.M. when the voltage of the generator reaches 6.2 volts and opens with a discharge current of 0-2 amperes. Relay contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Delco-Remy Switch, Model 1317. Lighting switch is mounted at base of steering column. Headlights are 6-8 volt, 21-21 cp. (double filament-double contact). Auxiliary head lights are 6-8 volt, 6 cp. S.C. Dome light is 6-8 volt, 6 cp. S.C. Dash, tail and tonneau lights are 6-8 volt, 3 cp. S.C. Stop and backing lights are each 6-8 volt, 21 cp. S.C.

CIRCUIT BREAKER:—Delco-Remy Model 410-C. A vibrating vircuit breaker is mounted on the dash. It begins to operate at 20-30 amperes limiting the current to 2-15 amperes. Circuit breaker contacts separate .012-.030 inch.

PACKARD

MODEL 4-43 (1928)
OWEN-DYNETO GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

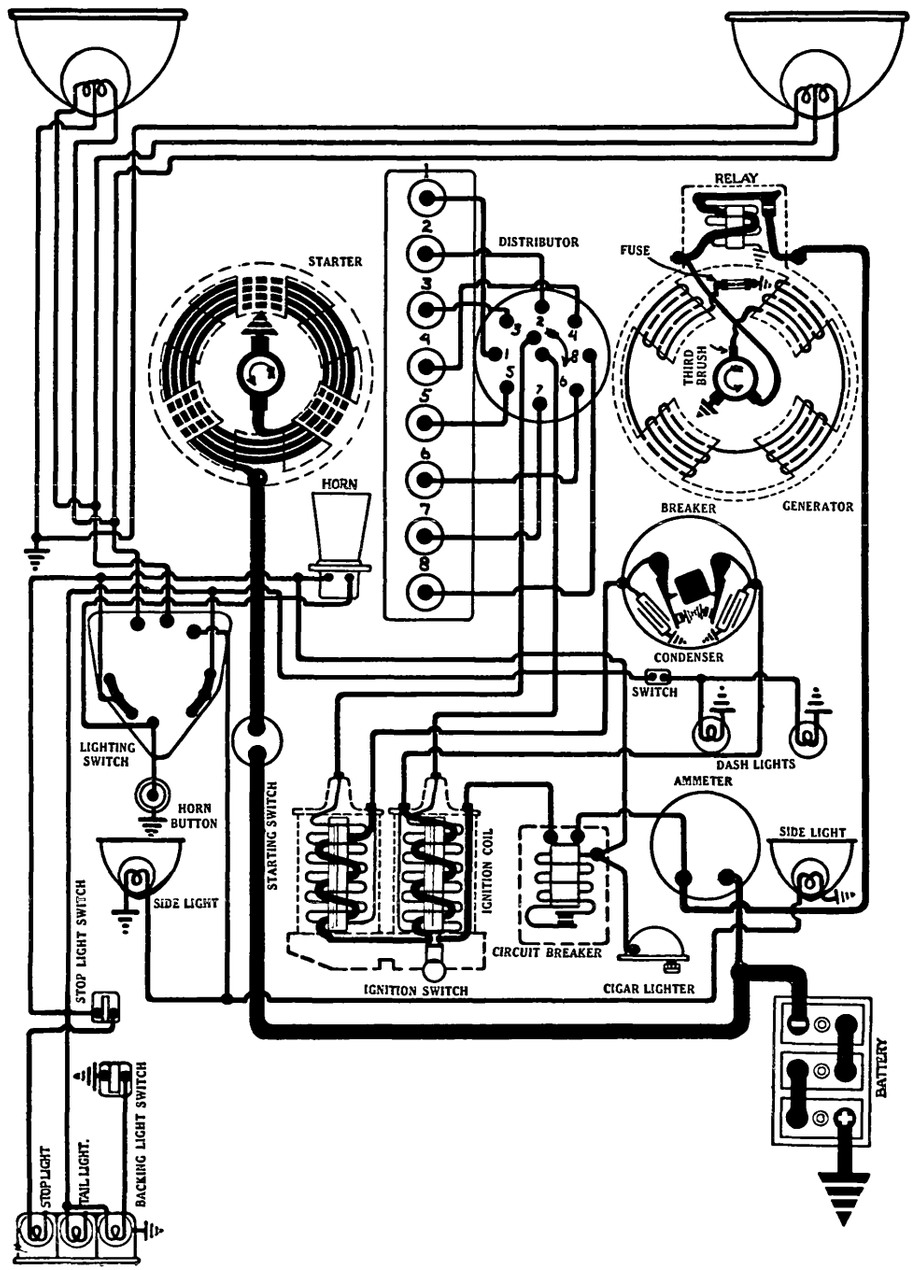
BATTERY:—Prest-O-Lite. Type A-617-SH. 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 170 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 32 hours. Battery is mounted in special compartment built in right front fender.

IGNITION:—Coil Model 553-A. Distributor Model 4033. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 40 degrees (on flywheel). Automatic advance begins at 800 R.P.M. (engine) and reaches a maximum of 20 degrees (flywheel) at 2000 R.P.M. of the crankshaft. The breaker has two sets of contacts mounted at an angle of 135 degrees on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. Each set of contacts control one coil and fire the plugs in four cylinders. The firing interval must be accurately set to secure proper performance. See Timing. Breaker arm spring tension is 17-21 ounces.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and manual advance control rod. Then remove manual advance stop screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oilers on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of heavy grease on the face of the breaker cam every month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position of 21/32 inch (on flywheel) before top dead center with the spark control lever in the fully advanced position. With piston No. 1 in this position, flywheel mark 'S/' (viewed through starter hole with starter off engine) will register with indicator in housing. To set timing with No. 1 piston in firing position, first make certain the spark control lever is fully advanced. If breaker contacts are not beginning to separate, loosen manual advance arm clamp screw and rotate distributor until contacts mounted on stationary plate begin to separate. Tighten the clamp screw. Check the second set of contacts with Delco-Remy tool Part No. 822965. This is a special gauge which fits on the shaft in place of the regular firing cam. Turn gauge so that bumper of statioinary set of contacts fits in notch. If bumper of second set of contacts does not rest in notch, loosen two lockscrews on mounting plate and shift plate until proper setting is reached. Tighten the lockscrews.



Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are ⅞ inch Special Type Z. Gaps are .025 inch.

VALVE TIMING:—Exhaust valves close and inlet valves open at top dead center. To check valve timing, set tappet clearance of No. 1 valves at .004 inch (hot). Crank engine over until piston No. 1 reaches top dead center with the flywheel mark 'UDC Cyl. 1 & 8' opposite the indicator. The exhaust valve in cylinder No. 1 should close and the inlet valve open at this point.

To Set Valve Timing:—Two teeth on both camshaft and crankshaft sprockets are marked. To set timing, mesh chain with sprockets turned so that marked teeth are directly opposite each other (a straightedge across the shaft centers should bisect the marks).

STARTER:—Model DM-693 and DN-860. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise,

PACKARD

MODEL 4-43 (1928)
OWEN-DYNETO GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

looking at the commutator end. The starter is a six pole two brush machine with one field coil which is so constructed that it winds around three sides of each pole alternately so each pole is surrounded by a 'U' shaped section of the coil.

Starter Data

Motoring generator draws 7 amperes at 6 volts. Shunt field current is 4 amperes at 6 volts. Brush spring tension is 3 pounds. A five ampere field fuse is located on the commutator end plate of the generator. The generator end bearing is located in the engine.

Mounting:—Generator is mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and remove 3 flange mounting cap screws. Pry generator to the rear being careful not to disturb plate between generator and chain case which carries generator bearing and drive sprocket. If this is removed the timing of the valves will be disturbed. The generator must not be run on the test stand without bolting a special bearing on the drive end. This can be secured from the Owen-Dyneto Corporation and is their part No. 22196.

Oiling:—Drive end bearing of the generator is oiled by splash from the chain case. Put 4 or 5 drops of light engine oil in the commutator end bearing every month or each 1000 miles.

RELAY:—Type 20030. Relay is mounted on top of the generator. Relay closes at 385-400 R.P.M. when the voltage of the generator reaches 6.2 volts and opens with a discharge current of 0-2 amperes. Relay contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Delco-Remy Switch Model 1317. Lighting switch is mounted at base of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact). Auxiliary head lights are 6-8 volt, 6 cp. S.C. Dome light is 6-8 volt, 6 cp. S.C. Dash, tail and tonneau lights are 6-8 volt, 3 cp. S.C. Stop and backing lights are 6-8 volt, 21 cp. S.C.

CIRCUIT BREAKER:—Delco-Remy Model 410-C. A vibrating circuit breaker is mounted on the dash. It begins to operate at 20-30 amperes limiting the current to 2-15 amperes. Circuit breaker contacts separate .012-.030 inch.

PACKARD

MODELS 626-33 (1929) 640-45 (1929)
OWEN DYNETO GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

BATTERY:—(626-33) **Prest-O-Lite, Type A-615-SF,** 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 148.4 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 26.6 hours.

(640-45) **Prest-O-Lite, Type A-617-SF,** 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 169.6 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 32.2 hours. Battery is mounted on the right frame member.

IGNITION:—**North East Coil.** Coil is mounted on the back of the instrument board with the ignition switch (which is built in the base of the coil) extending through to the face of the instrument panel. Ignition current is 2.7 amperes at 6 volts with engine running and 6 amperes at 6 volts with engine stopped.

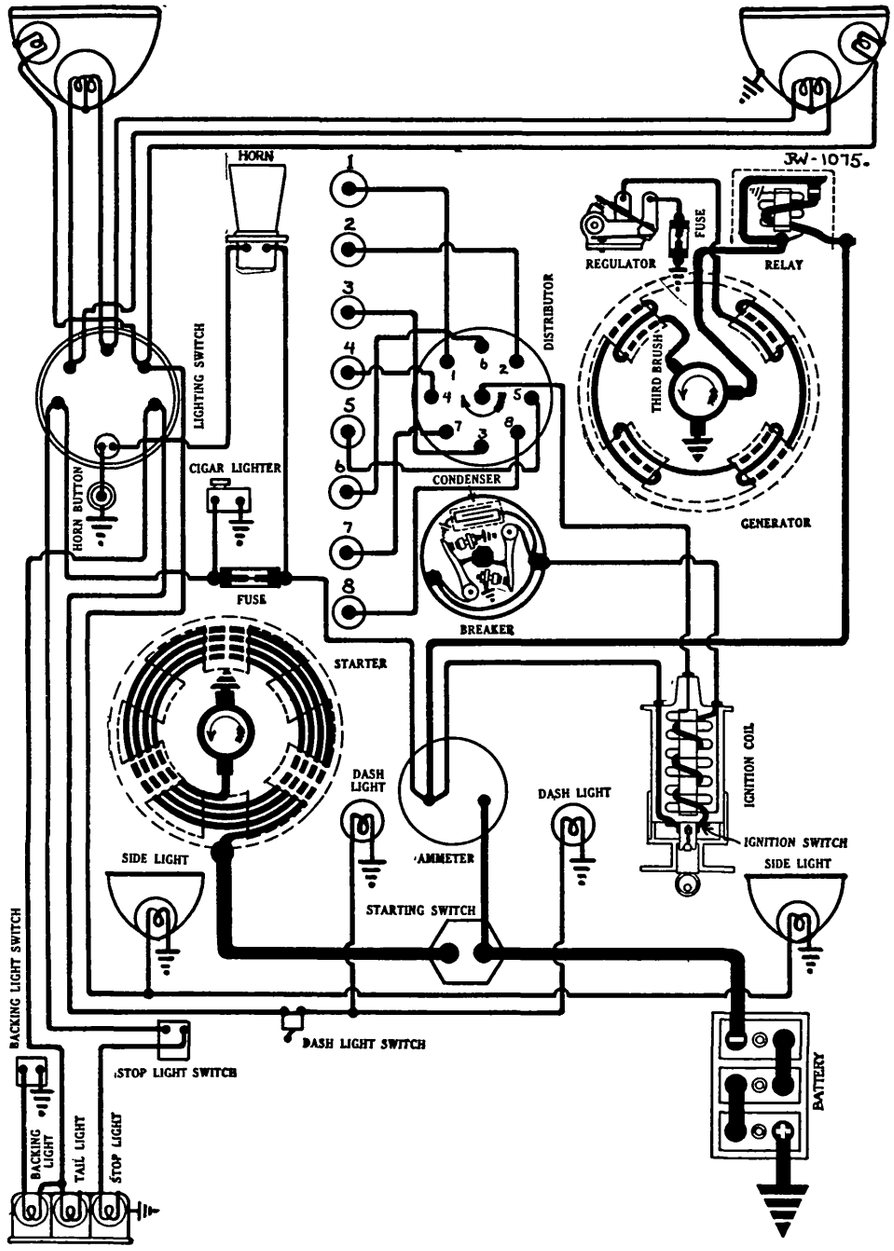
Distributor Type 10858. Breaker contacts separate .015-.020 inch. Set breaker gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is full automatic with an auxiliary retard controlled by a button on the dash to provide retard in starting and to prevent the engine laboring under load. Breaker has two sets of contacts on an eight sided cam. Contacts open simultaneously and must be synchronized to secure correct performance. See Timing.

Automatic Advance					
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	2		600
9.5		1000	19		2000

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and spark control and remove distributor head with cables intact. Then loosen advance clamp screw and lift distributor from place.

Oiling:—Fill the oiler on the side of the distributor with light engine oil and put several drops of oil in the wick oiler in the center of the shaft which is accessible after removing the distributor head and rotor, every 2000 miles.

Timing:—**Synchronization of Contacts:**—Check contacts with test lamps. If both sets of contacts do not open at the same instant, loosen lock screws on contact mounting plate and shift plate until contacts are synchronized. Check contact gap and reset at .015-.020 inch if necessary.



Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 21/32" (on the flywheel) before top dead center with the spark control button pushed all the way in, or in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Make certain that the spark control button is in the advanced position. Continue to crank engine until a point on the flywheel 21/32" before the top dead center mark is opposite the indicator in the flywheel case. Then loosen advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and connect the segment opposite the rotor to the spark plug in cylinder No. 1.

NOTE:—Flywheel is marked 'S/' at a point 21/32" before the dead center mark 'UP.DC.1/' for ignition setting. This mark should register with the pointer in the starter mounting sleeve hole when setting ignition (starter must be removed to see marks).

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Long. Gaps are .025 inch.

VALVE TIMING:—**Specifications:**—Head diameter of inlet valves is 1 21/32 inches (Model 626-33) and 1 13/16 inches (Model 640-45). Head diameter of

PACKARD

MODELS 626-33 (1929) 640-45 (1929)
OWEN DYNETO GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

exhaust valves is 1 15/32 inches (Model 626-33) and 1 11/16 inches (Model 640-45). Stem diameter is .3405 inch. Tappet clearance is .004 inch (hot).

Timing:—Inlet valves open and exhaust valves close at top dead center.

To Check Valve Timing:—Check tappet clearance No. 1 intake and exhaust valves (set at .004"). Intake valve should open and exhaust valve close with piston No. 1 on top dead center when flywheel mark 'UP.DC.1/-EX.CL.IN.OP' registers with pointer in starter mounting hole in flywheel housing (starter must be removed to see marks).

To Set Valve Timing:—With piston No. 1 on top dead center, turn camshaft until two marked teeth on camshaft sprocket are directly opposite two marked teeth on crankshaft sprocket (a straightedge across the shaft centers should bisect the marks). Mesh chain. See Generator Mounting for chain adjustment.

STARTER:—Model DM-693 and DN-860. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 26-28 ounces. The starter is a six pole motor with a single field coil which is so constructed that it winds around three sides of each pole piece. There are two brushes.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	3000	6	50
35 "	Lock	3.5	650

It is important that the starter should not draw more than 50 amperes running light.

Mounting:—Starter is sleeve mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove large pilot mounting screw from flywheel case directly above starter sleeve. Then pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model CD-840 and 845. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator is a four pole straight shunt machine with third brush control and 'Battery Charge Regulator'. To adjust generator output, remove the commutator cover and turn the slotted adjustment screw on the end plate. This shifts the third brush through a rack and pinion engagement. Turn the screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The 'Battery Charge Regulator' consists of an electrically operated thermostat which cuts a resistance in the field circuit and permits a relatively high charging rate without danger of overcharging the battery. The thermostat is compensated for temperature changes and is entirely automatic, requiring no service adjustment.

Generator Data

Amperes	Volts	R.P.M.
0	6.4	600
16-18	8.0	1400
7	7.0	3500

Motoring, generator draws 7 amperes at 6 volts. Shunt field current is 4 amperes at 6 volts. Brush spring tension is 3 pounds. A five ampere field fuse is mounted on the end plate.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and remove three flange mounting cap screws. Then carefully pry generator to rear without disturbing plate between generator flange and chain case which carries generator bearing and drive sprocket. If this is removed the timing of the camshaft will be affected. The generator must not be run on the test stand unless a special test bearing is bolted on the drive end. This can be secured from the Owen Dyneto Corporation and is their part No. 22196. Do not crank the engine with the generator out.

Chain Adjustment:—Adjust chain whenever sideplay at inspection plug hole is ½" or greater. To adjust, loosen generator flange mounting screws, pull generator away from engine, tighten mounting screws. If chain hums, adjustment must be backed off slightly. Sideplay at inspection hole should be ¼" with correct adjustment.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles. The drive end bearing is oiled from the chain case.

BATTERY CHARGE REGULATOR:—Model 20100, 20220. Regulator and cutout relay are mounted in a single case on the top of the generator. The relay contacts close at 600 R.P.M. when the generator voltage reaches 6.4 volts and open with a discharge current of 0-2 amperes. Relay contacts separate .015 inch. Air gap is .010 inch with contacts closed. The regulator consists of a fixed resistance wound on a spool and connected across the contacts of a special compensated thermostat. Thermostat is actuated by a fine resistance winding wound on the thermostat blade and connected across the generator. When the thermostat contacts open the resistance is cut in the field circuit.

LIGHTING:—Lighting switch is mounted at lower end of steering column. Headlights are 21 cp. double filament using the second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Auxiliary headlights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop and backing lights are 6-8 volt, 21 cp. S.C. Mazda 1129. Dash, tail and side lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

Switch:—Stop light switch is Clum Model 9094.

FUSES:—Generator field fuse is 5 ampere capacity. Lighting fuse mounted on block on dash is 20 ampere capacity.

PACKARD

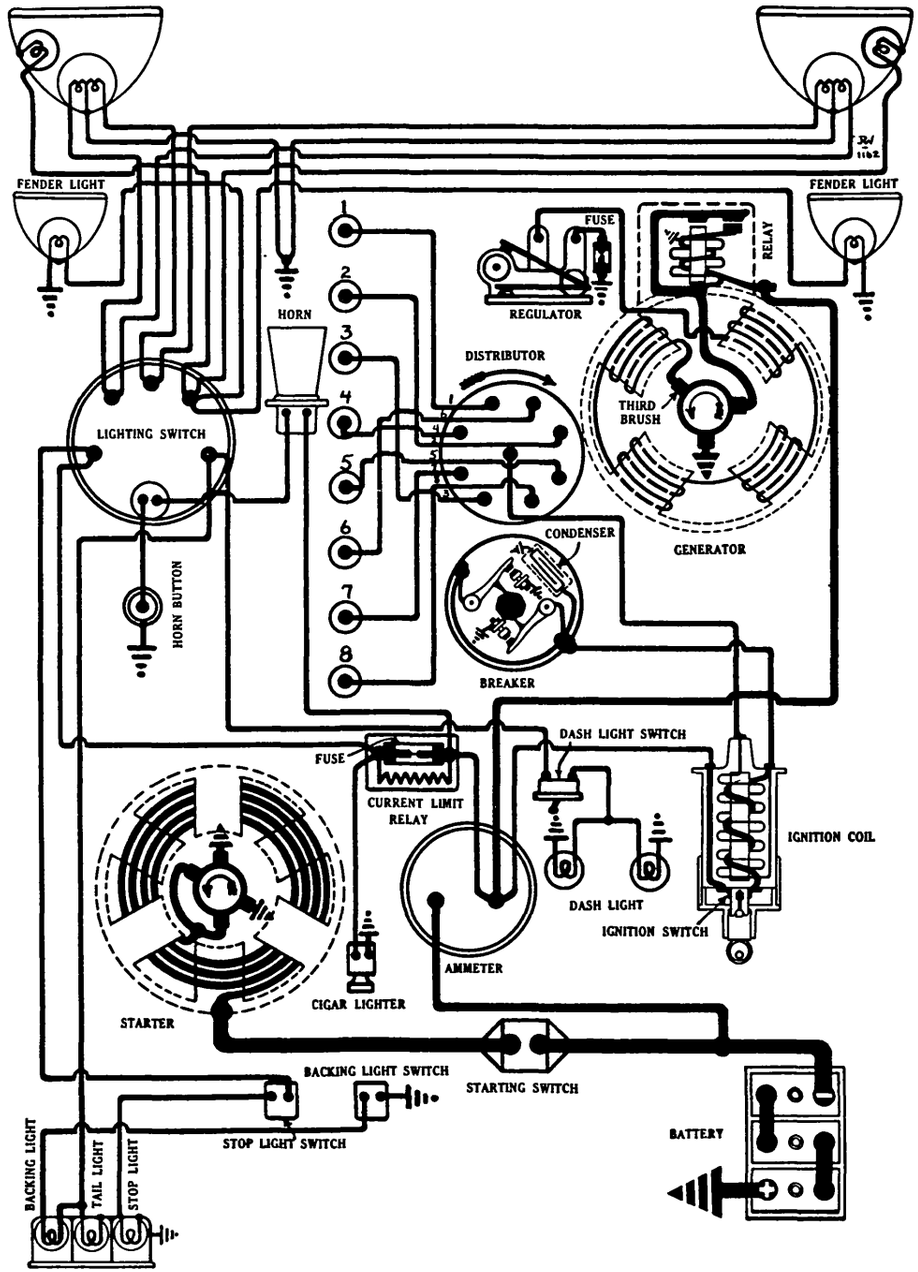
MODELS 726, 733 AND 740, 745 (1930)
OWEN-DYNETO GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

BATTERY:—(726, 733) Prest-O-Lite, Type A-615-SF, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 148.4 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 26.6 hours. Battery is mounted on the right frame member.

(740, 745) Prest-O-Lite, Type A-617-SF, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 169,6 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 32.2 hours.

IGNITION:—Coil Type 5022293. The ignition switch is built in the base of the coil. Coil is mounted on the back of the dash with the ignition switch extending through to the face of the instrument panel. The ignition current is 2.75 amperes at 6 volts with engine running at 400 R.P.M. decreasing to .8 amperes at 4000 R.P.M. Ignition current is 4.75 amperes at 6 volts with engine stopped.

Distributor Type 5010896. Breaker contact gap should be .020 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up the stud. Resurface contacts when necessary on a medium hard oilstone or use a fine flat contact file. Breaker arm spring tension is 16 ounces. Distributor is semi-automatic. Maximum manual advance is 40 degrees (engine). Automatic advance begins at 600 R.P.M. of the engine. Maximum automatic advance is 17.5 degrees reached at 3000 R.P.M. Breaker has two sets of contacts operating on a single eight lobe cam. Breaker contacts should open simultaneously and the breaker gap must be held at .020 inch for both sets of contacts to insure the simultaneous opening.



Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect manual spark control and primary lead and remove distributor head with cables intact. Then take out two hold-down screws and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down one turn every 1000 miles of operation. At the same time remove the distributor head and rotor and put one drop of oil on the breaker arm pivot pins and place a small bit of grease on the face of the breaker cam.

TIMING:—Breaker contacts begin to open when the piston entering power stroke reaches a position 29/32 inch before top dead center (measured on the flywheel) with the manual spark control button in the fully advanced position (pushed all the way in toward the dash). To set timing, turn engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance the manual spark control. Turn the engine over until piston reaches firing position when the ignition mark on the flywheel (which is 29/32 inch before the top dead center mark for cylinders 1 and 8) will be directly opposite the indicator on the flywheel housing. Then loosen the advance arm clamp screw and rotate the distributor until both sets of contacts begin to open. Tighten the clamp screw and see that the segment in the distributor head opposite the rotor is connected to the spark plug in cylinder No. 1.

NOTE:—The ignition mark on the flywheel, 'S/', can be viewed through the starter sleeve mounting hole after the starter has been removed. This mark must register with the pointer in the starter hole when setting the ignition.

Synchronization of Contacts. Contacts should be synchronized whenever ignition timing is checked or contact adjustment is changed. Use test lamps connected across each set of contacts to accurately determine when contacts open. The breaker plate is so constructed that it is movable after

PACKARD

MODELS 726, 733 AND 740, 745 (1930)
OWEN-DYNETO GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

the locking screw on the movable plate has been loosened. To synchronize contacts, loosen the locking screw and insert a screwdriver in the slot in the plate. Then shift the plate by turning the screwdriver until both contacts open at the same instant. The movable plate turns on two small pins punched in the plate underneath. Tighten the lock screw after making the adjustment.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Long. Gaps are .025 inch.

VALVE TIMING:—Specifications. Head diameter of inlet valves is 1 21/32 inches (726, 33) and 1 13/16 inches (740, 45). Stem diameter is .3405 inch. Head diameter of exhaust valves is 1 15/32 inches (726, 33) and 1 11/16 inches (740, 45). Tappet clearance on both inlet and exhaust valves is .004 inch (hot).

Timing:—Inlet valves open 20 degrees or 6½ teeth on the flywheel before top dead center. Exhaust valves close 20 degrees after top dead center.

To Set Valve Timing:—With piston No. 1 on top dead center, turn camshaft until two marked teeth on camshaft sprocket are directly opposite two marked teeth on crankshaft sprocket (a straightedge across the shaft centers should bisect the marks). Mesh chain. See Generator Mounting for chain adjustment.

STARTER:—Model DI-850 (726, 33)) DN-860 (740, 45). The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 26-28 ounces. The starter is a six pole motor with a single field coil which is so constructed that it winds around three sides of each field pole. There are four main brushes (two field lead brushes and two ground brushes, each connected in parallel).

Model DI-850 Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	4500	6	60
25 "	Lock	3.5	650

Model DN-860 Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	3000	6	50
35 "	Lock	3.5	650

Mounting:—Starter is sleeve mounted at the left of the engine on the forward face of the flywheel housing. To remove starter, disconnect cable and take out large pilot mounting screw in flywheel housing directly above starter sleeve. Then pull starter forward to clear Bendix and lift from place.

Oiling:—Starter is equipped with oilless bronze bearings. They require no attention.

GENERATOR:—Model CD-865. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field operating in conjunction with a 'Battery Charge Regulator'. To adjust the charging rate, remove the commutator cover and turn the slotted adjustment screw on the end plate. This shifts the third brush through a rack-and-pinion engagement. Turn the screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The Battery Charge Regulator consists of an electrically operated thermostat which cuts a resistance in the field circuit when the thermostat blade opens. This permits a relatively high charging rate while the battery is protected against overcharging. The thermostat is compensated for temperature changes and is entirely automatic. It requires no service adjustments.

Generator Data

Amperes	Volts	R.P.M.
0	6.4	600
16-18	8.0	1400
7	7.0	3500

Motoring, generator draws 7 amperes at 6 volts. Shunt field current is 4 amperes at 6 volts. Brush spring tension is 3 pounds. A five ampere field fuse is mounted under the regulator cover. The field is grounded through this fuse.

Mounting:—Generator is flange mounted at the right of the engine on the rear of the timing chain case. To remove generator, disconnect lead and remove three flange mounting cap screws. Then pry generator to the rear without disturbing the plate between the generator flange and chain case which carries the drive sprocket and generator bearing. Since the drive end bearing of the generator is in the engine, the generator cannot be run on the test bench unless a special test bearing is bolted in place. This can be secured from the Owen-Dyneto Corporation and is their part No. 22196. Do not crank the engine with the generator out of the engine.

Chain Adjustment:—Adjust chain whenever sideplay at inspection plug hole is ½" or greater. To adjust, loosen generator flange mounting screws, pull generator away from engine until sideplay at inspection hole is ¼", tighten mounting screws.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles of operation. The drive end bearing is oiled from the chain case.

BATTERY CHARGE REGULATOR AND CUTOUT:—Model 20220. The regulator and relay cutout are mounted in a single case on the generator field frame. Relay contacts close at 600 R.P.M. of the generator when the voltage reaches 6.4 volts and open with a discharge current of 0-2 amperes. Relay contact gap should be .015 inch. Air gap is .010 inch with contacts closed. The regulator consists of a fixed resistance wound on a spool and connected across the contacts of a specially compensated thermostat. One thermostat terminal is connected to the shunt field terminal of the generator and the other terminal is grounded through a 5 ampere field fuse. The thermostat is actuated by a fine resistance winding connected directly across the generator. When the thermostat contacts open the fixed resistance is cut in series with the shunt field. The regulator is adjusted by increasing or decreasing the spring tension of the thermostat arm. Increasing the spring tension will increase the operating voltage.

LIGHTING:—Lighting switch is mounted at the base of the steering column. Headlights are equipped with double filament bulbs. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights (in headlights) or fender lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop and backing lights are each 6-8 volt, 21 cp. S.C. Mazda 1129. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

Switch:—Stop light switch is Clum Model 9094. Backing light switch is Model 9179.

FUSES:—Generator field fuse is 5 ampere capacity. Lighting fuse mounted on fuse block on the dash is 20 ampere capacity.

PACKARD

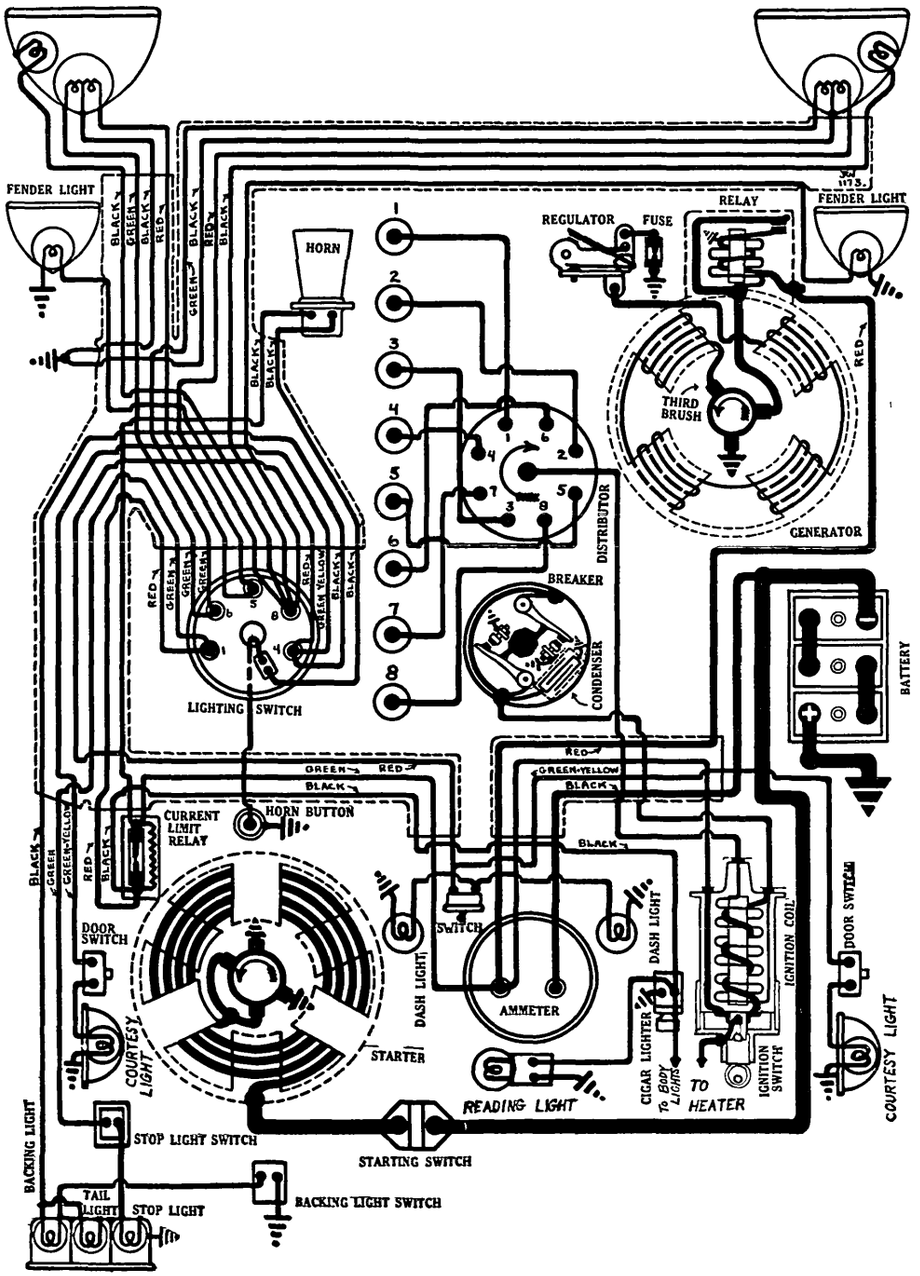
OWEN-DYNETO GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

BATTERY:—Prest-O-Lite, Type A-617-S, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 169.6 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 32.2 hours. Battery is mounted on the right frame member under the right hand dust shield.

IGNITION:—Coil Type 5025430. The ignition switch is built in the base of the coil. The coil is mounted on the back of the dash with the ignition switch extending through to the face of the instrument panel. Ignition current with engine running is 2.75 amperes at 6 volts at 400 R.P.M., gradually decreasing to .8 amperes at 4000 R.P.M. With engine stopped ignition current is 4.75 amperes at 6 volts. The coil has an extra terminal from which a lead is taken for the fuel pump when the electric fuel pump is installed.

Distributor Type 5010896. Breaker contact should be .020 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up the stud. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension should be 16 ounces. Distributor is semi-automatic. Maximum manual advance is 40 degrees (engine). Automatic advance begins at 400 R.P.M. of the engine. Maximum automatic advance is 17.5 degrees reached at 3000 R.P.M. Breaker has two sets of contacts operating on an eight lobe cam. Contacts apen simultaneously and are connected in parallel in the primary circuit of the ignition coil. The contact gap of .020 inch must be set very exactly to maintain this *simultaneous* opening.



Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and manual spark control and remove distributor head with cables intact. Then take out two hold-down screws in the distributor mounting and lift the distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down one turn every month or each 1000 miles of operation. At the same time remove the distributor head and rotor and put a drop of oil on the breaker arm pivot pins and place a small bit of vaseline or grease on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position 29/32 inch before top dead center (measured on the flywheel) with the manual spark control fully advanced (spark control button pushed all the way in toward the dash). To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance the manual spark control and turn the engine over until the ignition mark on the flywheel, which is 29/32 inch before the top dead center mark for cylinders Nos. 1 and 8, is directly opposite the indicator on the flywheel housing. Then loosen the advance arm clamp screw and rotate the distributor until both sets of contacts begin to open. Tighten the clamp screw and see that the segment in the distributor head directly opposite the rotor is connected to the spark plug in cylinder No. 1.

NOTE:—The ignition mark on the flywheel, 'S/', can be viewed through the starter sleeve mounting hole after the starter has been removed. This mark must register with the pointer at the bottom of the starter hole when setting the ignition.

Synchronization of Contacts. Contacts should be synchronized whenever ignition timing is checked or contact adjustment is changed. Use test lamps connected across each set of contacts to accurately determine when contacts open. The breaker plate is so constructed that it can be moved on the lower plate around two pins punched in the plate after the locking screw which holds it in position has been loosened. To synchronize con-

PACKARD

MODELS 826, 833 AND 840, 845 (1931)
OWEN-DYNETO GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

tacts, loosen the locking screw and insert a screwdriver in the slot in the movable plate. Shift the plate by turning the screwdriver until both contacts open at the same instant. Tighten the lock screw after making the adjustment.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Gaps should be .025 inch.

VALVE TIMING:—Specifications. Head diameter of inlet valves is 1 21/32 inches (826, 33) and 1 13/16 inches (840, 45). Stem diameter is .3405 inch. Head diameter of exhaust valves is 1 15/32 inches (826, 33) and 1 11/16 inches (840, 45). Stem diameter is .3405 inch. Tappet clearance is .004 inch (hot).

Timing:—Inlet valves open 20 degrees before top dead center and the exhaust valves close 20 degrees after top dead center.

To Set Valve Timing:—With piston No. 1 on top dead center, turn camshaft until two marked teeth on camshaft sprocket are directly opposite two marked teeth on crankshaft sprocket (a straightedge across the shaft centers will bisect the marks). Mesh chain. See Generator Mounting for chain adjustment.

STARTER:—Model DI-850 (826, 833) DM-693 (840, 845). Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 26-28 ounces. The starter is a six pole series motor with a single field coil which is so constructed that it winds around three sides of each field pole. There are four main brushes (two field lead brushes and two ground brushes, each connected in parallel).

Model DI-850 Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4500	6	60
25 "	Lock	3.5	650

Model DM-693 Starter Data

0 lb. ft.	3000	6	50
35 "	Lock	3.5	650

Mounting:—Starter is sleeve mounted at the left of the engine on the forward side of the flywheel housing. To remove starter, disconnect cable and take out large pilot mounting screw in flywheel case directly above the starter sleeve. Pull starter forward to clear Bendix and lift from place.

Oiling:—Starter is equipped with oilless bronze bearings. They require no attention.

GENERATOR:—Model CL-896. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field in conjunction with a 'Battery Charge Regulator'. To adjust the charging rate, remove the commutator cover and turn the slotted adjustment screw on the end plate. This shifts the third brush through a rack and pinion engagement. Turn the adjustment screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The Battery Charge Regulator consists of an electrically operated thermostat which cuts the resistance in the field circuit when the thermostat blade opens the regulator contacts. This permits a relatively high charging rate and at the same time protects the battery against overcharging. The thermostat is compensated for temperature changes and requires no service adjustments.

Generator Data

Amperes	Volts	R.P.M.
0	6.2	480
8	7.0	680
18	8.1	1300
12	7.4	4000

A five ampere field fuse is mounted under the regulator cover on the generator. The shunt field is grounded through this fuse.

Mounting:—Generator is flange mounted at the right of the engine on the rear of the timing chain case. To remove generator, disconnect lead and take out three flange mounting cap screws. Then pull the generator to the rear without disturbing the intermediate flange which carries the generator bearing and drive sprocket. The drive end bearing is mounted in the engine and the generator can not be driven on the test bench unless a special test bearing is bolted in place. This is furnished by the Owen-Dyneto Corporation and is their part No. 22196. Do not attempt to crank the engine with the generator out.

Chain Adjustment:—Adjust chain whenever sideplay at inspection plug hole is ½" or greater. To adjust, loosen generator flange mounting screws, pull generator away from engine until sideplay at inspection hole is ¼", tighten mounting screws. If chain hums, adjustment should be backed off slightly.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles of operation. The drive end bearing is oiled from the chain case.

BATTERY CHARGE REGULATOR AND RELAY:—Model 20530. The Battery Charge Regulator and relay cut-out are mounted on the generator field frame in a single case. The relay contacts close at 480 R.P.M. when the generator voltage reaches 6.2 volts and open with a discharge current of 0-2 amperes. Relay contact gap is .015 inch. Air gap should be .010 inch with contacts closed. The regulator consists of a fixed field resistance connected across the contacts of the thermostat blade. This resistance is cut in series with the shunt field when the thermostat contacts open. The thermostat is actuated by a fine resistance wound on the thermostat blade which is connected across the generator. The regulator is adjusted by increasing or decreasing the spring tension on the thermostat arm by turning the small screw under the lower blade. Increasing the spring tension will increase the operating voltage.

LIGHTING:—Lighting switch is mounted at the lower end of the steering column. Headlights are equipped with double filament bulbs. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Auxiliary headlights (in headlights) and fender lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop and backing lights are 6-8 volt, 21 cp. S.C. Mazda 1129. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

Switch:—Lighting switch is Clum Model 9170. Stop light switch is Model 9094.

FUSES:—Generator field fuse is 5 ampere capacity. Lighting fuse mounted on the fuse block on the dash is 20 ampere capacity.

PACKARD

LIGHT EIGHT SERIES 900 (1932) SERIAL NUMBERS 360,001 UP
OWEN-DYNETO GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

CAR SERIAL NUMBER:—Stamped on plate on left front face of dash.

ENGINE NUMBER:—On top of left front motor arm.

BATTERY:—**Prest-O-Lite, Type 619-ST.** 6 volt, 19 plates. Capacity 170 amperes for 20 minutes. Positive (+) terminal is grounded. Battery mounted under left front seat. Battery size, 7 inches wide, 13 inches long, 9⅝ inches high.

IGNITION:—**Coil Type 5027936.** Lock coil type with ignition switch in base. Coil mounted on back of instrument board with ignition switch at right of instrument panel. Ignition current 2.2 amperes at 6 volts (800 R.P.M. of engine) or 1.2 amperes at 6 volts (2800 R.P.M. of engine). Stalled current at room temperature 4.8 amperes at 6 volts.

Distributor Type No. 5031262 (first cars), 5031780 (later cars). Two breaker arm, 8 lobe cam type with full automatic advance. Contacts must be synchronized to secure satisfactory engine performance—see Timing. Breaker contact gap set at .020 inch. Hold within limits of .015-.020 inch. To set gap, loosen lockscrew on stationary contact plate, shift plate (insert screwdriver in notch in plate), tighten locking screw. Breaker arm spring tension 18 ounces.

Cam Angles—Closed 28°. Open 17° (distributor) when synchronized.

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		300	2		600
6.25		1500	12.5		3000

Mounting:—Distributor mounted on cylinder head. Remove from right side. To remove distributor, disconnect primary lead, take off distributor cap, take out hold-down screw in mounting and lift out.

Oiling:—**1000 Miles.** Turn down grease cup under distributor head one turn. Keep cup filled with No. 3 cup grease. Take off distributor cap and rotor, put one drop of oil on breaker arm pivot pins, oil cam felt oiler under condenser.

Timing:—Standard setting 9° (on flywheel) before top dead center. Flywheels on first cars and vibration dampener (at front of engine) on later cars marked for top dead center 'D/C' with fifteen one degree graduations on rim before the dead center mark. To set timing, remove starter so that flywheel marks can be seen (first cars only), with No. 1 piston on compression stroke turn engine over until the ninth mark (indicating 9°) before the dead center mark 'D/C' is opposite the indicator, loosen advance arm clamp screw, rotate distributor until contacts begin to open,, tighten clamp screw, connect spark plugs as indicated on diagram (No. 1 terminal as designated).

Synchronization of Contacts. Contacts must open at the same instant. See complete article in Equipment Section. A simple method of synchronization is to block open the second set of contacts with a small piece of cardboard (the set mounted on the movable sub-plate) when the distributor is being timed. Then shift the insulator to the first set of contacts, loosen lockscrews on movable sub-plate, shift plate until second set of contacts begin to open, tighten lockscrews. Check timing by turning engine over one complete revolution (with insulator still in place in first set of contacts). The second set of contacts should open when the ignition mark on the flywheel or vibration dampener (ninth degree mark before 'D/C' mark) is directly opposite the indicator.

Intake	.004"	(hot)	
Exhaust	.004"	(hot)	Closed .....73 pounds (3 1/16")

Timing

Intake valves open 20° before top dead center. Close 65° after lower dead center.

Exhaust valves open 65° before lower dead center. Close 20° after top dead center.

STARTER:—Model DI-955. Starter drives engine through a Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 26-28 ounces. Starter is a six pole, series wound motor with a single field coil which is so shaped as to wind around three sides of each field pole. There are four main brushes (two field lead brushes and two ground brushes, each connected in parallel).

Starter Data

Toruque	R.P.M	Volts	Amperes
0 lb. ft.	3500-4000	6.0	60
27 " "	Lock	3.5	650

Starter Switch:—Model 21518. Switch is of electro-magnetic type and consists of an operating solenoid and main switch contacts mounted in a case on the starter field frame. Solenoid circuit is controlled by a starting push button on the instrument panel.

Mounting:—Starter sleeve mounted at left of engine on forward face of flywheel housing. To remove, disconnect cable and switch lead, take out large pilot mounting screw in housing directly above starter sleeve, pull starter straight forward to clear Bendix, lift out.

Oiling:—Oilless bronze bearings used. Require no attention.

GENERATOR:—Model CL-1005. Generator current regulation by third brush and Battery Charge Regulator'. To adjust generator output, take off commutator cover band, shift third brush by turning slotted adjustment screw on end plate. Turn screw clockwise to increase or counter-clockwise to decrease charging rate. See Relay-Regulator paragraph for data on Battery Charge Regulator.

Generator Data

Amperes	Volts	R.P.M.
0	6.2	480
8	7.0	680
18	8.1	1300
12	7.4	4000

Shunt field grounded through 5 ampere capacity field fuse mounted under relay-regulator cover.

Mounting:—Generator flange mounted on rear face timing chain case at right of engine. To remove, disconnect lead, take out three flange mounting capscrews, slide generator to rear to disengage drive coupling, lift out. Do not disturb intermediate flange carrying drive sprocket. Drive end bearing is in the engine. Generator can not be driven on test bench without special test bearing being used on drive end. This is Owen-Dyneto Part No. 22196.

Chain Adjustment:—To take up timing chain, loosen generator flange mounting screws, pull generator away from engine (pivoting on lower screw), tighten mounting screws. With correct adjustment chain should operate noiselessly. If chain hums adjustment is too tight and generator must be backed off slightly.

Oiling:—1000 Miles. Put 4-5 drops light engine oil in commutator end oiler. Drive end bearing is oiled from chain case.

RELAY-REGULATOR:—Model 20530. Relay cut-out and Battery Charge Regulator mounted in a case on the generator field frame. Relay contacts close at 480 R.P.M. with generator voltage of 6.2 volts and open with discharge current of 0-2 amperes. Relay contact gap .015 inch. Air gap .010 inch (contacts closed). Battery Charge Regulator consists of a fixed field resistance connected across a set of contacts controlled by an electrically operated thermostatic arm. Thermostat is set to operate with generator voltage of 8.0 volts (cold) or 7.6 volts (hot) cutting the resistance in the field circuit and reducing the output. See Equipment Section for complete data on Battery Charge Regulator.

LIGHTING:—Clum Switch Model 9170. Lighting switch mounted at lower end of steering column controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

CURRENT LIMIT RELAY:—Consists of a fixed resistance connected across 2 20 ampere fuses. Mounted on front of dash. Resistance limits current after fuses burn out with 20 ampere load.

GASOLINE GAUGE:—Electric type (see Carburetion Section).

FUEL PUMP:—Stewart-Warner mechanical fuel pump (see Carburetion Section.

HORNS:—Sparton horn mounted under engine hood.

PACKARD

STANDARD EIGHT, SERIES 901 AND 902 (1931-32)
DE LUXE EIGHT, SERIES 903 AND 904 (1931-32)
OWEN-DYNETO GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

BATTERY:—Prest-O-Lite, Type SH-6175-G (Hi-Level Type), 6 volt, 170 hour. The positive (+) terminal is grounded. Lighting capacity (5 ampere rate) is 5 amperes for 32 hours. Battery is mounted in a battery box built in the right hand dust shield.

IGNITION:—Coil Type 5025430. The ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the switch extending through to the face of the instrument panel. Ignition current is 2.75 amperes at 6 volts with engine running at 400 R.P.M., decreasing to .8 ampere at 4000 R.P.M. Current with engine stopped is 4.75 amperes at 6 volts. Ignition switch is Type No. 25472.

Distributor Type 5028025 (First 901, 2). 5028269 (First 903, 4), 5031780 (both series later cars). Two breaker, 8 lobe cam, full automatic advance type. Contacts must be synchronized so that they open at the same instant (see Timing).

Breaker Gap:—Set at .020". Hold within limits of .018-.020".

Breaker Arm Spring Tension:—18 ounces.

Cam Angles—Closed 28°. Open 17° (distributor) when synchronized.

Automatic Advance—Model 5028025

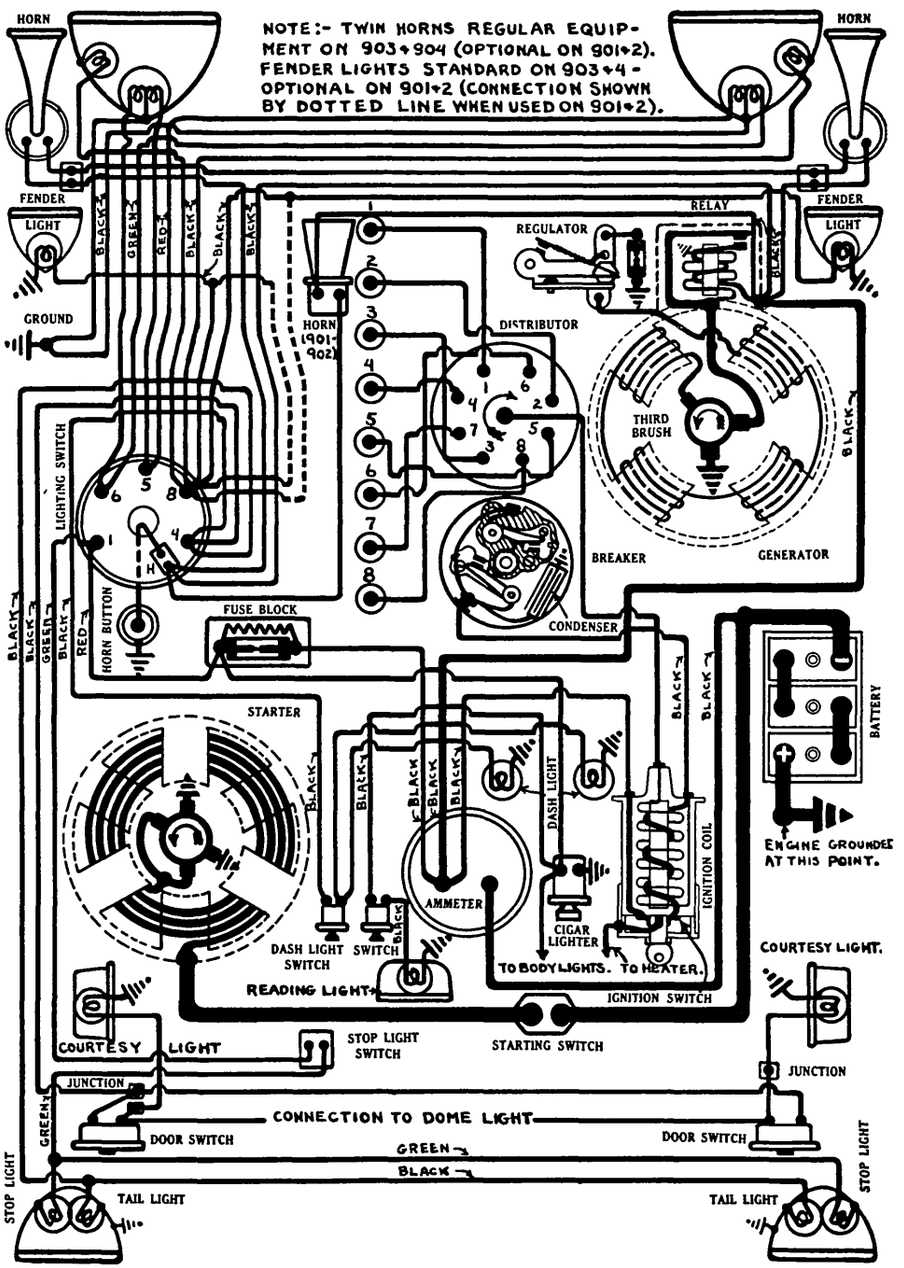
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	1.5		600
6.25		1400	12.5		2800

Automatic Advance—Model 5028269

Start		300	2		600
8.75		1500	17.5		3000

Automatic Advance—Model 5031780

Start		300	2		600
6.25		1500	12.5		3000



Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then take out two hold-down screws in the distributor mounting and lift the distributor from place.

Timing:—Engines are built with three compression ratios and each engine has a specific ignition setting. The standard engine is of medium compression while a low compression head and high compression head engine are also built. Ignition settings are as follows:

Engine Type	Ignition Setting
901, 2 Low Compression Head	12 degrees before T.D.C.
901, 2 Std. Compression Head	9 degrees before T.D.C.
901, 2 High Compression Head	4 degrees before T.D.C.
903, 4 Low Compression Head	12 degrees before T.D.C.
903, 4 Std. Compression Head	9 degrees before T.D.C.
903, 4 High Compression Head	1 degree before T.D.C.

To set ignition, crank engine over until piston No. 1 is approaching top dead center on compression stroke. Remove starter so that flywheel marks can be viewed through starter mounting hole. The flywheel is marked 'D.C.1-8' and is marked by straight lines placed one degree apart for 15 degrees before the top dead center point. Each 5 degree interval is marked by a slightly longer line. Crank engine over until the proper flywheel mark (see above table) is opposite the indicator. Then loosen advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and connect the spark plugs as indicated on the diagram.

Synchronization of Contacts. Contacts must be synchronized so as to open at the same instant. A simple method of checking synchronization is to block open the second set of contacts (mounted on movable plate) with a piece of cardboard or fibre insulator when the ignition is being set. Then shift the insulator to the first set of contacts, loosen the lock screws on the

35 "	Lock	3.5	650

Starting Switch Model 21518. Starting switch is electro-magnetic type mounted on starter field frame and controlled by starting button on instrument panel. Main starting switch contacts are operated by switch solenoid. Solenoid circuit completed through starting button.

Mounting:—Starter is sleeve mounted at the left of the engine on the forward side of the flywheel housing. To remove starter, disconnect cable and take out large pilot mounting screw in flywheel case directly above the starter sleeve. Pull starter forward to clear Bendix and lift from place.

Oiling:—Starter is equipped with oilless bronze bearings.

GENERATOR:—Model CL-1005. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field in conjunction with a 'Battery Charge Regulator'. To adjust the chairging rate, remove the commutator cover and turn the slotted adjustment screw on the end plate. This shifts the third brush through a rack and pinion engagement. Turn the adjustment screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. See Relay-Regulator paragraph and article in Equipment Section on Battery Charge Regultor.

Generator Data

Amperes	Volts	R.P.M.
0	6.2	480
8	7.0	680
18	8.1	1300
12	7.4	4000

A five ampere field fuse is mounted under the regulator cover on the generator. The shunt field is grounded through this fuse.

Mounting:—Generator is flange mounted at the right of the engine on the rear of the timing chain case. To remove generator, disconnect lead and take out three flange mounting cap screws. Then pull the generator to the rear without disturbing the intermediate flange which carries the generator bearing and drive sprocket. The drive end bearing is mounted in the engine and the generator can not be driven on the test bench unless a special test bearing is bolted in place. This is furnished by the Owen-Dyneto Corporation and is their part No. 22196. Do not attempt to crank the engine with the generator out.

Chain Adjustment:—Adjust chain whenever sideplay at inspection plug hole is ½" or greater. To adjust, loosen generator flange mounting screws, pull generator away from engine until chain sideplay at inspection hole is ¼", tighten mounting screws. With correct adjustment chain should be silent. If chain hums, back off adjustment slightly.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles of operation. The drive end bearing is oiled from the chain case.

BATTERY CHARGE REGULATOR AND RELAY:—Model 20530. The Battery Charge Regulator and relay cut-out are mounted on the generator field frame in a single case. The relay contacts close at 480 R.P.M. when the generator voltage reaches 6.4 volts and open with a discharge current of 0-2 amperes. Relay contact gap is .015 inch. Air gap should be .010 inch with contacts closed. The regulator consists of a fixed field resistance connected across the contacts of the thermostat blade. This resistance is cut in series with the shunt field when the thermostat contacts open. The thermostat is set to operate at 8.0 volts (cold), or 7.6 volts (hot). Thermostat is compensated for temperatue changes.

Note:—Battery Charge Regulator Model 21262 supersedes Model 20530. The two types are identical except that an extra terminal is provided on the Model 21262 connected to the main generator brush lead which is used when automatic starting (optional) is installed on the car.

LIGHTING:—Clum Switch Model 9170. Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Stop and backing lights	6-8	21	SC	1129

Fender lights are standard equipment on the Model 903 and 904 and optional equipment on the Model 901 and 902. A spot light is supplied on open cars.

FUSES:—Generator field fuse is 5 ampere capacity. Lighting fuse mounted on the fuse block on the dash is 20 ampere capacity.

GASOLINE GAUGE:—K-S Telegauge hydrostatic type (see Carburetion Section).

FUEL PUMP:—Stewart-Warner mechanical pump (see Carburetion Section).

HORNS:—The Model 901 and 902 is regularly equipped with one Sparton 'S.O.S.' horn. The Model 903 and 904 is equipped with twin Sparton 'Trumpets',

PACKARD

TWIN SIX SERIES 905 AND 906 (1932), SERIAL NUMBERS 900,001 UP
OWEN-DYNETO GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

CAR SERIAL NUMBER:—On plate on left front side of dash. This series 900,001 up.

ENGINE NUMBER:—On left hand cylinder block under cylinder head.

BATTERY:—**Prest-O-Lite, Type AH-6175G Special,** 6 volt, 160 ampere hour capacity (5 ampere rate). Starting capacity 170 amperes for 20 minutes. Positive (+) terminal grounded. Battery mounted in right hand front fender. Battery size, 7 inches wide, 13 inches long, 9⅝ inches high.

IGNITION:—**Coil Model CE-4001 (first cars), CE-4020—2 used.** The CE-4020 assembly consists of two coils and a Type 16-S Electrolock with the primary lead to the coils protected by armored cable. See Equipment Section for complete data on Electrolock. Ignition current—6 amperes at 6 volts (engine running), 10 amperes at 6 volts (stopped) maximum draw for both coils.

Distributor Model IGO-4001. Two breaker arm, 6 lobe cam type with full automatic advance. Contacts open alternately at 33½ and 26½ firing intervals corresponding to the engine firing intervals of 67 and 53 degrees. Cylinder blocks are set at 67 degrees angle resulting in this unequal firing interval. Contacts must be synchronized for satisfactory engine performance (see Timing). Breaker contact gap set at .020 inch. Hold within limits of.015-.020 inch. To set gap, loosen lock screws on stationary contact mounting plate, turn eccentric adjusting screw, tighten lock screws (first set mounted directly on breaker plate), or loosen lock nut on stationary contact mounting stud, turn up stud, tighten lock nut (second set mounted on moveable sub-plate).

Cam Angles—Closed 40°. Open 20° (distributor) each set independently.

		Automatic Advance			
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	0		600
3		450	6		900
6		850	12		1700
8		1400	16		2800

Mounting:—Distributor mounted at front of engine between cylinder banks. Driven from camshaft through tongue-and-slot coupling (offset so that it can be replaced only in correct position). To remove distributor, disconnect primary leads, take off distributor cap and spark plug cable conduits, take out mounting screws in mounting bracket, lift distributor out.

Oiling:—**1000 Miles.** Put few drops medium engine oil in each of two oilers on side of distributor housing. Breaker cam face oiled by wick oiler assembled on breaker plate. Check wick every 10,000 miles and replace if dry.

Timing:—Standard setting 7° (on vibration dampener at front of engine) before top dead center. To set timing, turn engine over until No. 1R piston (No. 1 of right hand bank) enters compression stroke and stop with the seventh mark from the 'UDC' reference line on the vibration dampener at the front of the engine directly opposite the timing poiner on the chain case (vibration dampener is marked '1R-UDC' at top dead center point with fifteen one-degree graduations before this point—the seventh reference line from the 'UDC' mark is the timing point). Then loosen clamp screw on distributor mounting bracket, rotate distributor until right hand breaker contacts (fixed set mounted on breaker plate) begin to open, tighten locking screw. Use a test lamp to determine opening point. The timing for the left hand bank of cylinders is set by synchronizing contacts (see next paragraph).

Synchronization of Contacts—first method as part of timing operation. After setting timing of right hand cylinder bank (above), crank engine over exactly 67 degrees to firing position of piston No. 6L (No. 6 of the left hand bank) with the seventh graduation from the '6L-UDC' reference line directly opposite the timing pointer. Then loosen lock screws on movable breaker sub-plate, turn eccentric adjusting screw until left hand contacts begin to open, tighten lock screws. Use a test lamp to determine opening point.

PACKARD

TWIN SIX SERIES 905 AND 906 (1932), SERIAL NUMBERS 900,001 UP
OWEN-DYNETO GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

Synchronization of Contacts—second method. Synchronize contacts on a rotary spark gap and adjust movable breaker plate until left hand (movable contacts open exactly 33½ degrees after fixed set, and right hand (fixed) contacts open exactly 26½ degrees after this point. This will secure the correct alternate 33½ and 26½ degree firing interval (corresponding to 67 and 53 degrees of crankshaft rotation).

Firing Order:—1R-6L-5R-2L-3R-4L-6R-1L-2R-5L-4R-3L with cylinder banks right (R) and left (L) as viewed from the driver's seat. No. 1 cylinder nearest the radiator. See diagram for connections on distributor head.

Spark Plugs:—14 MM. Metric. A.C., Type K-9. Set gaps at .025 inch. Hold within limits of .025-.030 inch.

VALVE TIMING:—Valves mounted horizontally (20° angle) in valve alley between cylinder banks and are operated by rocker arms directly from the camshaft. An automatic valve tappet takeup is used so that rocker arms bear directly on valve stem without appreciable tappet clearance in service. Camshaft is mounted directly above crankshaft and is chain driven.

To Check Valve Timing. Turn engine over until piston No. 6R is on top dead center of compression stroke. No. 1R intake valve should open at this point. Vibration dampener is marked '1R-UDC' (first set of marks) at this point; the mark should be directly opposite the pointer on the chain case.

Camshaft Setting:—Sprockets are marked. Mesh chain with sprockets turned so that marks are in line with a straightedge across the shaft centers.

	Head Diameter	Stem Diameter	Stem Length	Seat Angle	Lift
Intake	1 21/32"	.3405"	6 35/64"	45°	5/16"
Exhaust	1 21/32"	.338"	6 35/64"	45°	5/16"

Tappet Clearance	Spring Pressure
Automatic valve tappet takeup used. No clearance in service.	Closed .....55-65 pounds (2 9/32")

NOTE—See article in Mechanical Equipment Section for data on Valve Take-up.

Timing

Intake valves open at top dead center. Intake valves close 45° after lower dead center.

Exhaust valves open 35° before lower dead center. Exhaust valves close 10° after top dead center.

STARTER:—Model DN-1072. Starter drives engine through outboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 26-28 ounces. Starter is a six pole, series wound motor with a single field coil which is so shaped as to wind around three sides of each field pole. There are four main brushes, two field lead brushes and two ground brushes each connected in parallel. Starter cranks engine at 125 R.P.M.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	6.0	50
35 "	Lock	3.5	650

Starter Switch:—Model 21518. Starter switch is electro-magnetic type mounted on starter field frame and controlled by starting button on instrument panel. Main switch contacts are closed by switch solenoid controlled by the starting button.

Mounting:—Starter sleeve mounted on forward side of flywheel housing (right rear motor support) at right of engine. To remove starter, disconnect cable and switch leads or take off switch, loosen lock nut and back out large pilot mounting screw in housing directly above starter sleeve, pull starter straight forward to clear Bendix housing, lift out.

GENERATOR:—Model CL-1033. Generator current regulation is by third brush system and 'Battery Charge Regulator'. Generator output controlled by shifting third brush through rack and pinion engagement by turning slotted adjustment screw on end plate. To adjust generator output, take off commutator cover, turn adjustment screw clockwise (right hand) to increase or counter-clockwise (left hand) to decrease charging rate. Generator rotation counter-clockwise at commutator end. See Relay Regulator paragraph for details on Battery Charge Regulator operation.

Generator Data

Amperes	Volts	R.P.M.
0	6.5	600
12	7.5	1000
18	8.0	1500
9	7.5	5000

Shunt field grounded through 5 ampere field fuse mounted under relay-regulator cover.

Mounting:—Generator mounted on special sliding bracket at front of engine and driven by the fan belt. To remove, disconnect lead, loosen nuts on two studs in generator mounting slide on front face of crankcase, slide generator toward engine and slip off drive belt, take off nuts and lift generator out.

Belt Adjustment. Attach spring scale by wire looped around generator field frame at mounting slide. Loosen nuts on two mounting studs on front of mounting slide. Pull generator away from engine until scale reading is 180 pounds and tighten mounting nuts before slacking off on scale.

Oiling:—2500 Miles. Medium engine oil in oiler at each end of generator.

RELAY-REGULATOR:—Model 21732. Consists of relay cut-out and Battery Charge Regulator assembled in a single case mounted on generator field frame. Relay contacts close at 600 R.P.M. of generator with generator voltage of 6.5 volts and open with discharge current of 0-2 amperes. Relay contact gap .015 inch. Air gap .010 inch (contacts closed). Battery Charge Regulator consists of a fixed field resistance connected across a set of contacts controlled by an electrically operated thermostatic arm. Thermostat is set to operate with generator voltage of 8.0 volts (cold) or 7.6 volts (hot) cutting the resistance in the field circuit and reducing the output. Thermostat is compensated for temperature changes. See Equipment Section for complete details on construction and adjustment of Battery Charge Regulator.

NOTE:—Extra terminal on Battery Charge Regulator is used only when Automatic Starting (optional equipment) is installed. See article in Owen-Dyneto Automatic Starting in Equipment Section.

LIGHTING:—Clum Switch, Model 9170. Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Fender Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Lights	6-8	21	S.C.	1129
Dome Lights	6-8	6	S.C.	81

CURRENT LIMIT RELAY:—Consists of a fixed resistance connected across two 20 ampere capacity fuses on fuse block on front of dash. Resistance limits current after fuse burns out with 20 ampere load.

FUSES:—Generator field fuse mounted under plug in Battery Charge Regulator case is 5 ampere capacity. Lighting fuses on block on dash are 20 ampere capacity.

GASOLINE GAUGE:—Motometer electric combination gasoline and oil level gauge (see Carburetion Section).

FUEL PUMP:—Stewart-Warner mechanical fuel pump mounted at right front of crankcase (see Carburetion Section).

PACKARD

EIGHT MODEL 1001, 1002 (1933)
OWEN-DYNETO GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

CAR SERIAL NUMBER:—On plate on left hand front side of dash.

ENGINE NUMBER:—On top of left hand front motor support arm.

ENGINE:—Eight cylinder, 'L' head type, 3 3/16x5" bore and stroke, 320 cubic inch displacement, rated at 32.5 H.P., develops 120 H.P. at 3200 R.P.M. Standard compression ratio 6.0-1. Standard compression pressure 95-100 pounds at 125 R.P.M. Optional high compression ratio 6.36-1. Optional low compression ratio 5.0-1. A distinct ignition setting is used for each compression ratio (see Timing). Standard compression engines are not marked. High compression heads are marked 'H.C.' and low compression heads are marked 'L.C.'.

BATTERY:—Prest-O-Lite, Type A-619-ST, 6 volt, 19 plate, 144 ampere hour capacity (5 ampere rate). Starting capacity 170 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to frame.
Mounting:—On left hand side of frame under drivers' seat.
Dimensions:—Width, 7". Length, 12 15/16". Height, 9 3/16.

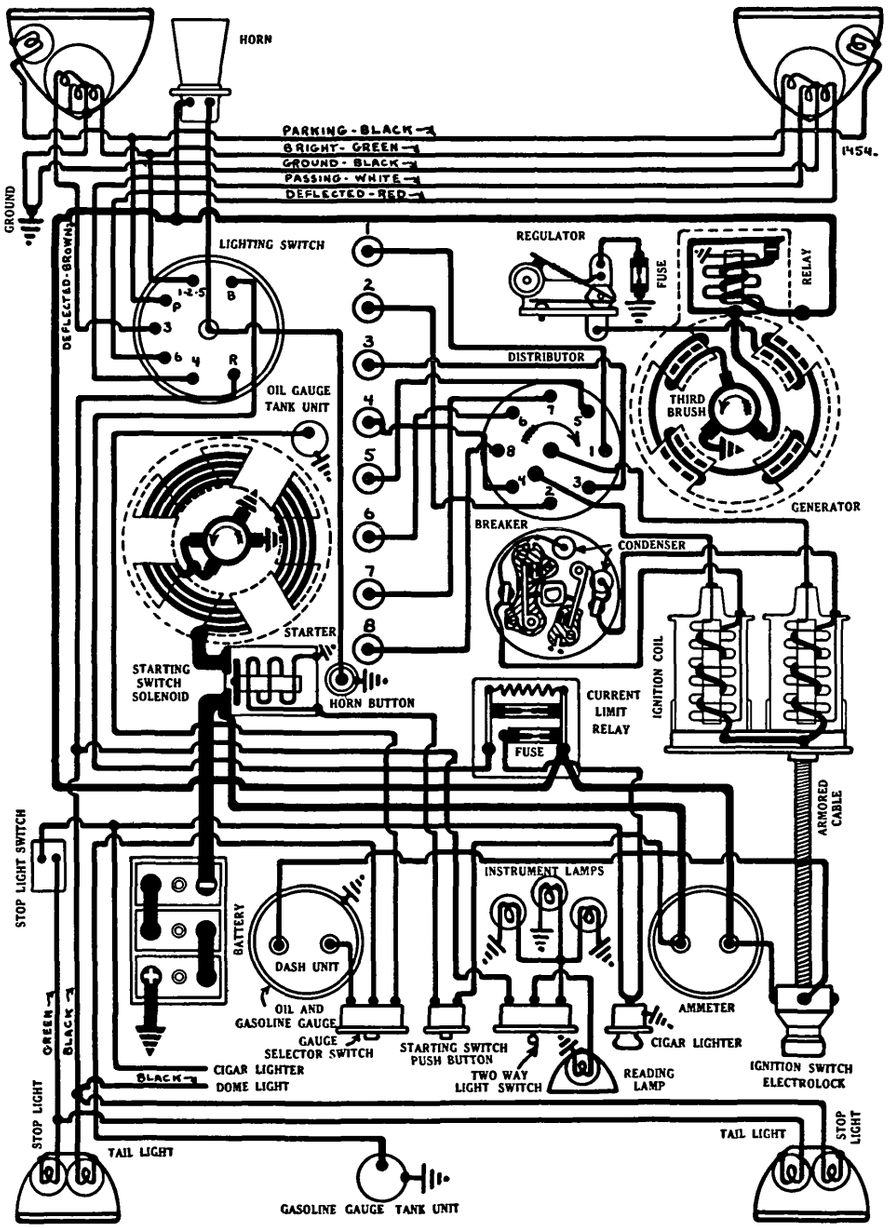
IGNITION:—Coil Type 5033449. Two coils are assembled as unit with ignition switch with an armored cable on the primary lead. Coils mounted on the cylinder head at left of distributor.
Ignition Current:—1.3 amperes at 6 volts (engine running), 5 amperes at 6 volts (engine stopped) for each coil.
Ignition Switch:—Electrolock, Type 16-S. Switch is assembled as a unit with the coils (see Equipment Section for complete data).

Distributor Type 5033450. Double breaker, 4-lobe cam, full automatic advance type. Contacts separate alternately at 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized (see Timing). Each set of contacts controls one coil and fires the spark plugs in four cylinders.
Breaker Gap:—Set contact gap .020". Hold within limits of .018-.022".
Breaker Arm Spring Tension:—15-19 ounces.

Cam Angles—Closed 44°. Open 46° (distributor) each set independently.

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	1.5		600
9.75		1200	19.5		2400



Mounting:—Distributor mounted on right hand side of cylinder head. To remove, disconnect primary leads, take off distributor cap, take out hold-down screw in advance plate, lift out.

Oiling:—1000 Miles. Turn down grease cup under distributor cup one turn. Keep cup filled with No. 3 cup grease. Take off distributor cap and rotor, put one drop of oil on breaker arm pivot pins, oil cam felt oiler on breaker plate.

IGNITION TIMING:—Standard setting for each compression ratio as follows:
Low Compression—14° (flywheel), .0912" (piston) before top dead center.
Std. Compression— 9° (flywheel), .0379" (piston) before top dead center.
High Compression— 7° (flywheel), .0229" (piston) before top dead center.

To Set Ignition Timing:—Vibration dampener at front of engine is marked 'D.C-1-8' at top dead center point for piston No. 1 and has fifteen one-degree marks before the dead center mark. To set timing, crank engine over by hand with No. 1 piston on compression stroke until piston reaches firing position with the proper mark on the vibration dampener directly under the pointer on the chain case (this will be the fourteenth, ninth or seventh line before the top dead center mark, depending upon the compression ratio of the engine). Then loosen advance arm clamp bolt, rotate distributor until first or 'fixed' set of contacts begin to open, tighten clamp bolt. The second or 'movable' set of contacts are timed by synchronizing the contacts—see below:

Synchronization of Contacts:—After distributor has been timed to engine (above), turn crankshaft 90° or ¼ revolution to firing position of piston No. 6 and stop with correct line on the vibration dampener at the front of the engine under the pointer on the chain case (the dampener is marked for top dead center of piston No. 6 and has the usual 1-degree reference marks before this point, the correct ignition marks being the fourteenth,

PACKARD

EIGHT MODEL 1001, 1002 (1933)
OWEN-DYNETO GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

ninth or seventh line before the dead center point). Then loosen lock screws on movable breaker sub-plate (carrying the second set of contacts), shift plate by inserting a screwdriver in the slot in the edge of the plate until contacts begin to open, tighten lock screws. The first or 'fixed' set of contacts will open again 90° or ¼ revolution after this point.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator. See diagram for correct connection of spark plug cables.

Spark Plugs:—14 MM. Metric. A.C. Type K-7. Set gaps at .025".

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is chain driven from the crankshaft in tandem with the generator. Chain is adjusted manually by shifting the generator (see Generator Mounting). Sprockets are marked. Chain should be meshed with sprockets turned so that marks are adjacent and in line with a straightedge laid across the shaft centers.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 21/32"	.3405"	7⅜"	45°	.358"
Exhaust	1 15/32"	.3405"	7⅜"	45°	.358"

Tappet Clearance		Valve Springs	
Intake	.004" (hot).	Closed	73 pounds—3 1/16".
Exhaust	.004" (hot).	(Total for both springs.)	

Timing

Intake Valves	Exhaust Valves
Open—30° before top dead center.	Open—65° before lower dead center.
Close—65° after lower dead center.	Close—30° after top dead center.

CARBURETION:—Stromberg Duplex Downdraft Carburetor, Model EE-22 (see Carburetor Section for complete data). Stromberg automatic choke is standard equipment.

Air Cleaner:—A.C. oil-wetted wire mesh type. Remove complete unit at 2500-mile intervals, clean wire mesh by dipping in pan of gasoline, dry thoroughly, re-oil by dipping in engine oil, drain before reassembling.

Fuel Pump:—A.C. Mechanical type combination fuel and vacuum pump (see Carburetion Section for complete data). Remove glass sediment bowl under pump when necessary, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—Motometer electric combination gasoline and oil gauge (see Carburetion Section).

STARTER:—Model DI-1034. Starter drive—Outboard Bendix. Rotation counter-clockwise at commutator end. Brush spring tension 26-28 ounces. Starter is a six-pole series wound motor with a single field coil so constructed that it winds around three sides of each field pole. There are four main brushes, two field lead brushes and two ground brushes, each connected in parallel.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3500-4000	6.0	60
27 "	Lock	3.5	650

Starter Switch:—Model 21518. Electro-magnetic type mounted on starter field frame and controlled by button on instrument panel. Main switch contacts are closed by switch solenoid, which is controlled by starting button.

Mounting:—Sleeve mounted on left hand forward face of flywheel housing. To remove, disconnect cable and switch leads or take off switch, back off lock nut and take out large pilot mounting screw on housing directly above starter sleeve. Pull starter forward to clear Bendix housing, lift out.

Oiling:—Starter bearings are oilless and require no attention.

GENERATOR:—Model CL-1005. Third brush regulation in conjunction with Battery Charge Regulator (see Equipment Section for complete data on Regulator). Rotation counter-clockwise at commutator end. Maximum charging rate is 18 amperes (cold) at 8.1 volts reached at 1300 R.P.M.

Charging Rate Adjustment. Third brush shifted through rack-and-pinion control by slotted adjusting screw on endplate. To adjust, take off commutator cover, turn adjusting screw to right or clockwise to increase, or to left or counter-clockwise to decrease charging rate.

Generator Data

Amperes	Volts	R.P.M.
0	6.2	480
8	7.0	680
18	8.1	1300
12	7.4	4000

Field Fuse:—3 ampere capacity in plug in regulator cover.

Mounting:—Flange mounted on right hand rear face of timing chain case. To remove, disconnect lead, take out three flange mounting cap screws, slide generator to rear to disengage drive coupling, lift out. Do not disturb intermediate flange carrying drive sprocket and generator drive end bearing. Generator cannot be driven on a test bench without a special bearing being used on the drive end.

Chain Adjustment. To take up timing chain, loosen generator flange mounting screws, pull generator away from engine, tighten mounting screws. There is a plug on the top of the chain case which can be removed to inspect timing chain adjustment. With correct adjustment chain should run noiselessly. If chain hums, adjustment is too tight and generator should be backed off slightly.

Oiling:—500 Miles. Few drops light engine oil in commutator end oiler. Drive end bearing is oiled from the chain case.

RELAY-REGULATOR:—Model 21262. Consists of cut-out relay and Battery Charge Regulator mounted on generator field frame. Relay contacts close at 480 R.P.M. with generator voltage of 6.2 volts and open with 0-2 ampere discharge current.

Contact Gap:—.015". **Air Gap:**—.010" with contacts closed.

Battery Charge Regulator is set to operate with generator voltage of 8.0 volts (cold) or 7.6 volts (hot) and reduces charging rate approximately one half by cutting resistance in field circuit (see Equipment Section for complete data on Regulator).

LIGHTING:—Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Lighting system employs new type triple filament bulbs and switch has special 'passing' position in addition to regular driving and 'depressed beam' positions.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32-32	Triple	3003
Fender Lights	6-8	3	S.C.	63
Instrument and Tail Lights	6-8	3	S.C.	63
Stop Lights	6-8	15	S.C.	87
Dome Light	6-8	6	S.C.	81
Body Lights	6-8	3	S.C.	63

FUSES:—Lighting fuses mounted on block on dash are 20 ampere capacity. Generator field fuse mounted in plug on regulator cover is 3 ampere capacity.

CURRENT LIMIT RELAY:—Mounted on dash. Consists of a fixed resistance connected across a 20 ampere fuse. Resistance limits current when fuse burns out with 20 ampere current load.

PACKARD

SUPER-EIGHT MODELS 1003, 1004 (1933)
OWEN-DYNETO GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

CAR SERIAL NUMBER:—On plate on left hand front side of dash.

ENGINE NUMBER:—On top of left hand front motor support arm.

ENGINE:—Eight cylinder, 'L' head type, 3½x5" bore and stroke, 384.8 cubic inch displacement, rated at 39.2 H.P., develops 145 H.P. at 3200 R.P.M. Standard compression ratio 6.0-1. Standard compression pressure 95-100 pounds at 125 R.P.M. Optional high compression ratio 6.38-1. Optional low compression ratio 5.0-1. A different ignition setting is used for each compression ratio (see Timing). Standard compression engines are not marked. High compression heads are marked 'H.C.' and low compression heads are marked 'L.C.' for identification.

BATTERY:—**Prest-O-Lite, Type A-619-ST,** 6 volt, 19 plate, 144 ampere hour capacity (5 ampere rate). Starting capacity 173 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to frame.
Mounting:—On left hand side of frame under driver's seat.
Dimensions:—Width, 7". Length, 13". Height, 9 3/16".

IGNITION:—**Coil Type 5033449.** Two coils are assembled as unit with ignition switch with an armored cable on the primary lead. Coils mounted on the cylinder head at the left of the distributor.

TWELVE CYLINDER MODELS 1005, 1006 (1933)
OWEN-DYNETO GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

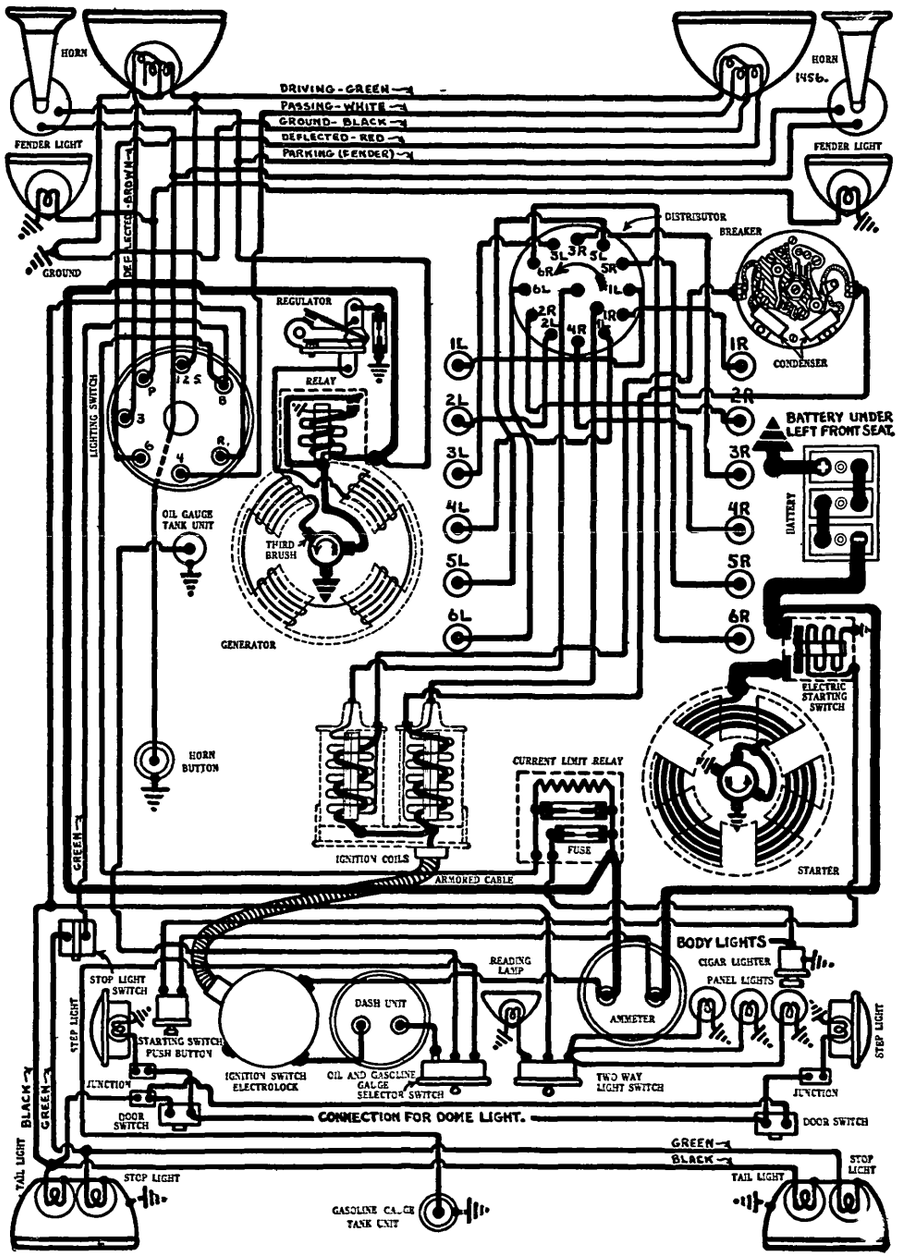
CAR SERIAL NUMBER:—On plate on left hand front side of dash.

ENGINE NUMBER:—On left hand cylinder block under cylinder head.

ENGINE:—Twelve cylinder 67 degree 'V', modified 'L' head type, 3 7/16x4" bore and stroke, 445.5 cubic inch displacement, rated 56.7 H.P., develops 160 H.P. at 3200 R.P.M. Standard compression ratio 6.0-1. Standard compression pressure 95-100 pounds at 125 R.P.M. Optional compression ratios are not offered.

BATTERY:—Prest-O-Lite, Type A-619-ST, 6 volt, 19 plate, 144 ampere hour capacity (5 ampere rate). Starting capacity 170 amperes for 20 minutes.
Grounded Terminal:—Positive(+) terminal grounded to frame.
Mounting:—In cradle on left hand frame side rail under driver's seat.
Dimensions:—Width, 7". Length, 12 15/16". Height, 9 3/16".

IGNITION:—Coil Model CE-4020, 4021 (2 coil assembly). Coils assembled as a unit with the ignition switch with an armored cable on the primary lead. Coils are mounted on the dash.
Ignition Current:—6 amperes at 6 volts (engine running), 10 amperes at 6 volts (engine stopped), maximum draw for both coils.
Ignition Switch:—Electrolock, Type 15-S. Switch is assembled as unit with coils (see Equipment Section for complete data).
Distributor Model IGO-4001, A. Double breaker, 6 lobe cam, full automatic advance type. Contacts open alternately at 33½ and 26½ degree intervals corresponding to the alternate unequal 67 and 53 degree firing intervals of the engine. Contacts must be synchronized to maintain this firing interval (see Timing).
Breaker Gap:—Set contact gap at .020". Hold within limits of .015-.020".
Breaker Arm Spring Tension:—20 ounces measured at tip of breaker arm.
Cam Angles—Closed 40°. Open 20° (distributor) each set independently.



Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	0		600
3		450	6		900
6		850	12		1700
8		1400	16		2800

Mounting:—Distributor mounted at front of engine between cylinder banks and is driven through offset tongue-and-slot coupling from the camshaft. To remove, disconnect primary leads, take off distributor cap and spark plug cable conduits, take out screws in mounting bracket, lift out.

Oiling:—1000 Miles. Put a few drops of medium engine oil in each of two oilers on side of distributor. Breaker cam surface is oiled by wick oiler on breaker plate. This wick should be checked at 10,000-mile intervals and replaced if found to be dry.

IGNITION TIMING:—Standard Setting 7° (flywheel) or .0155" (piston travel) before top dead center.
To Set Ignition Timing. Turn engine over with No. 1R piston (No. 1 of right hand bank) on compression stroke and stop when the seventh line before the top dead center mark '1R-UDC' on the vibration dampener at the front of the engine is directly under the pointer on the chain case. Vibration dampener is marked '1R-U.D.C.' at the top dead center point with fifteen one-degree marks before this point—the seventh line or 7° mark is the ignition mark. Then loosen clamp screw on distributor mounting bracket, rotate distributor until right hand or 'fixed' contacts begin to open, tighten clamping screw. Timing of left hand or 'movable' contacts (mounted on sub-plate) which fire spark plugs in left hand block is secured by synchronizing contacts.
Synchronization of Contacts—first method. After setting timing of fixed contacts firing plugs in right hand block (above), crank engine exactly 67

PACKARD

TWELVE CYLINDER MODELS 1005, 1006 (1933)
OWEN-DYNETO GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

to firing position of No. 6L piston (No. 6 of the left hand block) with the seventh graduation before the top dead center mark '6L-UDC' directly under the pointer on the chain case. Then loosen lock screws on movable sub-plate, turn eccentric adjusting screw until contacts begin to open, tighten lock screws, check contact gap.

Synchronization of Contacts—second method. Synchronize contacts on a rotary spark gap and shift movable sub-plate until left hand (movable) contacts open exactly 33½ degrees after right hand (fixed) contacts, and right hand contacts open again exactly 26½ degrees after this point. This will secure the correct unequal alternate firing intervals of 37½ and 26½ degrees, corresponding to 67 and 53 degrees of crankshaft rotation.

Firing Order:—1R-6L-5R-2L-3R-4L-6R-1L-2R-5L-4R-3L with cylinder banks right (R) and left (L) as viewed from driver's seat. No. 1 cylinder in each bank nearest radiator (see diagram for Spark Plug Connections).

Spark Plugs:—14 MM. Metric. A.C. Type K-7. Set plug gaps at .025 inch.

VALVE TIMING:—Camshaft Setting. Camshaft mounted directly above crankshaft between cylinder banks and is chain driven from the crankshaft. Valves are mounted horizontally in valve alley between cylinder banks and are operated by rocker arm directly from the camshaft. An automatic valve tappet clearance take-up is used and rocker arms bear directly on valve stems with no appreciable tappet clearance in service. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

To Check Valve Timing. Turn engine over until piston No. 6R is on top dead center entering power stroke with 'IR-UDC' mark on vibration dampener directly under pointer on chain case. No. 1R intake valve should begin to open at this point.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 21/32"	.3405"	6 35/64"	45°	5/16"
Exhaust	1 21/32"	.338"	6 35/64"	45°	5/16"

Tappet Clearance	Valve Springs
Automatic tappet clearance take-up used. No clearance in service.	Closed—70 pounds—2 7/32".

NOTE—See article in Mechanical Equipment Section for data on Valve Take-up.

Intake Valves	Timing	Exhaust Valves
Open—At top dead center.		Open 35° before lower dead center.
Close—45° after lower dead center.		Close—10° after top dead center.

CARBURETION:—Stromberg Downdraft Dual Carburetor, Model EE-3 (see Carburetor Section for complete data). Stromberg Automatic Choke is standard.

Fuel Pump:—A.C. combination fuel and vacuum pump (see Carburetion Section for complete data). Remove glass sediment bowl under pump when necessary, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—Motometer Electric combination gasoline and oil gauge (see Carburetion Section for complete data).

STARTER:—Model DN-1072. Starter drive—Outboard Bendix. Rotation counter-clockwise at commutator end. Brush spring tension 26-28 ounces. Starter is six-pole series wound motor with a single field coil so shaped that it winds around three sides of each field pole. There are four main brushes, two field lead brushes and two ground brushes each, connected in parallel. Starter cranks engine at 125 R.P.M.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	6.0	50
35 "	Lock	3.5	650

Starter Switch:—Model 21676. Electro-magnetic type mounted on starter field frame and controlled by starting button on instrument panel. Main switch contacts are closed by switch solenoid which is controlled by starting button.

Mounting:—Sleeve mounted in right hand front face of flywheel housing. To remove, disconnect cable and switch leads or take off switch, loosen lock nut and back out large pilot mounting screw in housing directly above starter sleeve, pull starter forward to clear Bendix housing, lift out.

GENERATOR:—Model CO-1119. Third brush regulation in conjunction with Battery Charge Regulator (see Equipment Section for complete data on Regulator). Rotation counter-clockwise at commutator end. Maximum charging rate 24 amperes (cold) at 8.0 volts reached at 1500 R.P.M.

Charging Rate Adjustment. Third brush shifted through rack-and-pinion control by slotted adjusting screw on endplate. To adjust charging rate, take off commutator cover, turn adjusting screw to right or clockwise to increase charging rate and to left or counter-clockwise to decrease charging rate.

Generator Data

Amperes	Volts	R.P.M.
0	6.5	475
20	7.5	1000
24	8.0	1500
13	8.0	5000

Field Fuse:—3 ampere capacity in plug in Regulator cover.

Mounting:—Generator mounted on sliding bracket at left front of engine and driven by the fan belt. To remove, disconnect lead, loosen nuts on two studs in generator mounting slide, slide generator toward engine and slip off drive belt, take off nuts and lift generator out.

Belt Adjustment. Attach spring scale by wire looped over generator frame at mounting slide. Loosen nuts on mounting studs, pull generator away from engine until scale reading is 180 pounds, tighten mounting nuts.

Oiling:—500 Miles. Few drops light engine oil in oiler at each end.

RELAY-REGULATOR:—Model 21262. Consists of relay cut-out and Battery Charge Regulator mounted in case on generator field frame. Relay contacts close at 475 R.P.M. with generator voltage of 6.5 volts and open with discharge current of 0-2 amperes.

Contact Gap:—.015". **Air Gap:**—.010" (contacts closed).

Battery Charge Regulator set to operate with generator voltage of 8.0 volts (cold) or 7.6 volts (hot) reducing charging rate approximately one-half. Regulator is compensated for temperature changes (see Equipment Section for complete data).

LIGHTING:—Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Lighting system employs new type triple filament bulbs and has third switch position for passing in addition to regular driving and depressed beam positions.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32-32	Triple	3003
Fender Lights	6-8	3	S.C.	63
Instrument and Tail Lights	6-8	3	S.C.	63
Stop Lights	6-8	15	S.C.	87
Dome Light	6-8	6	S.C.	81
Body Lights	6-8	3	S.C.	63

FUSES:—Lighting fuses mounted on Current Limit Relay are 20 ampere capacity. Generator field fuse in plug on regulator case is 3 ampere capacity.

CURRENT LIMIT RELAY:—Mounted on dash. Consists of a fixed resistance connected across a 20 ampere fuse. Resistance limits current after fuse burns out with 20 ampere current.

SERIAL NUMBER:—First number 374,001. On plate on left hand front side of dash.

COMPRESSION:—**Ratio**—6.0-1 std. head. 6.36-1 optl. **Pressure**—(std) 95-100 lbs., (optl.) 123 lbs., at 125 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model 5033449.** Two coil unit assembled with ignition switch.

Ignition Current—1.3 amperes running, 5 stopped (each coil).

Ignition Switch—Delco-Remy Model 430-F. K.

Distributor Model 5033450. Two breaker, 4 lobe cam, full automatic advance type. Contacts open alternately at regular 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized—see Timing. Each set of contacts controls one coil and fires spark plugs in four cylinders.

Breaker Gap—Set gap at .020". Limits, .018-.022".
Breaker Arm Spring Tension—15-19 ounces.
Cam Angles (Distributor Degrees) — Closed 45°. Open 45°. Each set of contacts operates independently and controls one ignition coil.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	1.5	600
9.75	1200	19.5	2400

IGNITION TIMING:— Flywheel Degs. Piston Position
Std. (6-1) Engines.....6° BTDC.....0168" BTDC
H.C. (6.36-1) Engines..4° BTDC.....0075" BTDC
Timing (Stationary Contacts), all engines:—Vibration dampener at front of engine marked 'D.C.-1-8' at top dead center point for piston #1 and has 15 one-degree graduations before this point. To set timing with #1 piston on compression, turn engine over until pistion reaches firing position with correct mark on vibration dampener in line with pointer on chain case cover (sixth mark standard engines, fourth mark H.C. engines). Loosen advance arm clamp bolt, rotate distributor until first or stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt. Second or movable set of contacts should then be timed by synchronizing distributor.

Synchromization (Movable Contacts):—After timing distributor (above), turn engine over 90° or ¼ revolution to firing position for piston #6, stop with correct line on vibration dampener at front of engine lined up with pointer (sixth line standard engines, fourth line H.C. engine before dead center mark for piston #6). Loosen lockscrew on movable plate carrying second set of contacts, shift plate by inserting screwdriver in slot and prying on plate until contacts begin to open, tighten lockscrew.

Synchronization, second method:—If distributor is synchronized on rotary spark gap or other test equipment, set firing intervals at regular 45-45-45 (distributor degrees).

Motor Gauge—Weidenhoff Adapter #114, Rod #5.

Firing Order:—1-6-2-5-8-3-7-4. Spark plug cables not connected in this order on distributor. See diagram.

Spark Plugs:—AC. Type K-7. 14 MM. Metric Type.

Spark Plug Gaps—.025" (all engines).

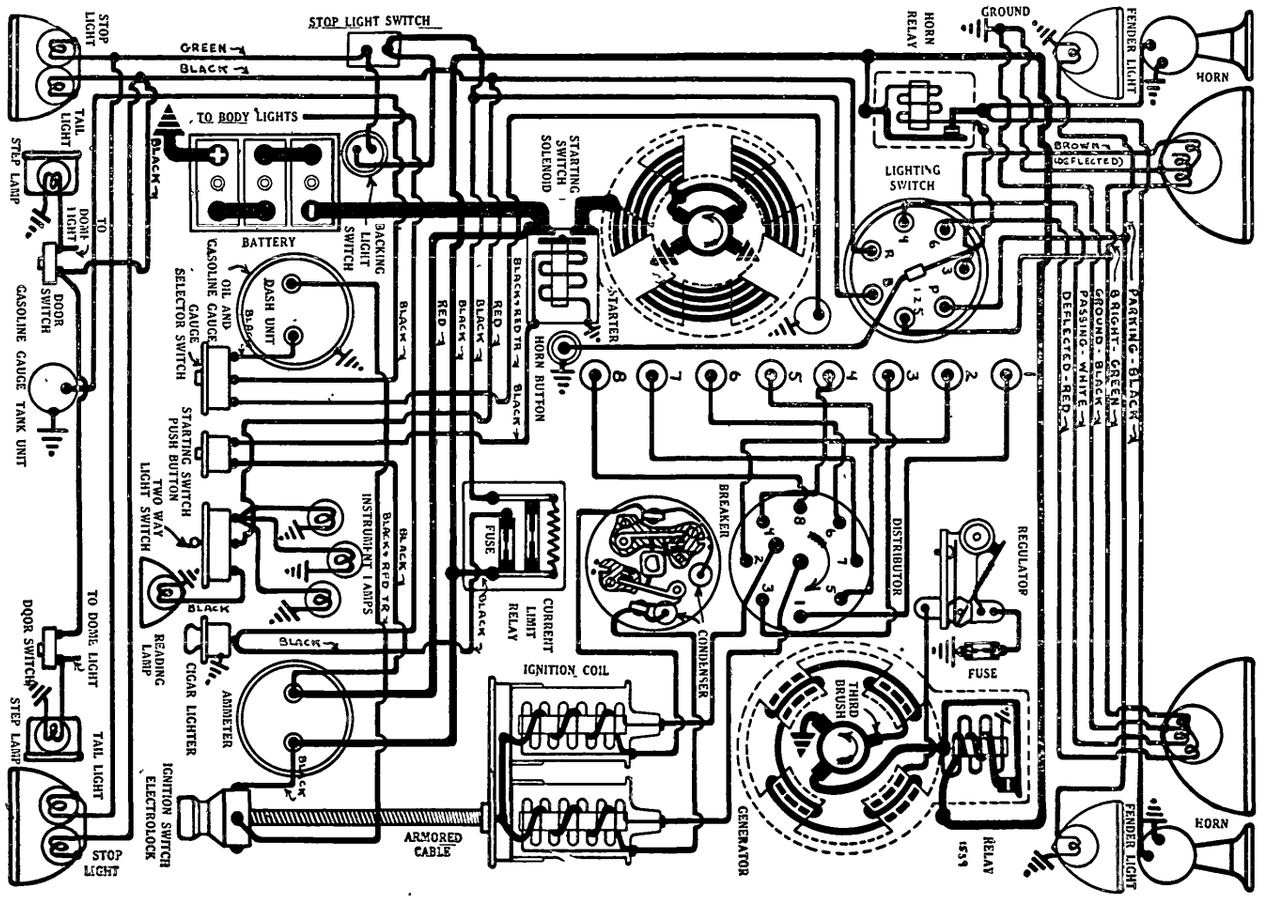
CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg Model EE-22, 1 15/16" dual, downdraft type.

Automatic Choke—Stromberg.

Fuel Pump:—AC, Type F combination fuel and vacuum pump.

Gasoline Gauge:—Motometer Electric type combination gasoline and oil gauge. Oil reading secured by pressing button of selector switch.



VALVE TIMING:—**To Check Timing**—Check tappet clearance #1 intake valve. This valve should open with piston 30° or .4070" before top dead center when flywheel mark 'INT' (visible through starter mounting hole in flywheel housing with starter removed) lines up with indicator on housing within case.

Motor Gauge—Weidenhoff Adapter #114, Rod #5.

Tappet Clearance:—.004" Int., .006" Exh., engine warm.

Valve Spring Pressure:—73 lbs. at 3 1/16" (valve closed).

LUBRICATION:—**Crankcase Capacity**—8 quarts.
Normal Oil Pressure—35 pounds.

BATTERY:—Prest-O-Lite, Type 619-ST. 6 volt, 19 plate, 144 A.H. capacity (5 ampere rate).

Starting Capacity—170 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under left front seat.

STARTER:—Model DI-1034, DI-1161. Armature No. 13292.

Starter Drive—Outboard Bendix.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—56-60 ounces.

Cranking Engine—125 R.P.M., 125-150 amps., 5.5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4500	6.0	60
5 "	1010	5.5	200
9.4 "	650	4.8	300
14.2 "	410	4.5	400
19.3 "	220	4.2	500
24.0 "	100	3.8	600
29.2 "	Lock	3.6	730

Starting Switch, Model 21518. Electro-magnetic (solenoid) type mounted on starter field frame and controlled by pushbutton on instrument panel.

Startix Type 'F'—Optional. See article in Electrical Equipment Section for complete data on Startix, Circuit Controller and special Owen-Dyneto 40203 Cutout Relay which must be installed when Startix used.

Mounting:—Sleeve mounted in flywheel housing left hand front side. To remove, take out pilot mounting screw in flywheel housing.

GENERATOR:—Model CO-1177. Armature No. 23661. Third brush control used in conjunction with Battery Charge Regulator. See Equipment Section for complete data on Regulator.

Charging Rate Adjustment—Third brush shifted through rack-and-pinion control by slotted adjusting screw on endplate. To adjust, take off commutator end cover, turn adjusting screw to right or clockwise to increase, or left or counter-clockwise to decrease charging rate.

Performance Data

Amperes	Volts	R.P.M.
0	6.5	475
20	7.5	1000
24	8.0	1400
13	8.0	5000

Field Fuse—3 ampere capacity (in plug in regulator case).

Mounting:—Flange mounted on right hand rear face of timing chain case. To remove, take out three mounting screws, slide generator to rear to disengage drive coupling, lift out. Do not disturb intermediate flange carrying drive sprocket.

Chain Adjustment — Loosen generator flange mounting screws, pull generator away from engine until chain sideplay as measured at chain inspection plug hole in top of chain case cover is ¼", tighten mounting screws. Adjust chain whenever sideplay exceeds ½".

RELAY-REGULATOR:—Model 21262. Mounted on generator field frame. Consists of Cut-out Relay and Battery Charge Regulator.

Cut-out Relay

Cuts in—6.5 volts or 475 R.P.M.
Cuts out—0-2 ampere discharge current.
Relay Contact Gap—.015".
Air Gap—.010" (contacts closed).

Battery Charge Regulator

Set to operate at 8.0 volts (cold), 7.6 volts (hot). Reduces charging rate approximately ½ by cutting in a field resistance unit. See Equipment Section for complete data.

LIGHTING:—R.B.M. Lighting Switch. Switch mounted at lower end of steering column and controlled by lever on steering wheel. Switch has special passing position providing assymmetrical passing beam. Headlight bulbs are special triple filament type.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-32-32	3003
Parking, Instrument, Tail	3	63
Stop light	15	87
Body Lights	6	81

FUSES:—Lighting—20 ampere capacity on block on dash. A resistor is connected across the lighting fuse to limit current load after fuse blows out
Generator Field—3 ampere in plug in regulator case.

HORNS:—Sparton twin horns. Horns operated by horn relay.

SERIAL NUMBER:—First number, 752001. On plate on left hand front side of dash.

COMPRESSION:—**Ratio**—6.0-1 Std. head. 6.38-1 optl. **Pressure**—(std) 95-100 lbs., (optl.) 123 lbs., at 125 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model 5033449.** Two coil unit assembled with ignition switch.
Ignition Current—1.3 amperes running, 5 stopped (each coil).
Ignition Switch—Delco-Remy Model 430-F, K. See article in Electrical Equipment Section for complete data.

Distributor Model 5033450. Two breaker, 4 lobe cam, full automatic advance type. Contacts open alternately at regular 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized—see Timing. Each set of contacts controls one coil and fires spark plugs in four cylinders.
Breaker Gap—Set gap at .020". Limits, .018-.022".
Breaker Arm Spring Tension—15-19 ounces.
Cam Angles (Distributor Degrees) — Closed 45°. Open 45°. Each set of contacts operates independently and controls one ignition coil.

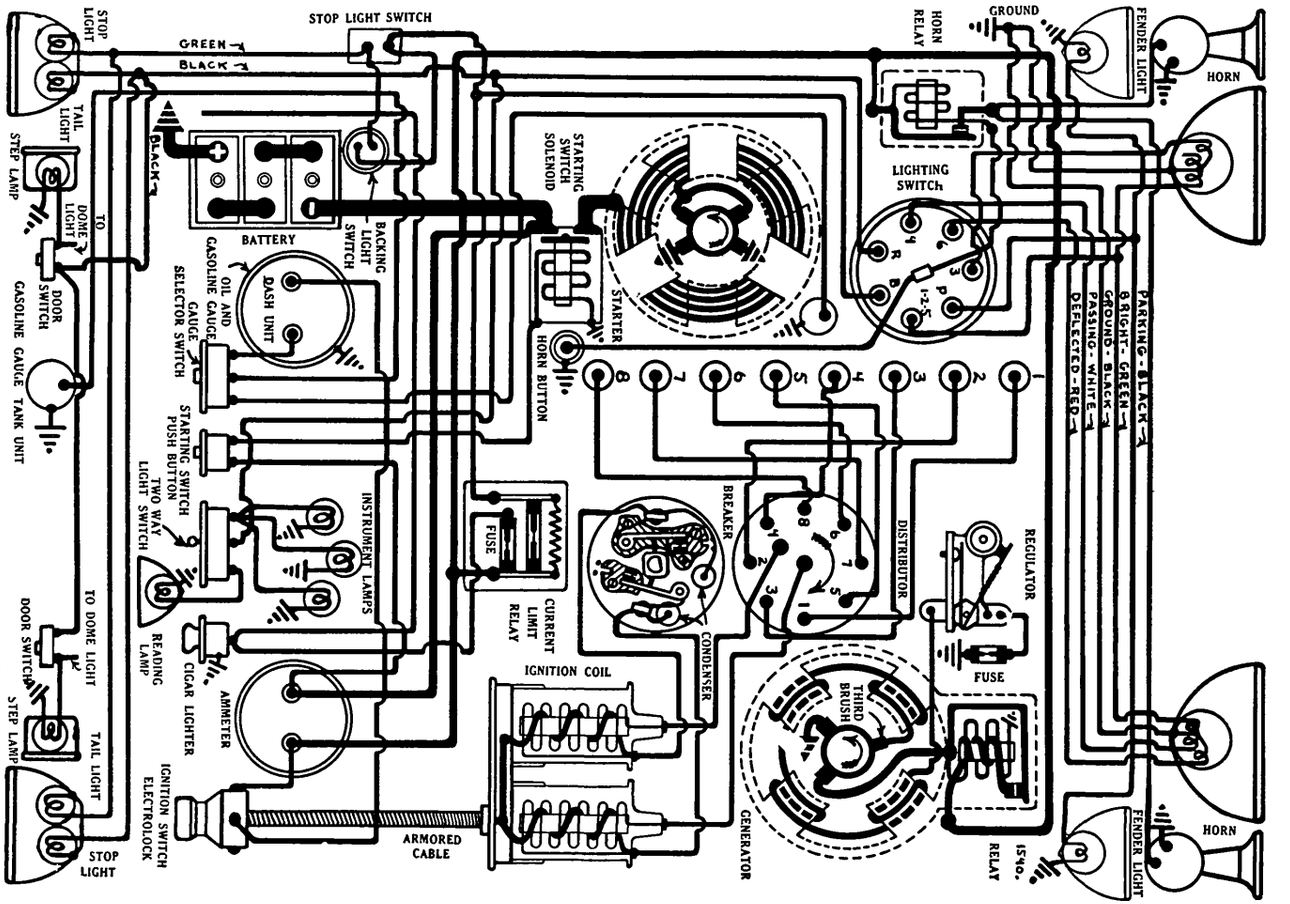
Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	1.5	600
9.75	1200	19.5	2400

IGNITION TIMING:— Flywheel Degs. Piston Position
Std. (6-1) Engines.....6° BTDC.....0168" BTDC
H.C. (6.38-1) Engines..4° BTDC.....0075" BTDC

Timing (Stationary Contacts), all engines:—Vibration dampener at front of engine marked 'D.C.-1-8' at top dead center point for piston #1 and has 15 one-degree graduations before this point. To set timing with #1 piston on compression stroke, turn engine over until piston reaches firing position, stop when sixth graduation (standard engines), fourth graduation (H.C. engine before top dead center mark lines up with pointer on chain case cover. Loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt. Second or movable set of contacts timed by synchronizing distributor.

Synchronization (Movable Contacts):—After timing distributor (above), turn engine over 90° or ¼ revolution to firing position for piston #6, stop when sixth graduation (standard engine), fourth graduation (H.C. engine) before top dead center mark for piston #6 lines up with pointer, loosen lockscrews on movable sub-plate (carrying second set of contacts), shift plate by inserting screwdriver in slot and prying on plate until contacts begin to open, tighten lockscrews.



Synchronization, second method:—If distributor is synchronized on rotary spark gap or other test equipment, set firing intervals at regular 45-45-45 (distributor degrees).

Motor Gauge—Weidenhoff Adapter #114, Rod #5.

Firing Order:—1-6-2-5-8-3-7-4. Spark plug cables not connected in this order on distributor. See diagram.

Spark Plugs:—AC. Type K-7. 14 MM. Metric Type.
Spark Plug Gaps—.025" (all engines).

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.
Carburetor:—Stromberg Model EE-22, 2 1/16" dual downdraft type.
Automatic Choke—Stromberg.
Fuel Pump:—AC, Type F combination fuel and vacuum pump.
Gasoline Gauge:—Motometer Electric type combination gasoline and oil gauge. Press selector switch button for oil reading.

VALVE TIMING:—To Check Timing—Check tappet clearance #1 intake valve. This valve should open with piston 30° or .4070" before top dead center when flywheel mark 'INT' (visible through starter mounting hole in flywheel housing with starter removed) lines up with indicator on housing within case.

Motor Gauge—Weidenhoff Adapter #114, Rod #5.

Tappet Clearance:—.004" Int., .006" Exh., engine warm.

Valve Spring Pressure:—73 lbs. at 3 1/16" (valve closed).

LUBRICATION:—Crankcase Capacity—10 quarts.

Normal Oil Pressure—35 pounds.

BATTERY:—Prest-O-Lite, Type 619-ST. 6 volt, 19 plate, 144 A.H. capacity (5 ampere rate).

Starting Capacity—170 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under left front seat.

STARTER:—Model DN-1107, DN-1162. Armature No. 13409.

Starter Drive—Outboard Bendix.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—56-60 ounces.

Cranking Engine—125 R.P.M., 125-135 amperes, 5.5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	6.0	50
5.8 "	850	5.2	200
11.4 "	520	4.8	300

23.0 "	220	4.2	500
26.6 "	140	4.0	600
39.0 "	Lock	3.6	810

Starting Switch, Model 21518. Electro-magnetic (solenoid) type mounted on starter field frame and controlled by pushbutton on instrument panel.

Startix Type 'F'—Optional. See article in Electrical Circuit Controller and special Owen-Dyneto 40203 Cutout Relay which must be installed when Startix used. Equipment Section for complete data on Startix,

Mounting:—Sleeve mounted in flywheel housing left hand front side. To remove, take out pilot mounting screw in flywheel housing.

GENERATOR:—Model CO-1177. Armature No. 23661. Third brush control used in conjunction with Battery Charge Regulator. See Equipment Section for complete data on Regulator.

Charging Rate Adjustment—Third brush shifted through rack-and-pinion control by slotted adjusting screw on endplate. To adjust, take off commutator end cover, turn adjusting screw to right or clockwise to increase, or left or counter-clockwise to decrease charging rate.

Performance Data

Amperes	Volts	R.P.M.
0	6.5	475
20	7.5	1000
24	8.0	1400
13	8.0	5000

Field Fuse—3 ampere capacity (in plug in regulator case).

Mounting:—Flange mounted on right hand rear face of timing chain case. To remove, take out three mounting screws, pull generator away from engine engage drive coupling, lift out. Do not disturb intermediate flange carrying drive sprocket.

Chain Adjustment — Loosen generator flange mounting screws, pull generator away from engine until chain sideplay as measured at chain inspection plug hole in top of chain case cover is ¼", tighten mounting screws. Adjust chain whenever sideplay exceeds ½".

RELAY-REGULATOR:—Model 21262. Mounted on generator field frame. Consists of Cut-out Relay and Battery Charge Regulator.

Cut-out Relay

Cuts in—6.5 volts or 475 R.P.M.

Cuts out—0-2 ampere discharge current.

Relay Contact Gap—.015".

Air Gap—.010" (contacts closed).

Battery Charge Regulator

Set to operate at 8.0 volts (cold), 7.6 volts (hot). Reduces charging rate approximately ½ by cutting in a field resistance unit. See Equipment Section for complete data.

LIGHTING:—R.B.M. Lighting Switch. Switch mounted at lower end of steering column and controlled by lever on steering wheel. Switch has special passing position providing assymmetrical passing beam. Headlight bulbs are special triple filament type.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-32-32	3003
Parking, Instrument, Tail	3	63
Stop light	15	87
Body Lights	6	81

FUSES:—Lighting—20 ampere capacity on block on dash. A resistor is connected across the lighting fuse to limit current load after fuse blows out.

Generator Field—3 ampere in plug in regulator case.

HORNS:—Sparton twin horns. Horns operated by horn relay.

SERIAL NUMBER:—First number 901,601. On plate on left front side of dash.

COMPRESSION:—Ratio—Std. 6.0-1 head. Optl. 6.3-1 head. **Pressure**—(Std. head) 95-100 lbs., (Optl. hd.) 123 lbs. at 125 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-19" with engine idling at 375 R.P.M. or 8 M.P.H.

IGNITION:—Coil Model CE-4022, CE-4023 (1108). Two coil unit assembled with ignition switch.

Ignition Current—6 amperes (running), 10 amperes (stopped) maximum current for both coils.

Ignition Switch—Mitchellock Model 16-S, Type 5323 or Delco-Remy Models 430-H, J.

Distributor Model IGO-4001, 2. Double breaker, 6 lobe cam, full automatic advance type. Contacts open alternately at 33½° and 26½° intervals corresponding to irregular 67 and 53 degree firing intervals of engine (irregular firing interval caused by 67° included angle between cylinder banks). Contacts must be synchronized—see Timing.

Breaker Gap—Set gaps at .020". Limits, .018-.022"

Breaker Arm Spring Tension—20 ozs. at tip of arm.

Cam Angles (Distributor Degrees) — Closed 40°. Open 20°. Each breaker operates independently and controls one coil.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	375	4	750
4	625	8	1250
6	850	12	1700
8	1400	16	2800

IGNITION TIMING:— Flywheel Degs. Piston Position
Std. (6.0-1) Engines....6° BTDC..... .0134" BTDC.
H.C. (6.33-1) Engines..4° BTDC..... .0060" BTDC

Timing (Stationary Contacts), all engines:—Vibration dampener at front of engine marked '1R-UDC' at top dead center point for piston #1R and has fifteen one degree graduations before this point. To set timing with #1R piston on compression, turn engine over until piston reaches firing position with correct mark on dampener lined up with pointer on chain case cover (sixth mark standard engines, fourth mark H.C. engines before dead center mark). Loosen clamp screw on mounting bracket, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp screw. Second or movable contacts should then be timed by synchronizing distributor.

Synchronization (Movable Contacts):—After timing distributor (above), crank engine over exactly 67° to firing position for piston #6L, stop when correct mark on vibration dampener lines up with pointer (sixth mark standard engines, fourth mark H.C. engines before dead center mark '6L-UDC'). Loosen lockscrews on movable subplate carrying second set of contacts, turn eccentric adjusting screw until contacts begin to open, tighten lockscrews.

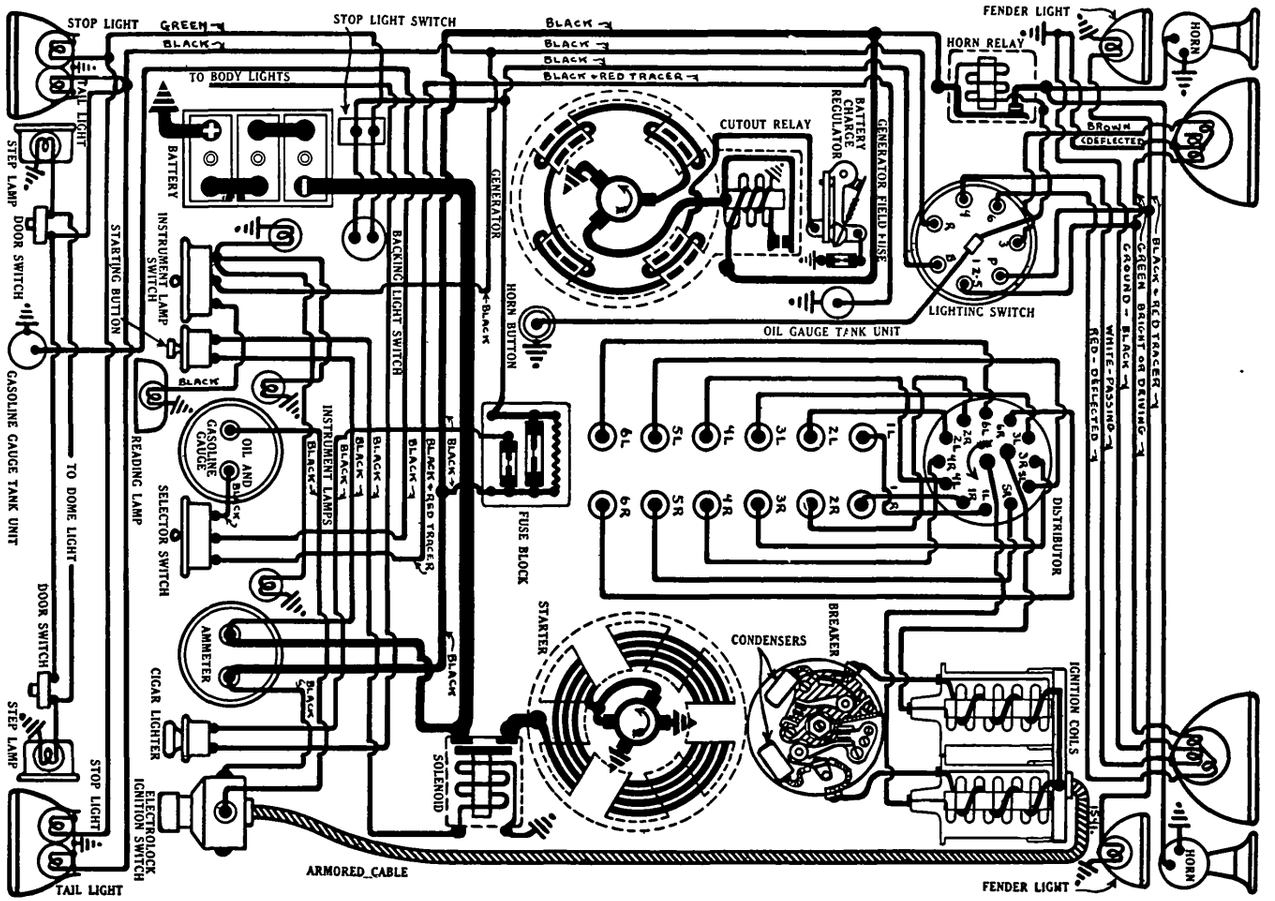
Synchronization (Second Method):—If distributor is synchronized on rotary spark gap or other test equipment, set movable contacts to open 33½° after first or stationary set. Distributor intervals are irregular 33½-26½-33½ (distributor degrees).

Motor Gauge—Weidenhoff Adapter #114, Rod #2.

Firing Order: — 1R-6L-5R-2L-3R-4L-6R-1L-2R-5L-4R-3L. #1 cylinder nearest radiator and cylinder banks right (R) and left (L) as viewed from driver's seat. Spark plug cables not connected in this order—see diagram.

Spark Plugs:—AC. Type K-7. 14 MM. Metric type.

Spark Plug Gaps—.025" (all engines).



CARBURETION: — (Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg. Model EE-3, 1½" dual, downdraft type.

Automatic Choke—Stromberg.

Fuel Pump:—AC. Type I combination fuel and vacuum pump.

Gasoline Gauge:—Motometer electric type gasoline and oil gauge. Oil reading obtained by pressing button of selector switch.

VALVE TIMING:—To Check Timing—Intake valve in #1 cylinder of right hand bank (1R) should begin to open with piston No. 6R on top dead center entering power stroke when mark '1R-UDC' on vibration dampener at front of engine lines up with pointer on chain case cover.

Motor Gauge—Weidenhoff Adapter #114, Rod #2.

Tappet Clearance:—None in service (automatic take-up). See article Mechanical Equipment Section.

Valve Spring Pressure:—70 lbs. at 2 7/32" (valve closed).

LUBRICATION:—Crankcase Capacity—10 qts.
Normal Oil Pressure—50 pounds.

BATTERY:—Prest-O-Lite, Type 619-ST. 6 volt, 19 plate, 144 A.H. capacity (5 hour rate).

Starting Capacity—170 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under left hand front seat.

STARTER:—Model DN-1107, DN-1162. Armature No. 13409.

Starter Drive—Outboard Bendix.

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—56-60 ounces.

Cranking Engine—125 R.P.M., 125-135 amperes at 5.5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	6.0	50
5.8 "	850	5.2	200
11.4 "	520	4.8	300
17.0 "	340	4.5	400
23.0 "	220	4.2	500
26.6 "	140	4.0	600
39.0 "	Lock	3.6	810

Starting Switch:—Model 21518. Electro-magnetic (solenoid) type mounted on starter field frame and controlled by pushbutton on instrument panel.

Startix Type 'F':—Optional. See article in Electrical Equipment Section for complete data on Startix, Circuit Controller and special Owen-Dyneto 40203 Cutout Relay which must be installed when Startix used.

Mounting:—Sleeve mounted in flywheel housing right hand front face. To remove, take out pilot mounting screw in flywhel housing.

GENERATOR:—Model CO-1166. Armature No. 23566. Third brush control used in conjunction with Battery Charge Regulator. See Equipment Section for complete data on Regulator.

Charging Rate Adjustment—Third brush shifted through rack-and-pinion control by slotted adjusting screw on end plate. To adjust, take off commutator end cover, turn adjusting screw to right or clockwise to increase, or to left or counter-clockwise to decrease charging rate.

Performance Data

Amperes	Volts	R.P.M.
0	6.5	475
20	7.5	1000
24	8.0	1400
13	8.0	5000

Field Fuse—3 ampere capacity in plug in regulator case.

Mounting:—Special pivot mounting at left front of engine with fan belt drive. To remove, take out clamp bolt, swing generator toward engine, remove drive belt, take out mounting bolt in pivot bracket.

Belt Adjustment:—Loosen clamp bolt above generator, swing generator out until reading on spring scale attached to frame is 180 lbs., tighten clamp bolt.

RELAY-REGULATOR:—Model 21262. Mounted on generator field frame. Consists of Cut-out Relay and Battery Charge Regulator.

Cut-out Relay

Cuts in—6.5 volts or 475 R.P.M.
Cuts out—0-2 ampere discharge.
Relay Contact Gap—.015".
Air Gap—.010" (contacts closed).

Battery Charge Regulator

Set to operate at 8.0 volts (cold), 7.6 volts (hot). Reduces charging rate approximately one-half by cutting in field resistance. See Equipment Section for complete data.

LIGHTING:—R.B.M. Lighting Switch. Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Switch has special passing position providing assymmetrical passing beam. Headlight bulbs are special triple-filament type.

Bulb Specifications

Lamp	Candlepower	Madza No.
Headlights	32-32-32	3003
Parking, Instrument, Tail	3	63
Stop light	15	87
Body lights	6	81

FUSES:—Lighting—20 ampere capacity on block on dash. Resistor connected across lighting fuse limits current load after fuse blows out.

Generator Field—3 ampere in plug in regulator case.

HORNS:—Sparton Twin horns. Vibrator type. Operated by horn relay.

SERIAL NUMBER:—Stamped on plate on left front side of dash. Use engine number (1516 up) on upper left hand corner of cylinder block.

COMPRESSION:—Ratio—6.5-1 Std., 7.0-1 Optl. **Pressure**—120 lbs. at 300 R.P.M. Std. 6.5-1 head.

VACUUM READING:—Gauge should show steady reading of 18-19" with engine idling at 300 R.P.M.

IGNITION:—Coil Models CE-4607, 12 (LHD), CE-4608, 13 (RHD). At left of engine.
Ignition Switch—Mitchellock Model 24-B, Type 6511 or 6513 (LHD), Type 6512 or 6514 (RHD).
Distributor Model IGH-4026, 4026-A. Double breaker, 4 lobe cam, full automatic advance type with 'Fuel Compensator' or manual adjustment at distributor. Contacts open alternately at 45° intervals corresponding to 90° firing interval of engine and must be synchronized (see Timing).
Breaker Gap—Set at .020". Limits .018-.022".
Breaker Arm Spring Tension—16-20 ounces.
Cam Angles—Closed 32°, Open 13°, distributor. Both sets together when properly synchronized.

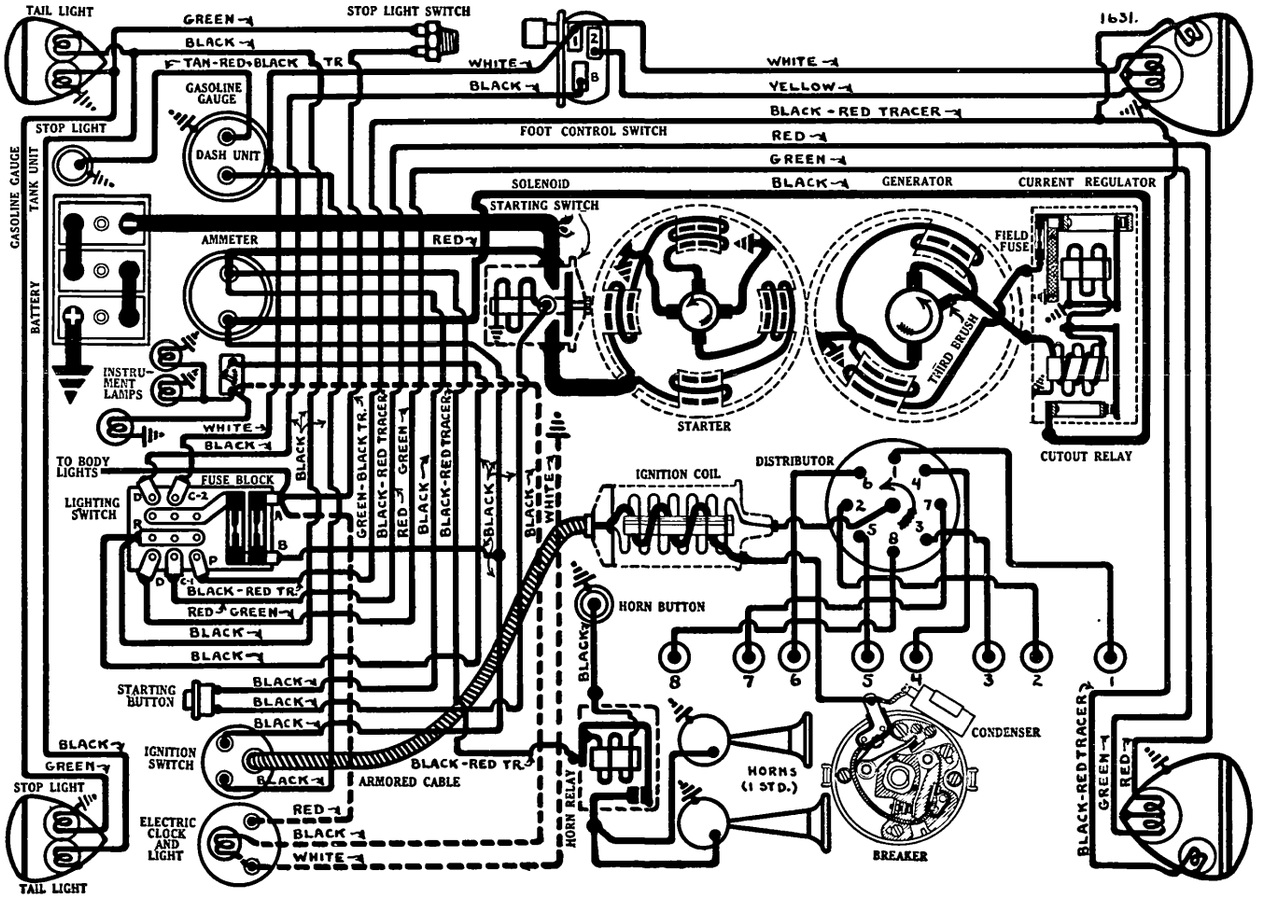
Automatic Advance—IGH-4026

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	525	4	1050
4	810	8	1620
6	1150	12	2300
8	1650	16	3300
10	2200	20	4400

Automatic Advance—IGH-4026-A

Start	300	0	600
2	660	4	1320
4	1100	8	2200
6	1460	12	2920
8	1830	16	3660
10	2200	20	4400

Fuel Compensator—Manual adjustment at distributor providing 10° maximum advance and retard from center '0' position. Should be set at '0' for fuel of approximately 68-70 octane rating and advanced or retarded for fuel of higher or lower rating to secure slight 'ping' pulling heavy load.



Removal:—Distributor mounted at left of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position All engines (6.5-1, 7.0-1) 7° BTDC. ..... .0180" BTDC.
Timing (Stationary Contacts)—Manufacturer recommends use of Neon timing light or Synchroscope. Remove cover over timing inspection hole in left front face of flywheel housing under starter, mark firing point for #1 piston on flywheel with chalk (midpoint between second and third graduations to right of line marked '#1 UP D.C.'), clip timing light lead to #1 spark plug, direct light on flywheel. Loosen thumbnut and set Fuel Compensator at '0'. Idle engine, loosen advance arm clamp bolt, rotate distributor until chalk mark on flywheel appears to line up with indicator on housing, tighten clamp bolt.

Synchronizing (Movable Contacts)—Synchronization may be checked with the Neon Timing Light by marking firing point for #6 piston on flywheel (midpoint between third and fourth graduations before lined marked '#6 UP D.C.'), and watching position of mark with engine idling. Engine must be stopped to set synchronization. To adjust, place #6 piston in firing position (turn engine over by rolling car with gears engaged), loosen lockscrews on movable sub-plate carrying second set of contacts, shift plate until contacts begin to open, tighten lockscrews.

Synchronization (Other Methods)—See Equipment Section for directions on synchronization using indicator and synchronizing marks on rotor fantail. If other methods used, firing intervals should be regular 45-45-45 distributor degrees.

Motor Gauge—Weidenhoff Adapter #114, Rod #5.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).
Spark Plugs:—A.C., Type K-7. 14 MM. Metric.
Spark Plug Gap—Set at .028". Limits .028-.030".

CARBURETION:—See Carburetion Section for data.
Carburetor:—Stromberg, Model EE-14, 1" dual downdraft type with integral automatic choke.
Fuel Pump:—A.C., Type R-1521807 diaphragm type.
Gasoline Gauge:—A.C., electric type.

VALVE TIMING:—To Check Timing—Use gauge to measure #1 piston travel. Set tappet clearance #1 exhaust valve at .006". This valve should be fully closed with piston .006" ATDC. when 5° point on flywheel (midpoint between second and third graduation to left of line marked '#1UP D.C.') lines up with indicator in inspection hole in left front face of flywheel housing under starter. Reset tappet clearance at .009" with engine warm.
Motor Gauge—Weidenhoff Adapter #114, Rod #5.
Tappet Clearance:—.007" Int., .009" Exh., with engine warm.
Valve Spring Pressure:—40 lbs. at 1⅝" (valve closed). 110 lbs. at approx. 1 5/16" (valve open).

LUBRICATION:—Crankcase Capacity—7 qts.
Normal Oil Pressure—35 pounds.

BATTERY:—Delco, Type 17-K. 6 volt, 17 plate, 110 A.H. capacity (20 hour rate).
Starting Capacity—131 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under driver's seat.

STARTER:—Model MAX-4006. Armature MAW-2006.
Starter Drive—Outboard barrel type Bendix.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—31-42 ounces (new brushes).
Cranking Engine—125 R.P.M., 200 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Starting Switch:—Auto-Lite Solenoid Type SS-4001. Delco-Remy Control Switch Type 1400. See Equipment Section for complete data.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange capscrews.

GENERATOR:—Model GAR-4611-5. Armature GAR-2116. Air-cooled. Third brush control and Current Regulator (two-rate relay). See Equipment Section for complete data.

Charging Rate Adjustment—Use test meters to check generator output. Short out regulator by connecting jumper wire between fuse cup on regulator case and ground on generator frame while adjustment is being made. Shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction. Remove jumper wire.

Maximum Charging Rate—23 amperes (cold), 2400 R.P.M.

NOTE—Manufacturer recommends installation of a smaller pulley — Part No. SP-185 — (2" diameter measured at bottom of belt groove or 3½" at top of groove) for increased generator output at lower car speeds.

Performance Data

Cold — Regulator Contacts Closed — Hot					
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
22.4	8.8	2400	19.2	8.4	2600

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-36 ozs. (new brushes).
Field Current—3.51-3.89 amperes at 6.0 volts.
Field Fuse—5 ampere in knurled cup on side of regulator case.
Motoring Current—5.03-5.57 amperes at 6.0 volts (½ ampere more for relay and regulator).

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot bolts, clamp bolt, and lock bolt on link, pull generator away from engine by spring scale looped on generator lug parallel to link until scale reading is 25 lbs.

RELAY-REGULATOR:—Model TC-4302-A. Mounted on generator. Consists of Cutout Relay and Current Regulator in a single case. See Equipment Section for complete data on these units.

Cutout Relay
Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge at 6.5 volts.
Relay Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Current Regulator
Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—R.B.M. Switch Model 1500. Delco-Remy Foot Control Switch Model 471-Z, 471-U (R.H.D.). Foot operated control switch provides assymetrical 'Country Passing' beam with main switch in 'Country Driving' position (passing beam composed of lower beam left hand headlamp, upper beam right hand headlamp).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330-C
Parking	1	51
Instrument, Tail	3	63
Stop	15	87
Dome	6	81

FUSES:—Lighting—20 ampere on back of switch.
Accessory—20 ampere on back of lighting switch.
Generator Field—5 ampere in regulator.

HORNS:—Sparton. Vibrator type. One horn standard. Twin horns optl. Operated by horn relay.
Horn Relay:—Delco-Remy Type 266-TK. Relay requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—Stamped on plate on left front face of dash. Use engine number 385,501 (1200, 1, 2), 1,755,101 (1203, 4, 5) up stamped on left side of crankcase at front.

COMPRESSION:—Ratios as follows:

Model	Std. Head	Low Comp.	High Comp.
1200, 1, 2	6.5-1	6.0-1	7.0-1
1203, 4, 5	6.3-1	6.0-1	7.0-1

Pressure—110 lbs. at cranking speed for standard heads.

VACUUM READING:—Gauge should show steady reading of 18-19" with engine idling at 350 R.P.M. or 7 M.P.H.

IGNITION:—**Coil Model 539-K.** Mounted on cylinder head at side of distributor.

Ignition Switch—Model 430-L. Connected to coil by armored cable. Switch has two 'on' positions (key turned to right or left). On cars with automatic starting, right hand 'on' position is regular running position. Left hand 'on' position is used to secure gasoline gauge reading with engine not running.

Distributor Model 662-W. Double breaker, 4 lobe cam, full automatic advance type. Contacts open alternately at regular 45° intervals corresponding to 90° firing interval of engine and must be synchronized (see Timing).

Breaker Gap—Set at .020". Limits .018-.022".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles—Closed 34°. Open 11° distributor. Both sets together when properly synchronized.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	1	600
10	1800	20	3600

Removal:—Distributor mounted on left side of cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position

All (High Comp.)	4° BTDC.	.0075" BTDC.
All (Std. Comp.)	6° BTDC.	.0168" BTDC.
All (Low Comp.)	8° BTDC.	.0299" BTDC.

Timing (Stationary Contacts)—With #1 piston on compression, turn engine over until piston reaches firing position, stop when correct graduation on vibration dampener at front of engine lines up with pointer on chain case cover (vibration dampener has fifteen 1° graduations before the dead center mark 'DC/1-8'—see table above for setting for each type engine). Loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt. Then synchronize movable contacts.

Synchronization (Movable Contacts)—Turn engine over 90° to #6 firing position (vibration dampener marked 'DC/2-6' with usual 1° graduations before this point—see table above). Loosen lockscrews on sub-plate carrying movable contacts, turn eccentric adjusting screw until contacts begin to open, tighten lockscrews.

Synchronization (Other Methods)—See Equipment Section for directions on use of Delco-Remy synchronizing tool #1838182. If distributor synchronized by using other types of equipment, set firing intervals at regular 45-45-45 (distributor degrees).

Motor Gauge—Weidenhoff Adapter #114, Rod #5.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—A.C., Type K-7. 14 MM. Metric.
Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EE-23, 1¼" dual, downdraft type with integral automatic choke.

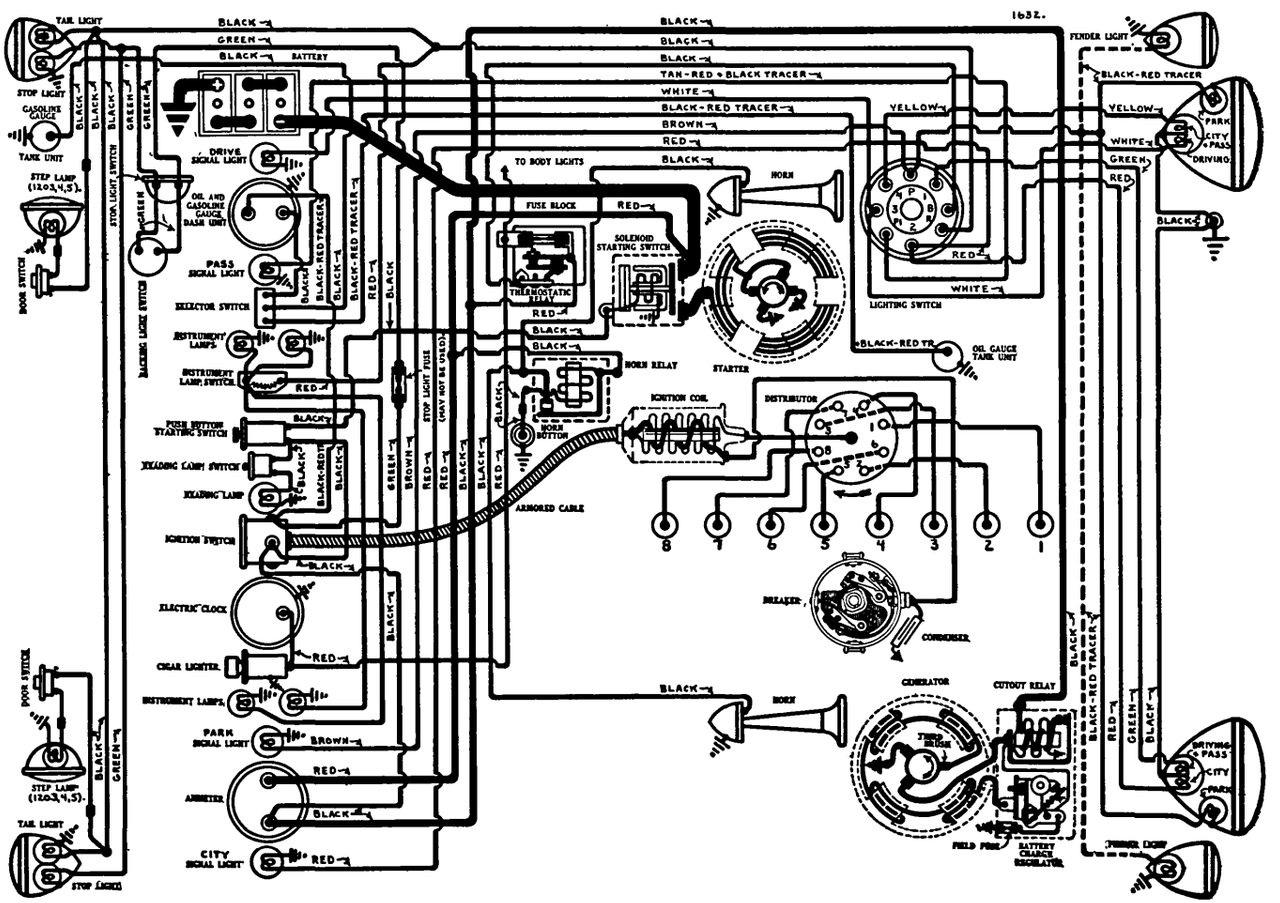
Fuel Pump:—A.C., Type I-1521777 diaphragm type combination fuel and vacuum pump.

Gasoline Gauge:—A.C. electric combination gasoline and oil gauge.

VALVE TIMING:—**To Check Timing**—Check tappet clearance #1 intake valve. This valve should open with piston 30° or .4070" before top dead center when flywheel mark 'INT' (visible through starter mounting hole in flywheel housing with starter removed) lines up with indicator on housing within case.

Motor Gauge—Weidenhoff Adapter #114, Rod #5.

Tappet Clearance:—.004" Int., .006" Exh., engine warm.



Valve Spring Pressure:—73 lbs. at 3 1/16" (valve closed).

LUBRICATION:—**Crankcase Capacity**—8 qts. (1200,1,2), 9½ qts. (1203,4,5).

Normal Oil Pressure—35 lbs. min. at 1000 R.P.M.

BATTERY:—**Prest-O-Lite, Type A619-ST.** 6 volt, 19 plate, 144 A.H. capacity (5 ampere rate).

Starting Capacity—170 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.

Location—On left side under rear compartment floor boards.

STARTER:—Mod. DI-1272, DI-1297. Armature No. 13292 (1200, 1, 2), Model DN-1270. Armature No. 13409 (1203, 4, 5).

Starter Drive—Outboard Bendix Type RCD10FXTD.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—56-60 ozs. (new brushes).

Cranking Engine—125 R.P.M., 140 amperes at 5.5 volts (1400, 1, 2), 125 amperes at 5.5 volts (1403, 4, 5).

Performance Data—DI-1272

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3500-4000	6.0	60
2 "	1600	5.5	128
3.6 "	1200	5.35	170
7.3 "	800	5.05	250
14.4 "	400	4.5	400
28 "	Lock	3.5	650
29.2 "	Lock	3.6	720

Performance Data—DN-1270

0 ft. lbs.	3000	6.0	50
2 "	1600	5.6	120
3.3 "	1200	5.45	150

15.0 "	400	4.65	360
35 "	Lock	3.5	650
39.0 "	Lock	3.6	810

Starting Switch:—Owen-Dyneto Solenoid Switch, Type 21518. Delco-Remy Control Switch 1398. Solenoid switch mounted on starter and controlled by push button switch on instrument panel. See Equipment Section for complete data on automatic starting for cars with this equipment.

Startix Type F (Optional)—See article in Electrical Equipment Section for complete data on Startix and Startix Circuit Controller. Cutout relay has special auxiliary contacts and resistance unit for Startix control (Type F must not be used without this resistance).

Removal:—Starter sleeve mounted in left front face of flywheel housing. To remove, take out pilot mounting screw in flywheel housing.

GENERATOR:—Model CO-1240. Armature No. 23704. Air cooled by air horn on generator field frame. Third brush control in conjunction with Battery Charge Regulator. See Equipment Section for complete data on Regulator.

Charging Rate Adjustment—Third brush shifted through rack-and-pinion control by slotted screw on commutator end plate. Turn adjusting screw to right or clockwise to increase, and to left or counter-clockwise to decrease charging rate.

Maximum Charging Rate—30-33 amperes (cold), 24-27 amperes (hot) at 8.0 volts.

Performance Data—Regulator Inoperative

Cold			Hot (215°F.)		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.5	600	0	6.6	690
4	6.7	660	4	7.05	760
8	7.0	720	8	7.4	840
12	7.2	800	12	7.7	925
16	7.5	900	16	7.9	1070
20	7.8	1000	20	8.0	1260
24	7.95	1100	24	8.0	1800
30	8.0	1600			

Rotation—Counter-clockwise at commutator end

Brush Spring Tension—20-22 ozs. (main), 12-14 ozs. (third brush).

Field Current—1.9-2.1 amperes at 6.0 volts.

Field Fuse—5 amperes in knurled plug on side of regulator case.

Motoring Current—5.1-5.7 amperes at 6.0 volts.

Removal:—Generator flange mounted on right rear face of timing chain case. To remove, take out three mounting screws, pull generator to rear to disengage drive coupling, lift out. Do not disturb intermediate flange carrying drive sprocket.

Chain Adjustment:—Loosen generator flange mounting screw, pull generator out or away from engine until sideplay as measured at chain inspection plug hole in top face of chain case is ¼", tighten mounting screws. Adjust chain whenever sideplay exceeds ½".

RELAY-REGULATOR: — Model 40210. Mounted on generator. Consists of Cutout Relay and Battery Charge Regulator. See Equipment Section for complete data on these units.

NOTE—This cutout relay has special auxiliary contacts and resistance for Startix control. See article on Type F Startix in Electrical Equipment Section.

Cutout Relay

Cuts In—6.8-7.0 volts, 600 R.P.M.

Cuts Out—1.5-3 ampere discharge current.

Relay Contact Gap—.020-.030".

Air Gap—.020-.030" with contacts closed.

Battery Charge Regulator

Setting—Contacts open at 8.0 volts. Limits are 7.8 volts minimum, 8.3 volts maximum.

Regulator Resistance—1.8 ohms.

LIGHTING:—R.B.M. Switch Model 1400. Located at lower end of steering column and controlled by lever on steering wheel. Pilot lights in right and left end instruments of instrument cluster indicate positions of lighting switch as follows:

Park—Parking and tail lamps lighted.
City—City Driving (lower headlamp beams).
Drive—Country Driving (upper headlamp beams).
Pass—Country Passing (passing beam).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Parking or Fender	3	63
Instr., Tail, Courtesy	3	63
Stop	15	87
Dome	6	81
Pilot (Tell-tales)	1	51

THERMOSTATIC RELAY:—(On Delco-Remy Model 1050-W Fuse Block). Thermostatic arm type current limit relay (no winding). Connected in lighting circuits. Contacts open with current load of 38 amperes at 70°F.

FUSES:—Body Lights—20 amperes on fuse block (see above).

Generator Field—3 amperes in knurled plug on side of regulator case.

HORNS:—Sparton Twin Horns. Vibrator type. Operated by horn relay.

Horn Relay:—R.B.M. Model 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with 4 volts across winding with relay in inverted position.

SERIAL NUMBER:—Stamped on plate on left front side of dash. Use engine number (903,101 up) stamped on left cylinder block below head.

COMPRESSION:—Ratio—6.4-1 Std., 6.0-1 Low Comp., 7.0-1 High Comp., all heads are aluminum.
Pressure—110 lbs. at cranking speed (125 R.P.M.) for Std. 6.4-1 head.

VACUUM READING:—Gauge should show steady reading of 18-19" with engine idling at 375 R.P.M. or 8 M.P.H.

IGNITION: — Coil Model CE-4022 (1207), CE-4023 (1208). Two coil unit mounted at front of engine.
Ignition Current—6 amperes idling, 10 amperes stopped (total for both coils).
Ignition Switch:—Delco-Remy, Type 430-M. Connected to coil unit by armored cable. Switch has two 'on' positions (key turned to left or right). On cars with automatic starting, right hand 'on' position is regular running position. Key should be turned to left to secure gasoline gauge reading with engine not running.

Distributor Model IGO-4002-A. Double breaker, 6 lobe cam, full automatic advance type. Contacts open alternately at 33½ and 26½ degree intervals corresponding to unequal 67 and 53 degree firing intervals of engine (caused by 67° included angle between banks) and must be synchronized (see Timing).
Breaker Gap—Set at .020". Limits .018-.022".
Breaker Arm Spring Tension—20 ozs. at tip of arm.
Cam Angles—Closed 40°. Open 20° distributor. Each set operates independently and controls one coil.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	0	600
2	525	4	1050
4	750	8	1500
6	975	12	1950
8	1200	16	2400

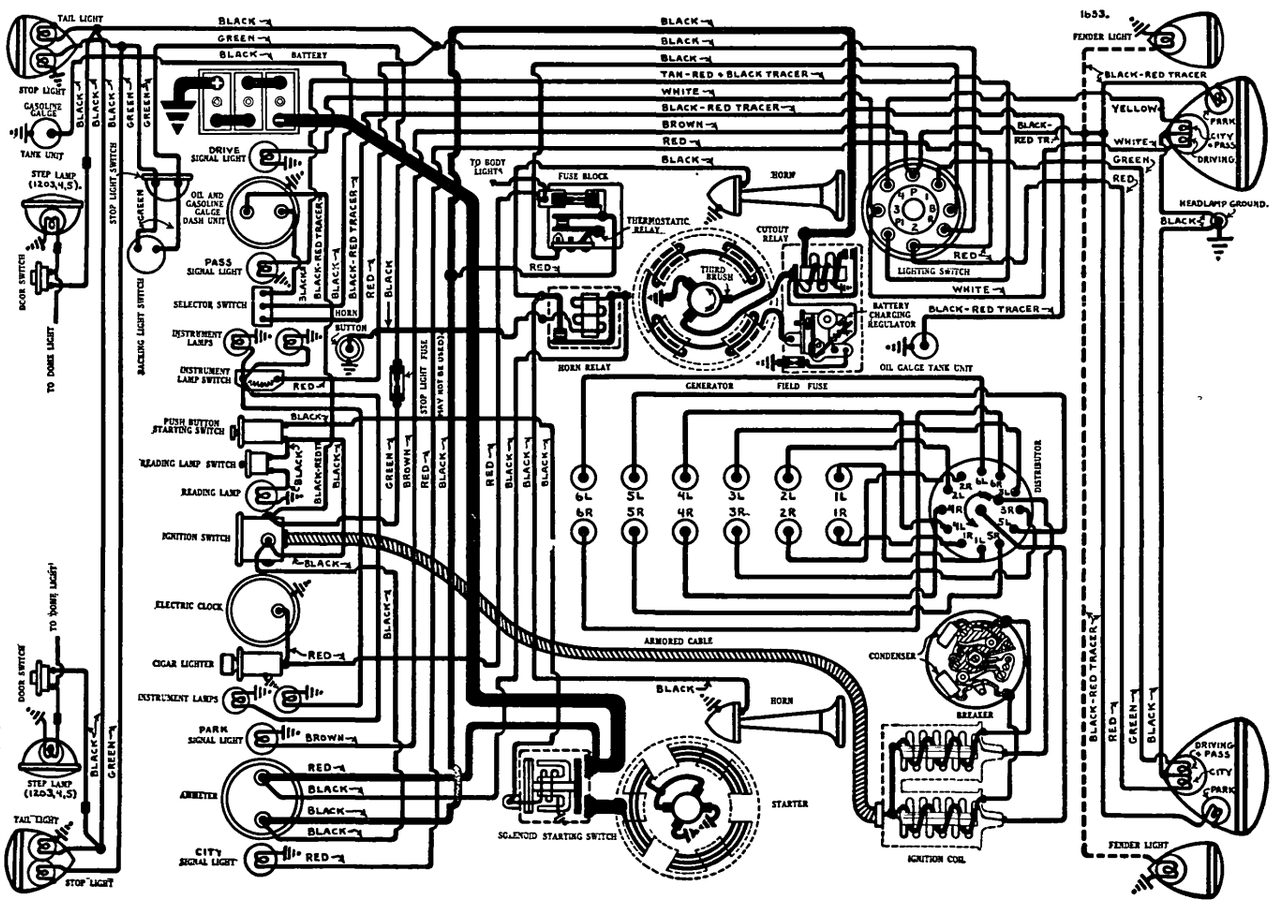
Removal:—Distributor mounted between cylinder banks at front of engine and driven through offset tongue-and-slot coupling from camshaft. To remove, take out screws in mounting bracket.

IGNITION TIMING:—

Flywheel Degs.	Piston Position
7.0-1 High Comp. ....4° BTDC	....0063" BTDC.
6.4-1 Std. Comp. ....6° BTDC	....0145" BTDC.
6.0-1 Low Comp. ....8° BTDC	....0255" BTDC.

Timing (Stationary Contacts)—With #1R piston (front piston—right hand bank) on compression, turn engine over until piston reaches firing position, stop when correct graduation on vibration dampener at front of engine lines up with pointer on chain case cover (vibration dampener has fifteen 1° graduations before the dead center mark '1R-UDC'—see table above for correct setting). Loosen clamp screw on mounting bracket, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp screw. Then synchronize movable contacts.

Synchronization (Movable Contacts)—After timing distributor (above), turn engine over 67° to firing position for piston #6L, stop when correct graduation on vibration dampener lines up with pointer (vibration dampener marked '6L-UDC' with fifteen 1° graduations before this point). Loosen lockscrews on movable sub-plate, shift plate by turning eccentric adjusting screw until movable contacts begin to open, tighten lockscrews.
Synchronization (Other Methods)—If distributor synchronized by other methods, set movable points to open 33½° after fixed points. Distributor firing intervals are unequal 33½-26½-33½ distributor degrees.



Motor Gauge—Weidenhoff Adapter #114, Rod #2.

Firing Order: — 1R-6L-5R-2L-3R-4L-6R-1L-2R-5L-4R-3L with cylinder banks right (R) and left (L) as viewed from driver's seat and #1 cylinder nearest radiator. Spark plugs not connected in this order on distributor cap (see diagram).

Spark Plugs:—A.C., Type K-7. 14 MM. Metric.

Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EE-3, 1½" dual, downdraft type.
Automatic Choke—Stromberg, Type C.
Fuel Pump:—A.C., Type I-1521778 diaphragm type combination fuel and vacuum pump.
Gasoline Gauge:—A.C. electric combination gasoline and oil gauge.

VALVE TIMING:—To Check Timing—Intake valve in #1 cylinder of right hand bank (1R) should begin to open with piston 6R on top dead center entering power stroke when mark '1R-UDC' on vibration dampener at front of engine lines up with pointer on chain case cover.
Motor Gauge—Weidenhoff Adapter #144, Rod #2.
Tappet Clearance:—None in service (automatic take-up). See article in Mechanical Equipment Section.
Valve Spring Pressure:—70 lbs. at 2 7/32" (valve closed).

LUBRICATION:—Crankcase Capacity—10 quarts.
Normal Oil Pressure—35 lbs. min. at 1000 R.P.M.

BATTERY:—Prest-O-Lite, Type A619-ST. 6 volt, 19 plate, 144 ampere hour (5 ampere rate).
Starting Capacity—170 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under rear compartment floor boards.

STARTER:—Model DN-1273. Armature No. 13409.
Starter Drive—Outboard Bendix Type RCD10FXTD.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—56-60 ozs. (new brushes).
Cranking Engine—125 R.P.M., 125 amperes, 5.5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	6.0	50
2 "	1600	5.6	120
3.3 "	1200	5.45	150
6.3 "	800	5.2	210
15.0 "	400	4.65	360
35 "	Lock	3.5	650
39.0 "	Lock	3.6	810

Starting Switch:—Owen-Dyneto Solenoid Switch, Type 21676. Delco-Remy Control Switch, Type 1398. Solenoid switch mounted on starter and controlled by push button switch on instrument panel. See Equipment Section for complete data on automatic starting for cars with this equipment.

Startix Type F (Optional)—See article in Electrical Equipment Section for complete data on Startix and Startix Circuit Controller. Cutout relay has special auxiliary contacts and resistance unit for Startix control (Type F must not be used without this resistance).
Removal:—Starter sleeve mounted in right front face of flywheel housing. To remove, take out pilot mounting screw in flywheel housing.

GENERATOR:—Model CO-1271. Armature No. 23709. Air-cooled type. Third brush control in conjunction with Battery Charge Regulator. See Equipment Section for complete data on Regulator.
Charging Rate Adjustment—Third brush shifted through rack-and-pinion control by slotted adjusting screw on commutator end plate. Turn adjusting screw to right or clockwise to increase, and to left or counter-clockwise to decrease charging rate.
Maximum Charging Rate—30-33 amperes (cold), 24-27 amperes (hot) at 8.0 volts.

Performance Data—Regulator Inoperative

Cold			Hot (215°F.)		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.5	600	0	6.6	690
4	6.7	660	4	7.05	760
8	7.0	720	8	7.4	840
12	7.2	800	12	7.7	925
16	7.5	900	16	7.9	1070
20	7.8	1000	20	8.0	1260
24	7.95	1100	24	8.0	1800
30	8.0	1600			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—20-22 ozs. (main), 12-14 ozs. (third brush).
Field Current—1.9-2.1 amperes at 6.0 volts.
Motoring Current—5.1-5.7 amperes at 6.0 volts.
Field Fuse—5 ampere in knurled plug on side of regulator case.

Removal:—Generator mounted on special pivot bracket at left front of engine with fan belt drive. To remove, take out clamp bolt at top of generator and pivot bolt at bottom.
Belt Adjustment:—Loosen clamp bolt above generator, swing generator away from engine until reading on scale attached to field frame is 180 lbs.

RELAY-REGULATOR: — Model 40210. Mounted on generator. Consists of Cutout Relay and Battery Charge Regulator in a single case. See Equipment Section for complete data on these units.

NOTE—This cutout relay has special auxiliary contacts and resistance for Startix control. See article on Type F Startix in Electrical Equipment Section.

Cutout Relay

Cuts In—7.8-8.0 volts, 600 R.P.M.
Cuts Out—1.5-3 ampere discharge current.
Relay Contact Gap—.020-.030".
Air Gap—.020-.030" with contacts closed.

Battery Charge Regulator

Setting—Contacts open at 8.0 volts. Limits are 7.8 volts minimum, 8.3 volts maximum.
Regulator Resistance—1.8 ohms.

LIGHTING:—R.B.M. Switch, Model 1400. Located at lower end of steering column, controlled by lever on steering wheel. Pilot lights in right and left end instruments of instrument cluster indicate positions of lighting switch as follows:
Park—Parking and Tail lamps lighted.
City—City Driving (lower headlamp beams).
Drive—Country Driving (upper headlamp beams).
Pass—Country Passing (passing beam).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Parking or Fender	3	63
Instr., Tail, Courtesy	3	63
Stop	15	87
Dome	6	81
Pilot (Tell-tales)	1	51

THERMOSTATIC RELAY:—(On Delco-Remy Model 1050-W Fuse Block). Thermostatic arm type current limit relay (no winding). Connected in lighting circuits. Contacts open with current load of 38 amperes at 70°F.

FUSES:—Body Lights—20 amperes on fuse block (see above).
Generator Field—3 amperes in knurled plug on side of regulator case.

HORNS:—Sparton Twin Horns. Vibrator type. Operated by horn relay.
Horn Relay:—R.B.M. Model 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with 4 volts across winding with relay in inverted position.

SERIAL NUMBER:—Stamped on plate on left front side of dash. Use engine number (X-27900 and up) stamped on boss on upper left hand corner of cylinder block (obscured by oil filter when filter is installed).

COMPRESSION:—Ratio 6.5-1 Std. aluminum head, no optl. Pressure 110 lbs. at 125 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-19" with engine idling at 300 R.P.M. or 6 M.P.H.

IGNITION:—Coil Model CE-4614, CE-4615 (RHD). Service winding (coil less switch and cable) CE-3224ES. Coil mounted at left of engine.

Ignition Switch:—Mitchellock Model 24-B, Type 6513, 6514 (RHD). Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton Model 50184, Mitchell No. 6760.

Distributor Model IGH-4026-A. Double breaker, 4 lobe cam, full automatic advance type with 'Fuel Compensator' or manual adjustment at distributor. Contacts open alternately at 45° intervals corresponding to 90° firing interval of engine and must be synchronized. See Ignition Timing.

Breaker Gap—Set at .020". Limits .018-.022".

Cam Angle or Dwell—Closed at 32°. Open 13° distributor. Both sets together when properly synchronized.

Breaker Arm Spring Tension—16-20 ounces.

Condenser—Part No. IGB-1025C. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
2	660	4	1320
4	1100	8	2200
6	1460	12	2920
8	1830	16	3660
10	2200	20	4400

Fuel Compensator—Manual adjustment at distributor providing 10° maximum advance and retard from center 'O' position. See Ignition Timing for setting.

Distributor Removal:—Mounted at left side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Standard Setting as shown. See Fuel Compensator Setting below.

	Flywheel Degrees	Piston Position
All engines	7° BTDC	.0202" BTDC.

NOTE—On cars with Startix, wire on 'IGN' terminal must be disconnected and taped to prevent automatic starting.

Timing (Stationary Contacts)—Remove cover over timing inspection hole in left front face of flywheel housing under starter. Loosen thumbnut and set Fuel Compensator at 'O'. With #1 piston on compression turn engine over (engage gears and roll car) until piston reaches firing position, stop when white mark (midpoint between third and fourth graduations to right of line marked '#1 UP D.C.') on flywheel lines up with pointer on housing. Loosen advance arm clamp bolt, rotate distributor until contacts just open, tighten clamp bolt. Then synchronize movable contacts.

Timing (With Neon Timing Light)—This method recommended by manufacturer. Connect lead to #1 spark plug wire. With engine idling, adjust distributor so that timing mark (as indicated above) lines up with pointer on housing.

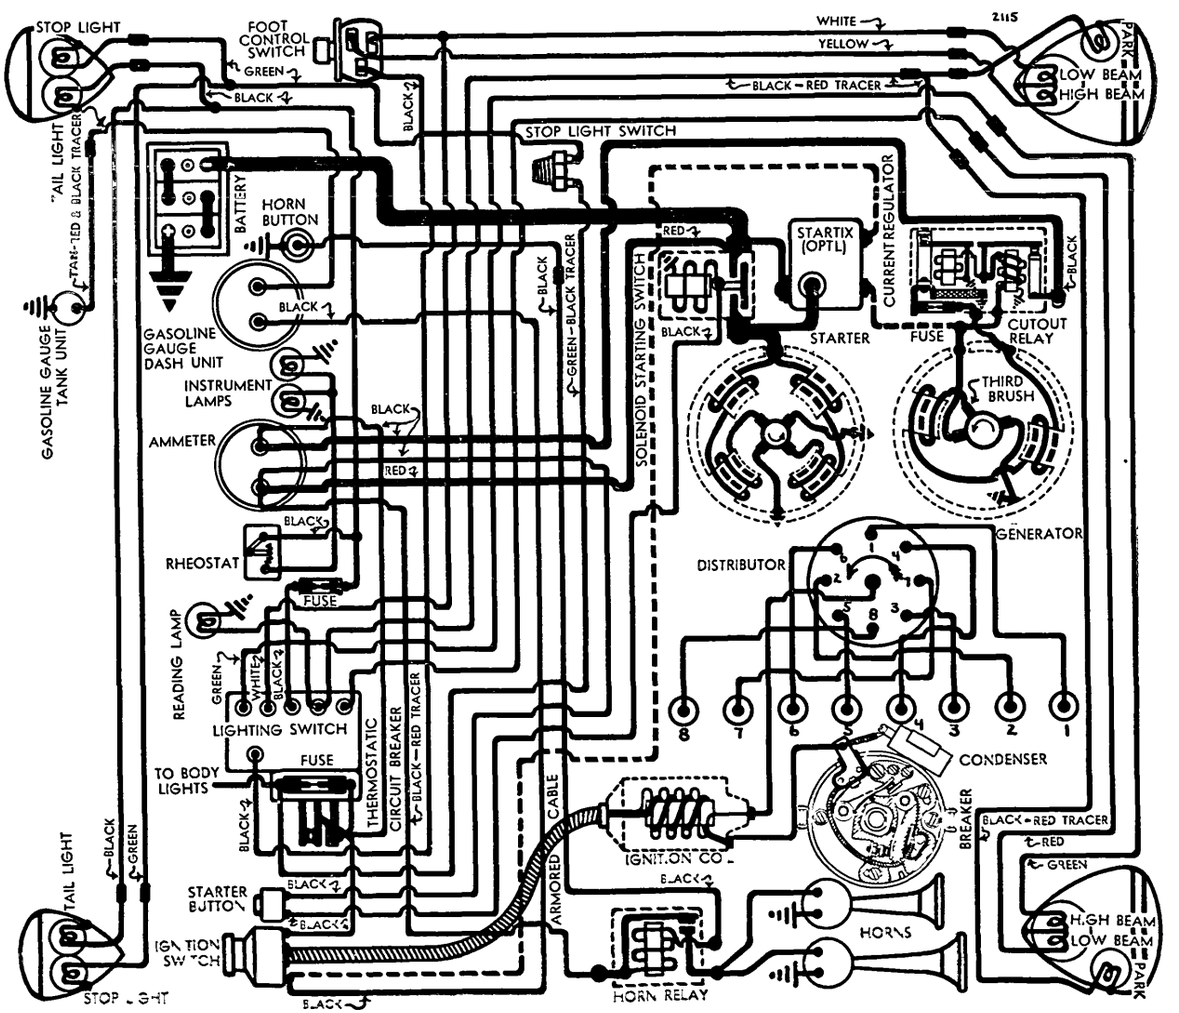
Synchronizing (Movable Contacts)—Synchronization may be checked with the Neon Timing Light. Connect lead to #6 spark plug wire, remove cover over timing inspection hole as directed above and direct light at flywheel. White mark on flywheel (to right of line '#6 UP D.C.') should line up with pointer on housing, with engine idling. Engine must be stopped to set synchronization. To adjust, place #6 piston in firing position (turn engine over by rolling car with gears engaged), loosen lockscrews on movable sub-plate carrying second set of contacts, shift plate until contacts begin to open, tighten lockscrews.

Synchronization (Other Methods)—See Equipment Section for directions on synchronization using indicator and synchronizing marks on rotor fantail. If other methods are used, firing intervals should be regular 45-45-45 distributor degrees.

NOTE—Manufacturer recommends use of Winn Synchrometer ST-913 to synchronize contacts.

Timing (Motor Gauge)—Weidenhoff Adapter #114, Rod #5.

Fuel Compensator—Should be set at 'O' for fuel of 68-70 octane rating and advanced or retarded for fuel of higher or lower rating to secure slight 'ping' pulling heavy load.



Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—AC. Type K-7, Champion J-8, 14 MM Metric.

Spark Plug Gap—Set at .028". Limits .028-.030".

CARBURETION:—Carburetor—Stromberg Mod. EE-14. 1" dual downdraft type. See Carburetion Section for adjustments, overhaul and Jet Specifications.

NOTE—Do not adjust carburetor until engine is

warmed up so that choke valve is wide open and engine idling at slow or hot idling speed.

Idle Adjustment—Set throttle stopscrew so that engine idles at 300 R.P.M. or 6 M.P.H. Turn inner idling adjusting screw in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Repeat with outer idling adjusting screw. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump—Non-adjustable.

Fast Idle:—Stromberg type. No adjustment required.

Automatic Choke:—See separate article in Carburetion Section for complete data.

Air Cleaner:—AC. #1525940 oil-wetted type standard, #1526714 heavy duty oil bath optional.

Fuel Pump:—AC. Type X #1521808. Combination fuel-and-vacuum pump. See article in Carburetion Sec.

Gasoline Gauge:—AC. Electric #1515200 (dash unit-early cars) #1515315 (dash unit—later cars), #1515149 (tank unit on all cars). See article in Carburetion Section.

VALVE TIMING:—To Check Timing—Use gauge to measure #1 piston travel. Set tappet clearance #1 exhaust valve at .006". This valve should be fully closed with piston .006" after top dead center when 5° point on flywheel (midpoint between second and third graduation to the left of line marked '#1 UP D.C.') lines up with indicator in inspection hole in left front face of flywheel housing under starter. Reset tappet clearance at .010" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #5.

Tappet Clearance:—.007" Int., .010" Exh., hot.

NOTE—Splasher in right front fender should be removed when valve adjustments are made.

Valve Spring Pressure:—40 lbs. at 1⅝" (valve closed), 110 lbs. at 1 5/16" approx. (valve open).

LUBRICATION:—Crankcase Capacity—7 qts. (full).

Normal Oil Pressure—35 lbs.

BATTERY:—Prest-O-Lite, Type HP2-17 HiLeval. 6 volt, 17 plate, 114 ampere hour capacity (20 hour rate).

Starting Capacity—133 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.5 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under driver's seat.

STARTER:—Model MAX-4006. Armature MAW-2006.

Drive—Outboard barrel type Bendix A-1729.

Cranking Engine—125 R.P.M., 200 amps. at 5.0 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—31-42 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out two flange capscrews.

Starting Switch:—Auto-Lite Solenoid Type SS-4001. Delco-Remy Control Switch Type 1400. Solenoid switch mounted on starter and controlled by switch on instrument panel. See Equipment Section for complete data.

Solenoid Switch

Closes with terminal voltage of 4 volts or less and will remain closed until voltage drops to .75-2.0 volts. Current draw 3 amperes at 6 volts.

NOTE—Startix Type 'D' optional. Type 'F' must not be used on these cars. See article in Equip. Section.

GENERATOR:—Mod. GAR-4611A-5. GBR-4601-5. Armature GAR-2116. Third brush control in conjunction with Current Regulator (two-rate charging control). Ventilated by fan on drive pulley.

NOTE—Early 1936 cars with 'GAR' generators equipped with large pulleys. These should be checked and replaced with pulley (Part No. SP-185) which has a 2" diameter measured at bottom of belt groove or 3½" at top of groove. This pulley increases generator output at lower car speeds.

Charging Rate Adjustment—Use test meters to check generator output. Short out current regulator by connecting jumper wire from 'F' terminal on generator to ground. Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction. Remove jumper wire.

Maximum Charging Rate—22 amperes at 8.8 volts (GAR), 22 amps. at 8.0 volts (GBR). Do not exceed.

Performance Data—GAR-4611A-5

Cold Regulator Contacts Closed			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	720	0	6.4	760
4	6.8	860	4	6.8	925
8	7.25	1000	8	7.25	1125
12	7.7	1160	12	7.7	1350
16	8.1	1360	16	8.1	1680
22.4	8.8	2400	19.2	8.4	2600

Performance Data—GBR-4601-5

0	6.4	720	0	6.4	760
4	6.7	810	4	6.75	880
8	7.0	950	8	7.1	1030
12	7.3	1080	12	7.4	1460
16	7.6	1500	16	7.8	1660
22	8.0	2700	19.4	8.0	2800

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24 ozs. min. (worn brushes), 36 ozs. max. (new brushes).

Field Current—(GAR) 3.51-3.89 amperes at 6 volts, (GBR) 4.13-4.57 amperes at 6 volts.

Field Fuse—5 ampere in plug on regulator case.

Removal:—Pivot mounted at left front of engine. To remove, take out two pivot bolts, one clamp bolt and one lock bolt.

Belt Adjustment:—Loosen pivot bolts, clamp bolt and lock bolt on link, pull generator away from engine by spring scale looped on generator lug parallel to link until scale reading is 25 lbs.

RELAY-REGULATOR:—Model TC-4302-A, TC-4302-B. Mounted on generator. Consists of Cutout Relay and Current Regulator (two-rate charging control). See article in Equipment Section for complete data.

Cutout Relay

Cuts In—6.5-7.25 volts.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.015-.045".

Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.

Contacts Close—1.2-1.4 volts below opening point.

Contact Gap—.005" minimum.

Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Hall, Pre-focused type with special non-interchangeable lenses. Left headlamp aimed straight ahead, right headlamp deflected slightly to right (upper beam with lenses in place). Passing beam (lower beam left hand headlamp, upper beam right hand headlamp) controlled by foot selector switch with lighting switch in third or 'Clear Road Beam' position.

Switches

Lighting—Delco-Remy Model 480-Y.

Foot Selector—Delco-Remy Model 471-T, 471-U, or R.B.M. Model 1050-A.

Instrument Light Rheostat—Soreng-Manegold No. I-2060-A.

Stop Light—Hydraulic type mounted on brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330-C
Parking	1	51
Instrument, Tail	3	63
Stop	15	87
Dome	6	81

THERMOSTATIC RELAY:—Mounted on lighting switch (part of assembly). Non-adjustable. Contacts will remain closed with current of 25 amperes but will open in one minute with current of 38 amperes at temperature of 70-80° F.

FUSES:—Body and Stop Light—20 amperes on back of lighting switch.

Tail Lamp—20 amperes in connector near lighting switch.

Generator Field—5 amperes on regulator case.

HORNS:—Sparton. Vibrator type. One horn standard. twin horns optl. Operated by horn relay.

Horn Relay:—R.B.M. Model 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with 4 volts across winding with relay in inverted position.

SERIAL NUMBER:—Stamped on plate on engine side of dash. Use engine number (390000-1400, 1, 2; 757000-1403, 4, 5) stamped on left side of block at front of engine near oil filter.

COMPRESSION:—Ratio and pressure (std. head) as follows:

Model	Std Head	Optl. Hds.	Compres. (Std. Hd.)
1400, 1, 2	6.5-1	6.0-1, 7.0-1	110 lbs. @ 125 R.P.M.
1403, 4, 5	6.3-1	6.0-1. 7.0-1	110 lbs. @ 125 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-19" with engine idling at 350 R.P.M. or 7 M.P.H.

IGNITION:—Coil Model 539-K. Mounted on cylinder head at side of distributor.

Ignition Current—2.2 amperes idling, 4.4 stopped.

Ignition Switch:—Model 430-L. Connected to coil by armored cable. Switch has two 'on' positions (key turned to right or left). On cars with Startix, right hand 'on' position is regular running position with Startix operative. Left hand 'on' position is used to secure gasoline gauge reading or to run engine with automatic starting inoperative.

Distributor Model 662-T. Double breaker, 4 lobe cam, full automatic advance type with manual control. Contacts open alternately at regular 45° intervals corresponding to 90° firing interval of engine and must be synchronized. (See Ignition Timing).

Breaker Gap—Set at .020". Limits .018-.022".

Cam Angle or Dwell—Closed 34°. Open 11° distributor. Both sets together when properly synchronized.

Breaker Arm Spring Tension—19-23 ounces.

Condenser—Part No. 829092. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	1	600
10	1800	20	3600

Fuel Compensator—Manual adjustment at distributor providing 12° maximum advance and retard from center 'O' position. See Ignition Timing for setting.

Distributor Removal:—Mounted on left side of cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Initial settings as shown. See Fuel Compensator Setting below.

	Flywheel Degrees	Piston Position
All Models (Std. Hd.)	6° BTDC	.0168" BTDC
All Models (6.0-1 Hd.)	8° BTDC	.0299" BTDC
All Models (7.0-1 Hd.)	4° BTDC	.0075" BTDC

Timing (Stationary Contacts)—Loosen thumbnut and set Fuel Compensator at 'O'. With #1 piston on compression, turn engine over until piston reaches firing position, stop when correct graduation on vibration dampener at front of engine lines up with pointer on chain case cover (vibration dampener has fifteen 1° graduations before the dead center mark 'DC/1-8'—see table above for setting for each type engine). Loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt. Then synchronize movable contacts.

Timing (With Neon Timing Light)—This method recommended by manufacturer. Connect lead to #1 spark plug wire. With engine idling, adjust distributor so that timing mark (as indicated above) lines with pointer on chain case cover.

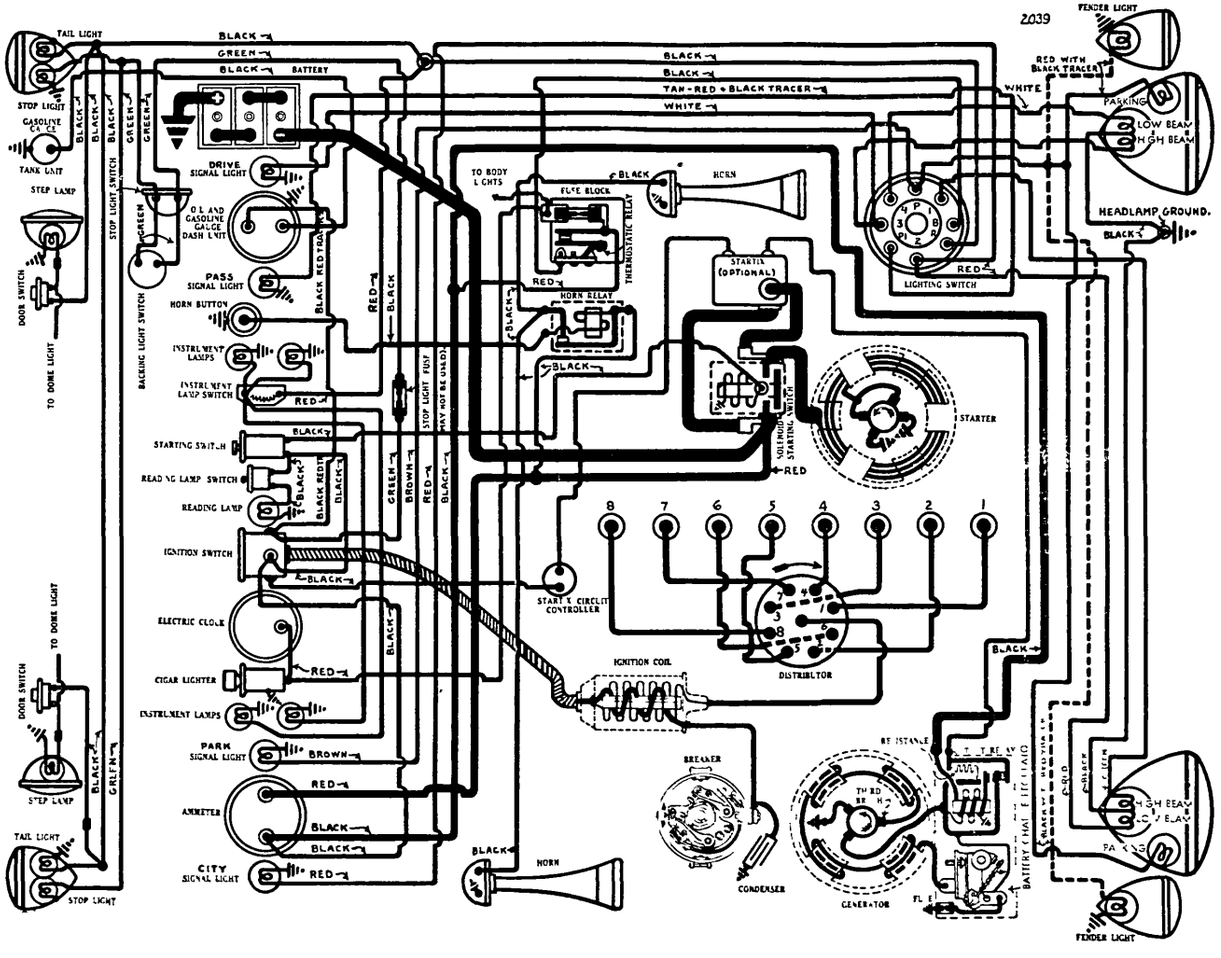
Synchronization (Movable Contacts)—Synchronization may be checked with the Neon Timing Light. Connect lead to #6 spark plug wire and direct light at pointer on chain case. With correct line before mark 'DC/2-6' marked in chalk for better visibility (see table above), idle engine. This line should line up with pointer on chain case cover. Engine must be stopped to set synchronization. To adjust, turn engine over to #6 firing position, loosen lockscrews on sub-plate carrying movable contacts, turn eccentric adjusting screw until contacts begin to open, tighten lockscrews.

Synchronization (Other Methods)—See Equipment Section for directions on synchronization using Delco-Remy synchronizing tool #1838182. If distributor synchronized by using other types of equipment, set firing intervals at regular 45-45-45 (distributor degrees).

NOTE—Manufacturer recommends use of Winn Synchrometer (Packard Tool #ST-913) to synchronize contacts.

Timing (Motor Gauge)—Weidenhoff Adapter #114, Rod #5.

Fuel Compensator Setting—Provides manual adjustment at distributor for octane rating of fuel used. After ignition set as above, road test car to give a slight 'ping' pulling heavy load. Adjusted by loosening thumbnut and advancing or retarding pointer on scale. Adjustment permits 12° advance or retard from center 'O' position.



Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—AC. Type K-7, Champion J-8, 14 MM. Metric.

Spark Plug Gap—.028-.030".

CARBURETION:—Carburetor—Stromberg Model EE-23. 1¼" dual downdraft type with integral automatic choke. See Carburetion Section for adjustments, overhaul and Jet Specifications.

NOTE—Do not adjust carubretor until engine is

warmed up so that choke valve is wide open and engine idling at slow or hot idling speed.

Idle Adjustment—Set throttle stopscrew so that engine idles at 350 R.P.M. or 7 M.P.H. Turn inner idling adjusting screw in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Repeat with outer idling adjusting screw. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Adjusted by changing position of pump link rod in throttle valve lever. Inner Hole (Min. stroke)—Summer temperatures. Outer Hole (Max. stroke)—Winter temperatures.

Fast Idle:—Integral with carburetor. For complete data see article on Stromberg Automatic Choke on EE-23 Carburetors.

Adjustment—With engine cold, open and close the throttle allowing choke to close; if engine hot, choke must be held in closed position manually. With fast idle adjusting screw backed away from fast idle cam, turn screw in until it just contacts cam, then turn screw in 2½-3 turns.

Automatic Choke:—With integral Fast Idle. See separate article (Stromberg EE-23) in Carburetion Section for complete data.

Air Cleaner:—AC. #1525441 oil-wetted type standard, #1525905 heavy duty oil bath type optional.

Fuel Pump:—AC. Type F. #1521777. Combination fuel-and-vacuum pump. See separate article in Carburetion Section.

Gasoline Gauge:—AC. Electric #1515310 (dash unit), #1515400 (tank unit—except sedan), #1515401 (tank unit—sedan only).

VALVE TIMING:—To Check Timing—Check tappet clearance #1 intake valve. This valve should open with piston 30° or .4070" before top dead center when flywheel mark 'INT' (visible through starter mounting hole in flywheel housing with starter removed) lines up with indicator on housing within case.

Motor Gauge—Weidenhoff Adapter #114, Rod #5.

Tappet Clearance:—.004" Int., .006" Ehx., engine warm.

Valve Spring Pressure:—73 lbs. at 3 1/16" (valve closed).

LUBRICATION:—Crankcase Capacity—8 qts. (1400,1,2), 9½ qts. (1403, 4,5).

Normal Oil Pressure—35 lbs.

BATTERY:—Prest-O-Lite, Type H4-21. 6 volt, 21 plate, 150 ampere hour capacity (20 hour rate).

Starting Capacity—175 amperes for 20 minutes.

Zero Capacity—300 amperes for 6.3 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under rear compartment floor boards.

Willard, Type RH-5-19 (Export). 6 volt, 19 plate, 153 ampere hour capacity (20 hour rate).

Starting Capacity—180 amperes for 20 minutes.

Zero Capacity—300 amperes for 6.6 minutes.

STARTER (1400, 1, 2):—Auto-Lite Model MAX-4014.

Armature No. MAW-2090.

Drive—Outboard Barrel Type Bendix Model A-1729.

Cranking Engine—125 R.P.M., 160 amperes, 5.2 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
.65 "	3300	5.5	100
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Starter sleeve mounted in left front face of flywheel housing. To remove, take out pilot mounting screw in flywheel housing.

Starting Switch:—Solenoid Type SS-4001. Controlled by pushbutton switch on instrument panel. Operative with ignition switch 'on.' See Equipment Section for complete data.

Solenoid Switch

Closes with terminal voltage of 4 volts or less and will remain closed until voltage drops to .75-2.0 volts. Current draw 3 amperes at 6 volts.

Startix (optional)—Type 'F' automatic starting switch and Startix circuit controller (anti-backfire unit), controlled by ignition switch. See article in Electrical Equipment Section for complete data.

NOTE—Control Unit (Relay Regulator) has extra terminal and resistance coil which are used with Startix Type 'F.'

STARTER (1403, 4, 5):—Owen-Dyneto Model DN-1298.

Armature No. 13409.

Drive—Outboard Bendix Type RCD10FXTD.

Cranking Engine—125 R.P.M., 130 amperes, 5.6 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—56-60 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	6.0	50
2 "	1600	5.6	120
3.3 "	1200	5.45	150
6.3 "	800	5.2	210
15.0 "	400	4.65	360
35.0 "	Lock	3.5	650
39.0 "	Lock	3.6	810

Starting Switch:—Solenoid Type SS-4001A. See data directly above for this switch, Startix and Removal.

GENERATOR:—Model CO-1300. Armature No. 23865. Air-cooled. Third brush control type with Battery Charge Regulator (two-step charging rate).

Charging Rate Adjustment—Third brush shifted through rack-and-pinion control by slotted screw on commutator end plate. Turn adjusting screw to right or clockwise to increase, and left or counter-clockwise to decrease charging rate.

Maximum Charging Rate—30-33 amperes (cold), 24-27 amperes (hot) at 8.0 volts.

Performance Data

Cold — Regulator Inoperative — Hot

Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	7.0	580	0	7.3	625
5	7.2	630	5	7.5	700
10	7.5	700	10	7.7	800
15	7.7	790	15	7.9	930
20	7.9	910	20	8.0	1100
25	8.0	1080	25	8.0	1380
30	8.0	1380	28	8.0	2000
32	8.0	1900			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—20-22 ozs. (main), 12-14 ozs. (third).

Field Current—3.5-3.7 amperes at 6.0 volts.

Motoring Current—16.7-18 amperes at 6.0 volts (½ ampere more if relay and regulator in circuit).

Field Fuse—5 ampere capacity in knurled plug in side of regulator case.

Removal:—Generator flange mounted on right rear face of timing chain case. To remove, take out three mounting screws, pull generator to rear to disengage drive coupling, lift out. Do not disturb intermediate flange carrying drive sprocket.

Chain Adjustment:—Loosen generator flange mounting screw, pull generator out or away from engine until sideplay as measured at chain case is ¼", tighten mounting screws. Adjust chain whenever sideplay exceeds ½".

CONTROL UNIT (RELAY-REGULATOR):—Model 40210. Consists of Cutout Relay (No. 40203) with auxiliary contacts and resistance coil (for use with Startix Type 'F") and Battery Charge Regulator.

Cutout Relay

Cuts In—6.8-7.2 volts, 600 R.P.M.

Cuts Out—0-2.5 amperes discharge current.

Contact Gap—.030-.032".

Air Gap—.020-.025" with contacts closed.

Auxiliary Contacts—Should open when main contacts close, close when main contacts open.

Battery Charge Regulator

Setting—8.2 volts (cold), 7.8 volts (hot)—contact opening point.

Regulator Resistance—1.85 ohms.

LIGHTING:—Headlamps—Hall, Pre-focused Flex-beam type with special non-interchangeable lenses. Headlamps aimed straight ahead with lighting switch in 'Country Driving' (upper beam) position. 'Country Passing' beam (upper beam right hand headlamp, lower beam left hand headlamp) controlled by lighting switch.

Headlamp Beam Indicator—Separate beam indicator for each position of lighting switch (1—Parking, 2—City Driving, 3—Country Driving, 4—Country Passing), located on instrument panel.

Switches

Lighting—R.B.M. Model 1400.

Instrument Lamp Rheostat—Soreng-Manegold No. J2060A.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Parking or Fender	3	63
Instr., Tail, Courtesy	3	63
Stop	15	87
Dome	6	81
Indicators	1	51

THERMOSTATIC RELAY:—(On Delco-Remy Model 1050-W Fuse Block). Thermostatic arm type current limit relay (no winding). Connected in lighting circuits. Contacts open with current load of 38 amperes at 70° F.

FUSES:—Body Lights—20 ampere on fuse block (see above).

Generator Field—5 amperes in knurled plug on side of regulator case.

HORNS:—Sparton Twin Horns. Vibrator type. Operated by horn relay.

Horn Relay:—R.B.M. Model 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with relay in inverted position.

SERIAL NUMBER:—Stamped on plate on left front side of dash. Use engine number stamped on front of left cylinder block below head. First number—904000.

COMPRESSION:—Ratio 6.4-1 (Std. aluminum head)., 6.0-1, 7.0-1 (optl. aluminum heads). Compression 110 lbs. at 125 R.P.M. for standard head (6.4-1).

VACUUM READING:—Gauge should show steady reading of 18-19" with engine idling at 375 R.P.M. or 8 M.P.H.

IGNITION:—Coil Model CE-4022 (1407), CE-4023 (1408). Two coil unit mounted at front of engine.

Ignition Current—6 amps. idling, 10 amps. stopped (total for both coils).

Ignition Switch:—Delco-Remy, Type 430-M. Connected to coil unit by armored cable. Switch has two 'on' positions (key turned to left or right). On cars with automatic starting, right hand 'on' position is regular running position. Key should be turned to left to secure gasoline gauge reading with engine not running.

Distributor Model IGO-4002-A. Double breaker, 6 lobe cam, full automatic advance type with 'Fuel Compensator' or manual adjustment at distributor. Contacts open alternately at 33½ and 26½ degree intervals corresponding to unequal 67 and 53 degree firing intervals of engine (caused by 67° included angle between banks) and must be synchronized (see Timing).

Breaker Gap—Set at .020". Limits .018-.022".

Cam Angle or Dwell—Closed 40°. Open 20° distributor. Eeach set operates separately and controls one coil.

Breaker Arm Spring Tension—20 ozs. at tip of arm.

Condenser—Part No. IG-2671E,A. (one of each). Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	525	4	1050
4	750	8	1500
6	975	12	1950
8	1200	16	2400

Fuel Compensator—Manual adjustment at distributor providing 10° maximum advance and retard from center 'O' position. See Ignition Timing for setting.

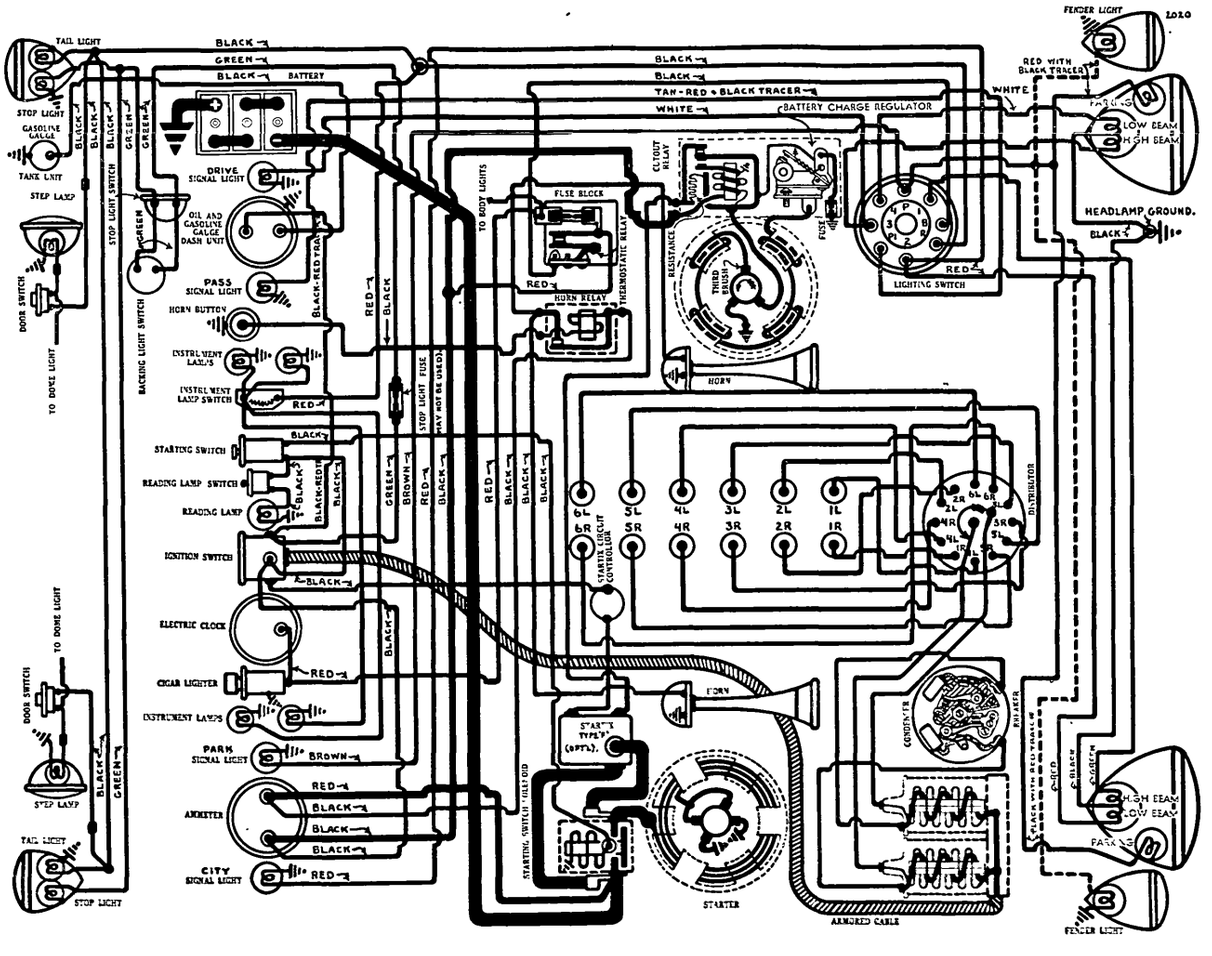
Distributor Removal:—Distributor mounted on bracket between cylinder banks at front of engine. To remove, take out screws in bracket.

IGNITION TIMING:—Initial setting as shown. See Fuel Compensator Setting below.

	Flywheel Degrees	Piston Pos.
7.0-1 High Comp.	4° BTDC	.0063" BTDC.
6.4-1 Std. Comp.	6° BTDC	.0145" BTDC.
6.0-1 Low Comp.	8° BTDC	.0255" BTDC.

Timing (Stationary Contacts):—Loosen thumbnut and set Fuel Compensator at 'O'. With #1R piston (front piston—right bank) on compression, turn engine over until piston reaches firing position, stop when correct graduation on vibration dampener at front of engine lines up with pointer on chain case cover (vibration dampener has fifteen 1° graduations before the dead center mark '1R-UDC' see table above for correct setting). Loosen clamp screw on mounting bracket, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp screw. Then synchronize movable contacts.

Timing (With Neon Timing Light)—This method recommended by manufacturer. Connect lead to #1 spark plug wire. With engine idling, adjust distributor so that timing mark (as indicated above) lines up with pointer on chain case cover. Mark should be painted white for better visibility.
Motor Gauge—Weindenhoff Adapter #114, Rod #2.



Synchronization (Movable Contacts):—Synchronization may be checked with Neon Timing Light. Connect lead to #6L spark plug wire and direct light at pointer on chain case. With correct line before mark '6L-UDC' (see table above) marked in chalk for better visibility, idle engine. This line should line up with pointer on chain case cover. Engine must be stopped to set synchronization. To adjust, turn engine over to #6L firing position, loosen lockscrews on movable sub-plate, shift plate by turning eccentric adjusting screw until movable contacts begin to open, tighten lockscrews.

Synchronization (Other Methods)—If distributor synchronized by other methods, set movable points to open 33½° after fixed points. Distributor firing intervals are unequal 33½-26½-33½ distributor degrees.

NOTE—Manufacturer recommends use of Winn Synchrometer (Packard Tool #ST-913) to synchronize contacts.

Fuel Compensator Setting:—Should be set to provide best performance with a slight ping pulling heavy load. Adjusted by loosening thumbnut and moving pointer to left or right from center 'O' position.

Firing Order:—1R-6L-5R-2L-3R-4L-6R-1L-2R-5L-4R-3L with cylinder banks right (R) and left (L) as viewed from driver's seat and #1 cylinder nearest radiator. Spark plugs not connected in this order on distributor cap (see diagram).

Spark Plugs:—AC. Type K-7, Champion J-8, 14 MM. Metric.

Spark Plug Gap—.028-.030".

CARBURETION—Carburetor—Stromberg Model EE-3. 1½" dual downdraft type with Stromberg type 'C' automatic choke. See Carburetion Section for adjustments, overhaul and Jet Specifications.

NOTE—Do not adjust carburetor until engine is warmed up and choke valve is wide open and engine idling at slow or hot idling speed.

Idle Adjustment—Set throttle stopscrew so that engine idles at 375 R.P.M. or 8 M.P.H. Turn inner idling adjusting screw in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Repeat with outer idling adjusting screw. Readjust throttle stopscrew for correct idling speed. See separate article for other methods of adjustment on Stromberg EE-3 carburetors.

Accelerating Pump Setting—Adjusted by changing position of pump link rod in throttle valve lever. Inner Hole (Min. stroke)—Summer temperatures. Outer Hole (Max. stroke)—Winter temperatures.

Fast Idle:—To adjust with engine cold, open and close throttle allowing choke to close (if engine hot hold fast idle stopweight down with fast idle adjusting screw resting on ear of fast idle stopweight). Loosen locknut on adjusting screw, back off screw until it is free of stop, turn screw in until it just contacts stop, then turn screw in 2-2½ turns, finally tighten locknut on adjusting screw. See article in Carburetion Section.

Automatic Choke:—Stromberg Type 'C'. No adjustment required. See separate article in Carburetion Section for complete data.

Air Cleaner:—AC. #1525442 oil-wetted type standard, #1525902 heavy duty oil bath type optional.

Fuel Pump:—AC. Type I. #1521778. Combination fuel-and-vacuum pump.

Gasoline Gauge:—AC. Electric #1515309 (dash unit), #1515400 (tank unit—except sedan), #1515401 (tank unit—sedan only).

VALVE TIMING:—To Check Timing—Intake valve in #1 cylinder of right hand bank (1R) should begin to open with piston No. 6R on top dead center entering power stroke when mark '1R-UDC' on vibration dampener at front of engine lines up with pointer on chain case cover.

Motor Gauge—Weidenhoff #114 Adapter, #2 Rod.

Tappet Clearance:—None in service (automatic take-up) See article in Mechanical Equipment Section.

Valve Spring Pressure:—70 lbs. at 2 7/32" (valve closed).

LUBRICATION:—Crankcase Capacity—10 qts.
Normal Oil Pressure—35 lbs. at 1000 R.P.M.

BATTERY:—Prest-O-Lite, Type H4-21. 6 volt, 21 plate, 150 ampere hour capacity (20 hour rate).

Starting Capacity—175 amperes for 20 minutes.

Zero Capacity—300 amperes for 6.3 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under rear compartment floor boards.

STARTER:—Model DN-1299. Armature No. 13409.

Drive—Outboard Bendix Type RCD10FXTD.

Cranking Engine—125 R.P.M., 130 amps. at 5.6 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—56-60 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	6.0	50
2 "	1600	5.6	120
3.3 "	1200	5.45	150
6.3 "	800	5.2	210
15.0 "	400	4.65	360
35.0 "	Lock	3.5	650
39.0 "	Lock	3.6	810

Removal:—Starter sleeve mounted on right front face of flywheel housing. To remove, take out pilot mounting screw in flywheel housing.

Starting Switch:—Solenoid Type SS-4001A. Mounted on starter and controlled by pushbutton switch on instrument panel. Operative with ignition switch turned 'on'. See Equipment Section for complete data.

Solenoid Switch

Closes with terminal voltage of 4 volts or less and will remain closed until voltage drops to .75-2.0 volts. Current draw 3 amperes at 6.0 volts.

Startix (Optional)—Type 'F' automatic starting switch and Startix Circuit Controller (back-fire unit), controlled by ignition switch. See article in Electrical Equipment Section for complete data.

NOTE—Control unit (Cutout Relay) has extra terminal and resistance coil which are used with Startix Type F.

GENERATOR:—Model CO-1304. Armature No. 23691. Air-cooled, third-brush control type with Battery Charge Regulator (two-step charging control).

Charging Rate Adjustment—Third brush shifted through rack-and-pinion control by slotted screw on commutator end plate. Turn adjusting screw to right or clockwise to increase, and left or counter-clockwise to decrease charging rate.

Maximum Charging Rate—30-33 amperes (cold), 24-27 amperes (hot) at 8.0 volts.

Performance Data—Regulator Inoperative

Cold			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	7.0	580	0	7.3	625
5	7.2	630	5	7.5	700
10	7.5	700	10	7.7	800
15	7.7	790	15	7.9	930
20	7.9	910	20	8.0	1100
25	8.0	1080	25	8.0	1380
30	8.0	1380	28	8.0	2000
32	8.0	1900			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—20-22 ozs. (main), 12-14 ozs. (third).

Field Current—3.5-3.7 amperes at 6.0 volts.
Motoring Current—16.7-18 amperes at 6.0 volts (½ ampere more if relay and regulator in circuit).

Field Fuse—5 ampere capacity in knurled plug in side of regulator case.

Removal:—Generator mounted on special pivot bracket at left front of engine with fan belt drive. To remove, take out clamp bolt at top of generator and pivot bolt at bottom.

Belt Adjustment:—Loosen clamp bolt above generator, swing generator away from engine until reading on scale attached to field frame is 180 lbs.

CONTROL UNIT (RELAY-REGULATOR):—Mod. 40210. Consists of Type 40203 Cutout Relay with auxiliary contacts and resistance coil (for use with Type 'F' Startix) and Battery Charge Regulator in case on generator. See Equipment Section for data on these units.

Cutout Relay

Cuts In—6.8-7.2 volts, 600 R.P.M.

Cuts Out—0-2.5 amperes discharge current.

Contact Gap—.030-.032".

Air Gap—.020-.025" with contacts closed.

Auxiliary Contacts—Should open when main contacts close, close when main contacts open.

Battery Charge Regulator

Setting—8.2 volts (cold), 7.8 volts (hot)—contact opening point.

Regulator Resistance—1.85 ohms.

LIGHTING:—Headlamps—Hall, Pre-focused Flex-beam type with special non-interchangeable lenses. Head lamps aimed straight ahead with lighting switch in 'Country Driving' (upper beam) position. 'Country Passing' beam (upper beam right hand headlamp, lower beam left hand headlamp) controlled by lighting switch.

Headlamp Beam Indicator—Separate beam indicator for each position of lighting switch (1—Parking, 2—City Driving, 3—Country Driving, 4—Country Passing), located on instrument panel.

Switches

Lighting—R.B.M. Model 1400.

Instrument Lamp Rheostat—Soreng-Manegold No. J2060A.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Parking or Fender	3	63
Instrument, Tail, Courtesy	3	63
Stop	15	87

Indicators	1	51

THERMOSTATIC RELAY:—(On Delco-Remy Model 1050-W Fuse Block). Thermostatic arm type current limit relay (no winding). Connected in lighting circuits. Contacts open with current load of 38 amperes at 70° F.

FUSES:—Body Lights—20 ampere on fuse block (see above).

Generator Field—5 amperes in knurled plug on side of regulator case.

HORNS:—Sparton Twin Horns. Vibrator type. Operated by horn relay.

Horn Relay:—R.B.M. Model 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with relay in inverted position.

SIX, MODEL 115C

NOTE:—Delco-Remy equipment shown below used on first cars. Auto-Lite equipment used on later cars. See following pages for complete data on Auto-Lite equipment and for Tune Up data (Ignition Timing, Carburetion, Battery, Lighting) for all cars.

SERIAL NUMBER:—Stamped on plate on engine side of dash. Use engine number (T-1526 & Up) stamped on boss on left side of engine block near distributor.

IGNITION:—Coil Model 539-N. Mounted on left side of engine near distributor.
Coil Draw—½ ampere idling, 2½ stopped.
Ignition Switch:—Delco-Remy Model 435-L. Switch and cable assembly. Connected to coil by armored cable.
Ignition Lock—Briggs & Stratton No. 50184 (Lock cylinder). Key series—P1251-P1500.
Distributor Model 647-E. Single breaker, 6 lobe cam, full automatic advance with auxiliary vacuum spark control.
Breaker Gap—Set at .015".
Cam Angle or Dwell—36° (closed), 24° (open).
Breaker Arm Spring Tension—19-23 ounces.
Condenser—Part No. 1865972. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	1.5	600
3.25	600	6.5	1200
10.75	2000	21.5	4000

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port in carburetor above throttle) except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

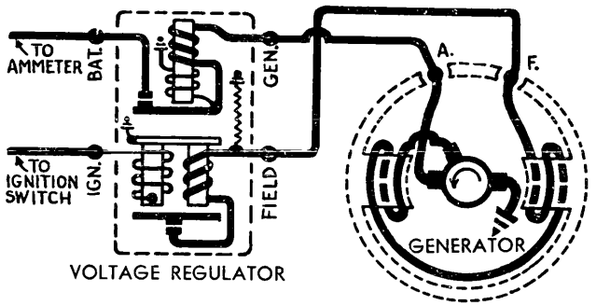
Engine Degrees	Vacuum (" of HG.)
Start	5-7"
15° Maximum	15-19"

Fuel Compensator—Manual adjustment at distributor providing 10° maximum advance and retard from center '0' position. See Ignition Timing for setting.
Distributor Removal:—Mounted on left side of engine. To remove, take out hold-down screw in advance arm.

STARTER:—Model 739-F. Armature No. 1866105.
Drive—Outboard barrel type Bendix A-1718.
Cranking Engine—125 R.P.M., 200 amps., 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs. each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5	65
12 ft. lbs.	Lock	3	475



Removal—Starter flange mounted on left front face of flywheel housing. To remove, take out flange screws.
Starting Switch:—Type 1539 Magnetic switch controlled by switch Type 1417 on instrument panel.

GENERATOR:—Model 948-U. Armature No. 1854856. Fixed third brush control type with external vibrating voltage regulator. Ventilated by fan on drive pulley.
NOTE—Third brush is clamped in position for maximum safe output and should not be disturbed.
Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data below and special article in Electrical Equipment Section for procedure and settings.
Maximum Charging Rate—As given in table below. Reached at car speed of approx. 30 M.P.H. To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'BAT' terminal and ground, ground 'F" terminal to eliminate regulator action.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22	8.0	3000
Hot	18	8.0	3500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third).
Field Current—2.3-2.6 amperes at 6 volts.
Removal:—Generator pivot mounted on left front of engine. To remove, take out clamp bolt and pivot bolts.
Belt Adjustment:—With bolts loose, swing generator away to give 25 lbs. reading on scale attached to clamp bolt, or ½" thumb deflection on belt midway between generator and fan pulleys.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5812 or 5827. Mounted on engine side of dash. Consists of Cutout Relay and vibrating type Voltage Regulator.
See Article in Electrical Equipment Section.

Cutout Relay
Cuts In—6.5-7.0 volts.
Cuts Out—3 amperes max. at 6.3 volts.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator
Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator over-compensated for temperature and must be checked at these points.
Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator spring tension by bending spring hanger at lower end of armature spring slightly until performance is as given above.
NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open-circuit.
Contact Gap—.015-.025".
Contact Spring Tension—2.7-3.5 ounces.
Air Gap—.060-.070" between armature and center of core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.

SUPER EIGHT, MODELS 1500, 1, 2

NOTE:—Delco-Remy Starter, Generator, Regulator, and Ignition System as given below used on first cars. Auto-Lite equipment used on later cars. See succeeding Super Eight article for complete tune up data (including Ignition Timing), Battery, and Lighting for all 1937 cars.

SERIAL NUMBER:—Stamped on plate on front of dash. Use engine number (395526 and Up) stamped on left side of engine near starter.

IGNITION:—Coil Model 539-K. Mounted on cylinder head to left of distributor.
Ignition Current—½ ampere idling, 2½ amperes stopped.
Ignition Switch:—D-R Model 430-L. Connected to coil by armored cable.
Distributor Model 663-L:—Single breaker, 8 lobe cam, full automatic advance type with vacuum spark control.
Breaker Gap—.015". Limits .0125-.0175".
Cam Angle or Dwell—31° (closed), 14° (open).
Breaker Arm Spring Tension—19-23 ounces.
Condenser—Part No. 1866049. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	1.5	600
9.75	2000	19.5	4000

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port in carburetor above throttle) except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG)
Start	6-8"
13° Max.	14-18"

Fuel Compensator—Manual adjustment at distributor provides 12° maximum advance or retard from center 'O' position. See Ignition Timing for setting.
Removal:—Distributor mounted on cylinder head. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

STARTER:—Model 729-H. Armature No. 1836105.
Drive—Outboard barrel type Bendix A-1729.
Cranking Engine—125 R.P.M., 175 amperes, 5.1 volt.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs. (each).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5	60
16 ft. lbs.	Lock	3.0	600

Removal:—Starter sleeve mounted on left front face of flywheel housing. To remove, take out pilot mounting screw in flywheel housing.
Starting Switch:—Type 1540 Magnetic switch mounted on starter controlled by separate push button switch on instrument panel.
NOTE—Plunger in end of magnetic switch can be used for starting engine at starter.

GENERATOR:—Model 961-J. Armature No. 1857866. Straight shunt (two brush) type with external current and voltage regulation. Ventilated by fan on drive pulley.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output controlled by Current Regulator. See Control Unit section below.
Maximum Charging Rate—25 amperes (cold) with discharged battery as indicated on test ammeter

SUPER EIGHT, MODELS 1500, 1, 2—Cont.

connected in line at 'BAT' terminal on Control Unit. Decreases as battery comes up on charge. Generator output constant at all speeds above 1650 R.P.M. or approx. 25 M.P.H.

Performance Data—Generator Cold

Amperes	Volts	R.P.M.
25	8.0	1650

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces.
Field Current—2.0-2.2 amperes at 6 volts.
Motoring Current—3.75 amps @ 6 volts, 450 R.P.M.
Removal:—Generator pivot mounted at left front of engine. To remove, take out mounting bolts.
Belt Adjustment:—With bolts loose, swing generator away to give 30 lbs. reading on scale attached to clamp bolt, or ½-¾" thumb deflection on belt midway between generator and fan pulleys.

CONTROL UNIT:—Model 5813. Mounted on dash. Consists of Cutout Relay, Vibrating Voltage and Current Regulator, in a single case.
NOTE—Cover of case is sealed. Units can be checked without breaking seal. To adjust, seal must be broken.
See Article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5-7.0 volts at 72° F.
Cuts Out—3 ampere max. discharge at 6.3 volts.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 72° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.
Checking—To check without breaking seal, disconnect lead at 'IGN' terminal on case, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3400 R.P.M. Check with setting as above (with 8-10 amps. charging rate).
To Adjust—This requires breaking of seal in order to remove cover. With voltmeter and ammeter connected (as above), set regulator by bending spring hanger at lower end of armature spring until performance is as shown above. Remove jumper and restore original connections.
NOTE—Voltage Regulator readings must be taken with cover on unit and setting should be checked by decreasing speed until Cutout Relay contacts open, and then increasing speed to original point.
Contact Gap—.015-.025".
Contact Spring Tension—3.5 ozs. minimum.
Air Gap—.060-.070" between armature and core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.

Current Regulator

Setting—24-26 amperes.
Checking—To check without breaking seal, disconnect 'IGN' and 'BAT' leads, connect ammeter with one lead to 'BAT' terminal and other to 'BAT' lead. Operate generator and check setting.
To Adjust—This requires breaking of seal. Proceed as outlined above and set regulator by bending spring hanger at lower end of armature spring until maximum output is as given.
NOTE—Generator voltage must not be allowed to exceed 8.5 volts with Voltage Regulator shorted out.
Contact Gap—.015-.025".
Contact Spring Tension—3.5 ozs. minimum.
Air Gap—.070-.080" between armature and core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.
NOTE—To repolarize generator whenever Control Unit is disconnected or removed, connect jumper between 'GEN' and 'BAT' terminals momentarily (after all leads connected). Do not run engine.

TWELVE, MODELS 1506, 7, 8

NOTE:—Delco-Remy Starter, Generator, and Regulator as shown below used on first cars. Auto-Lite equipment used on later cars. See succeeding article on Packard Twelve for complete tune up data (including Ignition), Battery, and Lighting for all 1937 cars.

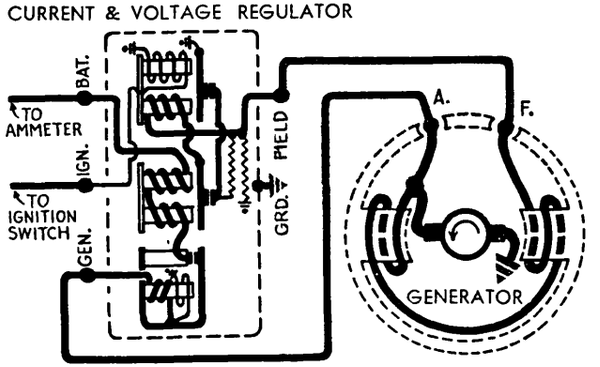
SERIAL NUMBER:—Stamped on plate on front of dash. Use engine number (905526 and up) stamped on left side of engine block below head.

STARTER:—Model 664. Armature No. 1866090.
Drive—Outboard Bendix Type RCD10FXTD.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—36-40 ounces.
Cranking Engine—125 R.P.M., 240 amps. 4.75 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	5.0	70
19 "	Lock	3.0	500

Removal:—Starter sleeve mounted in right front face of flywheel housing. To remove, take out pilot mounting screw in flywheel housing.
Starting Switch:—Model 1541. Magnetic type mounted on starter field frame. Controlled by pushbutton on instrument panel.



GENERATOR:—Model 930-F. Armature No. 1866069.
Straight shunt, two brush type with external voltage and current regulation. Ventilated by fan on drive pulley.
Maximum Charging Rate—28 amperes (cold), 8.0 volts, 1850 R.P.M. and above, with discharged battery (as indicated on test ammeter connected in charging line at 'BAT' terminal of regulator). Decreases as battery comes up on charge. Generator output constant at all speeds above 1850 R.P.M. or approximately 25 M.P.H.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output controlled by Current Regulator. See Control Unit Section below.

Performance Data—Generator Cold

Amperes	Volts	R.P.M.
28	8.0	1450

Rotation—Counter-clockwise at commutator end.

CURRENT & VOLTAGE REGULATOR

Packard Super Eight and Twelve

Brush Spring Tension—22-26 ounces.
Field Current—1.8-2.3 amperes at 6.0 volts.
Motoring Current—500 R.P.M., 4.25 amps., 6 volts.
Removal:—Generator mounted on special pivot bracket at left front of engine with fan belt drive. To remove, take out clamp bolt and pivot bolts.
Belt Adjustment:—Attach spring scale by wire looped over generator field frame, loosen pivot bolts and clamp bolt, pull generator away from engine until scale reading is 70-80 lbs.
NOTE—Replace drive belts in matched pairs only

CONTROL UNIT:—Model 5811. Mounted on dash. Consists of Cutout Relay, vibrating Voltage Regulator, and vibrating Current Regulator in a single case.
NOTE—Cover of regulator case is sealed. Units can be checked without breaking seal. Seal must be broken to make adjustments (voids warranty).
See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5-7.0 volts.
Cuts Out—3 ampere maximum discharge current.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.
Checking—To check without breaking seal, disconnect lead at 'IGN' terminal on case, connect jumper between 'IGN' and 'BAT' terminals, connect ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3400 R.P.M., adjust charging rate to 8-10 amperes, check voltage.
To Adjust—Remove cover (seal must be broken). Set regulator by bending spring hanger at lower end of armature spring until performance is as shown above (replace cover to check performance).
NOTE—All voltage regulator readings must be taken with cover in place. Cycle generator before taking readings by decreasing speed until Cutout Relay Contacts open and then increasing speed to original point.
Contact Gap—.015-.025".
Contact Spring Tension—3.5 ozs. minimum.
Air Gap—.060-.070" between armature and core with armature down so that fiber bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.

Current Regulator

Setting—28-30 amperes.
Checking—To check without breaking seal, disconnect 'IGN' lead at regulator case, connect test ammeter in charging line at 'BAT' terminal. Operate generator and increase speed until output is constant. Must not exceed setting as given above.
NOTE—Do not allow voltage to exceed 8.5 volts with regulator inoperative.
To Adjust—Remove cover (seal must be broken). Set regulator by bending spring hanger at lower end of armature spring until correct setting is secured (replace cover to check performance).
Contact Gap—.015-.025".
Contact Spring Tension—3.5 ozs. minimum.
Air Gap—.070-.080" between armature and core with armature down so that fiber bumper just touches stop. .008-.013" between fibre bumper and stop with armature up.
NOTE—Repolarize generator whenever Control Unit is disconnected or removed by connecting jumper between 'GEN' and 'BAT' terminals momentarily after all leads have been connected.

NOTE:—Delco-Remy electrical equipment (Distributor, Coil, Starter, Generator) used on first cars. See previous page for complete data. Tune up data below applies for all cars.

SERIAL NUMBER:—Stamped on plate on front of dash. Use engine number (T-1526 and Up) stamped on boss on left side of engine block near distributor.

COMPRESSION:—Ratio—6.3-1 Std., 6.75-1 Optl.

Pressures—105 lbs. (Std. 6.3-1 cast-iron head), 115 lbs. (Optl. 6.75-1 aluminum head) at cranking speed of 125 R.P.M.

VACUUM READING:—18-20" steady reading with engine idling at 6-8 M.P.H.

IGNITION:—Coil Model CE-4627. Service Coil CE-3224-ES (coil less switch and cable). Coil mounted on left side of engine block.

Coil Draw—½ ampere idling, 2½ stopped.

Ignition Switch:—Mitchellock Model 24-B. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton No. 50184 (cylinder). Key Series—P1251-P1500.

Distributor Model IGS-4011. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—Set at .018".

Cam Angle or Dwell—40° (closed), 20° (open).

Breaker Arm Spring Tension—18-20 ozs. (special).

Condenser—Part No. IG-2671K. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
.8	400	1.6	800
2	560	4	1120
4	880	8	1760
6	1240	12	2480
8	1620	16	3240
10	2000	20	4000

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port in carburetor above throttle) except when engine accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	6"
3	8.2"
6	10.4"
9	12.5"
12	14.8"
15	17.0"

Fuel Compensator—Manual adjustment at distributor providing 10° maximum advance or retard from center '0' position. See Ignition Timing for setting.

Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING:—For all engines as follows:

	Flywheel Degrees	Piston Position
Std. 6.3-1 head	2½-4° BTDC	.0025-.0064" BTDC.
Optl. 6.75-1 head	4 -6° BTDC	.0064-.0143" BTDC.

To Set Timing—Remove cover over inspection hole in left front face of flywheel housing under starter. Loosen thumbnut and set Fuel Compensator at '0', tighten thumbnut. With #1 piston on compression, turn engine over until piston reaches firing position, stop when correct graduation on flywheel before dead center mark #1UP D.C. lines up with pointer in inspection hole, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor opposite #1 segment in distributor cap.

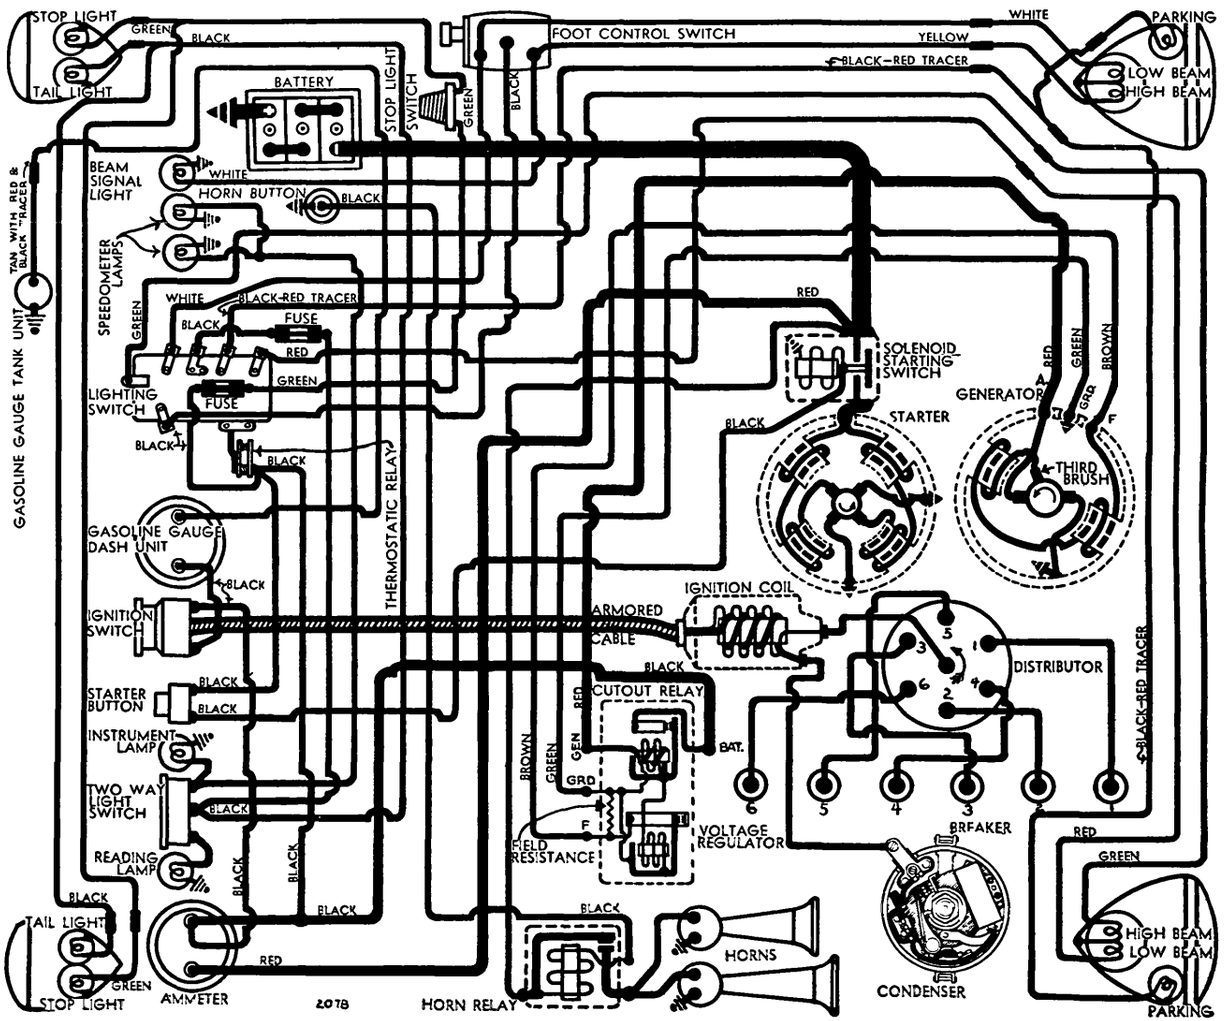
Timing (Neon Timing Light)—White mark provided on flywheel at firing point for std. 6.3-1 engine. Mark flywheel similarly at correct firing point when timing Optl. 6.75-1 engines.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type Y-4. 10 MM. Metric type.

NOTE—Y-4 discontinued by AC. Use No. 103.

NOTE—This is new type small plug. Use only thumb-and-finger pressure on 4½" wrench to tighten plugs.



Spark Plug Gaps—.026-.030".

CARBURETION:—Carburetor—Chandler-Groves (C-G) Model AOC-2, 1¼" Single barrel downdraft type. **See article in Carburetion Section for data.**

Idle Adjustment—With engine warmed up so that Automatic Choke and Fast Idle inoperative, adjust throttle stopscrew so that engine idles at 8 M.P.H. Turn idle adjusting screw in until engine begins to miss, then out until engine rolls, finally turn screw in slowly until engine fires smoothly. Readjust stopscrew for correct idle speed.

Accelerating Pump Setting—Throttle lever has three holes for pump link engagement. Set as follows:

Inner Hole (Min. stroke)—Hi-test fuel or high temperatures.

Center Hole—Normal temperatures.
Outer Hole (Max. stroke)—Low-test fuel or low temperatures.

Fast Idle:—Integral with carburetor.
See article in Carburetion Equipment Section.

Automatic Choke:—Integral with carburetor.
See article in Carburetion Equipment Section.

Air Cleaner:—AC. #1528085 Heavy duty oil-bath type standard.

Fuel Pump:—AC. Type AJ #1523202. Diaphragm type combination fuel-and-vacuum pump.
See article in Carburetion Equipment Section.

Gasoline Gauge:—AC. Electric. #1515328 (dash unit), #1515447 (tank unit).
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 exhaust valve at .013" (or set at .017" and insert .004" feeler to check closing). This valve should close with piston 5° or .0099" after top dead center when 5° point on flywheel (midway between second and third graduations after dead center mark '#1 UP.DC') lines up with pointer in inspection hole (Left front face of flywheel housing). Reset tappet clearance at .010" warm.

Tappet Clearance:—.007" Int., .010" Exh., engine warm

Valve Springs:—36-44 lbs. at 1⅝" (valve closed), 105-113 lbs. at 1 5/16" (valve open).

LUBRICATION:—Crankcase Capacity—7 qts.
Normal Oil Pressure—35 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WT-1-95. 6 volt, 15 plate, 95 ampere hour capacity (20 hour rate).
Starting Capacity—117 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.1 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under left front seat.

STARTER:—Model MAX-4006. Armature MAW-2006.
Drive—Outboard Barrel Type Bendix No. A-1729.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—31-42 ozs. (new brushes).
Cranking Engine—125 R.P.M., 200 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Model SS-4001. Magnetic type. Mounted on starter and controlled by pushbutton on instrument panel. See article in Electrical Equipment Section.

Switch Specifications

Closes with terminal voltage of 4 volts or less. Remains closed until voltage drops to .75-2.0 volts. Current draw, 3 amperes at 6.0 volts.

GENERATOR:—Model GCJ-4801-A. Armature GCJ-2006. Third brush control type with external voltage regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—25 amperes (cold), 22 amperes (hot), 8.0 volts, 2500 R.P.M. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Charging Rate Adjustment—Maximum charging rate controlled by third brush. To check charging rate, disconnect regulator 'F' lead, ground field terminal 'F' on generator. Shift third brush counter-clockwise to increase, or clockwise to decrease charging rate. Setting must not exceed maximum given above which is equivalent to clearance of not less than 2 commutator bars and one mica strip between third brush and nearest main brush. Remove the field ground and re-connect the regulator. See Regular Section below for Regulator setting.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850
4	6.65	920	4	6.65	1020
8	6.9	1080	8	6.9	1240
12	7.2	1240	12	7.2	1400
16	7.45	1400	16	7.45	1650
20	7.7	1580	20	7.7	2100
25	8.0	2500	22	8.0	2700

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—23-27 ozs. (new brushes).
Field Current—1.9-2.1 amperes at 6.0 volts.
Motoring Current—4.0-4.4 amperes at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Swing generator away from engine until reading on scale attached to clamp bolt lug is 25 lbs. or belt deflection midway between fan and generator pulleys is ½" with thumb pressure.

REGULATOR:—Model VRD-4001-A. Voltage Type. Mounted on dash. Consists of Cutout Relay and Vibrating Voltage Regulator in single case.
See article in Electrical Equipment Section.
NOTE—Regulator cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.
Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.
Contact Gap—.015" minimum.
Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.4-7.9 volts hot.
To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads), connect voltmeter between regulator 'B' and 'GD' terminals. Operate generator, charging fully charged battery,at speed equivalent to 30 M.P.H. car speed until voltage is steady. Voltmeter reading should be within 7.4-7.9 volts (high limit cold, low limit hot). If outside these limits, regulator is defective.
To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.
Contact Gap—.010" Min., .020" Max. with armature against stop pin.
Air Gap—.060" Min., .062" Max. contacts just opening.

LIGHTING:—Headlamps—Hall 'Flex-Beam,' Pre-focused type with special non-interchangeable lenses marked Right and Left. Passing beam (upper beam right hand headlamp, lower beam left hand headlamp) obtained by foot selector switch.

Switches

Lighting—Delco-Remy Model 480-L, Y.
Foot Selector—Delco-Remy Model 471-T.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Parking, Fender (Optl.)	1½	55
Instrument, Reading Spdmtr.	1½	55
Clock, Indicator	1	51
Stop	15	87
Tail	3	B63

FUSES:—Accessory—20 amp. on back of lighting switch.
Tail Light—20 amp. in lamp lead near light switch.

THERMOSTATIC RELAY:—Thermostatic arm type current limit relay. Mounted on light switch, protects headlamp circuits. Not adjustable. Contacts open with current load of 38 amperes at 70° F.

HORNS:—Sparton or Klaxon. Vibrator type, twin horns operated by horn relay.

Horn Relay:—R.B.M. Model 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with 4 volts across contacts when relay inverted.

SERIAL NUMBER —Stamped on plate on engine side of dash Use engine number (X-100026 and up) stamped on boss on left side of engine block near distributor

COMPRESSION:—Ratios and pressure as follows

Head	Pressure at 125 R.P.M.
Std 6 43-1	110 lbs
Optl 7 0-1	118 lbs

VACUUM READING:—18-20" steady reading with engine idling at 6 M P H

IGNITION:—Coil Model CE-4623. Service Coil (less switch and cable) CE-3224-ES Mounted on bracket on side of cylinder head above distributor

Coil Draw—½ ampere idling, 2½ amperes stopped

Ignition Switch:—Mitchellock Model 24-B Type 7065 Connected to coil by armored cable

Ignition Lock—Briggs & Stratton Mitchell No 6760 B & S #50184 (cylinder) **Key Series**—P1251-P1500

Distributor Model IGT-4004 Single breaker, 8 lobe cam, full automatic advance type with Vacuum Spark Control and Fuel Compensator or manual adjustment at distributor

Breaker Gap—Set at 015". Limits 0125- 0175"

Cam Angle or Dwell—27° closed, 17° open with 017" gap

Breaker Arm Spring Tension—18-20 ounces

Condenser—Part No IG-2671J Capacity 20- 25 mfd

Automatic Advance

Distributor		Engine	
Degrees	R P M	Degrees	R P M
Start	300	0	600
2	660	4	1320
4	1050	8	2100
6	1430	12	2860
8	1820	16	3640
10	2200	20	4400

NOTE—Heavier advance weight spring must be mounted on spring lug which has flat auxiliary spring behind it

Vacuum Spark Control—Vacuum unit mounted on side of distributor housing and linked directly to breaker plate Provides additional advance for all speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by spring within unit

Vacuum Spark Advance

Engine Degrees	Vacuum (" of HG)
Start	6"
5	9 5"
10	13 2"
15	17"

Fuel Compensator—Manual adjustment at distributor providing advance or retard adjustment from center '0' point on scale See Ignition Timing for setting

Removal:—Distributor mounted on left hand side of crankcase To remove, disconnect vacuum line, take out hold-down screw in advance arm

IGNITION TIMING—For all engines as follows

Head	Flywheel Degrees	Piston [illegible]
Std 6 4-1	7 BTDC.	0202" BTDC
Optl. 7.0-1 .	4° BTDC.	.0063' BTDC.

Timing—Remove cover over timing inspection hole in left front face of flywheel housing under starter. Loosen thumbnut and set Fuel Compensator at '0', tighten thumbnut. With #1 piston on compression, turn engine over until piston reaches firing position, stop when proper graduation on flywheel before dead center mark '#1 UP DC' (see table above —each graduation on flywheel equals 2°) lines up with pointer Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt

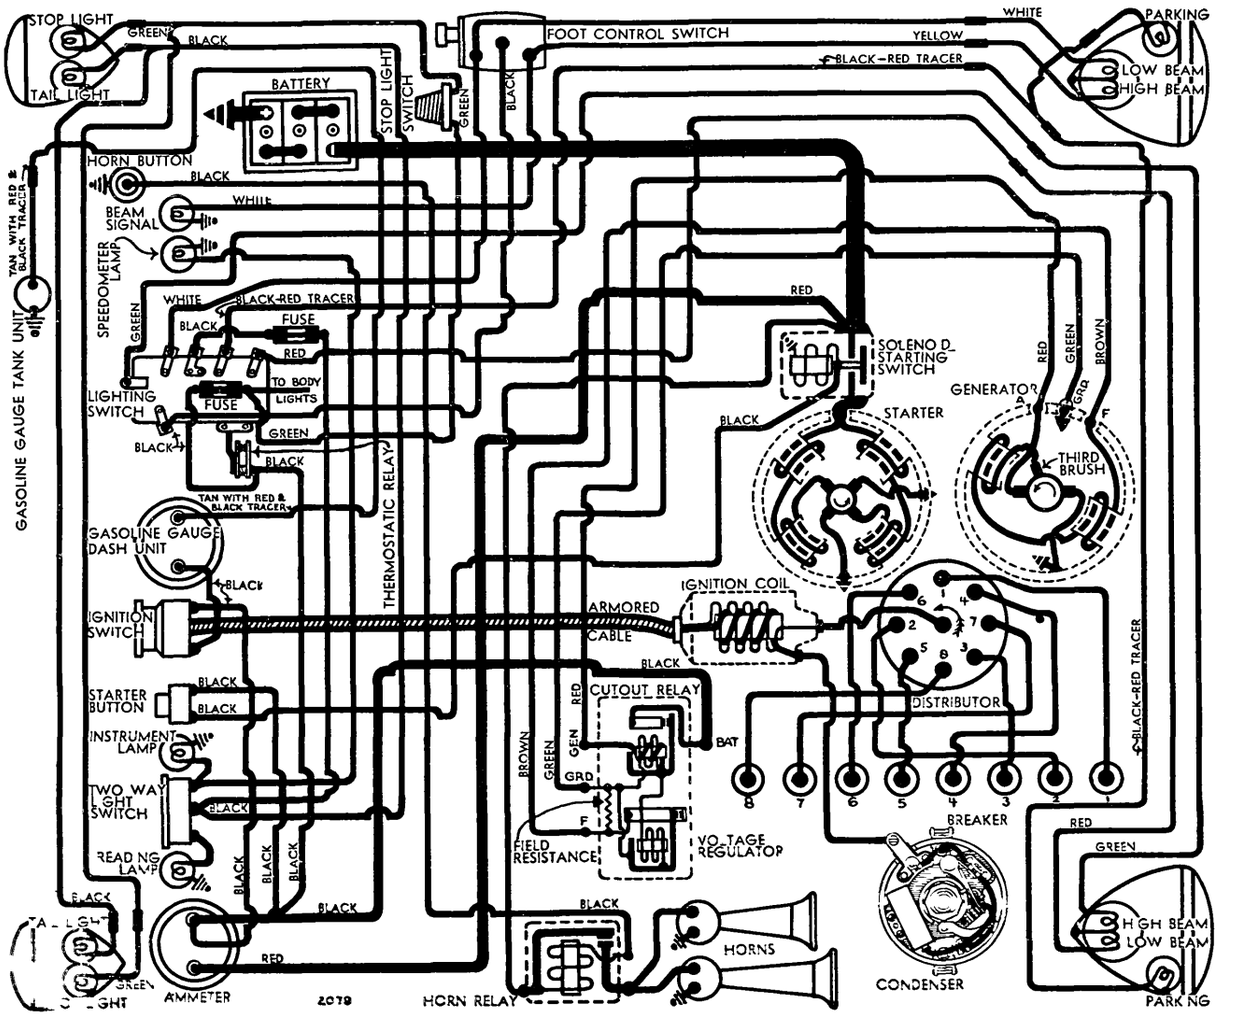
NOTE—No synchronization required for this distributor

Timing (Neon Timing Light)—White mark provided on flywheel at 7° point Mark flywheel similarly at 4° point for high compression engines See Electrical Equipment Section for complete instructions

Firing Order—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—AC Type Y-4 or Champion. 10 M M. Metric type.

NOTE—Y-4 discontinued by AC Use No. 103.



NOTE—This is new type small plug. Use only thumb -and-finger pressure on 4½" wrench to tighten plugs.

Spark Plug Gaps—.026-.030".

CARBURETION:—Carburetor—Stromberg Model EE-14 (first cars), Carter Model WDO Type 366-S (later cars). 1" Duplex or double barrel downdraft type. **See Article in Carburetion Section for data.**

Idle Adjustment (All Models)—Warm up engine so that Automatic Choke and Fast Idle are inoperative. Set throttle lever stopscrew so that engine idles at 300 R P M or 6 M P H. Turn inner idle adjusting screw in until engine begins to miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Not adjustable on either carburetor model.

Fast Idle:—Integral with carburetor. Stromberg type not adjustable. On Carter models, hold choke valve tightly closed, adjust fast idle lever screw so that throttle opening is .018" as measured on side opposite idle ports.

See Article in Carburetion Equipment Section.

Automatic Choke:—Stromberg type integral with Carburetor. Carter Climatic Control mounted on carburetor.

See Article in Carburetion Equipment Section.

Air Cleaner:—AC. #1526714 Heavy Duty oil-bath type standard.

Fuel Pump:—AC. Type AJ #1523202 combination fuel-and-vacuum pump.

See Article in Carburetion Equipment Section.

Gasoline Gauge:—AC. Electric type. No. 1515326 (dash unit), 1515443 (tank unit).

See Article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 exhaust valve at .013" (or set at .017" and insert .004" feeler to check closing). This valve should close with piston 5° or .0103" after top dead center when 5° point on flywheel (midway between second and third graduations after dead center mark '#1 UP.DC') lines up with pointer in inspection hole (left front face of flywheel housing). Reset tappet clearance at .010" warm.

Tappet Clearance:—.007" Int., .010" Exh., eng. warm.

Valve Springs—36-44 lbs. at 1⅝" (valve closed), 105-113 lbs. at 1 5/16" (valve open).

LUBRICATION:—Crankcase Capacity—7 quarts.

Normal Oil Pressure—35 lbs. at 30 M.P.H.

BATTERY:—Prest-O-Lite, Hi-Level Type HR2-17. 6 volt, 17 plate, 144 ampere hour capacity (20 hour rate).

Starting Capacity—133 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.5 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under front seat on left side.

Delco Battery Type 17-K. 6 volt, 17 plate, 110 ampere hour capacity (20 hour rate).

Starting Capacity—131 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.4 minutes.

STARTER:—Model MAX-4006. Armature MAW-2006.

Drive—Outboard Barrel Type Bendix No. A-1729.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—31-42 ozs. (new brushes).

Cranking Engine—125 R.P.M., 200 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Model SS-4001. Magnetic type. Mounted on starter and controlled by pushbutton on instrument panel. See article in Electrical Equipment Section.

Switch Specifications

Closes with terminal voltage of 4 volts or less. Remains closed until voltage drops to .75-2.0 volts. Current draw, 3 amperes at 6.0 volts.

GENERATOR:—Model GCJ-4801-A. Armature GCJ-2006. Third brush control type with external voltage regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—25 amperes (cold), 22 amperes (hot), 8.0 volts, 2500 R.P.M. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Charging Rate Adjustment—Maximum charging rate controlled by third brush. To check charging rate, disconnect regulator 'F' lead, ground field terminal 'F' on generator. Shift third brush counter clockwise to increase, or clockwise to decrease charging rate. Setting must not exceed maximum given above which is equivalent to clearance of not less than 2 commutator bars and one mica strip between third brush and nearest main brush. Remove the field ground and re-connect the regulator. See Regulator Section below for Regulator setting.

Performance Data

Cold			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	760	0	6.4	850
4	6.65	920	4	6.65	1020
8	6.9	1080	8	6.9	1240
12	7.2	1240	12	7.2	1400
16	7.45	1400	16	7.45	1650
20	7.7	1580	20	7.7	2100
25	8.0	2500	22	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—23-27 ozs. (new brushes).

Field Current—1.9-2.1 amperes at 6.0 volts.

Motoring Current—4.0-4.4 amperes at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Swing generator away from engine until reading on scale attached to clamp bolt lug is 25 lbs. or belt deflection midway between fan and generator pulleys is ½" with thumb pressure.

REGULATOR:—Model VRD-4001-A. Voltage Type. Mounted on dash. Consists of Cutout Relay and Vibrating Voltage Regulator in single case.

See Article in Electrical Equipment Section.

NOTE—Regulator cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum.

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.4-7.9 volts hot.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads), connect voltmeter between regulator 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 M.P.H. car speed until voltage is steady. Voltmeter reading should be within 7.4-7.9 volts (high limit cold, low limit hot). If outside these limits, regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.060" Min., .062" Max. contacts just opening.

LIGHTING:—Headlamps—Hall 'Flex-Beam' Pre-focused type with special non-interchangeable lenses marked Right and Left. Passing beam (upper beam right hand headlamp, lower beam left hand headlamp) obtained by foot selector switch.

Switches

Lighting—Delco-Remy Model 480-L, Y.
Foot Selector—Delco-Remy Model 471-T.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330-L
Parking, Fender (Optl)	1½	55
Instrument, Reading, Spdmtr.	1½	55
Clock, Indicator, Radio	1	51
Stop	15	87
Tail	3	B63

FUSES:—Accessory—20 ampere on back of lighting switch.

Tail Light—20 ampere in lamp lead near light switch.

THERMOSTATIC RELAY:—Thermostatic arm type current limit relay. Mounted on light switch, protects headlamp circuits. Not adjustable. Contacts open with current load of 38 amperes at 70°F.

HORNS:—Sparton or Klaxon. Vibrator type, twin horns operated by horn relay.

Horn Relay:—R.B.M. Model 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with 4 volts across contacts when relay inverted.

NOTE:—Delco-Remy Starter, Generator, and Ignition system used on first cars (see previous page for complete data). Tune up data below applies for all cars.

SERIAL NUMBER:—Stamped on plate on front of dash. Use Engine number (395526 and up) stamped on left side of engine near starter.

COMPRESSION:—Ratio and pressure as follows:

Head	Pressure at 125 R.P.M.
Std. 6.4-1	108 lbs.
Optl. 7.0-1	119 lbs.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 350 R.P.M. or 7 M.P.H.

IGNITION:—Coil Model CE-4026. Service coil (less switch and cable) CE-3186KS. Mounted on cylinder head.

Ignition Current—½ ampere idling, 2½ stopped.

Ignition Switch:—Delco-Remy Model 430-L. Connected to coil by armored cable.

Distributor Model IGT-4005. Single breaker, 8 lobe cam, full automatic advance type with vacuum spark control.

Breaker Gap—Set at .017" maximum.

Cam Angle or Dwell—27° (closed), 18° (open).

Breaker Arm Spring Tension—18-20 ounces.

Condenser—Part #IG-2671G. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	0	600
3	800	6	1600
6	1300	12	2600
9	1800	18	3600

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port in carburetor above throttle) except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG)
Start	7"
2°	10-11"
4°	13-14"
5.5°	16"

Fuel Compensator—Manual adjustment at distributor provides 12° maximum advance or retard from center 'O' position. See Ignition Timing for setting.

Distributor Removal:—Mounted on cylinder head. To remove, disconnect vacuum line connection, take out hold-down screw in advance arm.

IGNITION TIMING:—For all engines as follows:

	Flywheel Degrees	Piston Position
Std. 6.4-1 head	6-8° BTDC	.0168-.0299" BTDC
Optl. 7.0-1 head	4-5½° BTDC	.0075-.0141" BTDC

NOTE—Vibration damper at front of engine marked #1 UP.DC (top dead center) with 15 one degree graduations before this point.

To Set Timing—Loosen thumbnut, set Fuel Compensator at 'O'. With #1 piston on compression, turn engine over until it reaches firing position (see table above), stop when correct line on vibration damper at front of engine lines up with pointer. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.
NOTE—If neon timing light used, idle engine below 500 R.P.M.

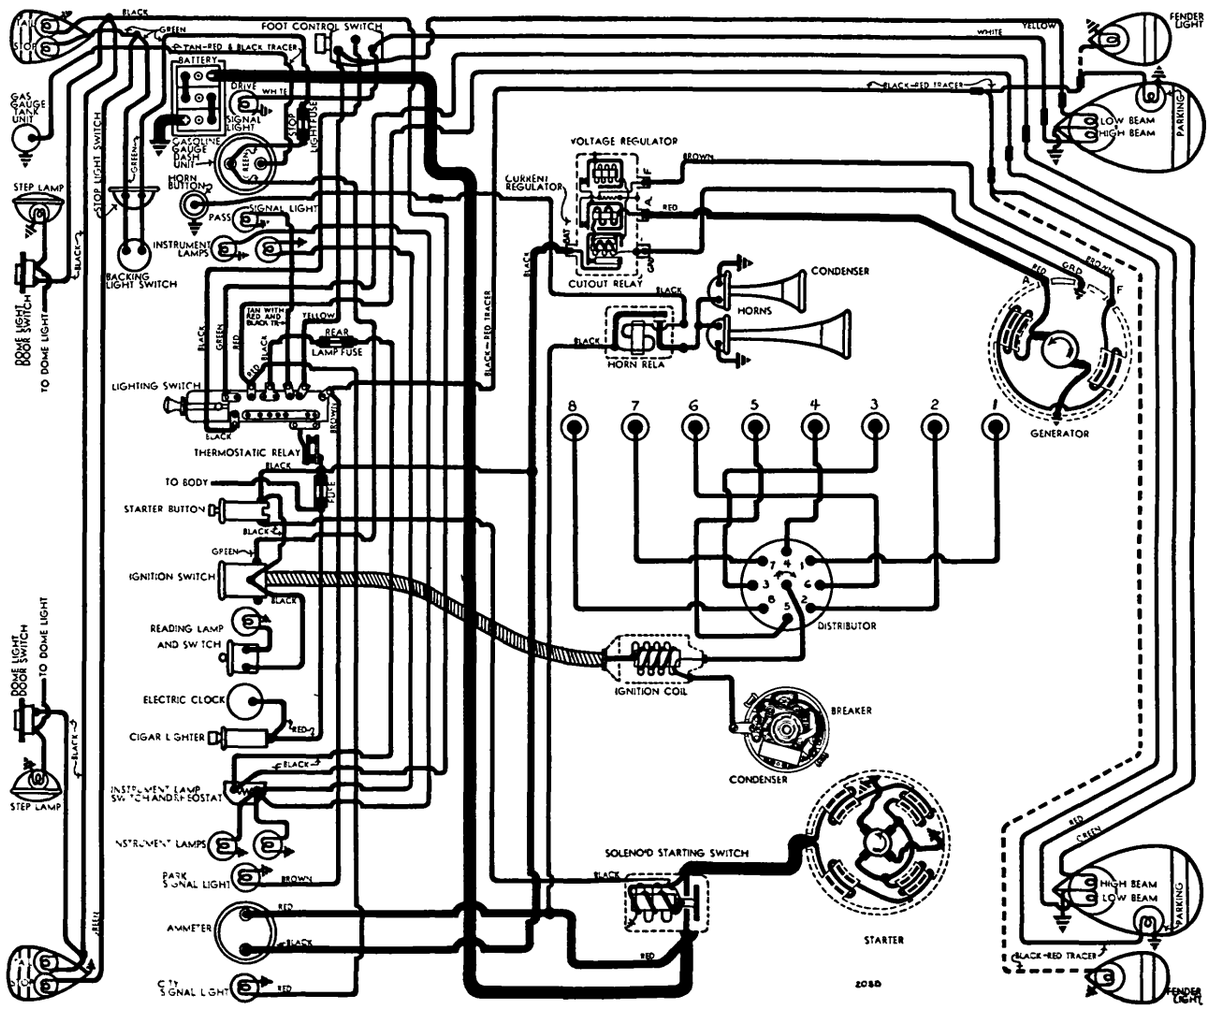
Fuel Compensator Setting—Provides manual adjustment at distributor for octane rating of fuel used. After ignition set as above, road test car to give a slight 'ping' pulling heavy load. Adjusted by loosening thumbnut and advancing or retarding pointer on scale. Adjustment permits 12° advance or retard from Center 'O' position.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—AC. Type Y-4. 10 MM. Metric type.

NOTE—Y-4 discontinued by AC. Use. No. 103.

Spark Plug Gap—.026-.030".



NOTE—Tighten plugs with 4½" wrench grasped between thumb and finger.

CARBURETION:—Carburetor—Stromberg Model EE-23. 1¼" dual downdraft type with integral automatic choke and fast idle.

See Article in Carburetor Section.

Idle Adjustment—With engine warm, choke valve wide open, engine idling at hot or slow idling speed, set throttle stopscrew so that engine idles at 350 R.P.M. or 7 M.P.H. Turn inner idling adjusting screw in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Repeat with outer idling adjusting screw. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Adjusted by changing position of pump link rod in throttle valve lever. Inner Hole (Min. stroke)—Summer temperatures. Outer Hole (Max. stroke)—Winter temperatures.

Fast Idle & Automatic Choke:—Integral with carburetor.

See Article in Carburetion Equipment Section.

Air Cleaner:—AC. #1528086 oil bath type.

Fuel Pump:—AC. Type F #1523196. Combination fuel-and-vacuum pump.

See Article in Carburetion Equipment Section.

Gasoline Gauge:—AC. Electric. Dash unit (#1515330-U. S.; #1515332-Canada). Tank unit (#1515448—all).

See Article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 exhaust valve at .005" (or .010", then insert .005" feeler). Turn engine over until pointer over damper (at front of engine) lines up with point 1 1/16" (plus or minus 11/32") past #1 UP.DC mark (feeler should withdraw with finger pull). Valve closes 30° or .4070" ATDC. Reset tappet clearance at .006" (hot).

Tappet Clearance:—.004" Int., .006" Exh., warm.

Valve Spring Pressure:—Valve closed—68-78 lbs. at 3 1/16". Valve open—154-164 lbs. at 2 45/64".

LUBRICATION:—Crankcase Capacity—8 qts. (dry).

Normal Oil Pressure—5-55 lbs. with SAE 20 oil.

BATTERY:—Prest-O-Lite, Hi-Level, Type HR4-21. 6 volt, 21 plate, 150 ampere hour capacity (20 hour rate).

Starting Capacity—175 amperes for 20 minutes.

Zero Capacity—300 amperes for 6.3 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Under front seat on left side.

Export—Willard, Type RH-5-19. 6 volt, 19 plate, 153 ampere hour capacity (20 hour rate).

Starting Capacity—180 amperes for 20 minutes.

Zero Capacity—300 amperes for 6.6 minutes.

STARTER:—Model MAX-4014. Armature MAW-2090.

Drive—Outboard Barrel Type Bendix Model A-1729.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—125 RPM., 160 amperes, 5.2 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
.65 "	3300	5.5	100
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Starter sleeve mounted on left front face of flywheel housing. To remove, take out pilot mounting screw in flywheel housing.

Starting Switch:—Model SS-4001 Magnetic type. Mounted on starter, controlled by pushbutton on instrument panel. See article in Electrical Equipment Section.

Switch Specifications

Closes with terminal voltage of 4.0 volts or less. Remains closed until voltage drops to .75-2.0 volts. Current draw, 3 amperes at 6.0 volts.

GENERATOR:—Model GCO-4803A. Armature GCO-2006F. Two brush, straight shunt type with external voltage and current regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—28 amperes (cold), 8.0 volts, 1850 R.P.M. and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and is dependent on battery condition.

Charging Rate Adjustment—No adjustment on generator. See Regulator section below for Voltage and Current Regulator settings.

Performance Data

Cold Amperes	Volts	R.P.M.	Hot Amperes	Volts	R.P.M.
0	6.4	825	0	6.4	900
4	6.6	940	4	6.6	1025
8	6.85	1050	8	6.85	1160
12	7.1	1175	12	7.1	1310
16	7.3	1300	16	7.3	1475
20	7.55	1450	20	7.55	1660
24	7.8	1610	24	7.8	1880
28	8.0	1850	28	8.0	2200

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—27-53 ozs. (new brushes).

Field Current—1.47-1.63 amperes at 6.0 volts.

Motoring Current—3.94-4.36 amperes at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—With mounting bolts loose, swing generator away from engine until reading on scale attached to clamp bolts is 30 lbs., or belt deflection (thumb pressure) midway between fan and generator pulleys is ½-¾".

REGULATOR:—Model VRB-4002-B. Voltage-Current Type. Consists of Cutout Relay, Vibrating Voltage Regulator, and Vibrating Current Regulator in case on dash.

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum.

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.4-7.9 volts hot.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads). Connect voltmeter between 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 MPH. car speed. Voltage should be within 7.4-7.9 volts (high limit cold, low limit hot). If outside these limits, regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.060" Min., .062" Max. contacts just opening.

Current Regulator

Setting—Not to exceed rating marked on cover.

To Check—Connect ammeter and voltmeter as directed for Voltage Regulator test. Operate generator at 30 MPH. car speed, add load (use bank of headlamp bulbs or turn on car lights and discharge battery) so that generator will charge at peak rate and bring Current Regulator into action. Charging current should not exceed 28 amperes. If more than slight excess noted, Current Regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap & Air Gap—Same as for Voltage Regulator.

LIGHTING:—Headlamps—Hall, Flex beam, pre-focused type with special non-interchangeable lenses marked 'Left' and 'Right.' 'Passing' beam (upper beam right hand headlamp, lower beam left hand headlamp) obtained with Foot Selector switch with Lighting Switch in 'Country Driving' (upper beams, both lamps) position.

Headlamp Beam Indicator—Separate beam indicator for each beam position (1—Park, 2—City, 3—Drive, 4—Pass), located on instrument panel (Drive and Pass in Gasoline gauge group, City and Park in Ammeter group).

Switches

Lighting—Delco-Remy Model 480-M.

Foot Selector—D-R Models 471-T, U (RHD).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamp—Right	32-32	2330
Headlamp—Left	32-21	1104
Parking, Fender	1½	55
Instrument, Panel, Tail	3	63
Stop	15	87
Indicator, Radio	1	51

THERMOSTATIC RELAY:—Thermostatic arm type current limit relay. Mounted on lighting switch. Not adjustable. Contacts open with current load of 38 amperes at 70° F.

FUSES:—Accessory—20 ampere, on lighting switch.

Tail Lamp—20 amperes, in connector near lighting switch.

Stop Lamp—20 amperes, in connector near gasoline gauge dash unit.

HORNS:—Sparton, Vibrator type, Twin horns operated by horn relay.

Horn Relay:—R.B.M. Model 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with relay in inverted position.

NOTE:—Delco-Remy Starter and Generator used on first cars (see previous article for complete data). Tune up data below applies for all cars.

SERIAL NUMBER:—Stamped on plate on front of dash. Use engine number (905526 and up) stamped on left side of engine block below head.

COMPRESSION:—Ratio and pressures as follows:

Head	Pressure at 125 R.P.M.
Std. 6.4-1	108 lbs.
Optl. 7.0-1	119 lbs.

VACUUM READING:—Steady reading of 18-20" with engine idling at 375 R.P.M. or 8 M.P.H.

IGNITION:—Coil Model CE-4023. Two coil unit. Service coil (less switch and cable) CE-3186FS. Mounted at front of engine.

Ignition Current—½ ampere idling, 2½ amperes stopped for each coil.

Ignition Switch:—Delco-Remy Model 430-M (switch and cable assembly). Connected to coil unit by armored cable.

Distributor Model IGO-4002-A (Std. 6.4-1 Eng.), IGO-4001-A (Optl. 7.0-1 Eng.). Double breaker, 6 lobe cam, full automatic advance type. Breaker contacts open alternately at 33½° and 26½° intervals corresponding to unequal 67° and 53° firing intervals of the engine (caused by 67° included angle between cylinder banks) and must be synchronized. See Timing.

Breaker Gap—Set at .020".

Cam Angle or Dwell—40° (closed), 20° (open) for each set (operate independently).

Breaker Arm Spring Tension—16-20 ounces.

Condenser—Part No. IG-2671-A and IG-2671-E (1 each). Capacity .20-.25 mfd.

Automatic Advance—IGO-4001-A

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
2	515	4	1030
4	730	8	1460
6	950	12	1900
8	1175	16	2350
10	1400	20	2800

Automatic Advance—IGO-4002-A

Start	300	0	600
2	525	4	1050
4	750	8	1500
6	975	12	1950
8	1200	16	2400

Removal:—Distributor mounted between cylinder banks at front of engine. To remove, take off distributor cap and cable conduit assembly, take out screws in mounting bracket.

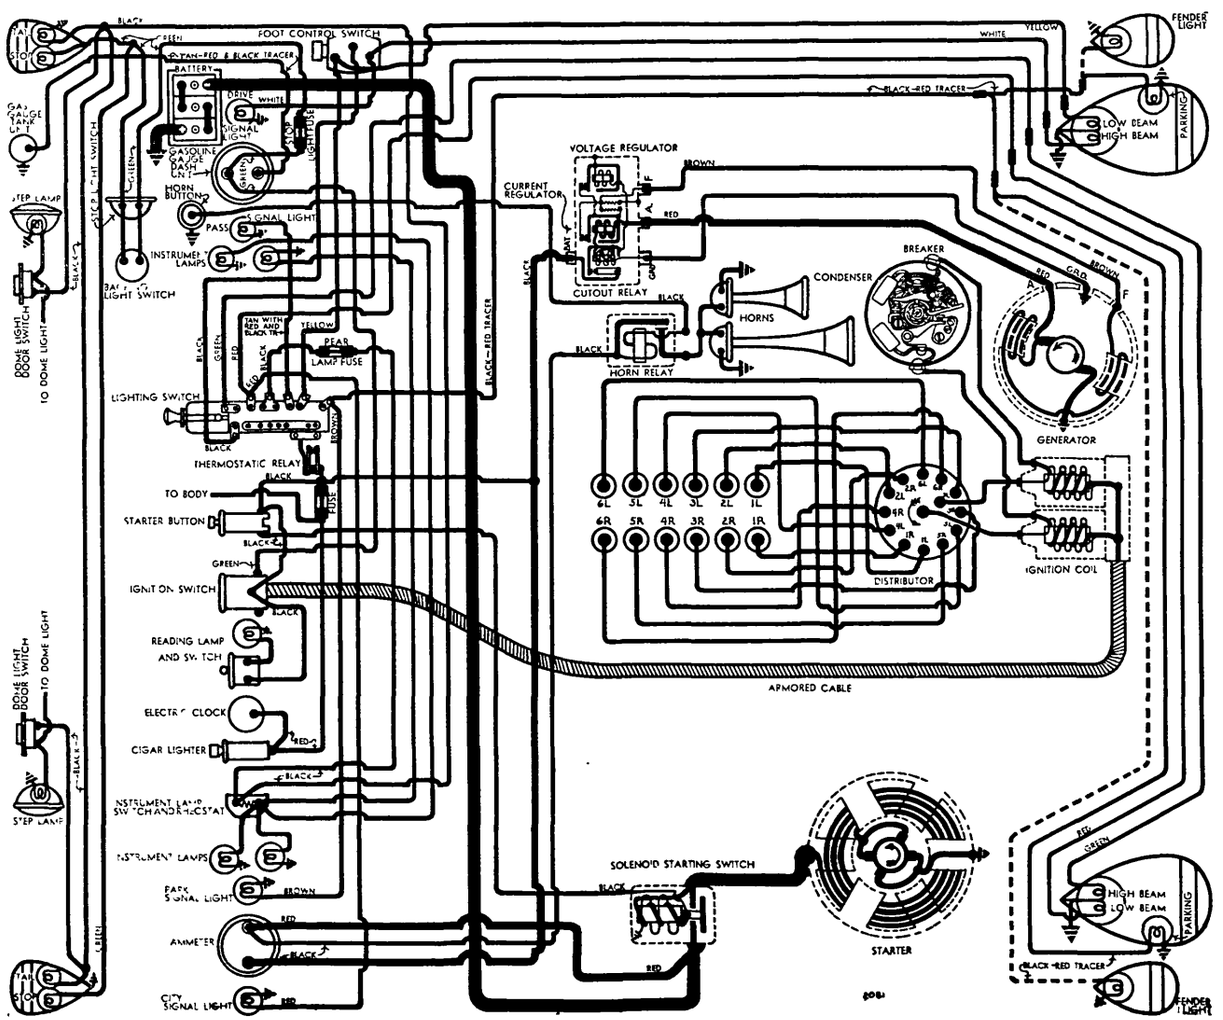
IGNITION TIMING:—Settings for all engs. as follows

Engine	Flywheel Degrees	Piston Position
Std. 6.4-1 Head	6-8° BTDC	.0145-.0255" BTDC
Optl. 7.0-1 Head	4-5½° BTDC	.0063-.0121" BTDC

NOTE—Vibration dampener at front of engine marked '#1R-UDC' (top dead center for #1 in right cylinder bank) and '#6L-UDC' (top dead center for #6 in left cylinder bank) with fifteen 1° graduations before each of these marks. Time stationary contacts which fire plugs in right hand bank first.

Timing (Stationary Contacts)—With #1R piston (front cylinder, right bank) on compression, turn engine over until piston reaches firing position, stop when correct graduation preceding '#1R-UDC' mark on vibration dampener lines up with pointer on chain case cover (see settings above). Loosen clampscrew on mounting bracket, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clampscrew. Then synchronize movable contacts.

Synchronization (Movable Contacts)—Turn engine over exactly 67° to firing position for #6L (rear piston, left bank), stop when correct graduation preceding '#6L-UDC' mark lines up with pointer, loosen lockscrews on sub-plate carrying second or movable contacts, shift plate until contacts begin to open, tighten lockscrews.



Synchronization (other methods)—Set movable contacts to open exactly 33½° after fixed contacts. Firing intervals are unequal 33½-26½-33½ distributor degrees.

Firing Order:—1R-6L-5R-2L-3R-4L-6R-1L-2R-5L-4R 3-L with cylinders numbered as shown on diagram (cylinder banks right R and left L as viewed from drivers seat and #1 cylinder nearest radiator.

Spark Plugs:—AC. Type Y-4 or Champion. 10 M.M. Metric type.
NOTE—Y-4 discontinued by AC. Use No. 103.
NOTE—Spark plugs are new type. Do not use more than thumb-and-finger leverage on 4½" wrench when tightening.

Spark Plug Gaps—.026-.030".

CARBURETION:—Carburetor—Stromberg Model EE-3, 1½" Dual, Downdraft type.
See Carburetion Section for complete data.
Idle Adjustment—Do not adjust until engine warmed up so that Automatic Choke and Fast Idle are inoperative. Set throttle stopscrew so that engine idles at 375 R.P.M. or 8 M.P.H. Turn inner idle adjusting screw in until engine begins to lag, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Adjust outer idle adjusting screw in the same manner. Readjust

throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Adjusted by changing pump link rod engagement in throttle lever as follows:
Inner Hole (Min. stroke)—Summer temperatures.
Outer Hole (Max. stroke)—Winter temperatures.

Fast Idle:—Mounted on carburetor. To adjust, stop engine, hold throttle valve and choke valve closed, turn fast idle adjusting screw in until it contacts ear on fast idle cam, then turn screw in additional 6-7 turns.

Automatic Choke:—Stromberg Model C. Mounted on manifold. Standard setting 28 notches lean.

See Article in Carburetion Equipment Section.

Air Cleaner:—AC. #1525442. Oil-wetted type.

Fuel Pump:—AC Type 'I' #1521778 combination fuel-and-vacuum pump. Diaphragm type.

See Article in Carburetion Equipment Section.

Gasoline Gauge:—AC Electric Type. #1515330 (dash unit), 1515449 (tank unit).

See Article in Carburetion Equipment Section.

VALVE TIMING:—To Check—Intake valve for #1R cylinder (front cylinder, right bank) should begin to open with piston on top dead center when mark '#1R-UDC' on vibration dampener lines up with pointer on chain case cover. Removal of right cylinder head and mounting of dial indicator over this valve to check opening recommended (no tappet clearance so that valve movement not otherwise evident).
Tappet Clearance—None in service (hydraulic valve takeup used). See article in Mechanical Equipment Section for complete data and valve grinding procedure.
Valve Spring Pressure—65-75 lbs. at 2 7/32" (valve closed), 140-150 lbs. at 1 29/32" (valve open).

LUBRICATION:—Crankcase Capacity—10 quarts.
Normal Oil Presure—5 lbs. minimum (idling), 55 lbs. maximum.

BATTERY:—Prest-O-Lite, Hi-Level, Type HR4-21. 6 volt, 21 plate, 150 ampere hour capacity (20 hour rate).
Starting Capacity—175 amperes for 20 minutes.
Zero Capacity—300 amperes for 6.3 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under front seat on left side.

Export—Willard, Type RH-5-19. 6 volt, 19 plate, 153 ampere hour capacity (20 hour rate).
Starting Capacity—180 amperes for 20 minutes.
Zero Capacity—300 amperes for 6.6 minutes.

STARTER:—Owen-Dyneto Model DN-1389. Armature No. 13409.
Drive—Outboard Bendix Type RCD10FXTD.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—56-60 ounces each.
Cranking Engine—125 R.P.M., 130 amps. 5.6 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	3000	6.0	50
5.8 "	850	5.2	200
11.4 "	520	4.8	300
17.0 "	340	4.5	400
23.0 "	220	4.2	500
26.6 "	140	4.0	600
39.0 "	Lock	3.6	810

Removal:—Starter sleeve mounted on right front face of flywheel housing. To remove, take out pilot mounting screw in flywheel housing.

Starting Switch:—Model SS-4001 Magnetic type. Mounted on starter, controlled by pushbutton on instrument panel. See article in Electrical Equipment Section.

Switch Specifications

Closes with terminal voltage of 4.0 volts or less. Remains closed until voltage drops to .75-2.0 volts. Current draw, 3 amperes at 6.0 volts.

GENERATOR:—Model GCE-4303A. Armature GBX-2035F. Two brush, straight shunt type with external voltage and current regulation. Ventilated by fan on drive pulley.
Maximum Charging [illegible]-30 amperes (cold), 8.0 volts, 1500 R.P.M. and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and is dependent on battery condition.
Charging Rate Adjustment—No adjustment on generator. See Regulator Section below for Voltage and Current Regulator settings.

Cold Performance Data			Hot Performance Data		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	740	0	6.4	785

8	6.8	920	8	6.8	975
12	7.05	1015	12	7.05	1070
16	7.25	1100	16	7.25	1165
20	7.5	1190	20	7.5	1275
24	7.7	1280	24	7.7	1385
30	8.0	1400	30	8.0	1580

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—23-27 ozs. (new brushes).
Field Current—1.9-2.1 amperes at 6.0 volts.
Motoring Current—4.0-4.4 amperes at 6.0 volts.

Removal:—Generator mounted on special pivot bracket at left front of engine with fan belt drive. To remove, take out clamp bolt and pivot bolt.

Belt Adjustment:—Attach spring scale by wire looped over generator frame, loosen pivot bolts and clamp bolt, pull generator away from engine until scale reading is 70-80 lbs.
NOTE—Replace drive belts in matched pairs only (Double Vee belt drive).

REGULATOR:—Model VRB-4008-A. Voltage-Current Type. Consists of Cutout Relay, Vibrating Voltage Regulator, and Vibrating Current Regulator in case on dash.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

See Article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.
Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.
Contact Gap—.015" minimum.
Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.4-7.9 volts hot.
To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads). Connect voltmeter between 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 M.P.H. car speed. Voltage should be within 7.4-7.9 volts (high limit cold, low limit hot). If outside these limits, regulator is defective.
To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.
Contact Gap—.010" Min., .020" Max. with armature against stop pin.
Air Gap—.060" Min., .062" Max. contacts just opening.

Current Regulator

Setting—Not to exceed rating marked on cover.
To Check—Connect ammeter and voltmeter as directed for Voltage Regulator test. Operate generator at 30 M.P.H. car speed, add load (use bank of headlamp bulbs or turn on lights and discharge battery) so that generator will charge at peak rate and bring Current Regulator into action. Charging current should not exceed 28 amperes. If more than slight excess noted, Current Regulator is defective.
To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.
Contact Gap & Air Gap—Same as for Voltage Regulator.

LIGHTING:—Headlamps—Hall, Flex beam, pre-focused type with special non-interchangeable lenses marked 'Left' and 'Right'. 'Passing' beam (upper beam right hand headlamp, lower beam left hand headlamp) obtained with Foot Selector switch with Lighting Switch in 'Country Driving' (upper beams both lamps) position.
Headlamp Beam Indicator—Separate beam indicator for each beam position (1-Park, 2-City, 3-Drive, 4-Pass), located on instrument panel. (Drive and Pass in Gasoline gauge group, City and Park in Ammeter group).

Switches

Lighting—Delco-Remy Model 480-M.
Foot Selector—D-R Models 471-T, U (RHD)

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamp—Right	32-32	2330
Headlamp—Left	32-21	1104
Parking, Fender	1½	55
Instrument, Panel, Tail	3	63

THERMOSTATIC RELAY:—Thermostatic arm type current limit relay. Mounted on lighting switch. Not adjustable. Contacts open with current load of 38 amperes at 70° F.

FUSES:—Accessory—20 ampere on lighting switch.
Tail Lamp—20 amp. in connector by lighting switch.
Stop Lamp—20 amps. in connector near gasoline gauge dash unit.

HORNS:—Sparton, Vibrator type. Twin horns operated by horn relay.

Horn Relay:—R.B.M. Model 10072. Current draw .4-.55 amperes at 6.0 volts. Coil resistance 11-14 ohms. Contacts must close with relay in inverted position.

PEERLESS

STANDARD EIGHT MODEL A (1930-31)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY: — Willard, Type WSB-15, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on left frame member under the floor boards of the front compartment.

IGNITION:—Coil Model CE-4013 (1930), CE-4202, 4302 (1931). Ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1.5 amperes at 6 volts with engine running and 4.5 amperes at 6 volts with engine stopped.

Distributor Model IGH-4011-A. Breaker contacts separate .018-.020 inch. Set contact gap by loosening the two lock screws on the stationary contact mounting plate (first set mounted on breaker plate) and turn eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. The second set (mounted on movable sub-plate) is adjusted by loosening the lock nut on the stationary contact stud and turning up the stud. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Engine is designed to operate with spark control button in the advanced position (pushed all the way intoward the dash). Pulling out the button provides an auxiliary retard for hand starting. Breaker has two sets of contacts operating on a four lobe cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. This firing interval must be accurately set by synchronizing contacts for satisfactory engine performance. See Timing.

Maximum Manual Advance:—15 degrees (engine).

Cam Angles—Closed 34.5°. Open 10.5° (distributor) when synchronized.

		Automatic Advance			
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		200	0		400
3		760	6		1520
6		1320	12		2640
7½		1600	15		3200

Mounting:—Distributor is mounted on rear of generator at right of engine and is gear driven from the armature shaft. To remove distributor, disconnect primary lead and manual spark control and remove distributor head with cables intact. Then take out mounting screw in advance arm and lift distributor from place.

Oiling:—Put 6 to 8 drops of light engine oil in the oiler on the side of the distributor head every 500 miles of operation. At the same time remove the distributor head and rotor and put 3 or 4 drops of oil in the oiler in the center of the shaft and put one drop of oil on the breaker arm pivot pins.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Auto-Lite tool and follow complete directions given in Equipment Section. Contacts can be synchronized after distributor has been timed to the engine by cranking engine over exactly 90 degrees when piston No. 6 will reach firing position (⅝ inch on flywheel before top dead center). If the second set of contacts do not open at this point, loosen the two lock screws on the movable sub-plate and shift plate until contacts begin to open. Tighten the lock screws.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position ⅝ inch (on the flywheel) before top dead center with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). See that spark control button is

PEERLESS

STANDARD EIGHT MODEL A (1930-31)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

fully advanced (pushed all the way in toward the dash) and remove inspection hole cover plate (in flywheel case at right of engine). Continue to turn ongine over until the ignition mark 'IGN' on the flywheel is directly opposite the indicator in the edge of the inspection hole. Then loosen advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and see that the rotor is directly opposite the segment in the distributor head connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order as shown on the diagram.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18MM. Metric. Champion Type 10. Gaps are .027 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 3/8 inches. Stem diameter, 5/16 inch. Tappet clearance, .006 inch (hot). Inlet valves open 8 degrees after top dead center and close 40 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1¼ inches. Stem diameter, 5/16 inch. Valve lift, 5/16 inch. Tappet clearance, .008 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 8 degrees after top dead center.

NOTE:—To set valve timing, crank engine over until piston No. 1 reaches top dead center with the flywheel mark 'DC1&8' directly opposite the indicator in the inspection hole in right side at the top of the flywheel housing. Then turn camshaft until there are exactly 13 links in the timing chain between the small 'o' stamped on the crankshaft sprocket and the camshaft sprocket when the timing chain is assembled. To check setting, first set tappet clearance at .007 inch and turn engine over until exhaust valve in cylinder No. 1 just closes. The flywheel mark 'No.1 EX.CL' should be directly opposite the indicator in the inspection hole. Tappet clearance of intake and exhaust valves should be .007 inch.

STARTER:—Model MAB-4029. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 44-56 ounces. Starter switch is mounted at lower end of steering column.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4020	5.5	46
.6 "	1900	5.5	100
3.4 "	1100	5.0	200
6.6 "	700	4.5	300
10.2 "	410	4.0	400
24 "	Lock	4.0	720

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler at each end of the armature every 1000 miles of operation.

GENERATOR:—Model GAL-4126 and 4134. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by prying on the brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush and mounting plate are held in position by friction between the mounting stud and the end plate. With standard car setting, the maximum charging rate is 16-18 amperes (cold) at 8 volts reached at 2025 R.P.M. or 25-30 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	675
6	6.9	835
10	7.3	1025
14	7.65	1275
17.2	8.0	2025
14	7.65	2925

Shunt field current is 4.08-4.52 amperes at 6 volts. Brush spring tension is 22-25 ounces (main brushes), 31-34 ounces (third brush). Generator motoring draws 4.27-4.73 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine. To remove generator, first disconnect all ignition wiring or remove distributor. Then disconnect generator lead and take out flange mounting screws. Pull generator to rear to disengage coupling and lift from place.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler at each end of the generator every 500 miles of operation. Every 5000 miles remove the grease cup directly under the bearing retainer on the commutator end of the generator and repack with light grease.

RELAY:—Model CB-4014. Relay is mounted on the generator. Relay contacts close at 675 R.P.M. or 10-11 M.P.H. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 1-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contact closed.

LIGHTING:—Pines Lighting Switch Model A-808. Switch is of 'Finger Tip Control' type and incorporates a lighting switch, starting switch and horn button in one unit mounted at the lower end of the steering column and controlled by a button on the steering wheel. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash, dome and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87.

FUSES:—Lighting fuses mounted on fuse block on dash (first cars) are 20 ampere capacity. A 20 ampere capacity fuse is mounted on the back of the gasoline gauge.

CURRENT LIMIT RELAY:—This device is a vibrating circuit breaker used instead of fuses in the lighting circuit on later cars. It begins to vibrate when the current reaches 25-30 amperes and continues limiting the current to a 15 ampere maximum.

PEERLESS

MASTER AND DE LUXE MASTER EIGHT, MODEL B (1930-31-32)
CUSTOM AND DE LUXE CUSTOM EIGHT, MODEL C (1930-31-32)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

CAR SERIAL NUMBER:—Stamped on brass plate on right front body sill.

ENGINE NUMBER:—Stamped on brass plate on left side crankcase wall at rear.

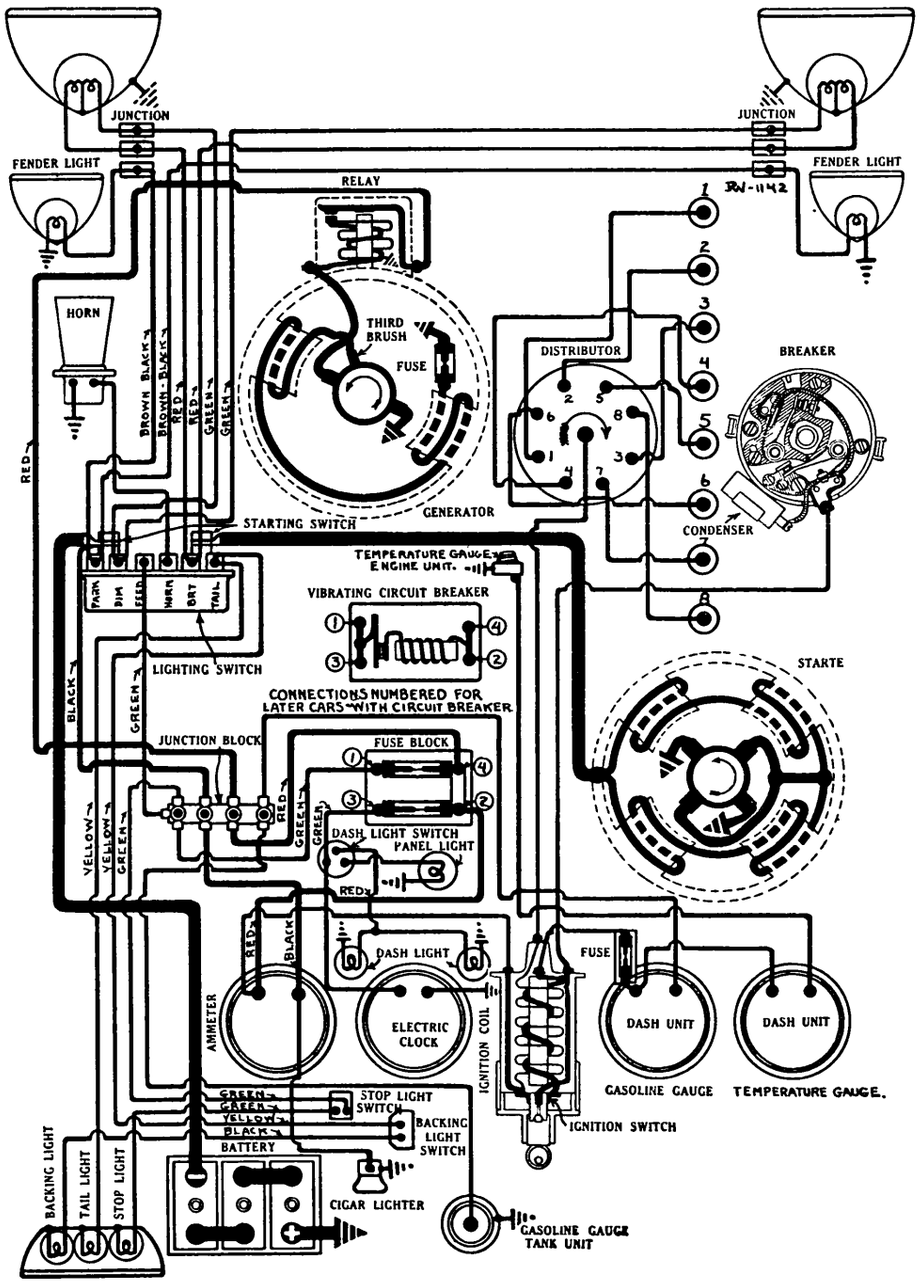
BATTERY:—**Willard, Type WSB-19,** 6 volt, 19 plate, 129 ampere hour capacity (20 hour rate). Starting capacity 158 amperes for 20 minutes. Positive (+) terminal grounded. Battery mounted on left frame member under front compartment floor boards. Battery size 7 1/16 inches wide, 13 inches long, 9¼ inches high.

IGNITION:—**Coil Model CE-4013, 4202, 4302.** Ignition switch is built in base of coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1.5 amperes at 6 volts with engine running and 4.5 amperes at 6 volts with engine stopped.

Distributor Model IGH-4010. Breaker contacts separate .018-.020 inch. Set contact gap by loosening two lock screws on stationary contact mounting plate (first set mounted on breaker plate) and turning eccentric adjusting screw until gap is .020 inch with breaker arm on lobe of cam. The second set (mounted on movable sub-plate) is adjusted by loosening the lock nut on the stationary contact mounting stud and turning up the stud. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Engine is designed to operate with manual spark fully advanced (with the button pushed all the way in toward the dash). Pulling out the button provides an auxiliary retard. Breaker has two sets of contacts operating on a single four lobe cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. This firing interval must be accurately set by synchronizing contacts (see Timing). Maximum manual advance is 15° (engine).

Cam Angles—Closed 34.5°. Open 10.5° (distributor) when synchronized.

Automatic Advance



Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	0		600
3		750	6		1500
6		1200	12		2400
10		1800	20		3600

Mounting:—Distributor is mounted on the cylinder head and may be removed from the right side. To remove distributor, disconnect manual spark control and primary lead and remove distributor head with cables intact. Then take out mounting screw in advance arm and lift distributor from place.

Oiling:—Put 6 or 8 drops of light engine oil in the oiler on the side of the distributor every 500 miles of operation. At the same time remove the distributor head and rotor and put 3 or 4 drops of oil in the oiler in the center of the shaft and put one drop of oil on the breaker arm pivot pins. Every 5000 miles put a small bit of grease on the face of the breaker cam.

Timing:—**Synchronization of Contacts.** Synchronize contacts on a rotary spark gap or use special Auto-Lite tool and follow complete directions given in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to engine by cranking engine over exactly 90 degrees when piston No. 6 will reach firing position (¾ inch on the flywheel before top dead center with the manual spark control fully advanced). If the second set of contacts (mounted on movable sub-plate) do not open at this point, loosen the two lock screws and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position ¾ inch (on the flywheel)

PEERLESS

CUSTOM AND DE LUXE CUSTOM EIGHT, MODEL C (1930-31-32)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

before top dead center with the spark control button fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). See that spark control button is pushed all the way in toward the dash and remove inspection hole cover in left front of flywheel housing. Turn engine over until the ignition mark 'IGN' on the flywheel is directly opposite the indicator on the edge of the inspection hole. Then loosen advance arm clamp screw and rotate distributor until the first set of contacts (mounted directly on the breaker plate) begin to open. Tighten the clamp screw and see that the rotor is directly opposite the segment in the distributor head connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs as shown on the diagram.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18MM. Metric. Champion Type 9-S. Gaps are .027 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Stem Length	Seat Angle	Lift
Intake	1⅝"	3710-.3715"	4 13/16"	30°	5/16"
Exhaust	1 9/16"	3710-.3715"	4 13/16"	45°	5/16"

	Tappet Clearance	Spring Pressure
Intake	.006" (hot)	105 pounds
Exhaust	.010" (hot)	

Timing

Intake valves open 2° after top dead center. Intake valves close 47° after lower dead center.

Exhaust valves open 43° before lower dead center. Exhaust valves close 2° after top dead center. Flywheel is marked 'No.1 EX.CL.' at point of exhaust closing for cylinders Nos. 1 and 8. Valve stem guides are removable. Valves with oversize stems are made for replacement.

To Check Valve Timing. Set tappet clearance of No. 1 exhaust valve at .007 inch (cold). With No. 8 piston on compression stroke, turn engine over until piston is 2° after top dead center with flywheel mark 'No.1 EX.CL.' at indicator on flywheel housing. No. 1 exhaust valve should close at this point.

To Set Valve Timing:—Crank engine over until piston No. 1 reaches top dead center when the flywheel mark 'DC 1&8' will be directly opposite the indicator in the inspection hole in the left front of the flywheel housing. Then turn camshaft so that there will be 10 links between the small 'o' stamped on the crankshaft sprocket and the camshaft sprocket when the chain is installed. To check timing, set No. 1 exhaust tappet clearance at .007 inch and crank engine over until No. 1 exhaust valve has just closed. The flywheel mark 'No.1 EX.CL.' should be directly opposite the indicator.

STARTER:—Model ML-4146, 4152 Exp. Starter drives engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter brush tension is 24-32 ounces. The starting switch is mounted at the lower end of the steering column.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3288	5.5	44
1.15 "	1940	5.5	100
4.2 "	1050	5.0	200
7.85 "	650	4.5	300
11.45 "	350	3.5	400
22.4 "	Lock	4.0	730

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and take out flange mounting screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler at each end of the armature every 1000 miles of operation.

GENERATOR:—Model GAR-4111. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift third brush (by prying on brush mounting stud with a screwdriver) counter-clockwise to increase or clockwise to decrease charging rate. Maximum charging rate 17 amperes at 1700 R.P.M. or 25-30 M.P.H.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	750
6	6.9	885
10	7.3	1030
14	7.65	1230
17	8.0	1700

Shunt field current is 4.75-5.25 amperes at 6 volts. Brush spring tension is 22-25 ounces (main brushes), 31-34 ounces (third brush). Generator motoring draws 5.0-5.65 amperes at 6 volts. A 7.5 amperes field fuse is mounted on the end plate.

Mounting:—Generator is mounted by special flange mounting at left of engine and is driven by the fan belt. To remove generator, disconnect lead and water pump drive coupling (water pump driven by generator shaft extension), take out flange mounting bolts under generator, slip off drive belt, lift generator out.

Belt Adjustment. To take up fan belt, loosen two lock nuts at rear of fan bracket fork, raise fan assembly until correct belt tension is secured, tighten nuts. Tension should be just sufficient to drive fan and generator without slipping.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler at each end of the generator every 500 miles of operation. Every 5000 miles remove the grease cup under the bearing retainer on the commutator end of the generator and fill with light grease.

RELAY:—Model CB-4014. Relay is mounted on the generator. Relay contacts close at 675 R.P.M. or 10-11 M.P.H. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 1-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Pines Lighting Switch, Model A-808. 'Finger Tip Control' type incorporating lighting switch, starting switch and horn button in a single unit mounted at lower end of steering column. Headlights are equipped with double filament headlight bulbs controlled by the lighting switch. See Equipment Section for complete data on Finger Tip Control.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Fender Lights	6-8	3	S.C.	63
Dash, Dome, Tail Lights	6-8	3	S.C.	63
Stop and Backing Lights	6-8	15	S.C.	87

FUSES:—Generator field fuse is 7.5 ampere capacity. Lighting fuses mounted on fuse block on dash (first cars) are 20 ampere capacity. A 20 ampere capacity fuse is mounted on the back of the gasoline gauge.

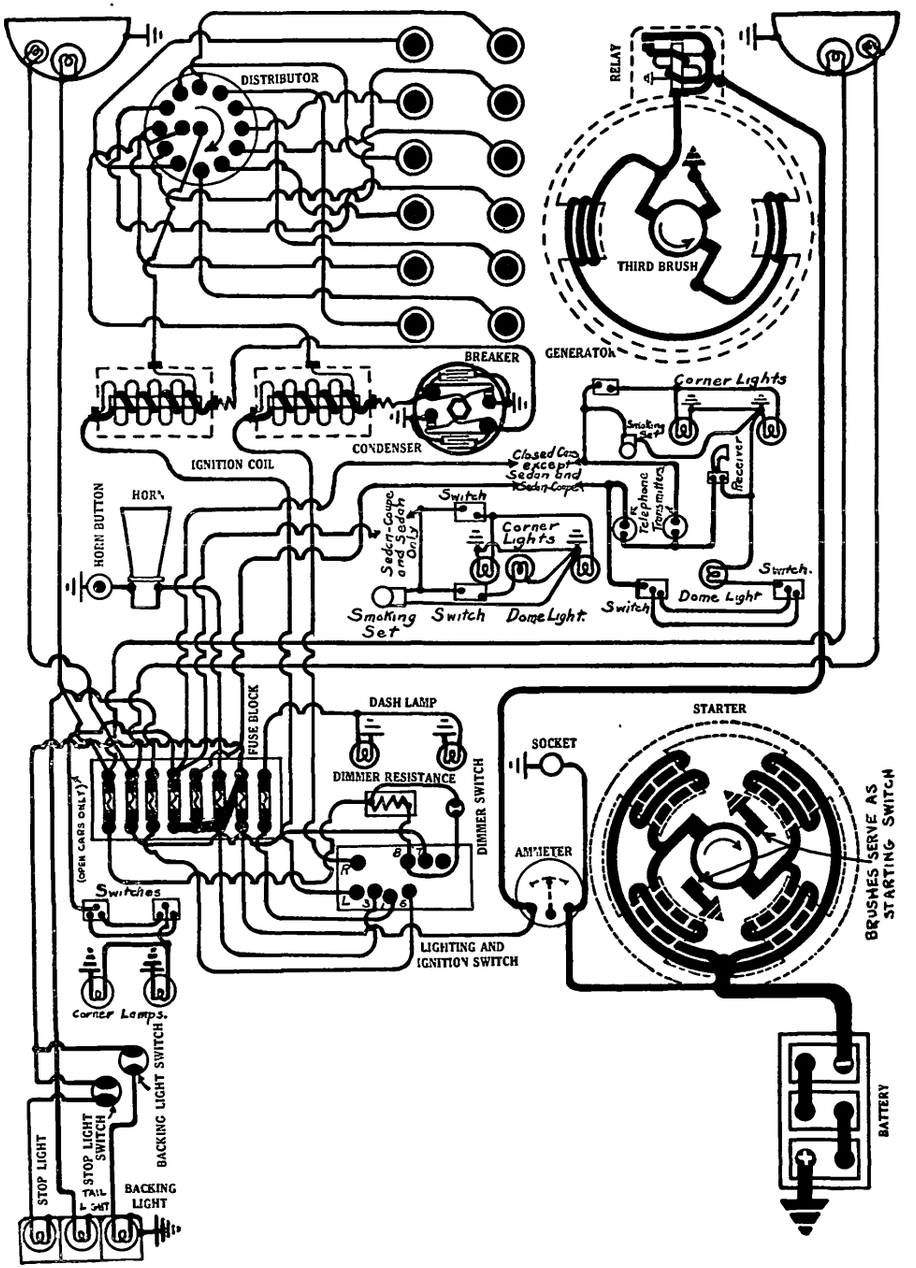
CURRENT LIMIT RELAY:—This device is a vibrating circuit breaker installed in later cars instead of the lighting fuses. It begins to vibrate when the current in the lighting circuits reaches 25-30 amperes and continues limiting the current to 15 amperes maximum.

PIERCE ARROW

MODEL 36 (1927-28) SERIAL NUMBERS 361000 UP
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type SJRR-6. 6 volt, 160 ampere hour. Starting capacity is 165 amperes for 20 minutes. Lighting capacity is 5 amperes for 31 hours. The positive (+) terminal is grounded. Battery is mounted on right chassis member in right front fender.

IGNITION:—Coil Model 2178 (Two used). Distributor Model 5265. A dual battery ignition system is used. Two ignition coils are mounted on the engine side of the dash. The right hand coil is controlled by the rear breaker in the distributor housing and fires the spark plugs at the right of the engine block over the exhaust valves. The left coil is controlled by the front breaker and fires the plugs at the left of the block over the intake valves. Breaker contacts separate .020-.025 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone. The distributor is of the semi-automatic type. Manual advance is 24-29°. Automatic advance begins at 575 R.P.M. and reaches a maximum of 14½°-17½° at 2000 R.P.M. The tension of the breaker arm spring should be 13-16 ounces. The ignition current is 4-4½ amperes at 6.5 volts with engine running, and 4-4¼ amperes at 6.2 volts with engine stopped.



Mounting:—Distributor is mounted at left of engine. To remove distributor, disconnect breaker leads and high tension cables or remove distributor head. Then disconnect manual advance rod and distributor drive coupling. Remove two base mounting screws and lift distributor from place.

OILING: — Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. If the track of the distributor button in the head is not well polished, apply a small amount of vaseline, removing all excess with a soft, clean cloth. Once each year repack the gear compartment with medium soft cup grease.

Timing:—The rear breaker contacts firing the spark plugs over the exhaust valves begin to open when the piston entering power stroke reaches a position 1¼ inches (Series 33) or 1⅜ inches (Series 36), measured on the flywheel, after top dead center with the manual spark control fully retarded. The forward set of contacts open 3°-9° after this point. To set timing, crank engine over until piston No. 1 enters compression stroke. Fully retard manual spark control and remove inspection hole cover on flywheel housing. Then turn engine over until the ignition mark 'Ignition' on the flywheel (which is 1¼ inches (33) or 1⅜ inches (36) after the top dead center mark) is opposite the indicator on the flywheel housing. Then loosen taper lock screw in center of breaker cam and locate cam so that the rear set of contacts are beginning to open. Tighten the lock screw. Set the forward contacts to open 3°-9° after this point. Connect the spark plugs as indicated on the diagram.

VALVE TIMING:—INLET VALVES. Head diameter, 1.718 inches. Stem diameter, .406 inch. Stem length, 7 9/16 inches. Tappet clearance, .003 inch. Spring pressure, 74 pounds (valve closed). Valve lift, 11/32 inch. Intake opens at 5° before top dead center and closes 45° after lower dead center.

EXHAUST VALVES:—Head diameter, 1.468 inches; stem diameter, .4060 inch; stem length, 7 9/16 inches; tappet clearance, .003 inch; spring pressure, 74 pounds (valve closed); valve lift, 11/32 inch; exhaust opens at 45° before lower dead center and closes 5° after top dead center. No oversize valve stems are made.

PIERCE ARROW

MODEL 36 (1927-28) SERIAL NUMBERS 361000 UP
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

FIRING ORDER: — The firing order is 1-5-3-6-2-4.

SPARK PLUGS: — Spark plug diameters are 7/8 inch. Gaps are .030 inch.

STARTER: — Model No. 252. The starter is connected to the engine through a mechanical gear shift. The two grounded motor brushes serve as a starter switch and are allowed to come in contact with the commutator when the gear shift is operated. This completes the circuit and permits the starter to crank the engine. When the starter button is released, a spring reverses these operations. The starter cranks the engine at 115 R. P. M. taking 180 to 300 amperes. Running free, the current is 50 amperes at 6 volts. Lock torque is 40 lb. ft. the current being 550-600 amperes at 2.75 volts. The brush tension should be 2¼ to 2¾ pounds.

Mounting.—Starter is mounted at right of engine on a special bracket mounting. To remove, disconnect pedal return spring and pedal rod and remove two hold-down screws in motor base. Then lift starter from place.

OILING: — Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles. Once each year disassemble, clean and repack starter clutch with pure vaseline. At the same time remove grease plug in reduction gear case and repack compartment with medium heavy cup grease.

GENERATOR: — Model No. 279. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. The maximum charging rate is 22 amperes reached at 1600 R. P. M. of the generator armature or 20 M. P. H.

Generator Data.

Amperes	R. P. M.
3	600
22	1600

The average output required is 15 amperes. To adjust the charging rate, loosen the generator cover band and the lock nut on the commutator end of the generator. Then shift the third brush mounting plate, by means of the handle attached, in a counter-clockwise direction to increase the charging rate and the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment.

Motoring freely, generator draws 4.25 amperes at 6.5 volts. Shuntfield current is 2 to 3.5 amperes at 8 to 9.75 volts. Generator brush spring tension is 1¾ pounds each.

Mounting.—Generator is mounted at right of engine. To remove, disconnect coupling at either end of generator and remove hold-down from generator base. Then lift generator from position.

OILING: — Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY: — Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts, which is reached at a car speed of approximatety 8 M. P. H., and open when the discharge current reaches 0 to 3 amperes. Contacts separate .030 inch The air gap between the relay armature and the coil core is .015 - .020 inch, contacts closed.

LIGHTING:—Switch Model 1186. Head lamps and stop lamp are each 6-8 volt, 21 cp. S.C. Backing and stop lamps are each 6-8 volt, 21 cp. S.C. Dome lamp is 6-8 volt, 15 cp. S.C. Dash, tail, auxiliary head lamps and tonneau lamp are each 6-8 volt, 4 cp. S.C.

Switches:—Dimmer switch is Delco-Remy Model 465-A or B.

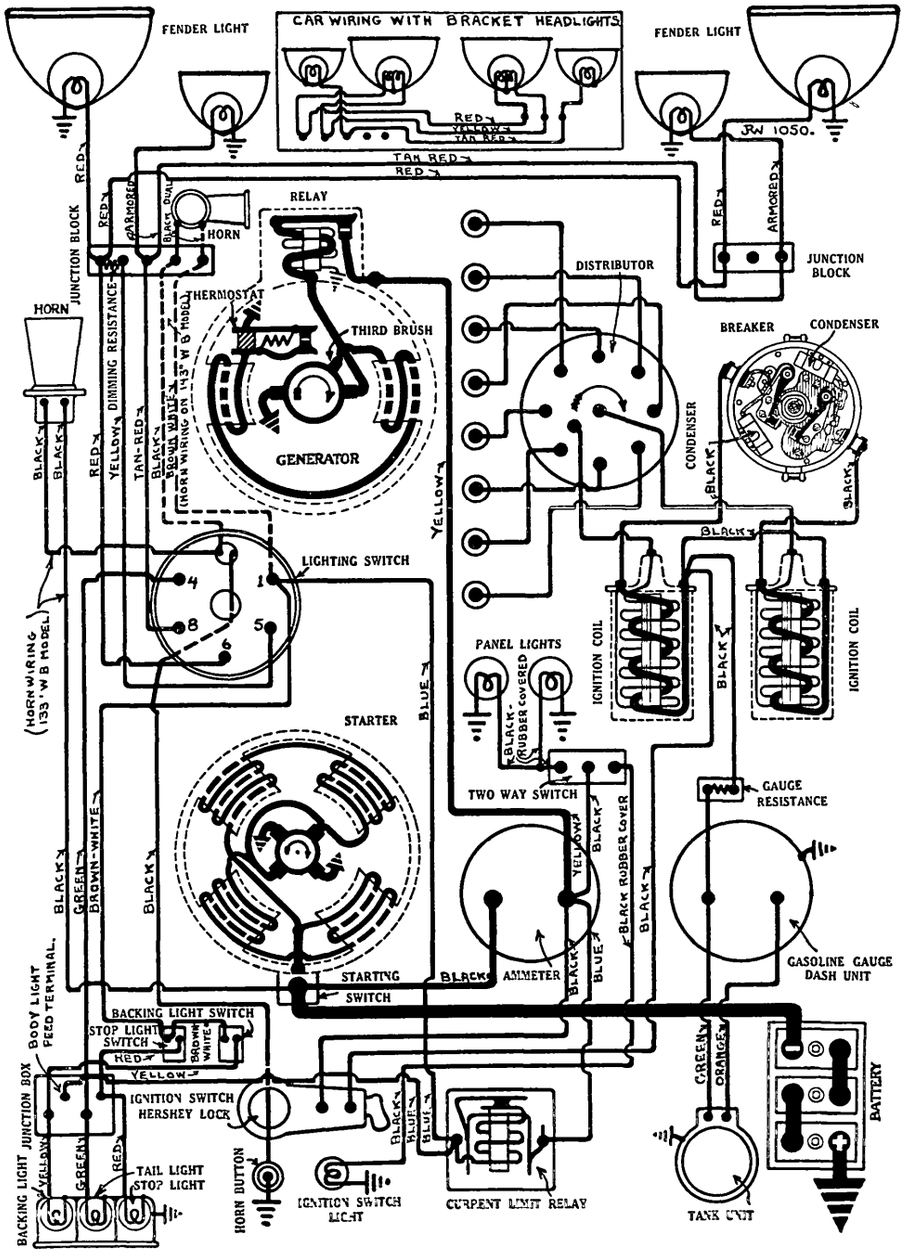
FUSES: — Main circuit fuse is 30 amperes. All other fuses are 10 amperes.

PIERCE ARROW

STRAIGHT EIGHT (1929)
MODEL 125 (123 INCH WHEELBASE) 126 (143 INCH WHEELBASE)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—U.S.L. Type 3-HVX-6X-6A, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 127 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 23.4 hours. Battery is mounted on the right frame member under the front floor boards.

IGNITION:—Coil Model 528-E (2 used). Ignition coils are mounted on the dash. Ignition current is 3.6 amperes at 6 volts with engine running and 8 amperes at 6 volts with engine stopped.



Distributor Model 668-E. Breaker contacts separate .018 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 35 degrees (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 19.5 degrees reached at 3200 R.P.M. Breaker has two sets of contacts operating on a single four sided cam. Each set of contacts controls one coil and fires the spark plugs in four cylinders. Contacts separate alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation which is the correct firing interval for the Pierce Arrow engine. Contacts must be synchronized for correct performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head and may be removed from the left side. To remove distributor, disconnect primary leads and spark control and take off distributor head with cables intact. Then remove nuts from three base mounting studs and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every 2500 miles. At the same time remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts:—To synchronize contacts, use special Delco-Remy tool, Part No. 1835009, and follow complete directions in Equipment Section. Contacts can be synchronized without tool after distributor has been timed to engine by cranking engine over 90 degrees from firing position of piston No. 4 when piston No. 1 will reach firing position with ignition mark on flywheel opposite the indicator at the right of the flywheel housing. If the second set of contacts do not separate at this point, loosen the two lock screws and turn the eccentric adjusting screw until contacts open. Tighten the lock screws and check the contact gap with breaker arm on lobe of the cam. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position one inch before top dead center on the flywheel with the spark control in the fully advanced position. To set timing, crank engine over until piston No. 4 enters compression stroke (the up stroke with both valves closed). Fully advance spark lever. Continue to crank engine until the ignition mark for piston No. 4 on the flywheel is opposite the indicator on the right side of the flywheel housing. Loosen advance arm clamp bolt and rotate distributor counter-clockwise until the set of contacts on the right side of the distributor begin to open. Tighten the clamp screw. Then crank engine over 90 degrees until ignition mark for piston No. 1 is opposite the indicator and check synchronization by making sure that the second set of contacts open at this point.

PIERCE ARROW

STRAIGHT EIGHT (1929)
MODEL 125 (123 INCH WHEELBASE) 126 (143 INCH WHEELBASE)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Firing Order:—The firing order is 1-6-2-5-8-3-7-4. Distributor is of the side outlet type and connections should be made 3-2-4-1-5-8-7-6 from front to rear of the distributor.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 21/32 inches. Stem diameter, .3725 inch. Valve lift, .359 inch. Tappet clearance, .002-.003 inch (hot). Inlet valves open 5 degrees after top dead center and close 45 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 9/16 inches. Stem diameter, .3715 inch. Valve lift, .359 inch. Tappet clearance, .003-.004 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 12 degrees after top dead center. Valve stem guides are removable.

To Check Valve Timing:—Check tappet clearance No. 1 intake valve. This valve should open with piston slightly past top dead center on intake stroke when flywheel mark 'IN.OP/1-8' registers with indicator on housing.

To Set Valve Timing:—Camshaft is chain driven with automatic take-up idler sprocket. To set timing, mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—Model 728-C. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal. The direction of rotation is clockwise (armature shaft) viewed from the commutator end. Starter brush spring tension is 20-28 ounces.

Starter Data

15.8 "	250	4.1	400
20.4 "	200	3.6	500
28 "	Lock	3.0	600

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable, pedal rod and pedal return spring and remove three flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter bearing olers every 2500 miles. Once each year remove the grease plug in the reduction gear case and repack the gear case with medium grease.

GENERATOR:—Model 955-C, P, Z. The direction of rotation is clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 10-12 amperes (hot) reached at 2100 R.P.M. or 25 miles per hour.

Generator Data

15.5		2400			

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at left of engine on rear of timing chain case. The water pump is mounted on the rear of the generator and is driven by an extension of the generator shaft. To remove generator, drain radiator, disconnect water pump couplings and remove water pump by taking two cap screws. Then disconnect generator lead, remove three flange mounting cap screws, pull generator to rear to disconnect shaft, and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 500 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 650 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-D. Lighting switch is mounted at lower end of steering column. Headlights mounted on fenders are 21 cp. single filament with a dimming resistance mounted on the junction block at the front of the car. Headlights mounted on brackets are 21 cp. double filament without the resistance. Headlights are 6-8 volt, 21 cp. S.C. Mazda 1129 or 6-8 volt, 21-21 cp. D.C. Mazda 1110. Auxiliary lights are 6-8 volt, 6 cp. S.C. Mazda 81. Stop and backing lights are each 6-8 volt, 21 cp. S.C. Mazda 1129. Step and tail lights are each 6-8 volt, 6 cp. S.C. Mazda 81. Dash, dome and corner lights are each 6-8 volt, 3 cp. S.C. Mazda 63. A 15 cp. Mazda 87 dome light may be used.

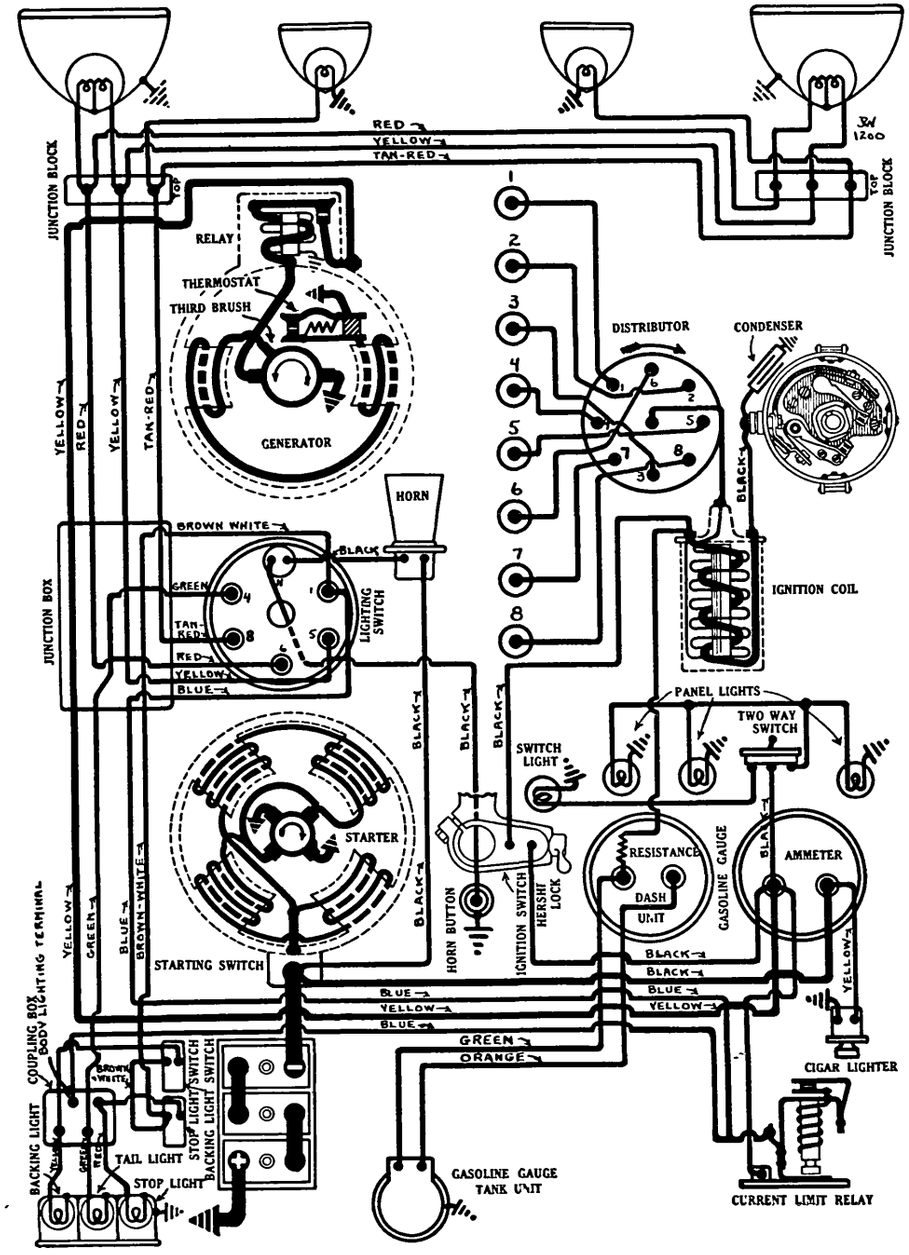
CURRENT LIMIT RELAY:—Model 410-C. This device is a vibrating circuit breaker mounted on the dash and wired in the lighting circuits. It begins to vibrate when the current reaches 20-30 amperes and continues to operate limiting the current to 2-15 amperes. Circuit breaker contact gap is .012-.030 inch. Air gap is .019-.025 inch with contacts closed.

PIERCE ARROW

MODEL C (1930)
PRODUCTION STARTED JANUARY 1, 1930
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type SJWR-5, 6 volt, 140 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 145 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 26 hours. Battery is mounted on the left frame member under the floor boards of the front compartment.

IGNITION:—Coil Model 528-E. Coil is mounted on the dash. Ignition current is is 1.8 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' type co-incidental steering post and ignition switch lock.



Distributor Model 652-E. Breaker contacts separate .018 inch. Set contact gap by loosening lock screw on stationary contact mounting plate directly behind contacts and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 33 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 20 degrees reached at 2600 R.P.M. of engine. Distributor has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized for correct ignition performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the shaft with medium cup grease and turn down two full turns every 2500 miles. At the same time remove the distributor head and rotor and put 8 or 10 drops of light engine oil in the oiler in the center of the shaft and put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. The contacts must be synchronized so that the set mounted on the movable sub-base open exactly 45 degrees after the set mounted directly on the breaker plate for satisfactory engine performance. To synchronize contacts, use special Delco-Remy tool, Part No. 820738, and follow complete directions given in Equipment Section. The contacts may be synchronized without special equipment after the distributor has been timed to the engine by cranking the engine over exactly 90 degrees from firing position of piston No. 4 when piston No. 1 will reach firing position. If the second set of contacts are not opening at this point, loosen the two lock screws on the movable sub-base and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap with the breaker arm on the lobe of the cam. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to separate when the piston entering power stroke reaches a position 8°26′ on the flywheel before top dead center with the manual spark control lever in the fully advanced position (vertical). To set timing, crank engine over until No. 4 piston enters compression stroke (the upstroke with both valves closed). Fully advance spark control lever and take off cover plate in flywheel inspection opening. Then crank engine over until the ignition mark on the flywheel is directly opposite the indicator on the housing. Loosen

DELCO-REMY IGNITION

advance arm clamp screw and rotate distributor until the first set of contacts (mounted directly on the base plate) begin to open. Tighten the clamp screw and see that the rotor is directly opposite the segment in the distributor head connected to the spark plug in cylinder No. 4. Connect the remaining spark plugs as shown on the diagram.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Champion No. 4-S. Gaps are .028 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 21/32 inches. Stem diameter, .3725 inch. Valve lift, .359 inch. Tappet clearance, .004 inch (hot). Inlet valves open 5 degrees after top dead center and close 45 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 9/16 inches. Stem diameter, .3715 inch. Valve lift, .359 inch. Tappet clearance, .006 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 12 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Check tappet clearance No. 1 intake valve. This valve should open with the piston slightly past top dead center on intake stroke when the flywheel mark 'IN.OP/1-8' lines up with the indicator on the housing.

To Set Valve Timing:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—**Model 728-C.** Starter is connected to the engine through a manual shift interconnected with the starting switch. The direction of rotation is clockwise (armature shaft), viewed from the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
1 "	1500	5.5	100
4.8 "	725	5.4	200
9.3 "	425	4.5	300
15.8 "	250	4.1	400
20 "	200	3.6	500
28 "	Lock	3.0	600

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and return spring. Then remove three flange mounting cap screws. Pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 2500 miles. Once each year remove the grease plug in the reduction gear case and repack gears with medium grease.

GENERATOR:—**Model 959-F.** The direction of rotation is counter-clockwise. viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed lock screw on the outside of the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting, the maximum charging rate is 22 amperes at 8.5 volts reached at 1600 R.P.M. or 26 M.P.H.

Generator Data

Cold Test			Hot Test

19-22	8.3-8.7	1550	9-12	7.3-7.7	1800-2000

Shunt field current is 5 amperes at 6 volts. Brush spring tension is 14-18 ounces. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator is flange mounted at the left front of the engine and is driven by the fan belt. To remove generator, disconnect lead and take off drive belt. Then remove flange mounting screws and lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 2500 miles of operation.

RELAY:—**Model 265-B.** Relay is mounted on the generator. Relay closes at 7 miles per hour when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—**Delco-Remy Switch, Model 486-D.** Lighting switch is mounted at the lower end of the steering column. Headlight equipment includes headlights mounted on fenders with auxiliary lights mounted on brackets, or bracket headlights with auxiliary lights mounted on the fenders. In each installation the headilghts are fitted with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Auxiliary headlights are 6-8 volt, 6 cp. S.C. Mazda 81 Dash lights are 6-8 volt, 3 cp. S.C. Mazda 63. Tail light is 6-8 volt, 6 cp S.C. Mazda 81. Stop and backing lights are each 6-8 volt, 21 cp. S.C. Mazda 1129. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87. Corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

CURRENT LIMIT RELAY:—**Model 410-C.** This device is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits. It begins to operate when the current reaches 25-30 amperes and continues to vibrate limiting the current to 2-15 amperes. Circuit breaker contact gap is .012-.030 inch. Air gap is .019-.025 inch with contacts closed.

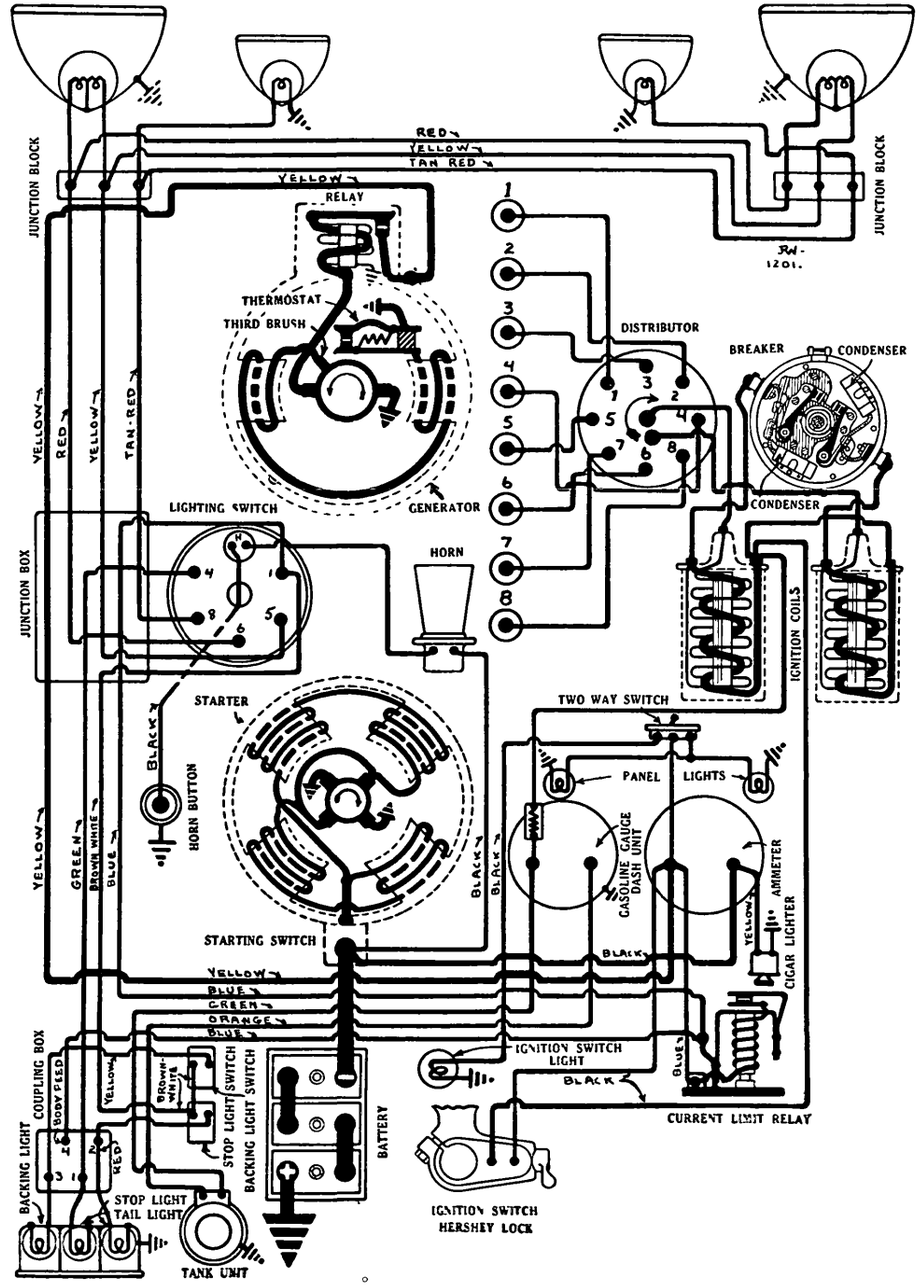
BATTERY:—Willard, Type SJWR-5 (1930), WJ-4-15 (1931), 6 volt, 132 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 145 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 26 hours. Battery is mounted on the right frame member under the floor boards of the front compartment.

IGNITION:—Coil Model 528-E (2 used). Coils are mounted on the dash. Ignition current is 3.6 amperes at 6 volts with engine running and 8 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' type co-incidental steering post and ignition switch lock.



Distributor Model 668-E. Breaker contacts separate .018 inch. Set contact gap by loosening lock screw on stationary contact mounting plate directly behind contacts and turning up eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 35 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 19.5° reached at 3200 R.P.M. Breaker has two sets of contacts operating on a four sided cam. Each set of contacts controls one coil and fires the spark plugs in four cylinders. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized for satisfactory ignition performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head and can be removed from the right side. To remove distributor, disconnect primary leads and spark control and remove distributor head with cables intact. Then take off three nuts on base of mounting studs and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft and turn down two full turns every 2500 miles. At the same time remove the distributor head and rotor and put 8 or 10 drops of light engine oil in the wick oiler in the center of the shaft and put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Contacts must be synchronized so that the set mounted on the movable sub-plate open exactly 45 degrees after the first set, which is mounted directly on the breaker plate. To synchronize contacts use special Delco-Remy tool, Part No. 1835009, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to engine by cranking engine over exactly 90 degrees from firing position of piston No. 4 to firing position of piston No. 1 (8°26' before top dead center with the flywheel mark 'IGN/1-8' at the indicator). If the second set of contacts do not open at this point, loosen the two lock screws on the mounting sub-base and turn the eccentric adjusting screw until they begin to open. Tighten the lock screws and check the contact gap with the breaker arm on the lobe of the cam. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to separate when the piston entering power stroke reaches a position which is 8°26' on the flywheel before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until No. 4 piston enters compression stroke (the up stroke with both valves closed). Fully advance spark control and take off cover plate in flywheel inspection

28 "	Lock	3.0	600

Mounting:—Starter is flange mounted at left engine on forward side of flywheel housing. Te remove starter, disconnect cable and starting pedal linkage and return spring. Then remove three flange mounting cap screws. Pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 2500 miles. Once each year remove the grease plug in the reduction gear case and repack gears with medium grease.

GENERATOR:—Model 927-L. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165° F. cutting the resistance connected across the thermostat contacts in series with the field and reduce the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed lock screw on the outside of the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting, the maximum charging rate is 22 amperes at 8.5 volts reached at 1600 R.P.M. or 26 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
20-22	8.5	1600	12-14	7.75	1800

Shunt field current is 1.8-2.3 amperes at 6 volts. Brush spring tension is 23-27 ounces. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator is flange mounted at the left front of the engine and is driven by the fan belt. To remove generator, disconnect lead and take off drive belt. Then remove flange mounting screws and lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 2500 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 7 miles per hour when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-D. Lighting switch is mounted at the lower end of the steering column. Headlight equipment includes headlights mounted on fenders with auxiliary lights mounted on brackets, or bracket headlights with auxiliary lights mounted on the fenders. In each installation the headlights are fittted with double filament bulbs using a second 32 cp. filament instead of dimmers. Headlights are 6-8 volt, 32-32 cp. D.C. Mazda 1000. Auxiliary headlights are 6-8 volt, 6 cp. S.C. Mazda 81. Dash lights are 6-8 volt, 2 cp. S.C. Mazda 63. Tail light is 6-8 volt, 6 cp. S.C. Mazda 81. Stop and backing lights are each 6-8 volt, 21 cp. S.C. Mazda 1129. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87. Corner lights are 6-8 volt, 3 cp. S.C. Mazda 63.

CURRENT LIMIT RELAY:—Model 410-E. This device is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits. It begins to operate when the current reaches 25-30 amperes and continues to vibrate limiting the curre nt to 5-18 amperes. Circuit breakers contact gap is .012-.030 inch. Air gap is .015-025 inch with contacts closed. Plunger spring tension is 5 ounces minimum.

MODEL 51 (1932) 147" W. B. MODEL 52 (1932) 142", 147" W. B.
MODEL 53 (1932) 137", 142" W. B.
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on right frame member near rear end right front spring. This series Model 52—142" W.B.—3,075,001 up, Model 52—147" W.B.—3,500,001 Up, Model 53—137" W.B.—2,050,001 Up, Model 53—142" W.B.—2,550,001 Up.

ENGINE NUMBER:—Stamped on upper right rear side of crankcase.

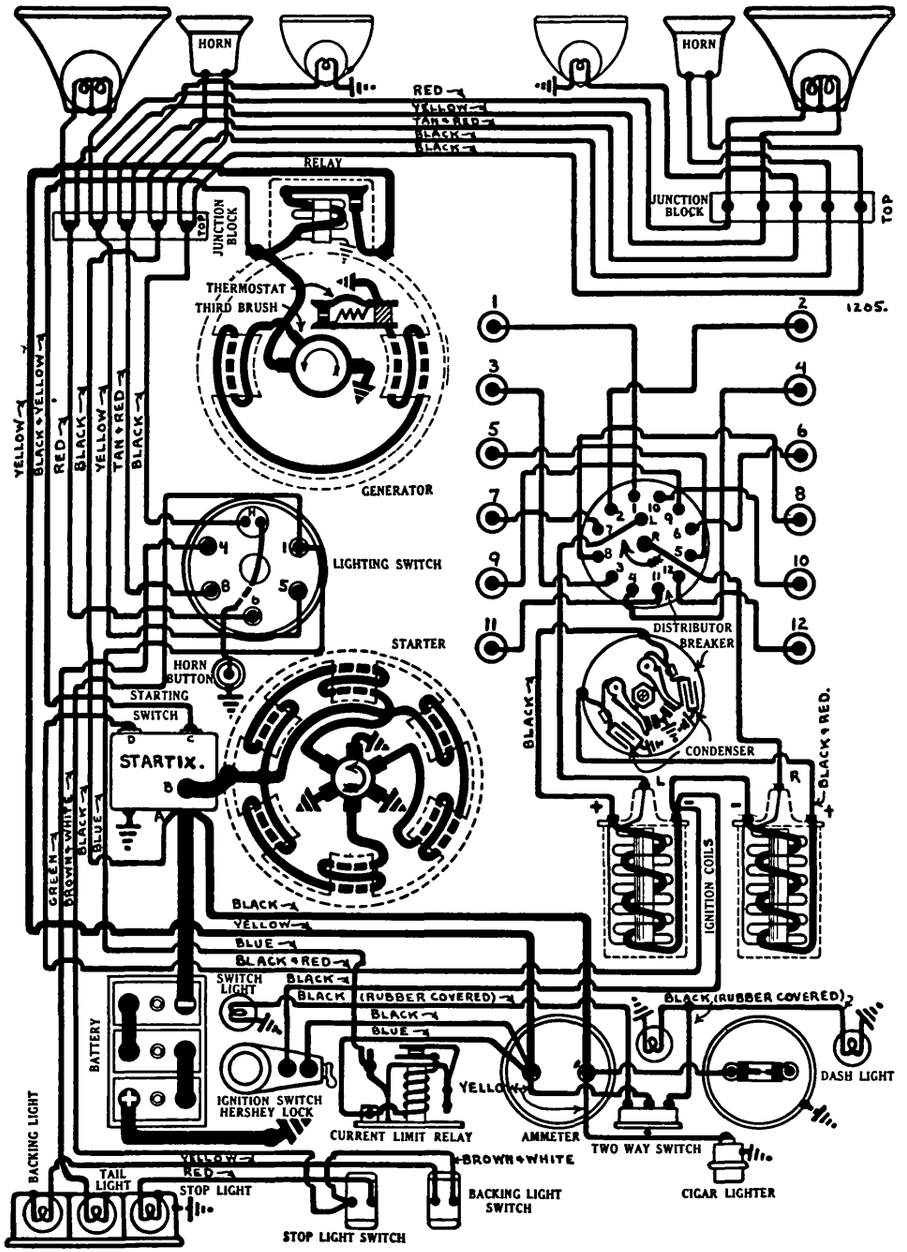
BATTERY:—**Willard, Type WH-5-19.** 6 volt, 19 plate, 153 ampere hour capacity (20 hour rate). Starting capacity 180 amperes for 20 minutes. Positive (+) terminal grounded. Battery mounted on left frame member under front compartment floor boards. Battery size 7 1/16 inches wide, 13 inches long, 9¾ inches high.

IGNITION:—**Coil Model 528-E (2 used).** Coils are mounted on the dash. Ignition current 3.6 amperes at 6 volts (engine running) 8 amperes at 6 volts (engine stopped) for both coils. Ignition switch Oakes 'Hershey' type coincidental ignition switch and steering post lock.

Distributor Model 4096. Two breaker arm, 6 lobe cam type with semi-automatic advance. Breaker contacts open alternately at 20 and 40 degree intervals corresponding to engine firing intervals of 40 and 80 degrees—engine has cylinder banks set at 80 degree angle and has uneven firing interval. Contacts must be synchronized (see Timing). Manual advance controlled by button on lower right of instrument panel. Ordinary running position with button pushed in—spark fully advanced, to retard spark pull out button. Breaker gap .018 inch. Hold within limits of .018-.024 inch. To set gap, loosen lockscrew on stationary contact plate (directly behind breaker arm), turn eccentric adjusting screw. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). Maximum manual advance 33° (engine).

Cam Angles—Closed 39°. Open 21° (distributor) each set independently.

Automatic Advance



Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	2		600
7		1500	14		3000

Mounting:—Distributor mounted at extreme rear of engine between cylinder banks. To remove, disconnect primary leads, take off distributor cap, disconnect manual spark control cable, take out distributor bracket mounting screws, lift distributor out.

Oiling:—**2500 Miles.** Turn down grease cup on side of shaft housing two turns. Keep cup filled with light cup grease. Put 8-10 drops light engine oil in distributor oiler. Take off distributor cap and rotor. Put 8-10 drops oil in breaker cam oiler.

Timing:—Standard setting 8° 26' (on flywheel) before top dead center with manual spark control fully advanced. To set timing ,first advance manual spark control (push button in toward dash) and see that distributor is rotated counter-clockwise as far as possible, disconnect wire on 'IGN' terminal of Startix to prevent automatic cranking of engine,, take off cover on inspection hole in flywheel housing. With No. 1 piston (No. 1 left hand bank) on compression stroke, turn engine over until flywheel mark 'IGN/NO.1' (which is 8° 26' before top dead center mark 'UDC/NO.1') is directly opposite indicator on housing. Take off distributor cap and rotor, loosen locking screw in center of breaker cam, carefully locate cam so that first set of contacts (mounted directly on breaker plate) are beginning to open, (use test lamp), tighten locking screw, connect spark plugs as shown on diagram (No. 1 terminal as designated).

Synchronization of Contacts.—First method as part of timing operation.

PIERCE ARROW

MODEL 51 (1932) 147" W. B. MODEL 52 (1932) 142", 147" W. B. MODEL 53 (1932) 137", 142" W. B. DELCO-REMY SYSTEM

After distributor has been timed (above), turn engine over 40° to firing position of piston No. 4 (second cylinder right hand bank) when flywheel mark 'IGN/NO.4' (which is 8° 26' before top dead center mark 'UDC/NO.4') will be directly opposite indicator on housing. Loosen lockscrews on movable sub-plate (carrying second set of contacts), shift plate until contacts begin to open, tighten lockscrews, check contact gap.

Second Method. Synchronize contacts on rotary spark gap and shift movable sub-plate until interval between opening of contacts is alternately 20 and 40 degrees.

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as shown on diagram or 1L-2R-5L-4R-3L-1R-6L-5R-2L-3R-4L-6R with cylinder banks right (R) and left (L) as viewed from driver's seat, No. 1 cylinder nearest radiator in each case.

Spark Plugs:—14 MM. AC Type K-10. Set gap at .025-.030 inch.

VALVE TIMING:—Valves are located on inner side of each cylinder bank and are operated by a single camshaft mounted directly above crankshaft. Camshaft driven by two-sprocket non-adjustable chain drive from crankshaft.

	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 21/32" (overall)	.3725"	45°	.312"
Exhaust	1 9/16" (overall)	.3715"	45°	.312"

Tappet Clearance		Spring Pressure	
Intake	.004" (hot)		
Exhaust	.006" (hot)	Closed	50-55 pounds

Timing

Intake valves open 4° before top dead center. Close 52° after lower dead center.

Exhaust valves open 40° before lower dead center. Close 16° after top dead center.

To Check Valve Timing. Check tappet clearance No. 1 intake valve (left hand bank). With No. 11 piston on compression stroke, turn engine over until flywheel mark 'IN.OP/NO.1' (which is 4° before top dead center mark 'UDC/NO.1') is directly opposite indicator on flywheel housing. No. 1 intake valve should begin to open at this point. An additional mark 'IN.OP./NO.4' which is 4° before the top dead center mark 'UDC/NO.4' is placed on the flywheel to indicate the intake opening point for cylinder No. 4.

To Set Valve Timing:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—**Model 498.** Starter drives engine through Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 36-40 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5.0	70
19 " "	Lock	3.0	500

Startix:—This model equipped with Startix automatic starting switch—see Equipment Section for complete article on Startix. When ignition setting is checked Startix should be disconnected (disconnect wire on 'IGN' terminal) to prevent automatic cranking of engine.

Mounting:—Starter flange mounted on front face flywheel housing at right of engine. To remove, disconnect cable, take out flange mounting screws, pull starter straight forward to clear Bendix housing.

Oiling:—Starter bearings oilless.

GENERATOR:—**Model 927-U.** Third brush regulation, thermostat control. Thermostat operates at 165°F. (contacts open, cuts in resistance) reducing output approximately 40%. To adjust charging rate, loosen lockscrew on commutator end plate, take off cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, tighten locking screw. Maximum charging rate is 20 amperes (cold) at 8.5 volts reached at 1600 R.P.M.. Rotation counter-clockwise at commutator end.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
20-22	8.5-8.7	1600	12-14	7.5-7.9	1800

Brush spring tension 20-28 ounces. Shunt field current 1.8-2.3 amperes at 6 volts.

Mounting:—Generator cradle mounted left front of engine driven by fan belt (double Vee belt). Water pump driven by extension of generator shaft. To remove, disconnect water pump drive coupling, disconnect lead, slack off fan belt adjustment, loosen mounting clamp band, lift generator out.

Belt Adjustment. To adjust belt, loosen clamp bolt on fan bracket, turn eccentric shaft spindle, tighten clamp bolt. Additional adjustment secured by taking off fan bracket, moving bracket up on engine block so that mounting bolts engage lower holes in bracket, and making final adjustment by means of eccentric shaft spindle.

RELAY:—**Model 265-G.** Mounted on generator. Relay contacts close with generator voltage of 6.75-7.5 volts and open with discharge current of 0-2.5 amperes. Relay contact limits .015-.025 inch. Air gap limits .012-.017 inch. (contacts closed).

LIGHTING:—**Delco-Remy Switch, Model 486-U.** Lighting switch mounted at lower end of steering column controlled by left hand lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch. Switch positions:

1. Upper position—Auxiliary lights on, tail light on.
2. Lever pulled down one notch—all lights off.
3. Lever pulled down two notches—Dim 'depressed beam' headlights and tail lights on.
4. Lever pulled down—Bright headlights on, tail light on.

Note:—Instrument lights and switch lock light controlled by push-pull button at extreme left instrument board. First position (button halfway out)—instrument lights on, second position (button entirely out)—instrument lights and switch lock light on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda Number
Headlights	6-8	32-32	DC	1000
Auxiliary lights	6-8	6	SC	81
Dash lights	6-8	3	SC	63
Tail and Tonneau lights	6-8	6	SC	81
Stop and backing lights	6-8	21	SC	1129
Dome light	6-8	15	SC	87

CURRENT LIMIT RELAY:—**Model 410-F.** Vibrating circuit breaker in lighting circuits starts with current load of 30-35 amperes limiting current to 5-18 amperes with direct short-circuit . Contact gap limits .012-.030 inch. Air gap limits .015-.025 inch (contacts closed). Spring pressure 5 ounces minimum (measured at brass button on contact arm with spring scale at right angles to arm).

GASOLINE GAUGE:—K-S Telegauge hydrostatic type (see Carburetion Section).

FUEL PUMP:—Stewart-Warner mechanical fuel pump mounted at left of engine (see Carburetion Section).

HORNS:—Klaxon Type K-26-E matched set Type 1475 (low note) Type 1476 (high note) Current draw 6.0-8.5 amperes at 6 volts (Type 1475) 5.0-6.5 amperes at 6.0 volts (Type 1476).

ELECTRIC CLOCK:—Mounted left center instrument panel. 5 ampere capacity fuse mounted on back of clock.

PIERCE ARROW

MODEL 54 (1932) 137" AND 142" W. B.
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on right frame member near rear end right front spring. This series Model 54—137" WB.—1,050,001 Up, Model 54—142" WB.—1,525,001 Up.

ENGINE NUMBER:—Stamped on upper right rear side of crankcase.

BATTERY:—Willard, Type WH-4-17. 6 volt, 17 plate, 136 ampere hour capacity 20 hour rate). Starting capacity 160 amperes for 20 minutes. Positive (+) terminal grounded. Battery mounted on left frame member under front compartment floor boards. Battery size 7 1/16 inches wide, 11 11/16 inches long, 9 5/16 inches high.

IGNITION:—Coil Model 528-E. Coil mounted on dash. Ignition current 1.8 amperes at 6 volts (engine running) 4 amperes at 6 volts (engine stopped). Ignition switch Oakes 'Hershey' type co-incidental ignition switch and steering post lock.

Distributor Model 660-P. Two breaker arm, 4 lobe cam type with semi-automatic advance. Breaker contacts open alternately at 45 degree intervals corresponding to 90 degree firing interval of engine. Contacts must be synchronized—see Timing. Manual advance controlled by button on dash, normal running position with button pushed in—spark fully advanced, pull button out to retard spark. Set contact gap at .018 inch. Hold within limits of .018-.024 inch. To set gap, loosen lockscrew on stationary contact plate (directly behind contact arm), turn eccentric adjusting screw. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface. Maximum manual advance 33° (engine).

Cam Angles—Closed 34°. Open 11° (distributor) when synchronized.

		Automatic Advance			
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	3		600
9.75		1600	19.5		3200

Mounting:—Distributor mounted on cylinder head at right. To remove, disconnect primary lead, disconnect manual advance control wire, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—2500 Miles. Turn down grease cup on side of shaft housing two turns. Keep cup filled with light cup grease. Take off distributor cap and rotor, put 8-10 drops light engine oil in wick oiler in center of shaft, apply thin film vaseline to face of breaker arm.

Timing: Standard setting 8° 26' (on flywheel) before top dead center with full manual advance. To set timing, first advance spark control button (push button in toward dash) and see that distributor is rotated counter-clockwise as far as possible, disconnect wire on 'IGN' terminal on Startix to prevent automatic cranking of engine, take off cover plate on inspection hole in flywheel housing. With No. 4 piston on compression turn engine over until flywheel mark 'IGN/4-5' (which is 8°26' before top dead center mark 'UDC/4-5') is directly opposite indicator on housing. Loosen advance army clamp bolt, rotate distributor until first set breaker contacts (mounted directly on breaker plate) begin to open (use test lamp), tighten clamp bolt, connect spark plugs as shown on diagram.

Synchronization of Contacts—First method as part of timing operation. After timing distributor (above) turn crankshaft 90° or ¼ revolution to firing position of piston No. 1 with flywheel mark 'IGN/1-8', which is 8°26' before the top dead center mark 'UDC/1-8' directly opposite indicator on housing, loosen lockscrews on movable plate (carrying second set of contacts), turn eccentric adjusting screw until contacts open, tighten locking

DELCO-REMY SYSTEM

screws, check contact gap, if outside limits of .018-.024 inch, reset at .022 inch, repeat synchronization.

Second Method—Using synchronizing tool. Use Delco-Remy tool, Part No. 1838182, follow complete instructions in Equipment Section.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—⅞-18 S.A.E. Champion Type C-4. Set gaps at .025-.030 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 21/32" (overall)	.3725"	45°	.359"
Exhaust	1 9/16" (overall)	.3715"	45°	.359"

Tappet Clearance		Spring Pressure	
Intake	.004" (hot)		
Exhaust	.006" (hot)	Closed	50-55 pounds

Intake Valves	Timing	Exhaust Valves
Open—5° after top dead center.	Open—40°	before lower dead center.
Close—45° after lower dead center.	Close—12°	after top dead center.

To Check Valve Timing. Check tappet clearance No. 1 intake valve. With piston No. 8 on compression turn engine over until flywheel mark 'IN.OP/1-8' (which is 5° after top dead center mark 'UDC/1-8') is directly opposite indicator on flywheel housing. No. 1 intake valve should begin to open at this point. An additional mark 'IN.OP/4-5' is placed 5° after the top dead center mark 'UDC/5-4'.

To Set Valve Timing:—Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—**Model 497.** Starter drives engine through outboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 36-40 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5.0	70
19 " "	Lock	3.0	500

Startix:—This model equipped with Startix automatic starting switch mounted on engine block—see Equipment Section for complete article on Startix. When checking ignition disconnect wire on 'IGN' terminal of Startix to prevent automatic cranking of engine.

Mounting:—Starter flange mounted on front face flywheel housing at left of engine. To remove, disconnect cable, take out 3 flange mounting screws, pull starter forward to clear Bendix housing, lift out.

Oiling:—Starter bearings oilless.

GENERATOR:—**Model 927-U.** Third brush regulation, thermostat control. Thermostat operates at 165°F. (contacts open, cuts in resistance) reducing output approximately 40%. To adjust charging rate, loosen lockscrew on commutator end plate, take off cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, tighten lockscrew. Maximum charging rate is 20 amperes (cold) at 8.5 volts reached at 1600 R.P.M. Rotation counter-clockwise at commutator end.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
20-22	8.5-8.7	1600	12-14	7.6-7.9	1800

Brush spring tension 20-28 ounces. Shunt field current 1.8-2.3 amperes at 6 volts.

Mounting:—Generator cradle. mounted left front of engine driven by fan belt (double Vee belt). Water pump driven by extension of generator shaft. To remove, disconnect water pump drive coupling, disconnect lead, slack off fan belt adjustment, loosen mounting clamp band, lift generator out.

Belt Adjustment. To adjust belt, loosen clamp bolt on fan bracket, turn eccentric shaft spindle, tighten clamp bolt. Additional adjustment secured by taking off fan bracket, moving bracket up on engine block so that mounting bolts engage lower holes in bracket, and making final adjustment by means of eccentric shaft spindle.

Oiling:—**2500 miles.** Put 8-10 drops light engine oil in oiler at each end of generator.

RELAY:—**Model 265-G.** Mounted on generator. Relay contacts close with generator voltage of 6.75-7.5 volts and open with discharge current of 0-2.5 amperes. Relay contact limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—**Delco-Remy Switch Model 486-U.** Lighting switch mounted at lower end of steering column controlled by left hand lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch. Switch positions:

1. Upper position—Auxiliary lights on, tail light on.
2. Lever pulled down one notch—all lights off.
3. Lever pulled down two notches—Dim 'depressed beam' headlights and tail lights on.
4. Lever pulled down—Bright headlights on, tail light on.

Note:—Instrument lights ond switch lock light controlled by push-pull button at extreme left instrument board. First position (button halfway out)—instrument lights on, second position (button entirely out)—instrument lights and switch lock light on.

CURRENT LIMIT RELAY:—**Model 410-F.** Vibrating circuit breaker in lighting circuits starts with current load of 30-35 amperes limiting current to 5-18 amperes with direct short-circuit . Contact gap limits .012-.030 inch. Air gap limits .015-.025 inch (contacts closed). Spring pressure 5 ounces minimum (measured at brass button on contact arm with spring scale at right angles to arm).

GASOLINE GAUGE:—K-S Telegauge hydrostatic type (see Carburetion Section).

FUEL PUMP:—Stewart-Warner mechanical fuel pump mounted at left of engine (see Carburetion Section).

HORNS:—Klaxon Type K-26-E matched set Type 1475 (low note) Type 1476 (high note) Current draw 6.0-8.5 amperes at 6 volts (Type 1475) 5.0-6.5 amperes at 6.0 volts (Type 1476).

ELECTRIC CLOCK:—Mounted left center instrument panel. 5 ampere capacity fuse mounted on back of clock.

PIERCE ARROW

EIGHT CYLINDER MODEL 836, 839 (1933)

DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On plate on right hand frame rail near right front spring rear shackle. First serial numbers this series—1,070,001 (136" W.B.), 1,550,001 (139" W.B.).

ENGINE NUMBER:—Stamped on left hand side of cylinder block at center of engine and directly below cylinder head.

ENGINE:—Eight cylinder 'in line', 'L' head type engine, 3½x4¾" bore and stroke, 366 cubic inch displacement, rated at 39.2 H.P., develops 135 H.P. at 3400 R.P.M. Standard compression ratio 5.5-1. No optional compression ratios offered.

BATTERY:—**Willard, Type WH-4-17,** 6 volt, 17 plate, 136 ampere hour capacity (20 hour rate). Starting capacity (20 minute rate) 160 amperes for 20 minutes.

Grounded Terminal:—Positive (+) terminal grounded to transmission cover.

Mounting:—In cradle under front floor boards on left hand side.

Dimensions:—Width, 7 1/16". Length, 11 11/16". Height, 9 5/16".

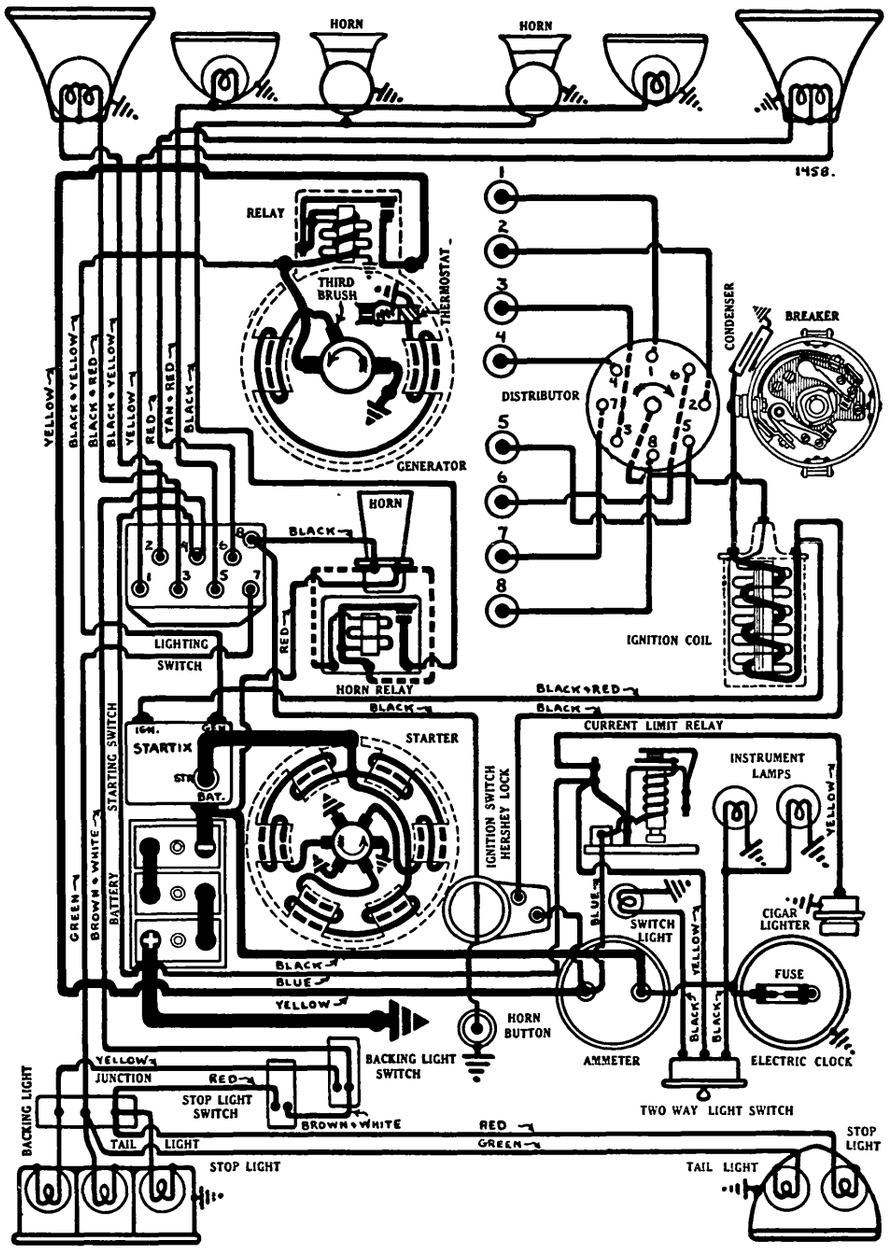
IGNITION:—**Coil Model 537-E.** Coil mounted on engine side of dash.
Ignition Current:—½-1½ amperes at 6 volts (engine running), 4-5 amperes at 6 volts (engine stopped).
Ignition Switch:—Oakes 'Hershey' type co-incidental ignition switch and steering column lock.

Distributor Model 662-J. Two-breaker arm, 4-lobe cam, semi-automatic advance type. Manual advance controlled by button at lower right of instrument panel. Button retards distributor 33° (engine) when pulled out for hand cranking or heavy pulling. Breaker contacts open alternately at 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized (see Ignition Timing).

Breaker Gap:—Set contact gap at .018". Hold within limits of .018-.024".
Breaker Arm Spring Tension:—17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface).

Cam Angles—Closed 34°. Open 11° (distributor) when synchronized.

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		300	2		600
9		1550	18		3100



Mounting:—Distributor mounted on right hand side of cylinder head. To remove, disconnect primary lead, disconnect manual advance control, take off distributor cap, take out hold-down screw in advance arm, lift out.

Oiling:—**2500 Miles.** Turn down grease cup on side of shaft two turns. Keep cup filled with light cup grease. Take off distributor cap and rotor, put 8-10 drops engine oil in wick oiler in center of shaft, oil breaker arm pivot pins, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard Setting—5° before top dead center with manual control fully advanced.

To Set Ignition Timing:—Take off cover plate over inspection hole in flywheel housing, fully advance spark control button (push button in toward dash), disconnect and tape wire on 'IGN' terminal of Startix to avoid automatic cranking. With No. 4 piston on compression turn engine over until flywheel mark 'IGN/5-4' (which is 5° before top dead center mark 'UDC/5-4') is directly opposite indicator on housing, loosen advance arm clamp bolt, rotate distributor cup until first set of contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, see that rotor is opposite No. 4 terminal in distributor cap (see diagram), connect spark plugs as indicated. Then synchronize contacts to time second set (mounted on breaker sub-plate).

Synchronization of Contacts:—First Method. Turn engine over 90° or ¼ revolution to firing position of piston No. 1 with flywheel mark 'IGN/1-8' (which is 5 before top dead center mark 'UDC/1-8') at indicator, loosen lock screws on movable sub-plate (carrying second set of breaker contacts), turn eccentric adjusting screw until contacts begin to open, tighten locking screws.

PIERCE ARROW

EIGHT CYLINDER MODEL 836, 839 (1933)

DELCO-REMY SYSTEM

Synchronization—Second Method. Use special Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—⅞-18 S.A.E. Std. Champion, Type C-4. Set spark plug gaps at .025 inch. Hold within limits of .025-.030 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine and driven from crankshaft by two-sprocket non-adjustable chain drive. Sprockets are marked and chain should be meshed with sprockets turned so that marks are adjacent and in line with a straightedge laid across the shaft centers.

To Check Valve Timing. With piston No. 8 entering power stroke, turn engine over until flywheel mark 'IN.OP./1-8' (which is 5° after top dead center mark 'UDC/1-8') registers with indicator on flywheel housing. With .010 inch tappet clearance No. 1 intake valve should begin to open at this point. An automatic valve tappet clearance take-up is used and there will ordinarily be no tappet clearance in service (see note below).

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 21/32" (overall)	.3725"	4¾"	45°	.359"
Exhaust	1 9/16" (overall)	.3715"	4¾"	45°	.359"

Tappet Clearance

None in service—.010" for timing. See note below.

Valve Springs

Closed—60-64 pounds—2 1/16".
Open—120-125 pounds—1¾".

NOTE:—The automatic hydraulic valve tappet clearance take-up is built into the valve lifter, operates entirely automatically, and requires no adjustment or attention. The valve lifter is built in two parts with the upper section (which is contact with the valve stem) forming a piston in the hollow lower part. Oil under pressure is forced into the upper part of the lifter and flows through a ball-check valve into the chamber between the two sections forcing the upper section into contact with the valve stem. A small coil spring assists in this operation. The ball-check valve prevents oil escaping when the entire lifter is forced up by the cam to open the valve. See article in Mechanical Equipment Section for complete data.

Timing

Intake Valves	Exhaust Valves
Open 5° after top dead center.	Open 40° before lower dead center.
Close 45° after lower dead center.	Close 12° after top dead center.

CARBURETION:—Stromberg Downdraft Carburetor, Model EE-3 (see Carburetor Section for complete data). Automatic manifold heat control and Stromberg Automatic Choke with built-in 'fast-idle' standard equipment.

Air Cleaner:—A.C. oil-wetted wire mesh type. Remove air cleaner at 2000-3000 mile intervals, clean by dipping in pan of gasoline, thoroughly dry, re-oil by dipping in engine oil, drain before reassembling.

Fuel Pump:—Stewart-Warner mechanical fuel pump mounted at right rear of crankcase (see Carburetion Section for complete data). Remove glass sediment bowl occasionally, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—Model 497. Six-pole type. Starter drive—Outboard Bendix drive with Startix automatic starting switch. See Equipment Section for complete data on Startix. Rotation counter-clockwise at commutator end. Brush spring tension 36-40 ounces on each brush.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5.0	70
19 "	Lock	3.0	500

Mounting:—Three cap screw flange mounting on left hand side of front face of flywheel housing. To remove, disconnect cable, take out flange mounting screws, pull starter forward to clear Bendix housing, lift out.

Oiling:—Starter bearings are oilless.

GENERATOR:—Model 927-V. Third brush regulation with thermostat control. Thermostat contacts open at 165°F. reducing charging rate approximately 40%. Rotation counter-clockwise at commutator end. Maximum charging rate 20 amperes (cold) at 8.5 volts reached at 1600 R.P.M.

Charging Rate Adjustment:—Take off commutator cover band, loosen small round lock screw on end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
20-22	8.5-8.7	1600	12-14	7.6-7.9	1800

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—1.8-2.3 amperes at 6 volts across field terminals.

Motoring:—Approximately 3.5 amperes at 6 volts.

Mounting:—Cradle mounted at left front of engine with fan belt drive (double Vee belt). Generator drives water pump through shaft extension and coupling. To remove, disconnect lead, disconnect water pump coupling, slack off fan belt adjustment, loosen mounting clamp band, lift out.

Belt Adjustment:—To adjust belt, loosen clamp bolt on fan bracket, turn eccentric shaft spindle until belt slippage is taken out, tighten clamp bolt. Additional adjustment secured by taking off bracket, moving bracket up until mounting bolts engage lower holes and then making final adjustment on the eccentric shaft spindle.

Oiling:—2500 Miles. Put 8-10 drops engine oil in oiler at each end.

RELAY:—Model 265-B. Mounted on generator field frame. Contacts close with generator voltage of 6.75-7.5 volts and open with 0-2.5 ampere discharge current.

Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 487-C, 487-E (Custom Models). Lighting switch mounted at lower end of steering column and controlled by left hand lever on steering wheel. Lighting system Guide 'Multi-beam' providing special asymmetrical passing beam with standard double filament bulbs.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Auxiliary Lights	6-8	6	S.C.	81
Dash Lights	6-8	3	S.C.	63
Tail and Tonneau Lights	6-8	6	S.C.	81
Stop and Backing Lights	6-8	21	S.C.	1129
Dome Light	6-8	15	S.C.	87

CURRENT LIMIT RELAY:—Model 410-F. Vibrating circuit breaker in lighting circuit. Starts to operate with current load of 30-35 amperes limiting load to 5-18 amperes with direct short-circuit.

Contact Gap:—.012-.030 inch. **Air Gap:**—.015-.025 inch (contacts closed).

Spring Tension:—5 ounces minimum (measured at brass button with spring scale at right angles to contact arm).

HORNS:—E.A. Vibrator type horns mounted under auxiliary headlights. Current draw 7 amperes at 6 volts each.

Klaxon Model K-26E, Type 1485 (low note), 1486 (high note) may be used on standard models and Type 1489 (low note), 1490 (high note) matched tone twin horns with Horn Relay Model 266-T on custom models. Current draw 6.0-8.5 amperes (Types 1485, 1489), 5.0-6.5 amperes (Types 1486, 1490) at 6 volts.

Horn Relay Model 266-T. Requires .25 ampere to close relay contacts. Horn current does not pass through horn button. Relay contact gap limits .015-.025". Air gap limits .012-.017" with contacts closed.

CLOCK:—Electric type mounted at left center of instrument panel. There is a 5 ampere capacity fuse mounted on the back of the clock.

PIERCE ARROW

TWELVE CYLINDER MODELS 1236, 1242, 1247 (1933)

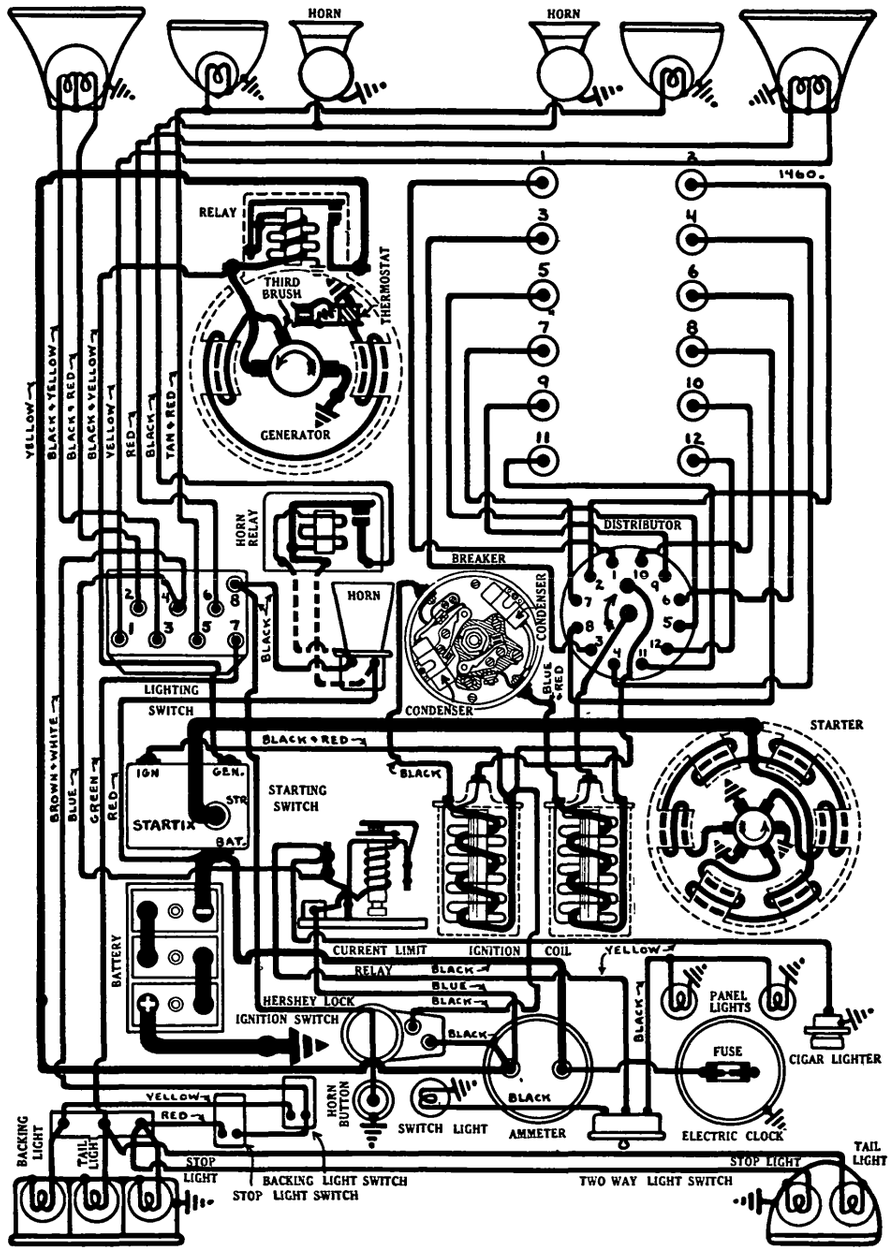
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on right hand frame side rail near right front spring rear shackle. First serial numbers as follows:
Model 1236:—136″ W.B.—2,075,001. 139″ W.B.—2,575,001.
Model 1242:—137″ W.B.—3,100,001. 142″ W.B.—3,525,001.
Model 1247:—142″ W.B.—3,525,001. 147″ W.B.—3,550,001.

ENGINE NUMBER:—Stamped on upper right rear side of crankcase.

ENGINE:—Twelve cylinder, 80° 'V' type, 'L' head engine. Model 1238—3⅜x4″ bore and stroke, 429 cubic inch displacement, rated at 54.6 H.P., develops 160 H.P. at 3400 R.P.M. Models 1242 and 1247—3½x4″ bore and stroke, 462 cubic inch displacement, rated at 58.8 H.P., develops 175 H.P. at 3400 R.P.M. Standard compression ratio 6.0-1. No optional compression ratios offered.

BATTERY:—Willard, Type WH-5-19, 6 volt, 19 plate, 153 ampere hour capacity (20 hour rate). Starting capacity (20 minute rate) 180 amperes for 20 minutes.
Grounded Terminal:—Positive (+) terminal grounded to transmission cover.
Mounting:—In cradle under front floor boards on left hand side.
Dimensions:—Width, 7 1/16″. Length, 13″. Height, 9¾″.



IGNITION:—Coil Model 537-E (2 used). Coils mounted on engine side of dash.
Ignition Current:—½-1½ amperes at 6 volts (engine running), 4-5 amperes at 6 volts (engine stopped) for each coil.
Ignition Switch:—Oakes 'Hershey' type co-incidental igntion switch and steering column lock located on steering column at instrument board.
Distributor Model 4105. Two breaker arm, 6-lobe cam, semi-automatic advance type. Manual advance controlled by button at lower right of instrument panel. Spark button retards distributor 33° (engine) when pulled out for hand cranking or heavy pulling. Breaker contacts open at 20° and 40° intervals corresponding to 40° and 80° firing intervals of engine—the engine has an included angle between cylinder banks of 80° resulting in unequal firing intervals between cylinders in opposite banks. Contacts must be synchronized (see Ignition Timing).
Breaker Gap:—Set contact gap at .018″. Hold within limits of .018-.024″.
Breaker Arm Spring Tension:—17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface).
Cam Angles—Closed 39°. Open 21° (distributor) each set independently.

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	2		800
7		1400	14		2800

Mounting:—Mounted at extreme rear of engine between cylinder banks. To remove, disconnect primary leads, take off distributor cap, disconnect manual spark control, take out distributor mounting bracket screws, lift out.
Oiling:—2500 Miles. Turn down grease cup on side of shaft two turns. Keep cup filled with light cup grease. Put 8-10 drops engine oil in oiler. Take off distributor cap and rotor, put 8-10 drops oil on breaker cam locking screw, oil breaker arm pivot pins, apply thin film vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting, 5° before top dead center with manual control fully advanced.
To Set Ignition Timing:—Take off cover plate over inspection hole in flywheel housing, fully advance manual spark control (push button in toward dash), disconnect and tape wire on 'IGN' terminal of Startix to prevent automatic cranking. With No. 1 piston on compression (No. 1 of left hand block), turn engine over until flywheel mark 'IGN.#1/' (which is 5° before top dead center mark 'UDC/No.1') is directly opposite pointer on flywheel housing, take off distributor cap and rotor, loosen locking screw in center of breaker cam, carefully locate cam so that first set of contacts (fixed set—mounted directly on breaker plate) are beginning to open, tighten locking screw. See that spark plugs are connected as shown on diagram. Then synchronize contacts to time second set (movable set—mounted on breaker sub-plate).
Synchronization of Contacts—First M thod. After timing distributor (above), turn engine over 40° or approximately ⅛ revolution to firing position of piston No. 4 (No. 2 of right hand bank) with flywheel mark 'IGN/#4' (which is 5° before top dead center mark 'UDC./No.4') directly opposite indicator on housing, loosen lock screws on movable sub-plate carrying second set of contacts, shift plate by turning eccentric adjusting screw until contacts begin to open, tighten locking screws.

PIERCE ARROW

TWELVE CYLINDER MODELS 1236, 1242, 1247 (1933)

DELCO-REMY SYSTEM

Synchronization of Contacts—Second Method. Synchronize contacts on rotary spark gap and shift movable sub-plate until the set of contacts mounted on it open 20° after fixed set. The fixed set of contacts (mounted directly on breaker plate) should open 40° after this point. This will give the correct unequal firing interval of 20-40-20 degrees.

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as shown on diagram or 1L-2R-5L-4R-3L-1R-6L-5R-2L-3R-4L-6R with cylinder banks right (R) and left (L) as viewed from driver's seat and No. 1 cylinder nearest the radiator.

Spark Plugs:—14 MM. Metric. Champion Type JN-5. Set gaps at .022-.025".

VALVE TIMING:—Camshaft Setting. Camshaft directly above crankshaft and driven by two-sprocket non-adjustable chain drive. Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge laid across the shaft centers.

To Check Valve Timing:—With piston No. 11 on compression stroke turn engine over until flywheel mark 'IN.OP.#1/' (which is 4° or 19° before top dead center mark 'UDC./No.1') is directly opposite indicator on flywheel housing. With .004" tappet clearance, No. 1 intake valve should begin to open at this point. An automatic valve tappet take-up is used and there will ordinarily be no tappet clearance in service. See Valve Timing paragraph on Model 836 for complete description of this device. There is an additional mark 'IN.OP.#4' (which is 4° or 19° before the top dead center mark UDC/No.4') to indicate the intake opening point for cylinder No. 4.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 21/32" (overall)	.3725"	4¾"	45°	.312"
Exhaust	1 9/16" (overall)	.3715"	4¾"	45°	.312"

NOTE:—Install all valves with .002-.003" stem clearance in guides.

Tappet Clearance	Valve Springs
Automatic hydraulic take-up used.	Close—60-64 pounds—2 1/16".
No tappet clearance in service.	Open—120-125 pounds—1¾"

NOTE—See special article in Mechanical Equipment Section for complete data on Hydraulic Valve Take-up.

Valve Timing—First 68 Cars, Model 1236

Intake valves—Open 4° before top dead center. Close 52° after lower dead center.

Exhaust valves—Open 40° before lower dead center. Close 16° after top dead center.

Valve Timing—After First 68 Cars, Model 1236, All 1242 and 1247

Intake valves—Open 19° before top dead center. Close 69° after lower dead center.

Exhaust valves——Open 56° before lower dead center. Close 28° after top dead center.

CARBURETION:—Two Stromberg Downdraft Carburetors Model EX-32. One carburetor used for each cylinder bank with inter-connected throttle controls and a single air cleaner (see Carburetor Section for complete data). Automatic manifold heat control and Stromberg Automatic Choke with built-in 'fast idle' standard equipment.

Air Cleaner:—A.C. oil-wetted wire mesh type. Remove at 2000-3000 mile intervals by unscrewing two thumb nuts at front of unit, clean by dipping in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before re-assembling.

Fuel Pump:—Stewart-Warner Mechanical Fuel Pump mounted at left rear of crankcase (see Carburetion Section). Remove glass sediment bowl under pump occasionally, empty water and sediment, clean filter screen (located above sediment bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—Model 498. Six-pole type. Starter drive—Outboard Bendix drive with Startix automatic starting switch (see Equipment Section for complete data on Startix). Rotation counter-clockwise at commutator end. Brush spring tension 36-40 ounces on each brush.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5.0	70
19 "	Lock	3.0	500

Mounting:—Three cap screw flange mounting on right hand front face of flywheel housing. To remove, disconnect cable, take out flange mounting screws, pull starter forward to clear Bendix housing.

Oiling:—Starter bearings are oilless.

GENERATOR:—Model 927-V. Third brush regulation with thermostat control. Thermostat contacts open at 165°F. reducing charging rate approximately 40%. Rotation counter-clockwise at commutator end. Maximum charging rate 20 amperes (cold) at 8.5 volts reached at 1600 R.P.M.

Charging Rate Adjustment:—Take off commutator cover band, loosen small round lock screw on end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
20-22	8.5-8.7	1600	12-14	7.6-7.9	1800

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—1.8-2.3 amperes at 6 volts across field terminals.

Motoring:—Approximately 3.5 amperes at 6 volts.

Mounting:—Cradle mounted at left front of engine with fan belt drive (double Vee belt). Generator drives water pump through shaft extension and coupling. To remove, disconnect lead, disconnect water pump coupling, slack off fan belt adjustment, loosen mounting clamp band, lift out.

Belt Adjustment:—To adjust belt, loosen clamp bolt on fan bracket, turn eccentric shaft spindle until belt slippage is taken out, tighten clamp bolt. Additional adjustment secured by taking off bracket, moving bracket up until mounting bolts engage lower holes and then making final adjustment on the eccentric shaft spindle.

Oiling:—2500 Miles. Put 8-10 drops engine oil in oiler at each end.

RELAY:—Model 265-B. Mounted on generator field frame. Contacts close with generator voltage of 6.75-7.5 volts and open with 0-2.5 ampere discharge current.

Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 487-C, 487-E (Custom Models). Lighting switch mounted at lower end of steering column and controlled by left hand lever on steering wheel. Lighting system Guide 'Multi-beam' providing special asymmetrical passing beam with standard double filament bulbs.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-32	D.C.	1000
Auxiliary Lights	6-8	6	S.C.	81
Dash Lights	6-8	3	S.C.	63
Tail and Tonneau Lights	6-8	6	S.C.	81
Stop and Backing Lights	6-8	21	S.C.	1129
Dome Light	6-8	15	S.C.	87

CURRENT LIMIT RELAY:—Model 410-F. Vibrating circuit breaker in lighting circuit. Starts to operate with current load of 30-35 amperes limiting load to 5-22 amperes with direct short-circuit.

Contact Gap:—.012-.030 inch. **Air Gap:**—.015-.025 inch (contacts closed).

Spring Tension:—5 ounces minimum (measured at brass button with spring scale at right angles to contact arm).

HORNS:—E.A. Vibrator type horns mounted under auxiliary headlights. Current draw 7 amperes at 6 volts each.

Klaxon Model K-26E, Type 1485 (low note), 1486 (high note) may be used on standard models and Type 1489 (low note), 1490 (high note) matched tone twin horns with Horn Relay Model 266-T on custom models. Current draw 6.0-8.5 amperes (Types 1485, 1489), 5.0-6.5 amperes (Types 1486, 1490) at 6 volts.

Horn Relay Model 266-T. Requires .25 ampere to close relay contacts. Horn current does not pass through horn button. Relay contact gap limits .015-.025". Air gap limits .012-.017" with contacts closed.

CLOCK:—Electric type mounted at left center of instrument panel. There is a 5 ampere capacity fuse mounted on the back of the clock.

SERIAL NUMBER:—Stamped on plate on right hand frame side member behind right front spring rear shackle. First numbers as follows:

836A (136" WB) 1,080,001
836A (144" WB) 1,560,001
840A (138" WB) 2,080,001
840A (144" WB) 2,580,001

COMPRESSION:—Ratio—5.5-1 head. No optional ratios.
Pressure—100 lbs. at 350 R.P.M. or 80-85 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 537-E. Mounted on dash.
Ignition Current—½-1½ amperes (idling), 4 amperes (stopped).
Ignition Switch—Oakes Hershey type co-incidental ignition switch and steering post lock.

Distributor Model 662-J. Double breaker, 4 lobe cam, semi-automatic advance type. Contacts open alternately at 45° intervals corresponding to 90° firing intervals of engine. Contacts must be synchronized (see Timing).
Breaker Gap—Set gap at .018". Limits, .018-.024".
Breaker Arm Spring Tension—17-21 ozs.
Cam Angles (Distributor Degrees) — Closed 34°. Open 11°. Both sets together when properly synchronized.
Manual Advance—33° (engine—maximum). Spark is retarded for hand cranking or heavy pulling by pulling out button on instrument panel.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	2	600
9	1550	18	3100

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines ..... 5° BTDC ..... .0115" BTD.
Timing (Stationary Contacts): — Take off cover plate over inspection hole in flywheel housing, disconnect and tape wire on 'IGN' terminal of Startix to avoid automatic cranking (if ignition turned on or timing light is used), advance spark control button (push button in toward dash). With #4 piston on compression, turn engine over until flywheel mark 'IGN/5-4' (which is 5° before top dead center mark 'UDC/5-4') lines up with indicator on housing, loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, synchronize.
Synchronization (Movable Contacts)—First Method—Turn engine over 90° or ¼ revolution to firing point for cylinder #1, stop with flywheel mark 'IGN/1-8' (which is 5° before top dead center mark 'UDC/1-8') in line with indicator on housing, loosen lock screws on movable sub-plate (carrying second set of contacts), turn eccentric adjusting screw until contacts begin to open, tighten locking screws.
Synchronization — Second Method — Use special synchronizing tool, Delco-Remy Part #1838182. and follow directions in Equipment Section.
Motor Gauge—Weidenhoff Adapter #114, Rod #29.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—Champion, Type C-45. 14 MM. Metric.
Spark Plug Gaps—.025". Limits, .022-.025".

CARBURETION: — (Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EE-3, 1 11/16" plain tube, dual, downdraft type.

Automatic Choke—Stromberg type.

Fuel Pump:—Stewart-Warner, Type 407-BW.

Gasoline Gauge:—K-S Telegauge, hydrostatic type.

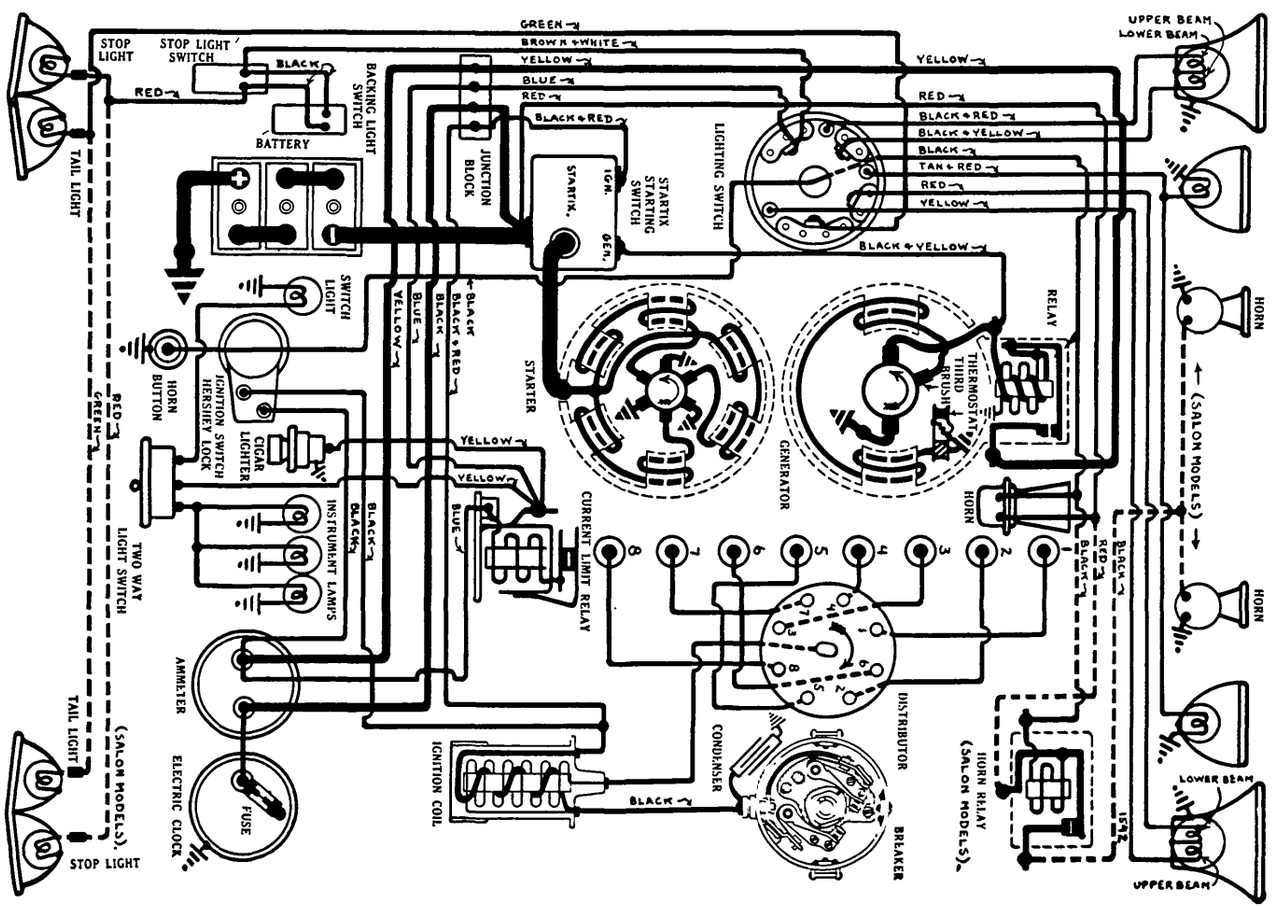
VALVE TIMING (836A):—To Check—Set tappet clearance #1 intake valve at .006". This valve should open with piston .0115" past top dead center when flywheel mark 'IN.OP/1-8' registers with indicator on flywheel housing. This mark is 5° after top dead center mark 'UDC/1-8'. Reset tappet clearance at .004" with engine hot.

Tappet Clearance:—.004" Int., .006" Exh., engine hot.

Valve Spring Pressure:—60-64 lbs. at 2 1/16" (valve closed). 100-125 lbs. at 1¾" (valve open).

Normal Oil Pressure—35 lbs. at 40 M.P.H.

Motor Gauge—Weidenhoff Adapter #114, Rod #29.



VALVE TIMING (840A):—To Check—Remove #1 intake hydraulic valve lifter, pull out plunger, remove spring, wash lifter assembly in gasoline, replace plunger, install lifter in bracket. Check clearance between end of plunger and valve stem (valve closed—clearance will be about .070"). Insert sufficient feeler stock to take up all except .010" clearance, turn engine over until piston #1 is .0122" past top dead center, stop when flywheel mark 'IN.OP/1-8' lines up with indicator on housing, #1 intake valve should begin to open at this point. Remove feeler stock, reassemble hydraulic valve lifter as directed below.

Motor Gauge—Weidenhoff Adapter #114, Rod #29.

Tappet Clearance:—None in service. See Installing Hydraulic Valve Lifters (above).

Valve Spring Pressure:—60-64 lbs. at 2 1/16" (valve closed). 120-125 lbs. at 1¾" (valve open).

Hydraulic Valve Lifters:—Use spring clamp on top of each lifter when lifter assemblies are being removed or installed to prevent lifters falling out. Plungers are selective fit in body and must not be interchanged. Lifters should be free fit in guides (they should fall through bracket hole of own weight with lifters and brackets dry). Lifter bracket gasket should be lined up so that there is no oil leakage between case and bracket and

oil supply and bleeder holes are not covered (gasket is 1/16" wider than bracket). Do not tighten bracket attaching bolts so that bracket is distorted, causing lifters to stick. Lifters should spin in brackets with engine running. Shift bracket to front or rear until lifter assemblies spin. Lifter plunger must not rotate in lifter body (this may cause sticking of plunger). Plunger spring should be tight fit and square with plunger. Spring should be tight fit in lifter body bore when nearly compressed and should offer considerable resistance to rotation of plunger. If hydraulic valve lifters are noisy, check for leaking check ball seat. To test, clean oil from lifter assembly, put a drop of gasoline on ball and ball seat, attach air line to bottom of plunger, immerse plunger in gasoline, note air bubbles.

Installing Hydraulic Valve Lifters: — Hydraulic lifters should always be installed without oil. Oil in lifter will retard escape of air and delay quieting of lifter when engine operated. Remove plunger from lifter body and wash out all oil with clean gasoline. Important—do not interchange plungers, they are selective fit in lifter bodies. When lifters are installed (new or after grinding valves), check mechanical clearance with lifter dry (all oil removed from assembly). Clearance should be not less than .015". To check clearance, compress plunger spring by prying between plunger cap and valve stem, use feeler to check clearance between these points. If clearance is insufficient, remove lifter from bracket, grind end of plunger to give correct clearance. Do not grind into check ball retaining pin.

LUBRICATION:—Pressure type. Helical gear type oil pump located in crankcase.

Oil Pressure Relief Valve—Located at pump. Adjust by adding or removing spacing washers.

Normal Oil Pressure—35 lbs. at 40 M.P.H.

Capacity and Oil—10 qts. (dry), 9 qts. (refill). Use SAE. #30 (summer or above 30°F.), #20-W (30° to 0°F.), #10-W (below 0°F.).

BATTERY:—Willard, Type WH-4-17, 6 volt, 17 plates, 136 A.H. capacity (20 hr. rate).

Starting Capacity—160 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under front floor.

STARTER:—Model 497. Armature No. 1843420. Six pole type, Bendix drive.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—36-40 ounces each.
Cranking Engine—100-150 R.P.M., 175 amperes, 5 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	5.0	70
19 "	Lock	3.0	500

Starting Switch:—Startix Type 'D' automatic starting controlled by ignition switch. See article in Electrical Equipment Section.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out three flange mounting cap screws.

GENERATOR: — Model 927-V (Std.). Armature No. 1839078. Third brush regulation with thermostat control. Thermostat contacts open at 200°F., reducing generator output approximately 40%.
Charging Rate Adjustment—Take off commutator cover band, loosen small round lock screw on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate.

Performance Data

	Amperes	Volts	R.P.M.
Cold	20-22	8.5-8.7	1600
Hot	12-14	7.6-7.9	1800

Rotation—Counter-clockwise at commutator end.
Shunt Field Current—1.8-2.3 amperes at 6.0 volts.
Brush Spring Tension—20-28 ounces each.

Mounting:—Cradle mounted at left front of engine. Fan belt Double Vee Belt) drive. To remove, slack off belt, disconnect water pump drive coupling, loosen mounting clamp band.
Belt Adjustment—To adjust, loosen clamp bolt on fan bracket, turn eccentric shaft spindle, tighten clamp bolt. Additional adjustment secured by taking bracket off engine and moving bracket up until mounting bolts engage lower holes. Correct adjustment secured when 10-lb. pull necessary to deflect belt 1" midway between pulleys.

SPECIAL GENERATORS: — Model 929-A. Optional equipment on standard models. Standard equipment on Salon models. See Equipment Section.

CUT-OUT RELAY:—Model 265-B (927-V Generator). Mounted on generator. See article in Electrical Equipment Section for complete data.
Cuts in—6.75-7.5 volts, 450 R.P.M. or 7 M.P.H.
Cuts out—0-2.5 ampere discharge.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017".

LIGHTING: — R.B.M. Lighting Switch. The lighting switch has 'Country Passing' position providing assymetric passing beam (upper beam left hand headlight, lower beam right hand headlight).

Bulb Specifications

Lamp	Candlepower	Mazda No.

Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

SERIAL NUMBER:—First number (1240A, 138" WB.), 3,110,001, (1240A, 144"WB.), 3,530,001. (1248A, 147" WB.) 3,560,001. On plate on right hand frame member behind right front spring rear shackle.

COMPRESSION:—Ratio—6.0-1 head. No optional heads. **Pressure**—115 lbs. at 350 R.P.M. or 80-85 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 537-E (2 used). Coils mounted on engine side of dash.
Ignition Current—½-1½ amperes (running), 4 amperes (stopped) each.
Igniti n Switch—Oakes Hershey Type co-incidental ignition switch and steering post lock.

Distributor Model 4105. Double breaker, 6 lobe cam, semi-automatic type. Contacts open alternately at 20° and 40° intervals corresponding to 40° and 80° (unequal firing interval caused by 80° included angle between cylinder banks). Contacts must be synchronized (see Timing).
Breaker Gap—Set gap at .018". Limits, .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Cam Angles (Distributor Degrees)—Closed 36°. Open 24°. Each set operates independently.
Manual Advance—33° (engine—maximum). Retard only. Spark is retarded by pulling out button on instrument panel.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	2	800
7	1400	14	2800

IGNITION TIMING:—Flywheel Degs. Piston Position
All engines .....5° BTDC. .....0092" BTDC.

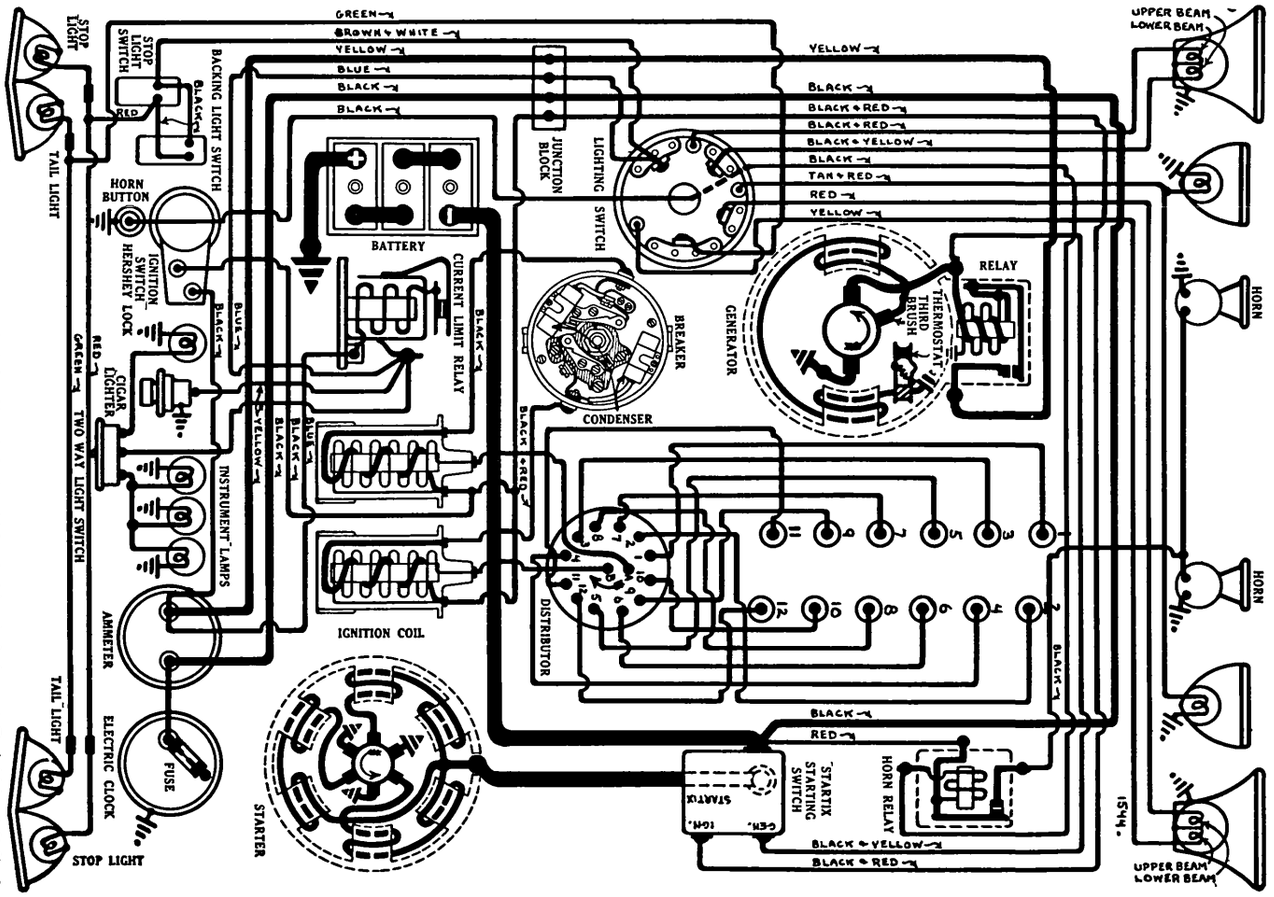
Timing (Stationary Contacts):—Take off cover plate over inspection hole in flywheel housing, disconnect and tape wire on 'IGN' terminal of Startix to avoid automatic cranking (if ignition turned on or timing light used to check contact opening), advance manual spark control (push button in toward dash). With #1 piston on compression, turn engine over until flywheel mark 'IGN.#1/' (which is 5° before top dead center mark 'UDC/No.1') lines up with indicator on housing, take off distributor cap and rotor, loosen locking screw in center of breaker cam, carefully locate cam so that stationary contacts (mounted directly on breaker plate) are beginning to open, tighten locking screw, check rotor position and spark plug connections. Then synchronize.

Synchronization (Movable Contacts)—First Method:—Turn engine over 40° or approximately 1/9 revolution to firing position for piston #4 (#2—right hand bank), stop when flywheel mark 'IGN.#4/' (which is 5° before top dead center mark 'UDC/No.4') lines up with indicator on housing, loosen lock screws on movable sub-plate carrying second set of contacts, turn eccentric adjusting screw until contacts begin to open, tighten locking screws.

Synchronization — Second Method: — Synchronize with synchronizing tool or rotary spark gap, shift sub-plate until movable contacts open exactly 20° after first or fixed set. Fixed contacts should open 40° after this point. Firing intervals are 20-40-20 (distributor degrees).
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as shown on diagram (right bank—2, 4, 6, 8, 10, 12; left bank—1, 3, 5, 7, 9, 11).

Spark Plugs:—Champion, Type JN-5. 14 MM. Metric.
Spark Plug Gaps—.025". Limits, .022-.025".



CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EX-32 (2 used). 1 11/16" plain tube, downdraft type. One carburetor used for each cylinder bank with connected throttles.
Automatic Choke—Stromberg.

Fuel Pump:—Stewart-Warner, Type 407-BZ.
Gasoline Gauge:—K-S Telegauge, hydrostatic type.

VALVE TIMING:—To Check—Remove #1 intake hydraulic valve lifter, pull out plunger, remove spring, wash lifter assembly in gasoline to remove all oil, replace plunger, install lifter in bracket. Check clearance between end of plunger and valve stem (valve closed—clearance will be about .070"). Insert sufficient feeler stock to take up all except .004" clearance, turn engine over until #11 piston .1303" BTDC, stop when flywheel mark 'IN.OP.#1/' lines up with indicator on housing, #1 intake valve should begin to open at this point. Remove feeler stock, reassemble hydraulic valve lifter as directed below.
Tappet Clearance—None in service. See installing Hydraulic valve lifters (below).
Valve Spring Pressure—60-64 lbs. at 2 1-/16" (valve closed, 120-125 lbs. at 1¾" (valve open).

Hydraulic Valve Lifters:—See data on Model 8-40A

for complete description. Hydraulic valve lifters are interchangeable between 8 and 12 cylinder models except for plunger cap or plug. Short caps are used on 12 cylinder models and a longer cap on 8 cylinder models.

Installing Hydraulic Valve Lifters: — Hydraulic lifters should always be installed without oil. Oil in lifter will retard escape of air and delay quieting of lifter when engine operated. Remove plunger from lifter body and wash out all oil with clean gasoline. Important—do not interchange plungers, they are selective fit in lifter bodies. When lifters are installed (new or after grinding valves), check mechanical clearance with lifter dry (all oil removed from assembly). Clearance should be not less than .015". To check clearance, compress plunger spring by prying between plunger cap and valve stem, use feeler to check clearance between these points. If clearance is insufficient, remove lifter from bracket, pull plunger out, remove spring, grind off lower end of plunger to give correct clearance. Do not grind into check ball retaining pin.

LUBRICATION:—Full pressure type. Helical gear type oil pump located in crankcase.

Normal Oil Pressure—40 lbs. at 40 M.P.H.

Oil Pressure Relief Valve—Located at oil pump. Adjustable by adding or removing spacing washers.

Capacity and Oil—14 qts. (dry), 12 qts. (refill). Use SAE. #30 (summer or above 30°F.), #20-W (30° to 0°F.), #10-W (below 0°F.).

BATTERY:—Willard, Type WH-5-19, 6 volt, 19 plate, 153 A.H. capacity (20 hr. rate).

Starting Capacity—180 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left hand side under front floor.

STARTER:—Model 498. Armature No. 1843420. Six pole type. Bendix drive.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—36-40 ounces each.

Cranking Engine—100-150 R.P.M., 175 amperes, 5 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	5.0	70
19 "	Lock	3.0	600

Starting Switch:—Startix Type 'D' automatic starting controlled by ignition switch. See Electrical Equipment Section for complete data.

Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, take out 3 flange mounting cap screws.

GENERATOR: — Model 927-V (Std.). Armature No. 1839078. Third brush regulation with thermostat control. Thermostat contacts open at 200°F., reducing generator output approximately 40%.

Charging Rate Adjustment—Take off commutator cover band, loosen small round lock screw on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate.

Performance Data

	Amperes	Volts	R.P.M.
Cold	20-22	8.5-8.7	1600
Hot	12-14	7.6-7.9	1800

Rotation—Counter-clockwise at commutator end.

Shunt Field Current—1.8-2.3 amperes at 6.0 volts.

Brush Spring Tension—20-28 ounces each.

Mounting:—Cradle mounted at left front of engine. Fan belt Double Vee Belt) drive. To remove, slack off belt, disconnect water pump drive coupling, loosen mounting clamp band.

Belt Adjustment—To adjust, loosen clamp bolt on fan bracket, turn eccentric shaft spindle, tighten clamp bolt. Additional adjustment secured by taking bracket off engine and moving bracket up until mounting bolts engage lower holes. Correct adjustment secured when 10-lb. pull necessary to deflect belt 1" at center (midway between pulleys).

SPECIAL GENERATORS:—Model 929-A. See Equipment Section for complete data when this generator installed as special equipment.

CUT-OUT RELAY:—Model 265-B (927-V Generator). Cuts in—6.75-7.5 volts, 450 R.P.M. or 7 M.P.H. (cold), 9 M.P.H. (hot).

Cuts out—0-2.5 ampere discharge.

Relay Contact Gap—.015-.025".

Air Gap—.012-.017".

LIGHTING:—R.B.M. Lighting Switch. The lighting switch has 'Country Passing' position providing assymetric passing beam (upper beam left hand headlight, lower beam right hand headlight).

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-32	1000
Auxiliary Headlights, Tail	6	81
Stop and Backing	21	1129
Dome	15	87
Instrument, Lock	3	63

CURRENT LIMIT RELAY:—Model 410-F. Vibrating circuit breaker. Starts to operate with load of 30-35 amperes, limiting load to 5-22 amperes.

Contact Gap—.012-.030".

Air Gap—.015-.030" (contacts closed).

Spring Tension—5 ozs. minimum at brass button.

HORNS:—Klaxon, Model K-26G, Type 1775 (low note), 1776 (high note). Matched set, blended tone, vibrator type. Operated by horn relay.

Horn Relay:—Model 266-T. Relay requires .25 amperes to close contacts. Current draw, .8 amperes.

Relay Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

EIGHT CYLINDER, MODEL 845 138"WB., AND 144"WB. (EARLY 1935) DELCO-REMY IGNITION, OWEN-DYNETO STARTER AND GENERATOR

NOTE—See following article on Model 845 (Delco-Remy Equipment) for complete data on Tune Up (Carburetion, Ignition, and Valve Timing) for these models. Specifications and equipment are identical except for starter and generator as given below.

SERIAL NUMBER:—First number (138"WB) 2,090,001, (144"WB) 2,590,001. On plate at right side of frame at rear of right front spring rear shackle.

ENGINE NUMBER:—Stamped on left side of cylinder block below head at center.

STARTER:—**Model DI-1237. Armature No. 16437.** Six pole type with a single field coil. Coil is constructed so that it winds around three sides of each field pole (see diagram).

Starter Drive—Outboard Bendix Type R-11SXT-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—56-60 ozs. (new brushes).

Cranking Engine—100-105 R.P.M., 175 amperes, 5.35 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4500	6.0	60
2 "	1600	5.5	130
3.6 "	1200	5.35	170
7.4 "	800	5.05	250
14.4 "	400	4.5	400
28.0 "	Lock	3.5	650
29.24 "	Lock	3.6	720

Starting Switch:—Type D Startix automatic starting controlled by ignition switch. See article in Electrical Equipment Section for complete data.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out three flange mounting capscrews.

GENERATOR:—**Model CO-1236. Armature No. 23691.** Air-cooled. Third brush control type with Battery Charge Regulator (two-step charging rate). See Equipment Section for complete data on Battery Charge Regulator.

Charging Rate Adjustment—Third brush shifted through rack-and-pinion control by slotted adjusting screw on commutator end plate. To adjust, turn adjusting screw to right or clockwise to increase, and to left or counter-clockwise to decrease charging rate.

Maximum Charging Rate—32 amperes (cold), 8.0 volts, 1600 R.P.M., 20-25 M.P.H. Charging rate (hot) with Battery Charge Regulator operative is 15 amperes at 2800 R.P.M.

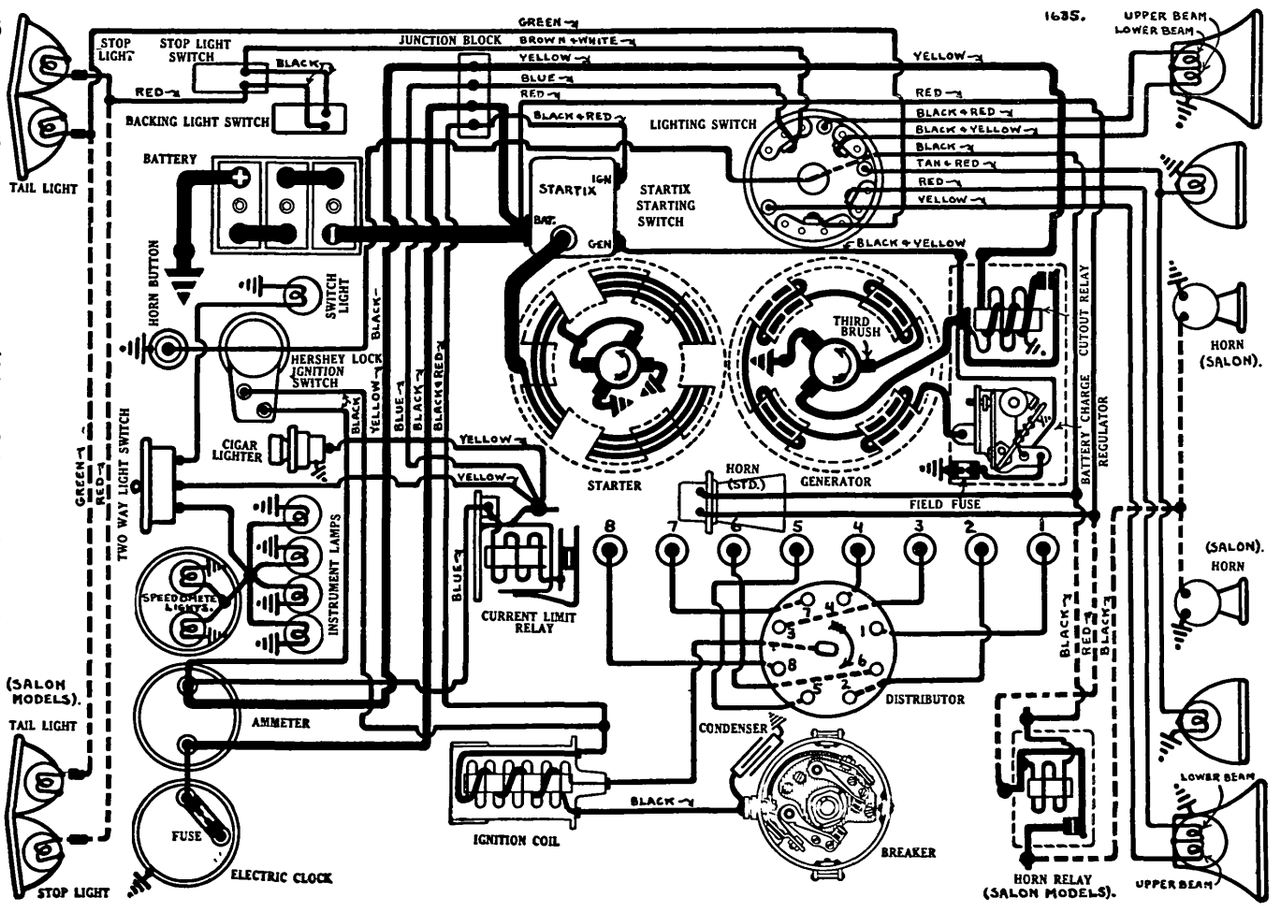
Performance Data—Regulator Inoperativ

Cold			Hot (133°F.)		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.5	560	0	6.5	580
4	6.7	620	4	6.7	630
8	7.0	680	8	7.1	700
12	7.4	750	12	7.5	790
16	7.6	840	16	7.7	880
20	7.8	920	20	7.9	1000
24	8.0	1040	24	8.0	1180
28	8.0	1200	26.4	8.0	1600
32	8.0	1600			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—20-22 ozs. (main), 12-14 ozs. (third brush).
Field Current—1.9-2.1 amperes at 6.0 volts.
Motoring Current—5.1-5.7 amperes at 6.0 volts (½ ampere more if relay and regulator in circuit).
Field Fuse—5 ampere in knurled plug on side of regulator case.

Removal:—Generator cradle mounted at left front of engine with fan belt drive (double Vee belt). To remove, slack off drive belt, disconnect water pump drive coupling, loosen mounting clamp band.

Belt Adjustment:—To adjust, loosen clamp bolt on fan bracket, turn eccentric shaft spindle until 10 lb. pull on belt midway between pulleys causes 1" deflection, tighten clamp bolt. Additional range of adjustment secured by taking bracket off engine and moving bracket up until mounting bolts engage lower holes.



RELAY-REGULATOR:—**Model 21262.** Consists of Cut-out Relay and Battery Charge Regulator in a single case on the generator field frame. See Equipment Section for complete data on Battery Charge Regulator.

Cutout Relay

Cuts In—6.8-7.0 volts, 600 R.P.M., 8-10 M.P.H.
Cuts Out—1.5-3 ampere discharge current.
Relay Contact Gap—.020-.030".
Air Gap—.020-.030" (contacts closed).

Battery Charge Regulator

Setting—Contacts open at 8.0 volts. Limits are 7.8 volts minimum, 8.3 volts maximum.
Regulator Resistance—2.15 ohms.

NOTE—See following article on Model 1245 and 1255 (Delco-Remy Equipment) for complete data for Tune Up (Carburetion, Ignition, and Valve Timing) for these models. Specifications and equipment are identical except for starter and generator as given below.

SERIAL NUMBER:—First number (1245-138"WB) 3,120,001, (1245-144"WB) 3,540,001, (1255) 3,570,001. On right plate on right side of frame at rear of right front spring rear shackle.

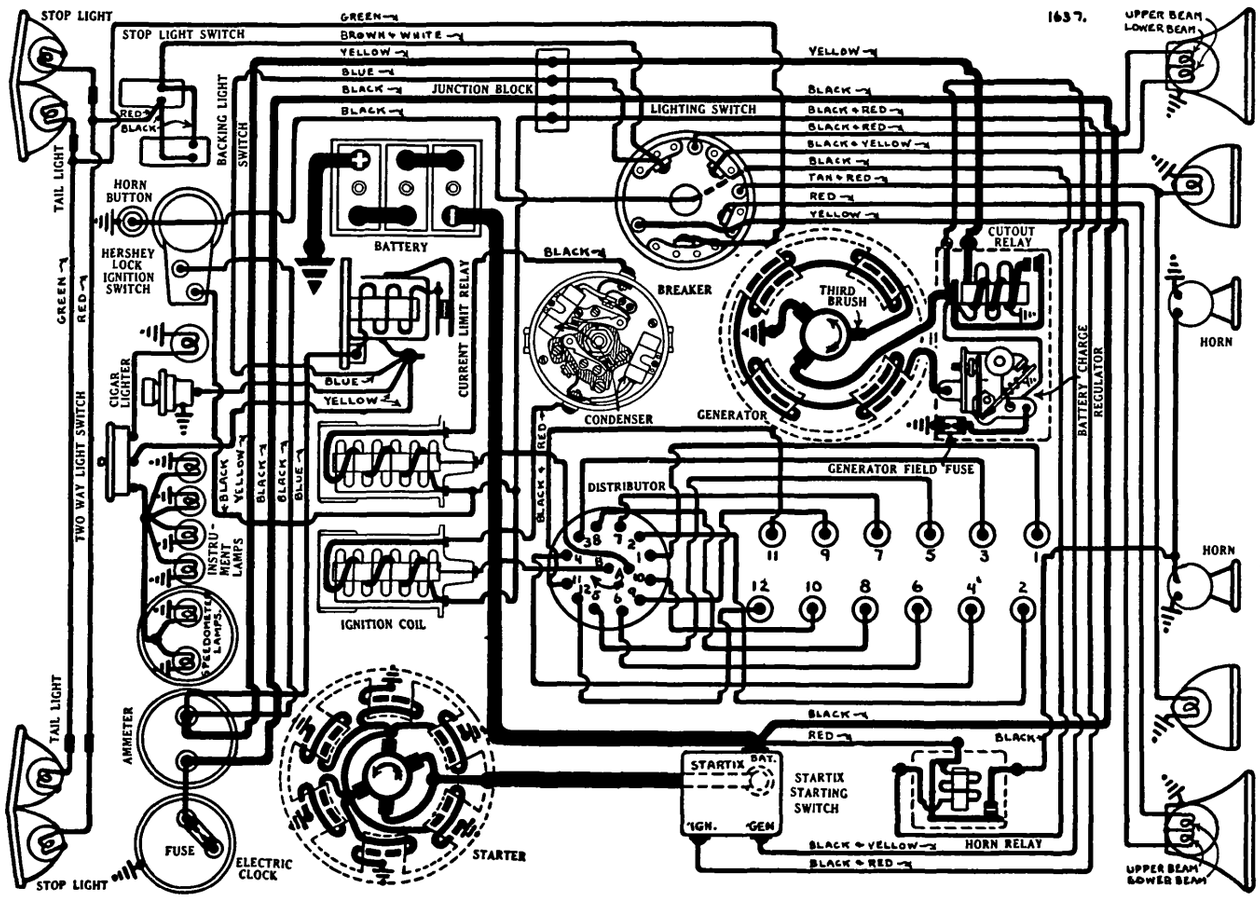
ENGINE NUMBER:—Stamped on left side of left cylinder block below head at center.

STARTER:—Model DY-1242. Armature No. 16439. Six pole type. Coils are constructed individually and grounded by fitting the coil lead into a slot in the pole piece. Coils are connected in parallel in two sets of three each (see diagram).

Starter Drives—Outboard Bendix type R-11FSXT-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—36-40 ozs. (new brushes).



Cranking Engine—100-105 R.P.M., 200 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	6.0	50
7.4 "	800	5.2	245
10.2 "	600	4.9	320
15.2 "	400	4.45	435
21.8 "	200	4.0	575
30.0 "	Lock	3.5	720

Starting Switch:—Type D Startix automatic starting controlled by ignition switch. See article in Electrical Equipment Section for complete data.

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out three flange mounting screws.

GENERATOR:—Model CO-1236. Armature No. 23691. Air-cooled. Third brush control type with Battery Charge Regulator (two-step charging rate). See Equipment Section for complete data on Battery Charge Regulator.

Charging Rate Adjustment—Third Brush shifted through rack-and-pinion control by slotted adjustment screw on commutator end plate. To adjust, turn adjusting screw to right or clockwise to increase, and to left or counter-clockwise to decrease charging rate.

Maximum Charging Rate—32 amperes (cold), 8.0 volts, 1600 R.P.M., 20-25 M.P.H. Charging rate (hot) with Battery Charge Regulator operative is 15 amperes at 2800 R.P.M.

Performance Data—Regulator Inoperative

Cold			Hot (133°F.)

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—20-22 ozs. (main), 12-14 ozs. (third brush).
Field Current—1.9-2.1 amperes at 6.0 volts.
Motoring Current—5.1-5.7 amperes at 6.0 volts (½ ampere more if relay and regulator in circuit).
Field Fuse—5 ampere in knurled plug on side of regulator case).

Removal:—Generator cradle mounted at left front of engine with fan belt drive (double Vee belt). To remove, slack off drive belt, disconnect water pump drive coupling, loosen mounting clamp band.

Belt Adjustment:—To adjust, loosen clamp bolt on fan bracket, turn eccentric shaft spindle until 10 lb. pull on belt midway between pulleys causes 1" deflection, tighten clamp bolt. Additional range of adjustment secured by taking bracket off engine and moving bracket up until mounting bolts engage lower holes.

RELAY-REGULATOR:—Model 21262. Consists of Cutout Relay and Battery Charge Regulator in a single case on the generator field frame. See Equipment Section for complete data on Battery Charge Regulator.

Cutout Relay

Cuts In—6.8-7.0 volts, 600 R.P.M., 8-10 M.P.H.
Cuts Out—1.5-3 ampere discharge current.
Relay Contact Gap—.020-.030".
Air Gap—.020-.030" (contacts closed).

Battery Charge Regulator

Setting—Contacts open at 8.0 volts. Limits are 7.8 volts minimum, 8.3 volts maximum.
Regulator Resistance—2.15 ohms.

SERIAL NUMBER:—On plate on right side of frame at rear of right front spring shackle under fender.

COMPRESSION:—Ratio—5.5-1. No optional ratios.
Pressure—100 lbs. at 350 R.P.M. or 80-85 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 537-E. Mounted on dash.
Ignition Current—2 amperes (idling), 4 (stopped).
Ignition Switch—Oakes Hershey type co-incidental steering post and ignition switch lock.

Distributor Model 662-J. Double breaker, 4 lobe cam, semi-automatic advance type. Contacts open alternately at 45° intervals corresponding to 90° firing interval of engine, and must be synchronized. See Timing.
Breaker Gap—Set at .018". Limits .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Cam Angles—Closed 34°. Open 11° (distributor). Both sets together when properly synchronized.
Manual Advance—33° (engine—maximum). Consists of retard operated by pulling out button on dash. Used for hand cranking or heavy pulling.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	2	600
9	1550	18	3100

Removal:—Mounted on right hand side of cylinder head. Take out hold-down screw in advance arm.

IGNITION TIMING:—....Flywheel Deg. Piston Pos.
All engines .....5° BTDC. ..... .0123" BTDC.
Timing (Stationary Contacts) — Advance spark control button (push button in), disconnect and tape wire on 'IGN' terminal of Startix (to avoid automatic cranking if ignition turned on), remove cover over inspection hole in flywheel housing. With #4 piston on compression, turn engine over until flywheel mark 'IGN/5-4' lines up with indicator on housing (mark is 5° before top dead center mark 'UDC/5-4'), loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, then check synchronization.

Synchronization (movable contacts) on engine—Turn engine over 90° or ¼ revolution to firing position for piston #1, stop when flywheel mark 'IGN./1-8' lines up with indicator (mark is 5° before top dead center mark 'UDC./1-8'), loosen lockscrews on movable sub-plate, turn eccentric adjusting screw until contacts begin to open, tighten lockscrews, check spark plug connections.

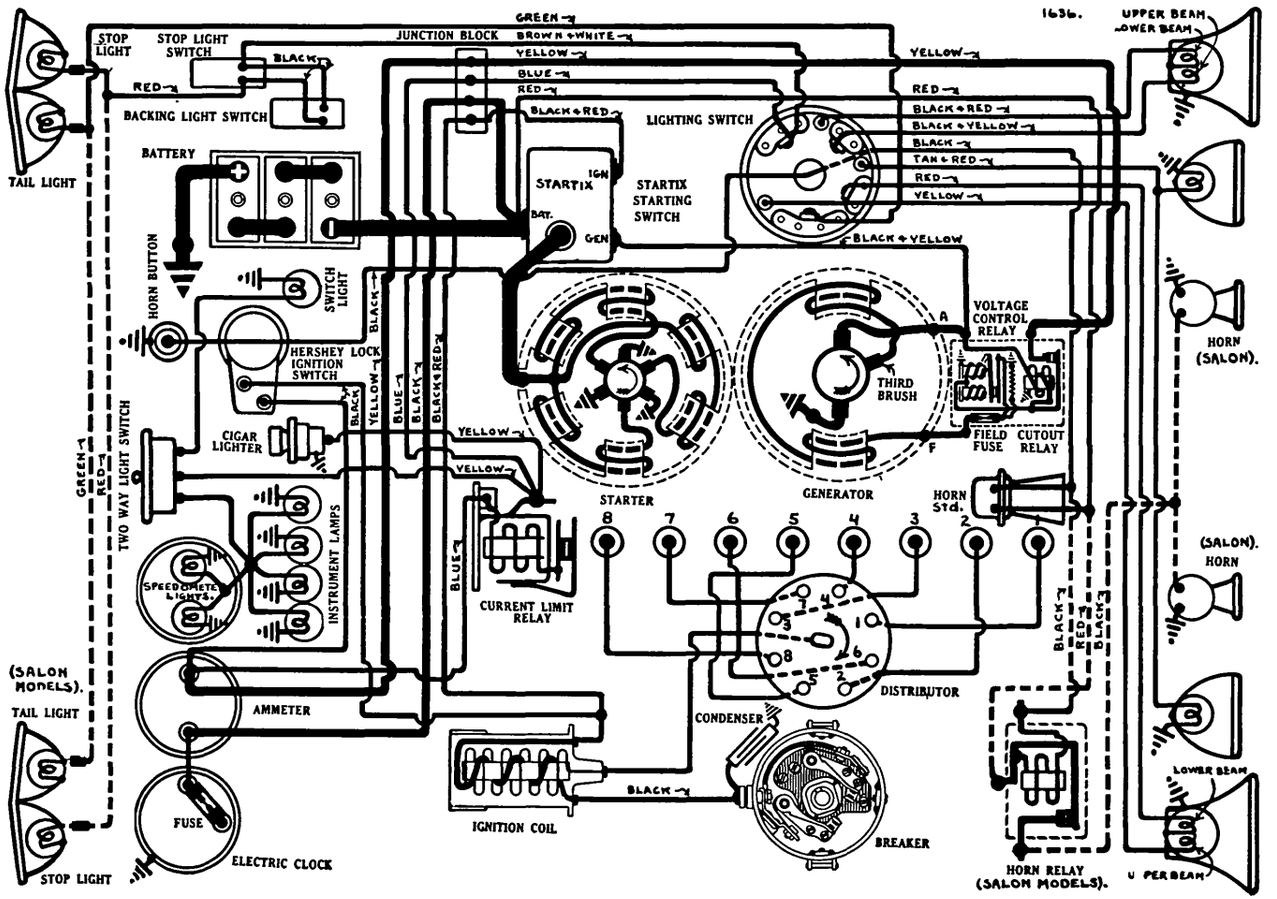
Synchronization (Using Tool) — Use special synchronizing tool, Delco-Remy Part No. 1838182, and follow complete directions in Equipment Section.

Motor Gauge—Weidenhoff Adapter #114, Rod #29.

Firing Order:—1-6-2-5-8-3-7-4. See Diagram.

Spark Plugs:—AC. Type K-10 or Champion Type J-5-C. 14 MM. Metric type.

Spark Plug Gaps—.025". Limits .022-.025".



CARBURETION:—See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EE-3, 1 11/16" downdraft type, with Fast idle.
Automatic Choke—Stromberg.

Fuel Pump:—A.C., Type D-1522112 diaphragm type. Supersedes Stewart-Warner Type 407-BW, used on first cars.

Gasoline Gauge:—K-S Telegauge hydrostatic type.

VALVE TIMING:—To Check Timing—Remove #1 in-

take hydraulic valve lifter, pull out plunger, remove spring, wash lifter assembly in gasoline, replace plunger, intall lifter in bracket. Check clearance between end of plunger and valve stem (valve closed—clearance will be about .070"). Insert sufficient feeler stock to take up all except .010" clearance. Turn engine over until piston #1 slightly past top dead center, stop when flywheel mark 'IN.OP./1-8' lines up with indicator on housing. #1 intake valve should begin to open at this point. Remove feeler stock, reassemble hydraulic lifter (see article in Mechanical Equipment Section for complete directions).

Motor Gauge—Weidenhoff Adapter #114, Rod #29. Piston position 5° or .0123" ATDC.

Tappet Clearance:—None in service. See article in Mechanical Equipment Section on Hydraulic Tappet Takeup.

Valve Spring Pressure:—60-65 lbs. at 2 3/32" (valve closed). 120-128 lbs. at 1 25/32" (valve open).

LUBRICATION:—Crankcase Capacity—9 qts. (refill).
Normal Oil Pressure—35 lbs. at 40 M.P.H.

BATTERY:—Willard, Type WH-4-17. 6 volt, 136 A.H. capacity (20 hour rate).
Starting Capacity—160 amperes for 20 minutes.
Grounded Terminal — Positive (+) terminal grounded to transmission cover bolt.
Location—Left hand side under front floor.

STARTER:—Model 497. Armature No. 1843420.
Starter Drive—Outboard Bendix Type R11SXT-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—36-40 ounces each.
Cranking Engine—100-105 R.P.M., 225 amperes, 4.8 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	5.0	70
19 "	Lock	3.0	500

Starting Switch:—Startix automatic starting system controlled by ignition switch. See Equipment Section for complete data.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out three flange mounting capscrews.

GENERATOR:—Model 929-A. Armature No. 1856943. Air-cooled. Third brush control type with external voltage regulation (two-step charging rate). Voltage Control Relay combined with Cutout Relay in case on generator field frame. See Equipment Section for complete data on Voltage Control Relay.

Charging Rate Adjustment—Use test ammeter and voltmeter to check generator output. Connect jumper wire between 'F' terminal on generator and ground on generator frame. This is important as voltage regulator must be shorted out when adjustment is being made. Loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase,, or clockwise to decrease charging rate. Tighten locking screw and remove jumper wire.

Maximum Charging Rate—23-26 amperes, 2200 R.P.M., 20-25 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	23-26	8.8-9.1	2200
Hot	17-20	8.1-8.5	2400

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Shunt Field Current—1.8-2.3 amperes at 6.0 volts.

Field Fuse—6 ampere capacity in regulator case.

Removal:—Cradle mounted at left front of engine with fan belt drive (double Vee belt). To remove, slack off belt, disconnect water pump drive coupling, loosen mounting clamp band.

Belt Adjustment:—To adjust, loosen clamp bolt on fan bracket, turn eccentric shaft spindle until 10 lb. pull on belt midway between pulleys causes 1" deflection, tighten clamp bolt. Additional range of adjustment secured by taking bracket off engine and moving bracket up until mounting bolts engage lower holes.

CONTROL UNIT:—Model 5540. Consists of Cutout Relay and Voltage Control Relay in case on generator field frame. See special article in Equipment Section for complete data on these units.

Cutout Relay

Cuts In—6.4-6.8 volts, 8-10 M.P.H.
Cuts Out—0-3 ampere discharge current.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70°F.
Contacts Close—7.3-7.7 volts at 70°F.
Contact Gap—.008-.013".
Contact Spring Tension—.7-.9 ounces.
Air Gap—.028-.040" between armature and core (armature down against lower stop), .028-.040" armature travel (between armature and lower stop).

LIGHTING:—R.B.M. Switch Model 1451 (body), 1450 (plate), 1452 (cover). Lighting switch provides 'Country Passing' assymetrical beam (upper beam left hand headlamp, lower beam right hand headlamp).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights	32-32	1000.
Auxiliary headlights	6	81.
Tail	6	81.
Stop and Backing	21	1129.
Dome	15	87.
Instrument, Lock	3	63.

FUSES:—Electric Clock—5 ampere on back of clock.
Generator Field—6 ampere in regulator case.

CURRENT LIMIT RELAY:—Model 410-F. Vibrating type. Starts to operate with current load of 30-35 amperes, limiting load to 5-22 amperes.
Contact Gap—.012-.030".
Air Gap—.015-.030" (contacts closed).
Spring Tension—5 ozs. min. measured at brass button.

HORNS:—Klaxon Model K-26-G. Type 1775 (low note). 1776 (high note). Vibrator type, blended tone, twin horns operated by horn relay.

Horn Relay:—Model 266-TK. Relay requires .25 amperes to close contacts. Current draw .8 amperes.
Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

SERIAL NUMBER:—On plate on right side of frame at rear of right front spring rear shackle under fender.

COMPRESSION:—Ratio—6.0-1 Std., 6.5-1 & 7.0-1 optl. **Pressure**—115 lbs. at 350 R.P.M. or 80-85 lbs. at cranking speed (std. 6.0-1 head).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 537-E (2). Coils mounted on dash.
Ignition Current—2 amperes (idling), 4 amperes (stopped), for each coil.
Ignition Switch—Oakes Hershey type co-incidental steering post and ignition switch lock.
Distributor Model 4105. Double breaker, 6 lobe cam, semi-automatic advance type. Contacts open alternately at 20° and 40° intervals corresponding to 40° and 80° firing intervals of engine (unequal firing interval caused by 80° included angle of cylinder banks). Contacts must be synchronized—See Timing.
Breaker Gap—Set at .018". Limits .018-.024".
Breaker Arm Spring Tension—17-21 ounces.
Cam Angles—Closed 39°. Open 21° (distributor). Each set operates independently.
Manual Advance—33° (engine—maximum). Consists of a retard operated by pulling out button on dash. Used for hand cranking or heavy pulling.

Automatic Advance

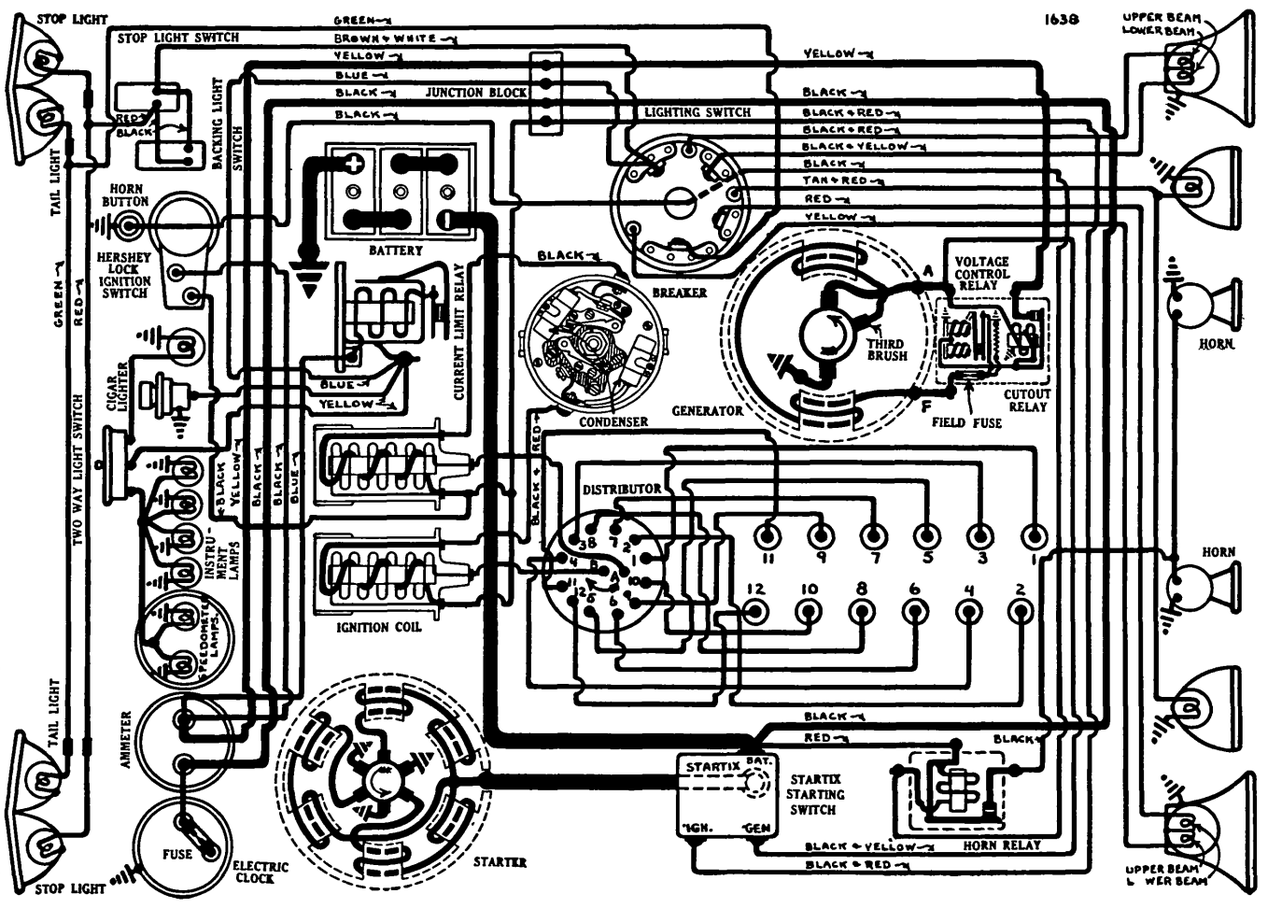
Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	2	800
7	1400	14	2800

Removal:—Mounted at rear of engine between cylinder banks. Take out distributor bracket screws.

IGNITION TIMING:— Flywheel Deg. Piston Pos.
All engines .....5° BTDC. .....0091" BTDC.
Timing (Stationary Contacts) — Advance spark control (push button in), disconnect and tape wire on 'IGN' terminal of Startix (to avoid automatic cranking when ignition is turned on), remove cover over inspection hole in flywheel housing. With #1 piston on compression, turn engine over until flywheel mark 'IGN. #1/' lines up with indicator on housing (mark is 5° before top dead center mark 'UDC/No. 1'). Loosen locking screw in center of breaker cam, carefully locate cam so that stationary contacts (mounted directly on breaker plate) are just opening, tighten locking screw, check rotor position. Then check synchronization.
Synchronization (movable contacts) on engine—Turn engine over 40° or exactly 1/9 revolution to firing position of piston #4 (#2 on right hand bank), stop when flywheel mark 'IGN. #4/' lines up with indicator on housing (mark is 5° before top dead center mark 'UDC/No. 4'). Loosen lockscrews on movable sub-plate turn eccentric adjusting screw until contacts open. Tighten lockscrews.
Synchronization—other methods—Use synchornizing tool or rotary spark gap, set movable contacts to open exactly 20° after first or stationary contacts (adjust by loosening lockscrews and turning eccentric adjusting screw on sub-plate). Firing intervals are 20-40-20 (distributor degrees).
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as shown on diagram (Right bank—1, 3, 5, 7, 9, 11; Left bank—2, 4, 6, 8, 10, 12 with #1 and 2 cylinders nearest radiator). Spark plug cables not connected in this order on distributor cap (see diagram).

Spark Plugs:—AC. Type K-10 or Champion Type J-5-C. 14 MM. Metric type.
Spark Plug Gaps—.025". Limits .022-.025".



CARBURETION:—See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EX-32, 1½" downdraft type. One carburetor used for each bank of cylinders (throttles must be synchronized).
Automatic Choke—Stromberg.

Fuel Pump:—A.C., Type D-1522113 diaphragm type. Supersedes Stewart-Warner Type 407-BZ, used on first cars.

Gasoline Gauge:—K-S Telegauge, hydrosatic type.

VALVE TIMING:—To Check Timing—Remove #1 intake hydraulic valve lifter, pull out plunger, remove spring, wash lifter assembly in gasoline to remove all oil, replace plunger, install lifter in bracket, check clearance between end of plunger and valve stem (valve closed clearance will be about .070"). Insert sufficient feeler stock to take up all except .004" clearance, turn engine over with #11 piston on compression, stop when flywheel mark 'IN.OP. #1/' lines up with indicator on housing, #1 valve should begin to open at this point. Remove feeler

stock, reassemble hydraulic lifter (see article in Mechanical Equipment Section for complete directions).

Motor Gauge—Weidenhoff Adapter #114, Rod #42. Piston position 19° or .1303" BTDC.

Tappet Clearance:—None in service. See article in Mechanical Equipment Section or Hydraulic Tappet Takeup.

Valve Spring Pressure:—60-65 lbs. at 2 3/32" (valve closed). 120-128 lbs. at 1 25/32" (valve open).

LUBRICATION:—Crankcase Capacity—14 qts. (dry), 12 qts. (refill).
Normal Oil Pressure—40 lbs. at 40 M.P.H.

BATTERY:—Willard, Type WH-5-19. 6 volt, 19 plate, 153 A.H. capacity (20 hour rate).
Starting Capacity—180 amperes for 20 minutes.
Grounded Terminal — Positive (+) terminal grounded to transmission top bolt.
Location—Left hand side under front floor.

STARTER:—Model 497. Armature No. 1843420.
Starter Drive—Outboard Bendix Type R11SXT-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—36-40 ounces each.
Cranking Engine—100 R.P.M., 225 amperes, 4.8 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	5.0	70
19 "	Lock	3.0	500

Starting Switch:—Startix automatic starting system controlled by ignition switch. See Equipment Section for complete data.

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out three flange mounting capscrews.

GENERATOR:—Model 929-A. Armature No. 1856943. Air-cooled. Third brush control type with external voltage regulation (two-step charging rate). Voltage Control Relay combined with Cutout Relay in case on generator field frame. See Equipment Section for complete data on Voltage Control Relay.

Charging Rate Adjustment—Use test ammeter and voltmeter to check generator output. Connect jumper wire between 'F" terminal on generator and ground on generator frame. This is important as voltage regulator must be shorted out when adjustment is being made. Loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase,, or clockwise to decrease charging rate. Tighten locking screw and remove jumper wire.

Maximum Charging Rate—23-26 amperes, 2200 R.P.M., 20-25 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	23-26	8.8-9.1	2200
Hot	17-20	8.1-8.5	2400

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).
Shunt Field Current—1.8-2.3 amperes at 6.0 volts.
Field Fuse—6 ampere capacity in regulator case.

Removal:—Cradle mounted at left front of engine with fan belt drive (double Vee belt). To remove, slack off belt, disconnect water pump drive coupling, loosen mounting clamp band.

Belt Adjustment:—To adjust, loosen clamp bolt on fan bracket, turn eccentric shaft spindle until 10 lb. pull on belt midway between pulleys causes 1" deflection, tighten clamp bolt. Additional range of adjustment secured by taking bracket off engine and moving bracket up until mounting bolts engage lower holes.

CONTROL UNIT:—Model 5540. Consists of Cutout Relay and Voltage Control Relay in case on generator field frame. See special article in Equipment Section for complete data on these units.

Cutout Relay

Cuts In—6.4-6.8 volts, 8-10 M.P.H.
Cuts Out—0-3 ampere discharge current.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70°F.
Contacts Close—7.3-7.7 volts at 70°F.
Contact Gap—.008-.013".
Contact Spring Tension—.7-.9 ounces.
Air Gap—.028-.040" between armature and core (armature down against lower stop), .028-.040" armature travel (between armature and lower stop).

LIGHTING:—R.B.M. Switch Model 1451 (body), 1450 (plate), 1452 (cover). Lighting switch provides 'Country Passing' assymetrical beam (upper beam left hand headlamp, lower beam right hand headlamp).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights	32-32	1000.
Auxiliary headlights	6	81.
Tail	6	81.
Stop and Backing	21	1129.
Dome	15	87.
Instrument, Lock	3	63.

FUSES:—Electric Clock—5 ampere on back of clock.
Generator Field—6 ampere in regulator case.

CURRENT LIMIT RELAY:—Model 410-F. Vibrating type. Starts to operate with current load of 30-35 amperes, limiting load to 5-22 amperes.
Contact Gap—.012-.030".
Air Gap—.015-.030" (contacts closed).
Spring Tension—5 ozs. min. measured at brass button.

HORNS:—Klaxon Model K-26-G. Type 1775 (low note). 1776 (high note). Vibrator type, blended tone, twin horns operated by horn relay.

Horn Relay:—Model 266-TK. Relay requires .25 amperes to close contacts. Current draw .8 amperes.
Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

SERIAL NUMBER:—Stamped on plate on right (1936), left (1937) side rail at rear of front spring rear shackle. First number as follows:

	(438-138" WB)	(444-144" WB)	(447-144" WB)
1936	2,215,001	2,600,001	
1937	2,225,001	2,610,001	1,100,001

COMPRESSION:—Ratio—6.4-1 Standard aluminum hd. No optl. ratios. **Pressure**—150 lbs. at 3400 R.P.M. or 75-80 lbs. at cranking speed (100-105 R.P.M.).

VACUUM READING:—Gauge should show steady reading of 19-20" with engine idling.

IGNITION:—Coil Model 539-K. Mounted on dash.

Ignition Current—2 amperes idling, 4 stopped.

Ignition Switch:—Delco-Remy Model 430-U. Switch and cable assembly. Connected to coil by armored cable. See article in Equipment Section.

Distributor Model 662-J. Double breaker, 4 lobe cam, semi-automatic advance type. Contacts open alternately at 45° intervals corresponding to 90° firing interval of engine, and must be synchronized. See Timing.

Breaker Gap—Set at .018". Limits .018-.024".

Cam Angle or Dwell—34° closed, 11° open (distrib.). Both sets together when properly synchronized.

Breaker Arm Spring Tension—19-23 ounces.

Condenser—Part No. 829092. Capacity .20-.25 mfds.

Manual Advance—33° (engine-maximum). Consists of retard operated by pulling out button on dash. Used for hand cranking or heavy pulling.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	2	600
9	1550	18	3100

Distributor Removal:—Mounted on right hand side of cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— **Flywheel Degrees** **Piston Pos.**
All engines .....5° BTDC.....0123" BTDC

Timing (Stationery Contacts)—Advance spark control button (push button in), turn ignition key to 'on' position with automatic starting inoperative (if ignition turned on), remove cover over inspection hole in flywheel housing. With #4 piston on compression, turn engine over until flywheel mark 'IGN/4' lines up with indicator on housing (mark is 5° before top dead center mark 'UDC/4'), loosen advance arm clamp bolt, rotate distributor until stationery contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, then check synchronization.

Synchronization (Movable Contacts)—Turn engine over 90° or ¼ revolution to firing position for piston #1, stop when flywheel mark 'IGN./1-8' lines up with indicator (mark is 5° before top dead center mark 'UDC./1-8'), loosen lockscrews on movable sub-plate, turn eccentric adjusting screw until contacts begin to open, tighten lockscrews, check spark plug connections.

Synchronization (Using Tool)—Use special synchronizing tool, Delco-Remy Part No. 1838182, and follow complete directions in Equipment Section.

Motor Gauge—Weidenhoff Adapter #114, Rod #29.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—Champion Type J-6. 14 MM. Metric.
Spark Plug Gap—.025". Limits .022-.025".

CARBURETION:—Carburetor—Stromberg Mod. EE-3, 1½" dual downdraft type.

See Carburetor Section for complete data.

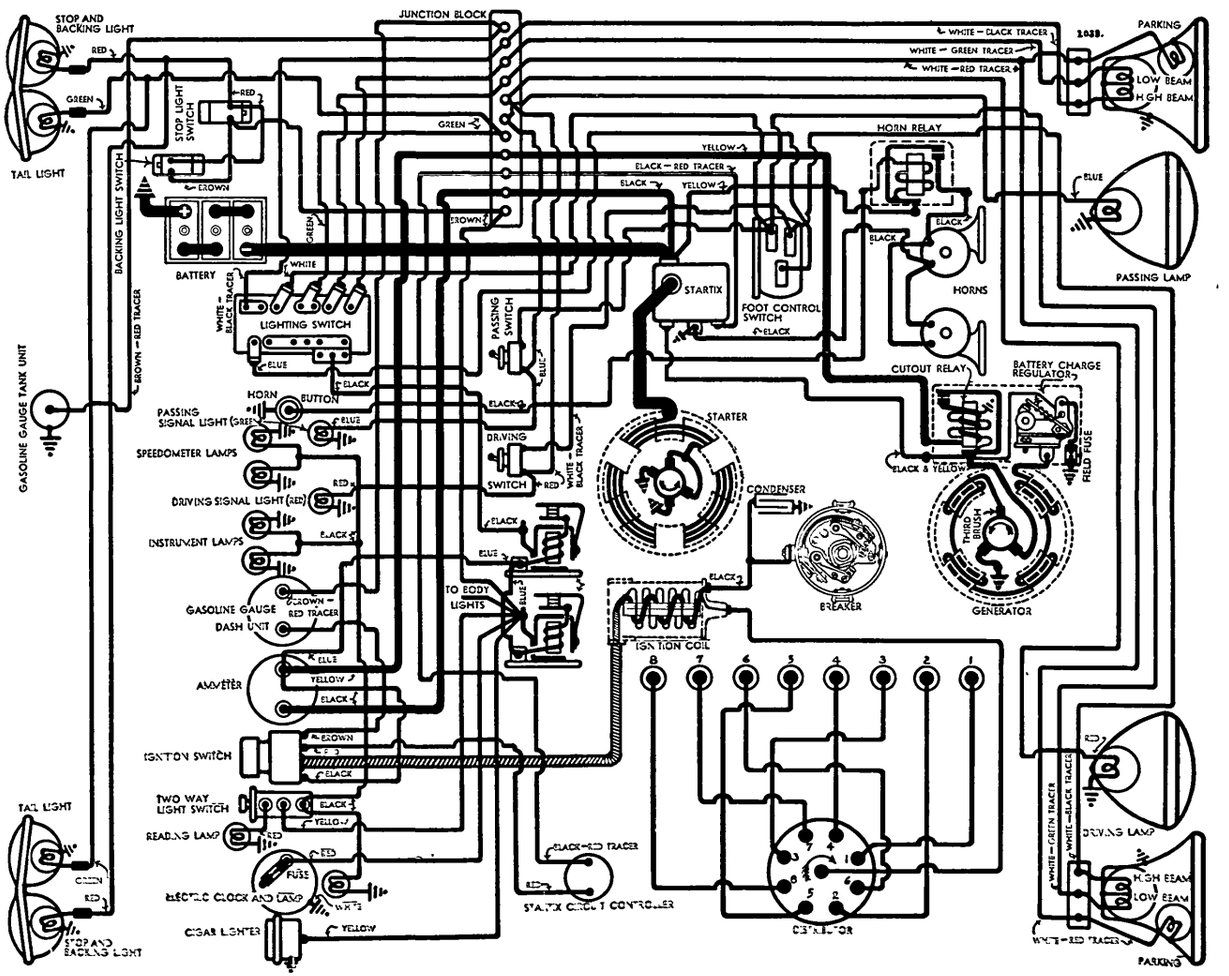
NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at hot or slow idling speed.

Idle Adjustment—Adjust each screw individually with engine idling on four cylinders (ground #1, 2, 7, 8 plug cables when adjusting inner screw, #3, 4, 5, 6 while adjusting outer screw). Turn screw in until engine begins to lag or miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Repeat with other adjusting screw in the same manner. Adjust throttle stopscrew so that idle speed is 37-39 explosions in 15 seconds (checked by removing plug in exhaust manifold).

Accelerating Pump Setting—Adjusted by changing position of pump link rod in throttle valve lever. Inner Hole (Min. stroke)—Summer temperatures. Outer Hole (Max. stroke)—Winter temperatures.

Fast Idle:—Stromberg type. See special article in Carburetion Section.

Automatic Choke:—Stromberg Type 'C' No. A-17630.
See article in Carburetion Equipment Section.



Air Cleaner:—AC. oil-wetted type standard.

Fuel Pump:—AC. Type D #1522112. Diaphragm type.
See article in Carburetion Equipment Section.

Gasoline Gauge:—Motometer Electric. Dash unit—NG-7833 (1936), NG-8440D (1937). Tank unit—NG-7741T (all).

See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Remove #1 intake hydraulic valve lifter, pull out plunger, remove spring, wash lifter assembly in gasoline, replace plunger, install lifter in bracket. Check clearance

between end of plunger and valve stem (valve closed—clearance will be about .070"). Insert sufficient feeler stock to take up all except .010" clearance. Turn engine over until piston #1 is .0123" past top dead center, stop when flywheel mark 'IN.OP./1-8' lines up with indicator on housing. #1 intake valve should begin to open at this point. Remove feeler stock, reassemble hydraulic valve lifter and install in engine. Run engine until valve lifter has become filled with oil and operates quietly.

See article in Mechanical Equipment Section.

Motor Gauge—Weidenhoff Adapter #114, Rod #29.

Tappet Clearance:—None in service. See article in Equipment Section on Hydraulic tappet take up.

Valve Spring Pressure:—60-65 lbs. at 2 3/32" (valve closed), 120-128 lbs. at 1 25/32" (valve open).

LUBRICATION:—Crankcase Capacity—9 qts. (refill). 10 qts. (dry).

Normal Oil Pressure—45 lbs. at 53 M.P.H.

BATTERY:—Willard, Type WH-4-17, RH-4-17 (Export) 6 volt, 17 plate, 136 ampere hour capacity (20 hour rate).

Starting Capacity—160 amperes for 20 minutes.

Zero Capacity—300 amperes for 5.4 minutes.

Grounded Terminal—Positive (+) term. grounded to transmission cover bolt.

Location—Left hand side under front floor.

STARTER:—Model DI-1314. Armature No. 16437.

Drive—Bendix Type RCD11FXT-10.

Cranking Engine—100-105 R.P.M., 175 amperes at 5.35 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—56-60 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	4500	6.0	60
2 "	1600	5.5	130
3.6 "	1200	5.35	170
7.4 "	800	5.05	250
14.4 "	400	4.5	400
28.0 "	Lock	3.5	650
29.24 "	Lock	3.6	720

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out three flange mounting capscrews.

Starting Switch:—Startix Type 'D'. Automatic starting switch and Startix circuit controller (anti-backfire unit), controlled by ignition switch. See special article in Equipment Section for complete data.

GENERATOR:—Model CO-1309. Armatur No. 23691. Air-cooled. Third brush control type with Battery Charge Regulator (two-step charging rate).

Charging Rate Adjustment—Third brush shifted through rack-and-pinion control by slotted adjusting screw on commutator end plate. To adjust, turn adjusting screw to right or clockwise to increase, and to left or counter-clockwise to decrease charging rate.

Maximum Charging Rate—32 amperes (cold), 8.0 volts, 1900 R.P.M., 20-25 M.P.H.

Performance Data—Regulator Inoperative

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	7.0	580	0	7.3	625
5	7.2	630	5	7.5	700
10	7.5	700	10	7.7	800
15	7.7	790	15	7.9	930
20	7.9	910	20	8.0	1100
25	8.0	1080	25	8.0	1380
30	8.0	1380	28	8.0	2000
32	8.0	1900			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—20-22 ozs. (main), 12-14 ozs. (third).
Field Current—3.5-3.7 amperes at 6.0 volts.
Motoring Current—16.7-18 amperes at 6.0 volts (½ ampere more if relay and regulator in circuit).
Field Fuse—5 ampere capacity in knurled plug in side of regulator case.

Removal:—Generator cradle mounted at left front of engine with fan belt drive (double Vee belt). To remove, slack off drive belt, disconnect water pump drive coupling, loosen mounting clamp band.

Belt Adjustment:—To adjust, loosen clamp bolt on fan bracket, turn eccentric shaft spindle until 10 lb. pull on belt midway between pulleys causes 1" deflection, tighten clamp bolt. Additional range of adjustment secured by taking bracket off engine and moving bracket up until mounting bolts engage lower holes.

CONTROL UNIT (RELAY-REGULATOR):—Mod. 40300. Consists of Cutout Relay and Battery Charge Regulator in a single case on the generator field frame. **See article in Electrical Equipment Section for complete data on Battery Charge Regulator.**

Cutout Relay

Cuts In—6.8-7.2 volts, 600 R.P.M., 8 M.P.H.
Cuts Out—0-2.5 amperes discharge current.
Contact Gap—.030-.032".
Air Gap—.020-.025" with contacts closed.

Battery Charge Regulator

Setting—8.2 volts (cold), 7.8 volts (hot)—contact opening point.
Regulator Resistance—1.85 ohms.

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused, Cross-beam type with special non-interchangeable lenses. Headlamps aimed straight ahead with lenses removed. Asymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp), controlled by foot selector switch with lighting switch in 'Country Driving' position.

Driving Lamp—Mounted on right of radiator. Controlled by separate switch on instrument panel with Red indicator lamp lighted with driving lamp 'on'. Lighted with lighting switch in 'Country Driving' position except when Driving Lamp Switch turned off.

Passing Lamp—Mounted at left of radiator. Controlled by separate switch on instrument panel with Green indicator lamp lighted with passing lamp 'on'. Lighted with lighting switch in 'City Driving' position or with foot selector switch in passing position (see Headlamps above) except when Passing Lamp Switch turned off.

Switches

Lighting—Delco-Remy Model 479-M.
Instrument Lamps—Delco-Remy Model 1411.
Foot Selector—Delco-Remy Model 471-Z.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Stop and Backing	21	1129
Driving and Passing	32	1323 * *
Driving and Passing Pilots	3	64
License Plate	3	63
Instrument Panel, Parking	1½	55
Tail, Dome & Corn., Smoke Cab.	6	81

* * This bulb Pre-focused, single contact type.

FUSES:—Electric Clock—5 ampere on back of clock.
Generator Field—5 ampere in regulator case.

CURRENT LIMIT RELAY:—Model 410-N. Two units used. Vibrating type. Starts to operate with current load of 35-40 amperes, limiting load to 5-22 amps.

Contact Gap—.012-.030".
Air Gap—.015-.030" with contacts closed.
Spring Tension—5 ounces minimum measured at brass button.

HORNS:—Klaxon Model K-33-S. Type 2051 (low note), 2052 (high note). Vibrator type, blended tone, twin horns operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
2051 (low note)	11-13	.042-.046"
2052 (high note)	10-12	.032-.036"

Horn Relay:—Model 266-TK. Requires .25 amperes to close contacts. Current draw .8 amperes.

Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—Stamped on plate on right (1936), left (1937) frame side rail at rear of front spring rear shackle. First number as follows:

138" WB—(1602) 3,130,001, (1702) 3,160,001.
144" WB—(1602) 3,140,001, (1702) 3,170, 001.
147" WB—(1603) 3,150,001, (1703) 3,180,001.

COMPRESSION:—Ratio—6.4-1 Standard aluminum head. No optl. ratios. **Pressure**—140 lbs. at 2500 R.P.M. or 80-85 lbs. at cranking speed (100-105 R.P.M.)

VACUUM READING:—Gauge should show steady reading of 19-20" with engine idling.

IGNITION:—Coil Model 553-E (2). Coils mounted on dash.

Ignition Current—2 amperes idling, 4 amperes stopped, for each coil.

Ignition Switch:—Delco-Remy Model 430-T. Switch and cable assembly. Connected to coil unit by armored cable. See article in Equipment Section.

Distributor Model 4105. Double breaker, 6 lobe cam, semi-automatic advance type. Contacts open alternately at 20° and 40° intervals corresponding to 40° and 80° firing intervals of engine (unequal firing interval caused by 80° included angle of cylinder banks). Contacts must be synchronized—see Timing.

Breaker Gap—Set at .018". Limits .018-.024".

Cam Angle or Dwell—Closed 39°. Open 21° (distributor). Each set operates independently.

Breaker Arm Spring Tension—19-23 ounces.

Manual Advance—33° (engine—maximum). Consists of a retard operated by pulling button on dash out. Used for hand cranking or heavy pulling.

Condenser—Part No. 1837231. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	400	2	800
7	1400	14	2800

Distributor Removal:—Mounted at rear of engine between cylinder banks. Take out distributor bracket screws.

IGNITION TIMING:—

	Flywheel Deg.	Piston Position
All engines	5° BTDC	.0091" BTDC

Timing (Stationary Contacts)—Advance spark control (push button in), if ignition turned 'on' turn key to 'on' position with automatic starting inoperative, remove cover over inspection hole in flywheel housing. With #1 piston on compression, turn engine over until flywheel mark 'IGN.#1' lines up with indicator on housing (mark is 5° before top dead center mark 'UDC/No.1'). Loosen locking screw in center of breaker cam, carefully locate cam so that stationary contacts (mounted directly on breaker plate) are just opening, tighten locking screw, check rotor position. Then check synchronization.

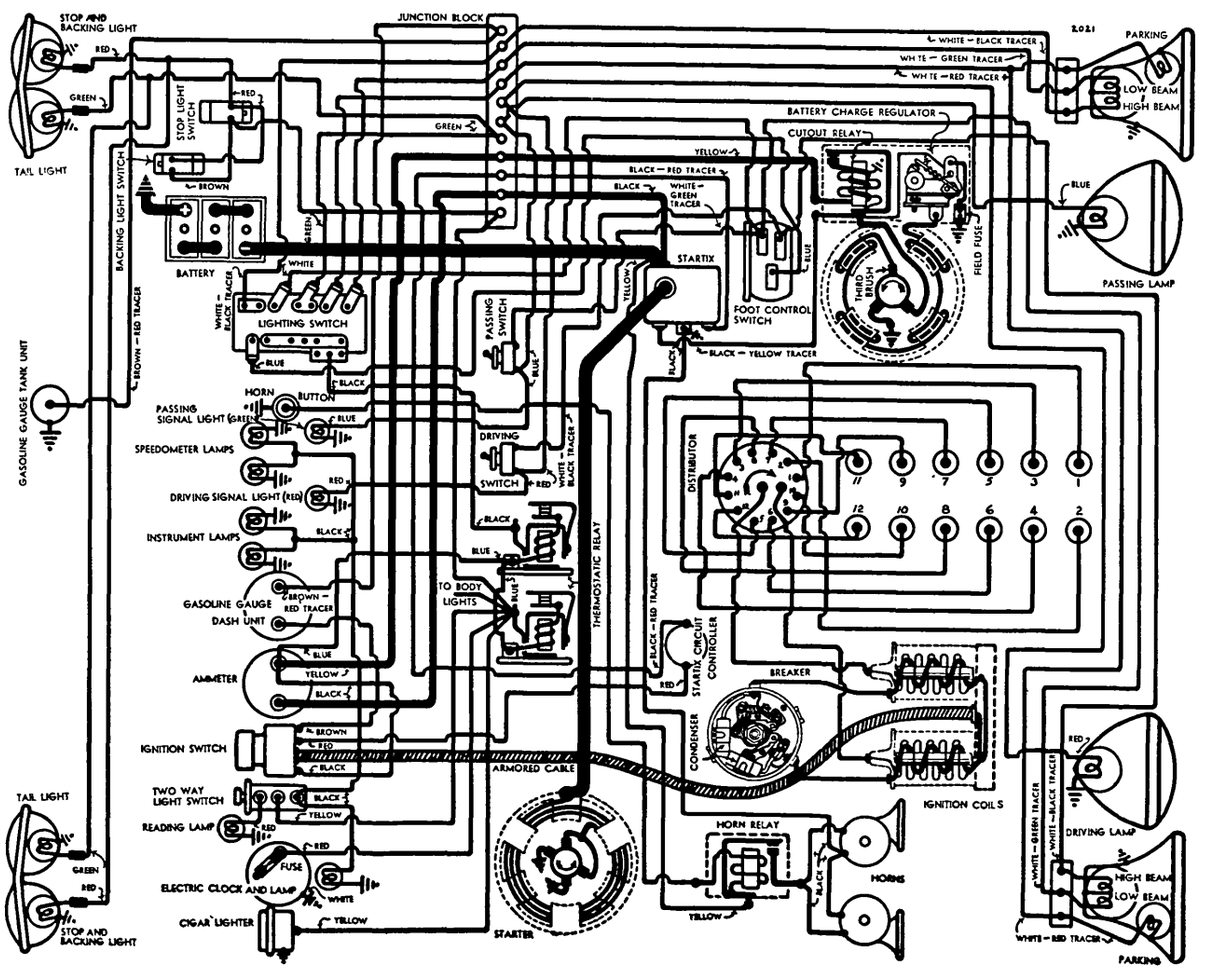
Motor Gauge—Weidenhoff #114 Adapter, #42 Rod.

Synchronization (Movable Contacts)—Turn engine over 40° or exactly 1/9 revolution to firing position of piston #4 (#2 on right hand bank), stop when flywheel mark 'IGN/No. 4' lines up with indicator on housing (mark is 5° before top dead center mark 'UDC/No. 4'). Loosen lockscrews on movtable subplate, turn eccentric adjusting screw until contacts open. Tighten lockscrews.

Synchronization—Other Methods—Use synchronizing tool or rotary spark gap, set movable contacts to open exactly 20° after first or stationary contacts (adjust by loosening lockscrews and turning eccentric adjusting screw on sub-plate). Firing intervals are 20-40-20 (distributor degrees).

Firing Order:—1-4-9-8-5-2-11-10-3-6-7-12 with cylinders numbered as shown on diagram (Right bank —1,3,5,7,9,11; Left bank—2,4,6,8,10,12 with #1 and 2 cylinders nearest radiator). Spark plug cables not connected in this order on distributor cap (see diagram).

Spark Plugs:—Champion Type J-6. 14 MM. Metric type.



Spark Plug Gap—.025". Limits .022-.025".

CARBURETION:—Carburetor—Stromberg Model EX-32, 1½" downdraft type. One carburetor used for each bank of cylinders (throttles must be synchronized.)

See Carburetor Section for complete data.

NOTE—Do not adjust carburetors until engine is warmed up so that choke valve is wide open and engine idling at hot or slow idling speed.

Idle Adjustment—Adjust one carburetor at a time. Cut out the six cylinders of the other bank by grounding the high tension lead of the coil firing that bank. Turn idle adjusting screw in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Then check idling speed by taking out plug in exhaust manifold and counting explosions or form small gap by disconnecting one high tension lead at spark plug and count sparks. Adjust throttle lever stopscrew so that there are 37-39 explosions in 15 seconds. Recheck idle adjusting screw setting (this must be reset if idling speed has been changed. After adjusting each carburetor, connect both coils, idle engine on all twelve cylin-

ders and check throttle valve synchronization (see article in Carburetion Section).

Accelerating Pump Setting—Adjusted by changing position of pump link rod in throttle valve lever. Inner Hole (Min. stroke)—Summer temperatures. Outer Hole (Max. stroke)—Winter temperatures.

Fast Idle:—Stromberg type. See special article in Carburetion Section.

Automatic Choke:—Stromberg Type 'C' No. A-16090. See article in Carburetion Equipment Section.

Air Cleaner:—AC. oil-wetted type standard, oil-bath heavy duty type optional.

Fuel Pump:—AC. Type D #1523010. Diaphragm type. See article in Carburetion Equipment Section.

Gasoline Gauge:—Motometer Electric. Dash unit—NG-8055D (1936), NG-8440D (1937). Tank unit—NG-7741T (all).
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Remove #1 intake hydraulic valve lifter, pull out plunger, remove spring, wash lifter assembly in gasoline to remove all oil, replace plunger, install lifter in bracket, check clearance between end of plunger and valve stem (valve closed—clearance will be about .070"). Insert sufficient feeler stock to take up all but .004" clearance, turn engine over with #11 piston on compression, stop when flywheel mark 'IN.OP#1/' lines up with indicator on housing, #1 intake valve should begin to open at this point. Remove feeler stock, reassemble hydraulic lifter and install in engine, run engine until lifter has become filled with oil and operates quietly.
See article in Mechanical Equipment Section.

Motor Gauge—Weidenhoff #114 Adapter, #42 Rod.

Tappet Clearance:—None in service. See article in Equipment Section on Hydraulic Tappet Take-up.

Valve Spring Pressure:—60-65 lbs. at 2 3/32" (valve closed), 120-128 lbs. at 1 25/32" (valve open).

LUBRICATION:—Crankcase Capacity—11 qts. (refill).
Normal Oil Pressure—45 lbs. at 53 M.P.H.

BATTERY:—Willard, Type WH-5-19, RH-5-19 (Export). 6 volt, 19 plate, 153 ampere hour capacity (20 hour rate).
Starting Capacity—180 amperes for 20 minutes.
Zero Capacity—300 amperes for 6.6 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Left hand side under front floor.

STARTER:—Model DI-1313. Armature No. 16437.
Drive—Bendix Type RCD11FXT-10.
Cranking Engine—100-105 R.P.M., 175 amperes at 5.35 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—56-60 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4500	6.0	60
2 "	1600	5.5	130
3.6 "	1200	5.35	170
7.4 "	800	5.05	250
14.4 "	400	4.5	400
28.0 "	Lock	3.5	650
29.24 "	Lock	3.6	720

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out three flange mounting capscrews.

Starting Switch:—Startix Type 'D' Automatic starting switch and Startix circuit controller (anti-backfire unit), controlled by ignition switch. See special article in Equipment Section for complete data.

GENERATOR:—Model CO-1309. Armature No. 23691. Air-cooled. Third brush control type with Battery Charge Regulator (two-step charging rate).
Charging Rate Adjustment—Third brush shifted through rack-and-pinion control by slotted adjusting screw in commutator end plate. To adjust, turn adjusting screw to right or clockwise to increase, and to left or counter-clockwise to decrease charging rate.
Maximum Charging Rate—32 amperes (cold), 8.0 volts, 1900 R.P.M., 25-30 M.P.H.

Performance Data—Regulator Inoperative

Cold			Hot		
Amps	Volts	R.P.M.	Amps	Volts	R.P.M.
0	7.0	580	0	7.3	625
5	7.2	630	5	7.5	700
10	7.5	700	10	7.7	800
15	7.7	790	15	7.9	930
20	7.9	910	20	8.0	1100
25	8.0	1080	25	8.0	1380
30	8.0	1380	28	8.0	2000
32	8.0	1900			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—20-22 ozs. (main), 12-14 ozs. (third).
Field Current—3.5-3.7 amperes at 6.0 volts.
Motoring Current—16.7-18 amperes at 6.0 volts (½ ampere more if relay and regulator in circuit).
Field Fuse—5 ampere capacity in knurled plug in side of regulator case.

Removal:—Generator cradle mounted on left front of engine with fan belt drive (double Vee belt). To remove, slack off drive belt, disconnect water pump drive coupling, loosen mounting clamp band.

Belt Adjustment:—To adjust, loosen clamp bolt on fan bracket, turn eccentric shaft spindle until 10 lb. pull on belt midway between pulleys causes 1" deflection, tighten clamp bolt. Additional range of adjustment secured by taking bracket off engine and moving bracket up until mounting bolts engage lower holes.

CONTROL UNIT (RELAY-REGULATOR):—Mod. 40300. Consists of Cutout Relay and Battery Charge Regulator in a single case on the generator field frame.
See article in Electrical Equipment Section for complete data on Battery Charge Regulator.

Cutout Relay
Cuts In—6.8-7.2 volts, 600 R.P.M., 8 M.P.H.
Cuts Out—0-2.5 amperes discharge current.
Contact Gap—.030-.032".
Air Gap—.020-.025" with contacts closed.

Battery Charge Regulator
Setting—8.2 volts (cold), 7.8 volts (hot)—contact opening point.
Regulator Resistance—1.85 ohms.

LIGHTING:—Headlamps—Guide Multi-beam, Pre-focused, Cross-beam type with special non-interchangeable lenses. Headlamps aimed straight ahead with lenses removed. Asymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp), controlled by foot selector switch with lighting switch in 'Country Driving' position.
Driving Lamp—Mounted on right of radiator. Controlled by separate switch on instrument panel with Red indicator lamp lighted with driving lamp 'on'. Lighted with lighting switch in 'Country Driving' position except when driving lamp switch turned off.
Passing Lamp—Mounted on left of radiator. Controlled by separate switch on instrument panel with Green indicator lamp lighted with passing lamp 'on'. Lighted with lighting switch in 'City Driving' position or with foot selector switch in passing position (see Headlamps above) except when passing lamp switch turned off.

Switches
Lighting—Delco-Remy Model 479-M.
Instrument Lamps—Delco-Remy Model 1411.
Foot Selector—Delco-Remy Model 471-Z

** This bulb Pre-focused, single contact type.

FUSES:—Electric Clock—5 ampere on back of clock.
Generator Field—5 ampere in regulator case.

CURRENT LIMIT RELAY:—Model 410-N. Two units used. Vibrating type. Starts to operate with current load of 35-40 amperes, limiting load to 5-22 amperes.
Contact Gap—.012-.030".
Air Gap—.015-.030" with contacts closed.
Spring Tension—5 ounces minimum measured at brass button.

HORNS:—Klaxon Model K-33-S. Type 2051 (low note), 2052 (high note). Vibrator type, blended tone, twin horns operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
2051 (low note)	11-13	.042-.046"
2052 (high note)	10-12	.032-.036"

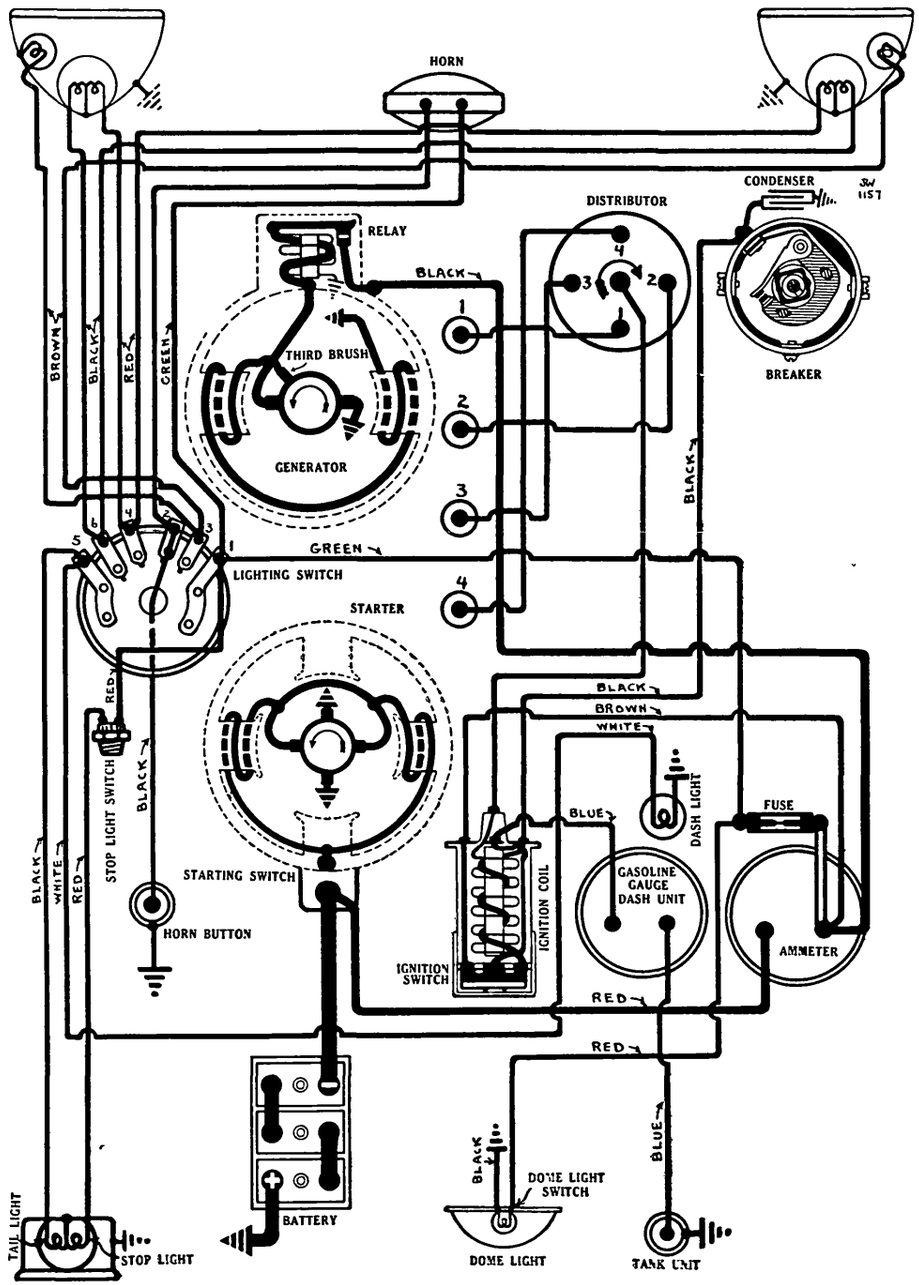
Horn Relay:—Model 266-TK. Requires .25 amperes to close contacts. Current draw .8 amperes.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

PLYMOUTH

MODEL U (1929-30)
MODEL 30-U (1930-31)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WS-1-13, 6 volt, 80 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted under the front floor boards on the left frame member.

IGNITION:—Coil Model 528-V, S; 536-Z, M. Ignition switch built in base of coil. Ignition coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.



Distributor Model 635-T, W (U), 629-A (3OU). Contact gap .020". Set contact gap by loosening lock screw on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 22 degrees (engine). Automatic advance begins at 600 R.P.M. of the engine. Maximum automatic advance is 20 degrees reached at 2400 R.P.M. of the engine.

Mounting:—Distributor is mounted at the front of the engine and is driven by spiral gears from the forward end of the camshaft. To remove distributor, disconnect primary lead and manual spark control and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor housing and turn down two turns every month or each 1000 miles. Keep the oiler on the distributor drive gear compartment filled with light engine oil. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position .050" (U), .045" (3OU) before top dead center with the manual spark control in the fully advanced position. To set timing, remove spark plug in cylinder No. 1 and screw the special micrometer timing gauge in place in the opening. Fully advance the manual spark control. Connect a six volt test lamp in series with the primary circuit by connecting one test lamp lead to the primary terminal on the distributor and the other lead to the relay terminal on the generator. If the battery is out of the car, connect this lead to one terminal of a six volt battery and ground the other battery terminal to the car frame. The lamp will remain lighted while the contacts are closed and will go out as the contacts open. Turn the engine over until piston No. 1 reaches top dead center and set micrometer gauge at zero. Then turn engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed) and stop when the gauge indicates .045 inch before top dead center. Loosen advance arm clamp screw and rotate distributor until the lamp goes out, indicating that the contacts are beginning to open. Tighten the clamp screw and see that the rotor is directly opposite No. 1 segment in the distributor head (see diagram). To check the ignition setting, crank the engine over several times and then stop with piston No. 1 on compression stroke at the exact instant the lamp goes out. If gauge reading is between .045-.055" (U), .040-.050" (3OU), before top dead center, ignition setting is satisfactory.

NOTE:—The new type timing gauge has a visible spark gap built in the gauge. If this indicator is used one terminal lead on the gauge should be clipped to the high tension lead from the coil at the distributor and the

PLYMOUTH

MODEL U (1929-30)
MODEL 30-U (1930-31)
DELCO-REMY GENERATING STARTING SYSTEM
DELCO-REMY IGNITION

other gauge terminal lead should be grounded to the engine. Turn on ignition and proceed with timing. No test lamp need be used.

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—18 MM. Metric. A. C. Type G-12. Gaps—.027-.030" (U), .020-.025".

VALVE TIMING:— (U):—INLET VALVES. Head Diameter 1 23/32". Stem Diameter, 3/8 inch. Stem length, 4 3/8 inches. Valve lift, 9/32 inch. Spring pressure, 56 pounds (valve open) and 40 pounds (valve closed). Tappet clearance, .005 inch (hot). Inlet valves open 5 degrees past top dead center and close 45 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 19/32 inches. Stem diameter, 3/8 inch. Stem length, 4 3/8 inches. Valve lift, 9/32 inch. Spring pressure, 56 pounds (valve open) and 40 pounds (valve closed). Tappet clearance, .006 inch (hot). Exhaust valves open 49 degrees before lower dead center and close 3 degrees after top dead center. Valve stem guides are removable.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .008". This valve should open with piston .010" past top dead center on intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Camshaft is gear driven. Mesh marked tooth on crankshaft gear with marked space between teeth on camshaft gear.

VALVE TIMING (3OU):—INLET VALVES. Head Diameter 1 27/32". Stem Diameter, 11/32 inch. Stem length, 5 1/16 inches. Valve lift, .3125 inch. Spring pressure, 38-43 pounds (valve closed), 54-59 pounds (valve open). Tappet clearance, .005 inch (hot). Inlet valves open at top dead center and close 40 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 19/32 inches. Stem diameter, 11/32 inch. Stem length, 5 1/16 inches. Valve lift, .3125 inch. Spring pressure, 38-43 pounds (valve closed), 54-59 pounds (valve open). Tappet clearance, .007 inch (hot). Exhaust valves open 48 degrees before lower dead center and close 2 degrees after top dead center.

To Check Valve Timing:—Use regular timing gauge. Set tappet clearance No. 1 intake valve at .008". This valve should open with piston on top dead center entering intake stroke. Reset tappet clearance at .005" (hot).

To Set Valve Timing:—Camshaft is gear driven. Mesh marked tooth on crankshaft gear with marked space between teeth on camshaft gear.

STARTER:—Model 714-J, 714-Q. Starter is connected to the engine through a Bendix drive (Model 714-J) or a manual pinion shift interconnected with the starting switch and an overrunning clutch (Model 714Q). The direction of rotation is counter-clockwise, viewed from the commutator end. Starter brush spring tension is 24-28 ounces. Starter switch used with Model 714-J starter is Model 404-Z. The starting switch is part of the starter assembly on the Model 714-Q.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out two flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles of operation. The drive end bearing is oilless.

GENERATOR:—Model 947-B (U), 943-R (3OU). Rotation is counter-clockwise viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed lock screw on the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting the maximum charging rate is 16 amperes (cold) reached at 2300 R.P.M.

Generator Data—Model 947-B

Amperes	Volts (Cold Test)	R.P.M.	Amperes	Volts (Hot Test)	R.P.M.
0	6.4	800	0	6.4	850
5.6	7.0	1000	6	7.0	1250
11.6	7.4	1325	9.4	7.4	1625
15	8.0	1900	11.0	7.55	2125
13.2	7.8	2500	10	7.45	2750

Generator Data—Model 943-R

Amperes	Cold Test Volts	R.P.M.	Amperes	Hot Test Volts	R.P.M.
0	6.4	760	0	6.4	850
6	7.0	1000	6	7.0	1200
10	7.4	1200	10	7.4	1600
17-19	8.0	2300	12.5	7.7	2300
12	7.7	3200	10	7.5	3200

Brush Spring Tension—14-18 ozs. (947-B), 24-28 ozs. (943-R).

Field Current—3.5-5.1 amperes (947-B), 3.5-4.5 amperes (943-R) at 6.0 volts.

Mounting:—Generator is mounted on special hinge bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward the engine and slip off the drive belt. Then remove the two bolts forming the bracket hinge and lift generator from place.

Belt Adjustment. The fan belt tension is adjusted by loosening the adjustment clamp bolt and the hinge bolts and then swinging the generator away from the engine until the correct belt tension is secured. Tighten the clamp bolt and bracket bolts after making the adjustment. The belt tension should be just sufficient to drive the generator and fan without slipping.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 1000 miles of operation.

RELAY:—Model 265-G. Relay is mounted on the generator. Relay closes at 750 R.P.M. when the generator voltage reaches 6.4-7 volts and opens with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch Model 9150. Lighting switch is mounted at lower end of steering column and is controlled by a lever on the steering wheel. Headlights are equipped with double filament bulbs. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights (in headlights) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash light is 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail light is 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament. Dome light is 6-8 volt, 15 cp. S.C. Mazda 87.

NOTE—Lighting switch on Model 'U' is Soreng-Manegold Model 5500-A.

FUSES:—Lighting fuse mounted on the back of the ammeter is 20 ampere capacity.

PLYMOUTH

FLOATING POWER MODEL PA (1931-32)
NEW MODEL PB (1932), SERIAL NUMBERS 1,680,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

CAR SERIAL NUMBER:—On right front door hinge pillar post.

ENGINE NUMBER:—Stamped on boss left side of cylinder block between Nos. 1 and 2 cylinders.

BATTERY:—**Willard, Type WS-1-13,** 6 volt, 13 plates, 86 ampere hour capacity (20 hour rate). Starting capacity 105 amperes for 20 minutes. Positive (+) terminal grounded to transmission. Battery mounted on left frame member under front compartment floor boards (PA) or under driver's seat (PB). Battery size, 7 1/16 inches wide, 9 1/16 inches long, 8 13/16 inches high.

IGNITION:—**Coil Model 526-T (PA), 534-Z (PB).** Ignition switch built in base of coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes with engine stopped.

Distributor Model 629-H (PA), 629-M (PB). Single breaker arm, 4 lobe cam type with full automatic advance. Distributor fitted with vacuum controlled spark retard (see Note). Breaker contact gap set at .020 inch. Hold within limits of .018-.024 inch. To set gap, loosen lock screw on crescent shaped stationary contact mounting plate, turn eccentric adjusting screw, tighten lock screw. Breaker arm spring tension, 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface).

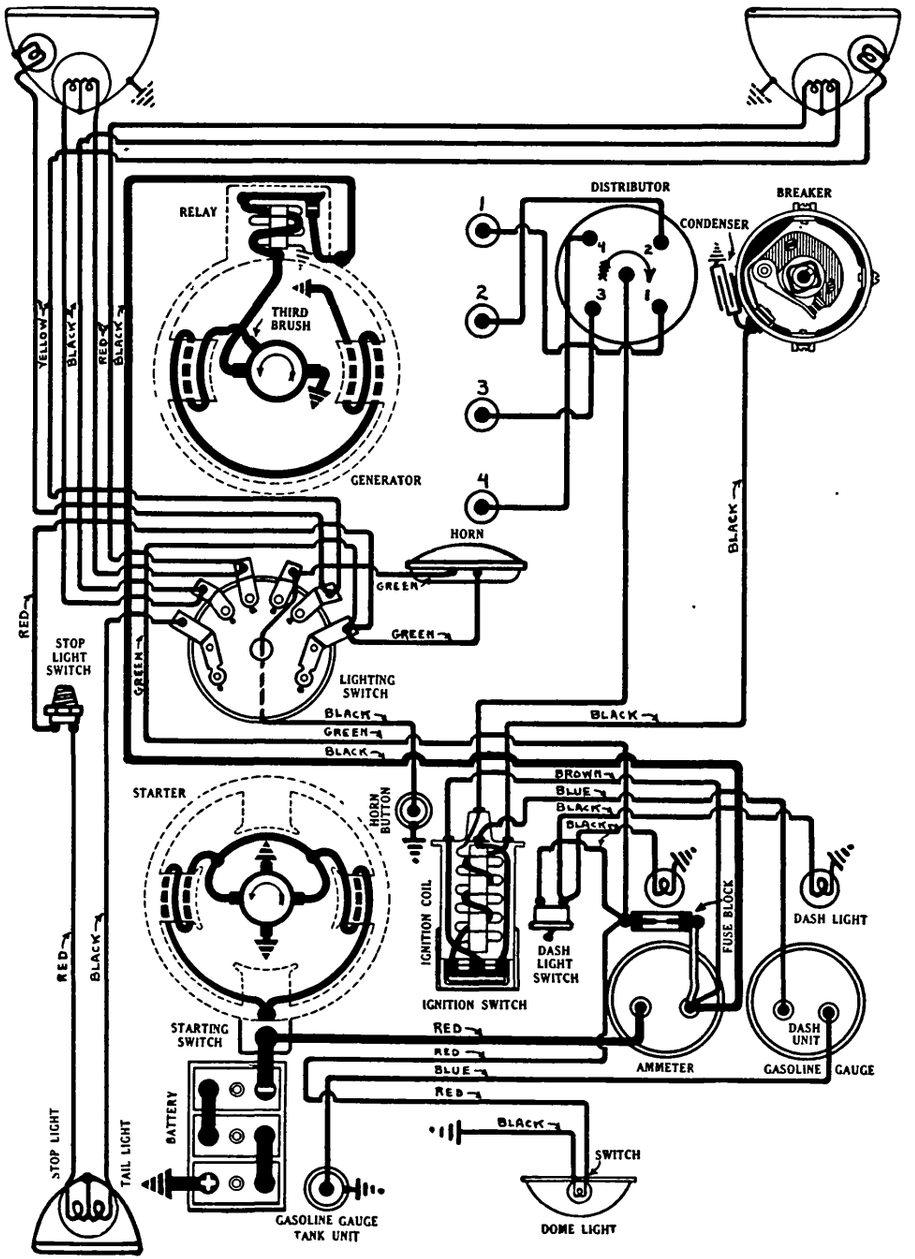
Cam Angles—(629-H) Closed 52°. Open 38°. (629-M) Closed 49°. Open 41° (distributor degrees in each instance).

Automatic Advance—Model 629-H

Degrees	Distributor	R.P.M.	Degrees	Engine	RPM.
Start		400	2		800
8		1300	16		2600

Automatic Advance—Model 629-M

Start		400	2		800
8		1450	16		2900



Vacuum Spark Control:—Model 680-A (PA), 680-E (PB). Mounted on bracket bolted to timing gear case and linked to distributor advance plate. Vacuum unit retards spark at idling speeds or when throttle is closed. Spark is advanced by return spring within unit when throttle is opened. Vacuum unit travel is ¼" maximum.

Vacuum	Vacuum Retard Data	Retard (Engine°)
5" of H.G.		Start
14" of HG. Maximum		20-22°

Mounting:—Distributor is mounted at the front of the engine and is driven from the forward end of the camshaft. To remove distributor, disconnect primary lead and take off distributor cap with cables intact. Disconnect vacuum spark control. Take out hold-down screw in advance arm and lift distributor from place.

Timing:—**(PA and First PB).** Standard setting .046 inch before top dead center To set timing, remove the ⅛ inch pipe plug in the cylinder head directly over No. 4 piston. Install regular Chrysler timing gauge (see Equipment Section). Set gauge dial at '0' with piston on top dead center. Check breaker contact gap (set at .020 inch) and connect test lamp in primary circuit at distributor, turn on ignition. With No. 1 piston on compression stroke, turn engine over until gauge reading is .046 inch before top dead center, loosen advance arm clamp screw, rotate distributor until contacts begin to open (test lamp will go out), tighten clamp screw and connect spark plugs as indicated on diagram (No. 1 terminal as designated). Check ignition setting by turning engine over several times and stop with No. 1 piston on compression at the point where the test lamp goes out, indicating that contacts are beginning to open. Gauge reading must be within limits of .043-.049 inch before top dead center.

(PB). Standard setting 10° (on flywheel) before top dead center. To set timing, first check breaker contact gap (set at .020 inch), take off timing inspection hole cover on left front face of flywheel housing directly below starter, connect test lamp in primary circuit at distributor, turn on ignition.

PLYMOUTH

FLOATING POWER MODEL PA (1931-32)
NEW MODEL PB (1932), SERIAL NUMBERS 1,680,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

With No. 1 piston on compression stroke, turn engine over until flywheel mark 'D/C' is directly opposite upper pointer in inspection hole. Loosen advance arm clamp screw, rotate distributor until contacts begin to open (test lamp will go out), tighten clamp screw and connect spark plugs as indicated on diagram (No. 1 terminal as designated).

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—(PA) 18 MM. Metric A.C. Type G-12. Set gaps at .022 inch. (PB) 14 MM. Metric. A.C. Type K-12. Set gaps at .028 inch.

VALVE TIMING:—Valves at right of engine. Camshaft gear driven from crankshaft. Gears marked for correct timing (see paragraph below).

Valve Dimensions (PA)

	Head Diameter	Stem Diameter	Stem Length	Seat Angle	Lift
Intake	1 27/32"	.372"	5 1/16"	45°	.3125"
Exhaust	1 9/32"	.372"	5 1/16"	45°	.3125"

Valve Dimensions (PB)

Intake	1 27/32"	.372"	5⅛" (overall)	45°	.3125"
Exhaust	1 27/32"	.372"	5⅛" (overall)	45°	.3125"

Tappet Clearance

	Operating	Timing
Intake	.005" (hot)	.008" (cold)
Exhaust	.007" (hot)	.009" (cold)

Spring Pressure

Closed .....40-44 pounds (1 7/8")
(PA) Open.....85 pounds (1 9/16")
(PB) Open....66-72 pounds (1 9/16")

Timing

Intake valves open 6° after top dead center with piston .0166" down on intake stroke. Intake valves close 46° after lower dead center.

Exhaust valves open 42° before lower dead center. Exhaust valves close 8° after top dead center with piston .0295" down on intake stroke.

To Check Valve Timing. Take out the ⅛ inch pipe plug in the cylinder head over No. 4 cylinder and screw the special timing gauge in place. Crank engine over until No. 4 piston is on top dead center and set gauge dial at zero. Turn engine over until No. 1 piston is on top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .008 inch and No. 1 exhaust valve at .009 inch. Crank engine over one complete revolution and stop when gauge indicates No. 1 piston is .0166 inch past top dead center. No. 1 inlet valve should begin to open at this point. Turn engine over 2 degrees until gauge reading is .0295 inch past top dead center. No. 1 exhaust valve should close at this point. Reset tappet clearance with engine hot to .005 inch (inlet) and .007 inch (exhaust).

To Set Valve Timing. Camshaft is driven by spiral gears from the crankshaft at the front of the engine. To set valve timing, turn crankshaft over until piston No. 1 is on top dead center (use timing gauge in opening over No. 4 piston). Then mesh gears so that the marked tooth on the crankshaft gear is opposite the space which is similarly marked on the camshaft gear. Both marks should be in line with a straightedge laid across the two shaft centers.

STARTER:—Model 714-Q. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch pedal. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension should be 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	R.P.M.
0 lb. ft	5000	5.0	65
3.0 "	1500	5.0	200
6.0 "	800	4.5	300
9.4 "	350	4.0	400
12.0 "	Lock	3.63	475

Mounting:—Starter is flange mounted at left of engine on forward face of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out two flange mounting cap screws. Pull starter forward to clear drive pinion and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every 5000 miles of operation. The drive end bearing is oilless.

GENERATOR:—Model 943-R (PA), 943-S (PB). Rotation is counter-clockwise viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust the generator output, loosen the small round headed lock screw on the commutator end plate and remove the commutator cover band. Then shift the third brush by hand in a counter clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting the maximum charging rate is 16-18 amperes (cold) reached at 2300 R.P.M. or 20-22 miles per hour.

Model 943-R Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	800	0	6.4	875
4	6.8	920	4	6.8	1075
8	7.2	1075	8	7.2	1400
18	8.3	2300	12.2	7.7	2400

Model 943-S Generator Data

15-18	7.9-8.3	2000	13-15	7.7-8.0	2400

Shunt field current is 3.5-4.5 amperes at 6 volts. Generator motoring draws 3 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is mounted on special hinge bracket at left of engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward the engine and slip off drive belt. Then remove the two bolts forming the bracket hinge and life generator from place.

Belt Adjustment. To take up fan belt, loosen mounting bolts and adjustment clamp bolt, attach spring scale by wire looped over top of generator field frame so that force of spring is tangent to top of generator and parallel to slot in adjustment arm. Pull generator away from engine until scale reading is 45-50 pounds and tighten adjustment bolt and mounting bolts before slacking off on scale.

Oiling:—Fill oiler at each end with light engine oil every 2000 miles.

RELAY:—Model 265-G. Relay is mounted on the generator. Relay closes at 8-10 M.P.H. or 800 R.P.M. when the generator voltage reaches 6.4-7 volts and opens with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch, Model 9150 (PA), 9271 (PB). Lighting switch mounted at lower end of steering column controlled by lower lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110

ENGINE NUMBER:—Stamped on boss on left side cylinder block between Nos. 1 and 2 cylinders.

ENGINE:—Six cylinder, 'L' head type, 3⅛x4⅛" bore and stroke, 189.8 cubic inch displacement, rated at 23.43 H.P., develops 70 H.P. at 3600 R.P.M. (standard compression engine) or 76 H.P. at 3600 R.P.M. (high compression Red Head engine). Standard compression ratio (Silver Dome Head), 5.5-1. Optional high compression ratio (Red Head engine) 6.5-1. A distinct ignition setting is used for each type engine (see Timing).

BATTERY:—Willard, Type WS.-1-13, 6 volt, 13 plate, 86 ampere hour (20 hour rate). Starting capacity 105 amperes for 20 minutes.

Grounded Terminal:—Positive (+) terminal grounded to transmission.

Mounting:—Battery mounted in cradle under driver's seat.

Battery Dimensions:—Width, 7 1/16 inches. Length, 9 1/16 inches. Height, 8 13/16 inches.

IGNITION:—Coil Model 537-W, 537-T, 538-T 538-W, 534-B Spec. (PC), 537-J, 538-J, 538-X, 534-B Spec. (PD). Coil mounted on engine side of dash.

Ignition Current:—1-2 amperes at 6 volts (engine running), 3-4 amperes at 6 volts (engine stopped).

Ignition Switch:—Unit with coil. Switch mounted on instrument board and connected to coil by armored primary lead (see Equipment Section).

Distributor Model 622-H (first cars), 644-H (later cars). Single breaker arm, 6-lobe cam type with full automatic advance. Condenser mounted on outside of distributor cup.

Breaker Gap:—Set gap at .020 inch. Hold within limits of .018-.024 inch.

Breaker Arm Spring Tension—19-23 ozs. measured behind contacts.

Cam Angles—Closed 36°. Open 24° (distributor degrees).

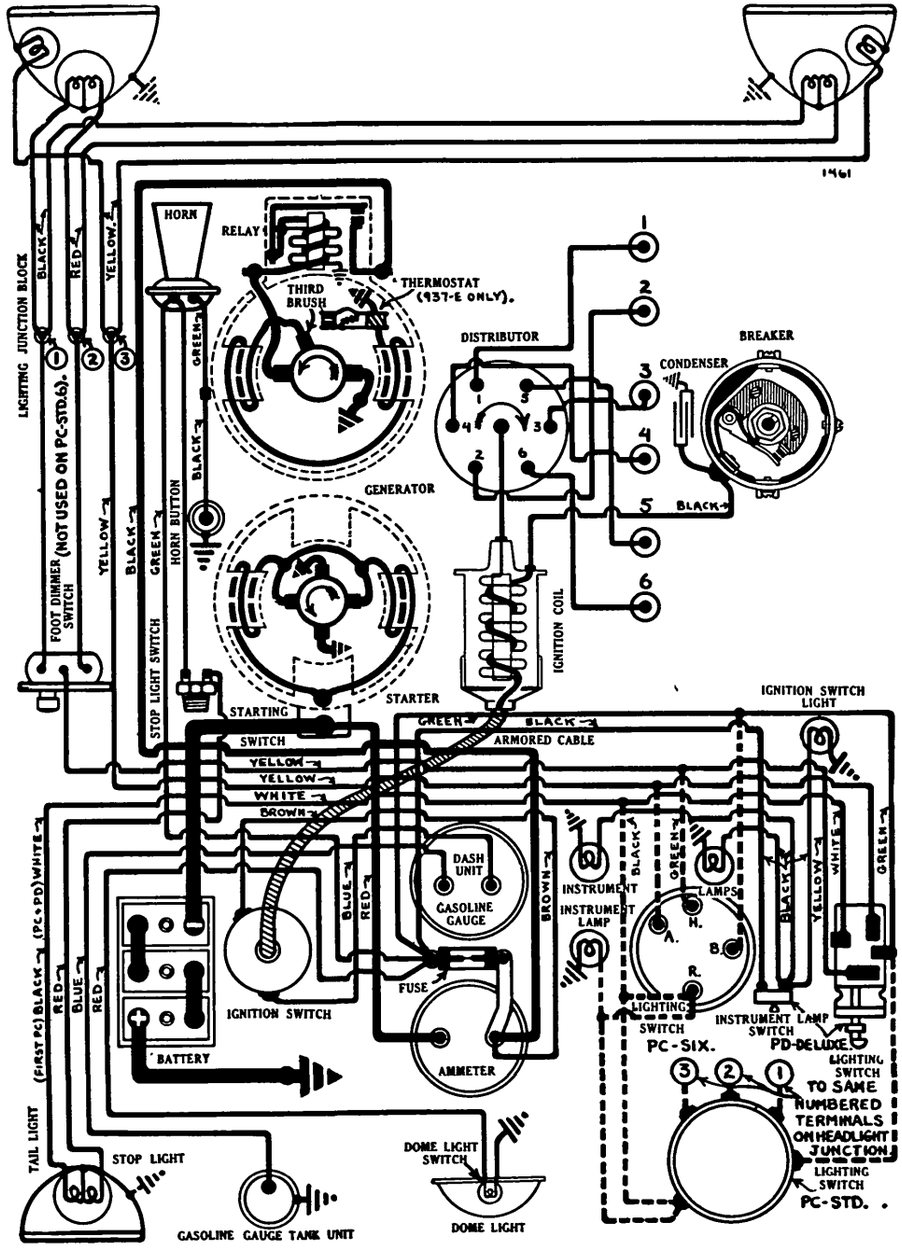
Automatic Advance—Model 622-H

Degrees	Distributor R.P.M.	Degrtes	Engine R.P.M.
Start	400	2	800
8.75	1100	17.5	2200
9	1200	18	2400

Automatic Advance—Model 644-H

Start	250	2	500
7	400	14	800
14	1200	28	2400

Mounting:—Distributor mounted on left side of crankcase and driven by inclined shaft from camshaft. To remove, disconnect breaker lead, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.



Oiling:—**500 Miles.** Turn down grease cup on side of housing one turn. Keep cup filled with medium cup grease.

2000 Miles. Take off distributor cap and rotor. Oil breaker arm pivot and fill wick oiler in center of shaft. Apply thin film vaseline on face of breaker cam.

IGNITION TIMING:—Standard setting for each engine and each type distributor as follows:

Engine	Distributor	Timing—Flywheel°	Piston Travel
Silver Dome Head	622-H	10° before TDC.	.039" before TDC.
Silver Dome Head	644-H	At top dead center.	Top dead center.
Red Head Engine	622-H	8° before TDC.	.025" before TDC.
Red Head Engine	644-H	2° after T.D.C.	.0016" after T.D.C.

To Set Ignition Timing:—Set breaker contact gap at .020 inch. Take off cover on inspection hole in left front face flywheel housing (directly under starter). With No. 1 piston on compression turn engine over until flywheel mark 'DC/' lines up with upper pointer in inspection hole. Loosen advance arm clamp screw, rotate distributor cup until contacts begin to open (use a test lamp), tighten clamp screw, see that rotor is opposite No. 1 terminal in distributor cap (see diagram) and connect spark plugs as indicated.

PLYMOUTH

NEW SIX MODEL PC (1933), SERIAL NUMBERS 1,759,001 UP
STANDARD SIX MODEL PC (1933), SERIAL NUMBERS 1,817,101 UP
DE LUXE MODEL PD (1933), SERIAL NUMBERS 2,000,001 UP
DELCO-REMY SYSTEM

Note on Ignition Pointer. For cars timed before top dead center a second pointer (located above the dead center pointer) is installed on the edge of the inspection hole. This pointer is correctly set for both standard and high compression engines when high compression head is installed at the factory. On engines timed at top dead center this separate ignition pointer is not used.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. Metric. A.C. Type K-12 (standard compression engines), Type K-10 (Red Head engines). Set spark plug gaps at .025 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive. Sprockets are marked. Mesh chain so that, with No. 1 piston on top dead center, marks on both sprockets are adjacent and in line with a straightedge laid across the shaft centers.

To Check Valve Timing. Install timing gauge in cylinder head over No. 6 piston and set gauge dial at zero on top dead center. Set tappet clearance No. 1 intake valve at .011" and No. 1 exhaust valve at .012" with engine cold. With No. 6 piston on compression turn engine over until gauge registers .014" past top dead center. No. 1 intake valve should be opening with all tappet clearance taken up. No. 1 exhaust valve closes 2° later when gauge registers .025". Reset tappet clearance at .005" (intake) and .007" (exhaust) with engine warm.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 15/32"	.340-.341"	4 25/32"	45°	5/16"
Exhaust	1 15/32"	.340-.341"	4 25/32"	45°	5/16"

Tappet Clearance	Operating	Timing
Intake	.005" (hot)	.011" (cold)
Exhaust	.007" (hot)	.012" (cold)

Valve Springs

Closed—34-38 pounds (1¾")—PD.
Closed—40-44 pounds (1 25/32")—P.C.
Open—75-81 pounds.

Valve Grinding:—Valve material chrome-nickel steel (intake), silchrome steel (exhaust). Special alloy exhaust valve seat inserts in cylinder block. Valves should be refaced on a valve grinder and then lapped in block. Ordinary reseating tool can not be used on exhaust valve seat inserts. These must be ground when necessary. Install valves with .001-.003" stem clearance in guide (intake), .003-.005" (exhaust). Valve stem guides removable.

Intake Valves	Timing	Exhaust Valves
Open 6° after top dead center.		Open 42° before lower dead center.
Close 46° after lower dead center.		Close 8° after top dead center.

CARBURETION:—Carter Down Draft Carburetor, Model C-6-A or C-6-A-2 (see Carburetor Section for complete data). Manifold heat control automatic.

Air Cleaner:—Copper mesh type integral with silencer. Remove complete unit every 2,500 miles, take off top plate containing felt pad (held in place by knurled nut), remove dirt from cleaner unit by dipping in gasoline, dry thoroughly, re-oil by dipping in S.A.E. No. 50 heavy oil and drain off excess oil before re-installing.

Fuel Pump:—A.C. Mechanical Fuel Pump mounted on right side of crankcase (see Carburetion Section for complete data). Remove sediment bowl on pump, empty water and sediment, clean filter screen (directly above bowl) when necessary.

Gasoline Gauge:—Motometer electric type (see Carburetion Section).

STARTER:—Model 734-H. Starter drive—overrunning clutch and manual pinion shift connected to starting switch pedal. Rotation counter-clockwise at commutator end. Brush spring tension, 24-28 ounces each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5.0	65
15 "	Lock	3.15	570

Mounting:—Two-capscrew flange mounting at left of engine on front face of flywheel housing. To remove, disconnect cable and pedal linkage, take out flange cap screws, pull starter forward to clear drive pinion, lift out.

GENERATOR:—Model 943-S, 937-G, H, K, M (Std.), 937-E, K (Radio). Third brush regulation, thermostat control (937-E, K). Thermostat contacts open at 175°F. reducing output approximately 40%. Rotation counter-clockwise at commutator end. Manufacturer recommends charging rate set at 8 amperes (10 amperes on cars with radio), maximum charge to battery as shown on dash ammeter with all lights on and car operated at speed of 20-22 M.P.H.

Charging Rate Adjustment:—Take off commutator cover band, loosen small lock screw on end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten lock screw.

Generator Data—Models 943-S, 937-H

	Amperes	Volts	R.P.M.		Amperes	Volts	R.P.M.
Cold	15-18	7.9-8.3	2000	Hot	13-15	7.7-8.0	2400

Generator Data—Models 937-E, K

Cold	20-22	8.2-8.4	2100	Hot	12-14	7.7-8.0	2800-3000

Generator Data—Models 937-G, M

Cold	15-17	7.95-8.15	1900	Hot	10-13	7.45-7.75	2100

Brush Spring Tension—24-28 ozs. (all brushes—943-S, 937-E), 23-27 ozs. (all brushes—937-G, M), 22-26 ozs. (main), 16-20 ozs. (third) on 937-H, K.

Field Current:—3.5-4.5 amperes at 6 volts across field terminals.

Mounting:—Pivot mounting on bracket at left front of engine and driven by fan belt. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine and lift off drive belt, take out two bolts forming bracket hinge, lift out.

Belt Adjustment:—To take up fan belt, loosen mounting bolts and adjustment clamp bolt, attach spring scale by wire looped over generator field frame so that force of spring is tangent to top of generator and parallel to adjustment arm slot. Pull generator away from engine until spring scale reading is 45-50 pounds, tighten adjustment bolt and mounting bolts before slacking off on scale.

RELAY:—Model 265-G. Mounted on generator field frame. Contacts close at 8-10 M.P.H. or approximately 800 R.P.M. with generator voltage of 6.75-7.5 volts. Contacts open with discharge current of 0-2.5 amperes.

Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Lighting switch is mounted on back of instrument board and is controlled by button on instrument panel. Double filament bulbs are used for 'depressed beam' dimming and are controlled by lighting switch (Standard Six), or by foot-operated dimmer switch mounted on the toeboard (First Six and De Luxe Models). Dimmer switch is Delco-Remy Model 465-Z.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21	D.C	1116
Parking Bulbs	6-8	3	S.C	63
Instrument Light	6-8	3	S.C	63
Stop and Tail Light	6-8	21-2	D.C	1158
Dome Light	6-8	15	S.C	87

NOTE:—Stop and tail light bulb is a double filament bulb and tail light lead (black braid) must be connected to 2 cp. filment. Stop light switch (hydraulc type) is screwed in forward end of brake master cylinder.

FUSES:—One 20 ampere capacity, mounted on back of ammeter.

HORNS:—Klaxon Model K-31, vibrator type, standard equipment. Model K-26 matched set optional equipment. Current drawn by horns, 4.0-6.5 amperes at 6 volts (Model K-31), 5.0-6.5 amperes at 6 volts (Model K-26 high note).

NOTE:—Twin horns are connected through 20 ampere fuse to battery terminal on starter switch.

SERIAL NUMBER:—First number 1,859,001. Located on right front door hinge pillar post.

COMPRESSION:—Ratio—5.8-1 std. cast-iron head. 6.5-1 optl. aluminum head.
Pressure—(5.6-1 std. head) approximately 95 lbs. at cranking speed. (6.5-1 optl. head) 135-145 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading reading of 16-18" with engine idling.

IGNITION:—Coil Model 540-A. Ignition switch is part of coil assembly (connected to coil by armored cable).
Ignition Switch—Delco-Remy Model 432-A.
Distributor Models 622-H, 622-U. Single breaker, 6-lobe cam, full automatic advance type.
Breaker Gap—Set gap at .020". Limits, .018-.024".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles (Distributor Degrees)—Closed 36°. Open 24°.
Automatic Advance— Model 622-H

Degrees	Distributor	R.P.M.
Start		400

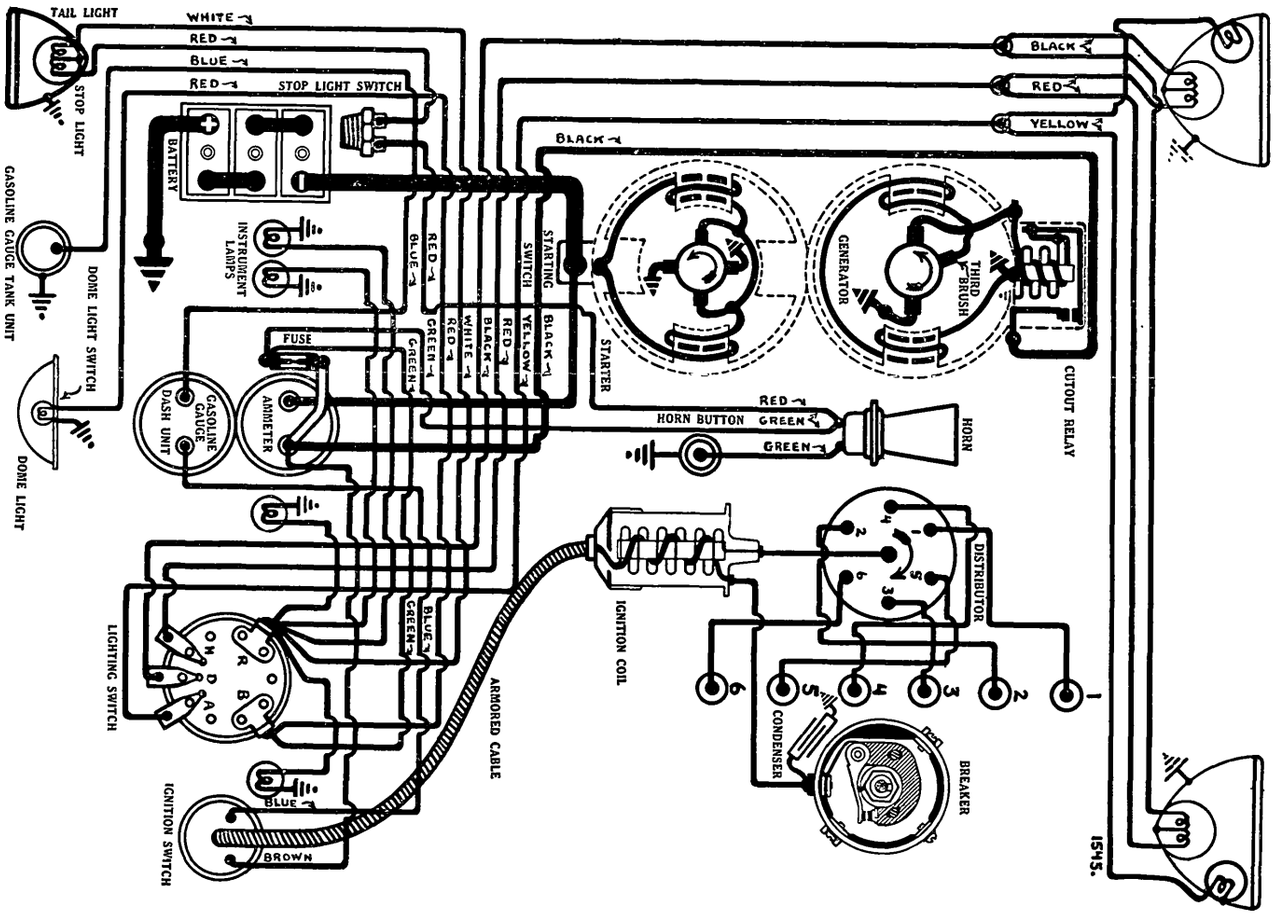
10		1200
Degrees	Engine	R.P.M.
2		800
20		2400



Mounting—On left hand side of crankcase. Held in place by hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position
Standard (cast-iron) head 9° BTDC..... .0342" BTDC.
High Comp. (H.C. Al. Head) 6° BTDC. .0152" BTDC.
Timing (Using Timing Light)—Connect timing light between distributor terminal and live terminal of generator relay. Turn engine over until No. 1 piston is on compression, stop when 'D/C' mark on flywheel registers with ignition (upper) pointer in inspection hole on left front face of flywheel housing, loosen advance arm clamp bolt, rotate distributor until timing light goes out, tighten clamp bolt, see that rotor is opposite No. 1 segment in distributor cap, check spark plug cable connections (see diagram).

High Comp. (Aluminum Head)—Ignition pointer correctly set for all cars with high compression aluminum heads when installed at factory.
Timing (using Gauge)—All cars can be timed using a Motor Gauge installed in timing plug hole over No. 6 piston. Use Weidenhoff Adapter #103, Rod #12.
Firing Order:—1-5-3-6-2-4 (see diagram).
Spark Plugs:—A.C., Type S-9 (Std. cast-iron head), Type SL-9 (aluminum head). 14 MM. Metric type. Type SL-9 plugs have a longer (7/16") thread length.
Spark Plug Gap—.025" (all engines).

CARBURETION:— (Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, Gasoline Gauge, and Automatic Choke (special equipment).
Carburetor:—Carter, Model C6B1, 1¼" plain tube, downdraft type.
Automatic Choke—Sisson (special equipment).
Fuel Pump:—A.C., Type B, on right hand side of crankcase.
Gasoline Gauge:—Motometer, Electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #6 intake valve at .001". This valve should

open with piston .015" past top dead center. Reset tappet clearance at .005" with engine hot.
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Tappet Clearance:—.005" Int., .007" Exh., engine hot.

Valve Spring Pressure:—34-38 lbs. at 1¾" (valve closed). 77-85 lbs. at 1 7/16" (valve open).

LUBRICATION:—**Crankcase Capacity**—5qts. (refill).
Normal Oil Pressure—30-60 lbs. at normal driving speeds.

BATTERY:—**Willard, Type WS-1-13**, 6 volt, 13 plate, 86 A.H. capacity (5 ampere rate).
Starting Capacity—105 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under left front seat.

STARTER:—**Model 734-H. Armature No. 823881.**
Rotation—Counter-clockwise (commutator end).
Brush Spring Tension—24-28 ounces each.
Cranking Engine—175-200 amperes at 5.0 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	65
15 "	Lock	3.15	570

Starting Switch:—Manual pinion shift connected to **starting switch lever. Switch mounted on starter** field frame. Shift pedal and accelerator linkage interconnected so that throttle is opened ¼-1/3 when starting pedal is depressed to start engine. See Equipment Section 'Starter Controls' for adjustment.

Mounting:—Flange mounted on left hand front face of flywheel housing.

GENERATOR:—**Model 937-G. Armature No. 817221. Third brush control type. Third brush setting should be adjusted by using test ammeter or by 'commutator bar' method (see below).**
Charging Rate Adjustment (Ammeter)—Use test ammeter to check generator output. With generator at room temperature, remove commutator cover band, loosen small round lock screw on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease, charging rate until output is 17 amperes at 8.2 volts. Tighten lock screw.
Commutator Bar Method—Remove generator from car, mount so that commutator can be seen, loosen lock screw on commutator end plate, shift third brush by hand so that there are exactly 2¾ commutator bars exposed between third brush and nearest main brush, tighten lock screw. This setting provides maximum safe output and must not be exceeded.
Standard Setting—17 amperes (cold), 8.2 volts.

Performance Data

	Amperes	Volts	R.P.M.
Cold—	15-17	7.95-8.15	1900
Hot—	10-13	7.45-7.75	2100

Rotation—Counter-clockwise at commutator end.
Shunt Field Current—3.5-4.5 amperes at 6.0 volts.
Brush Spring Tension—23-27 ounces each.
Mounting—Pivot mounting at left front of engine. Driven by fan belt. To remove, take out two hinge bolts and one clamp bolt.
Belt Adjustment—Loosen hinge bolts and clamp bolt. Use spring scale to pull generator horizontally away from engine until belt tension (scale reading) is 45-50 lbs., tighten clamp bolt and pivot bolts before slacking off scale tension.

RELAY CUT-OUT:—**Model 265-G.** Mounted on generator field frame.

Cuts in	Relay	Cuts out
6.75-7.5 volts.		2-5 ampere discharge.

Relay Contact Gap—.015-.025".
Relay Air Gap—.012-.017" (contacts closed).

LIGHTING:—**Clum Switch, Model 13786.** Switch is **mounted on instrument panel.**

Bulb Sizes

Position	Candlepower	Mazda No.
Headlights	21-21	1110
Parking and Instrument	3	63
Stop and Tail	21-2	1158
Dome	15	87

FUSES:—20 ampere capacity lighting fuse on back of ammeter.

HORNS:—**Klaxon, Model K-31 or K-26M (matched set blended tone). Vibrator type. Current draw, 4.0-6.5 amperes at 6.0 volts (K-31), 5.0-6.5 amperes at 6.0 volts (K-26 high note), 6.0-8.5 amperes at 6.0 volts (K-26 low note).**

SERIAL NUMBER:—First number 2,188,001. Located on right front door hinge pillar post.

COMPRESSION:—**Ratio**—5.8-1 std. cast-iron head. 6.5-1 optl. aluminum head.
Pressure—(5.6-1 std. head) approximately 95 lbs. at cranking speed. (6.5-1 optl. head) 135-145 lbs. at 1000 R.P.M. or approx. 110 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading reading of 16-18" with engine idling.

IGNITION:—Coil Model 540-A. Ignition switch part of coil assembly (connected by armored cable).
Ignition Switch—Delco-Remy Model 432-A.

Distributor Model 644-K:—Single breaker, 6-lobe cam, full automatic advance type.
Breaker Gap—Set gap at .020". Limits, .018-24".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles (Distributor Degrees)—Closed 36°. Open 24°.

Automatic Advance Data

Distributor Degrees	Distributor R.P.M.
Start	250
7.5	400
16	1200
Engine Degrees	**Engine R.P.M.**
4	500
15	800
32	2400

Mounting—On left hand side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Position
Standard (cast-iron head) 3° ATDC. .0038" ATDC.
High Comp. (H.C. Al. Head) 6° ATDC. .0152" ATDC.
Timing (using Timing Light)—Connect timing light between distributor terminal and live terminal on generator relay. Turn engine over until #1 piston is on compression, stop with piston slightly past top dead center when 3° mark (cast-iron head) or 6° mark (aluminum head) on crankshaft impulse neutralizer (at front of engine) is directly under pointer on chain case cover. Loosen hold-down screw in advance plate, center pointer on scale, tighten hold-down screw, loosen clamp bolt in advance arm, rotate distributor until timing light just goes out, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).
Timing (using Gauge)—All cars can be timed using a Motor Gauge installed in timing plug hole over No. 6 piston. Use Weidenhoff Adapter #103, Rod #12.

Firing Order:—1-5-3-6-2-4 (see diagram).

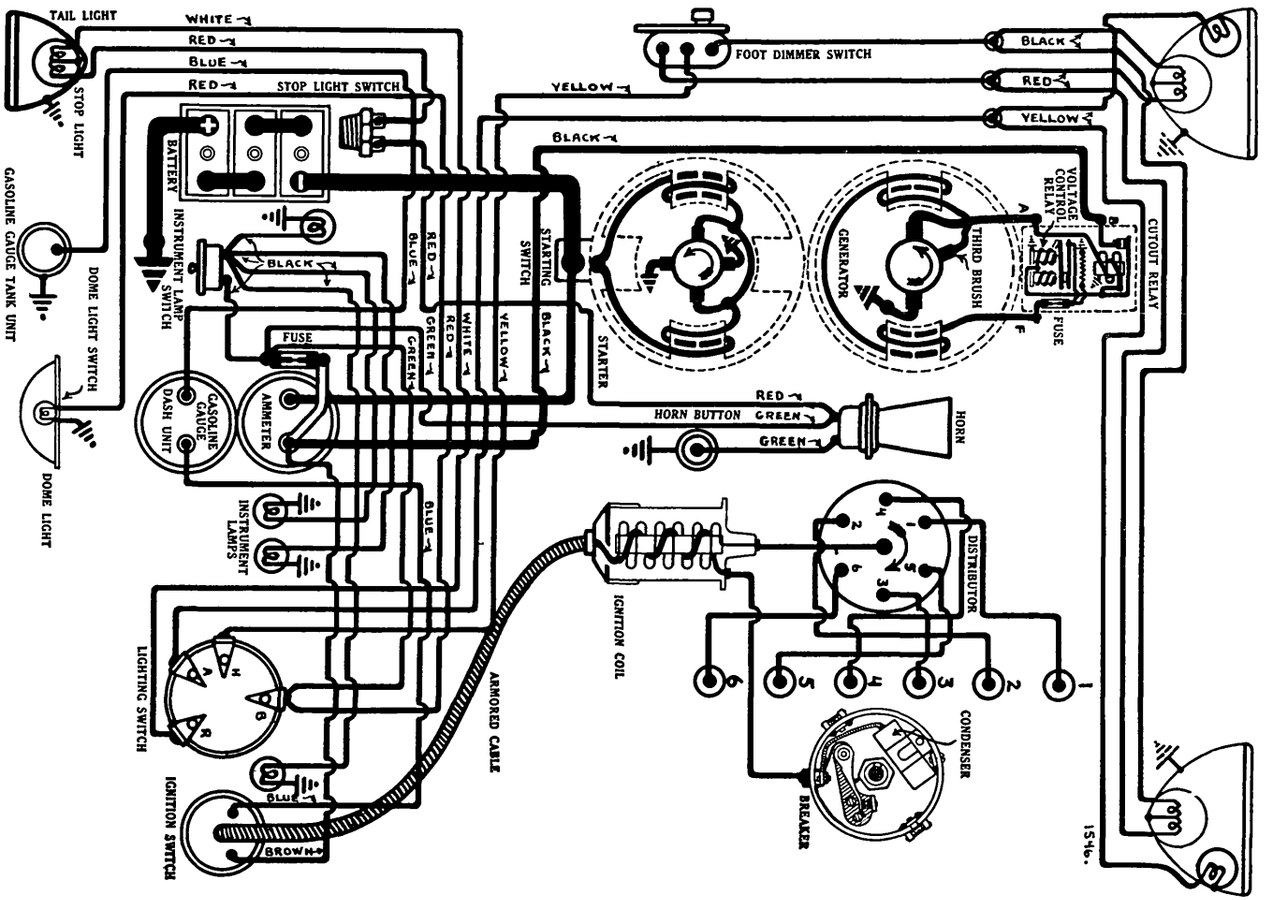
Spark Plugs:—A.C., Type S-9 (Std. cast-iron head), Type SL-9 (aluminum head. 14 MM. Metric type. Type SL-9 plugs have a longer (7/16") thread length.

Spark Plug Gap—.025" (all engines).

VALVE TIMING:—To Check—Set tappet clearance #6 intake valve at .011". Use regular timing gauge This valve should open with piston .015" past top dead center. Reset tappet clearance at .005" (hot). Tappet Clearance—.005" (intake—hot), .007" (exhaust—hot).

Valve Springs—	Pressure	Length
Valve Closed	34-38 lbs.	1¾"
Valve Open	77-85 lbs.	(do not compress springs to less than 1 7/16").

LUBRICATION:—Pressure type. Oil pump located at **right of crankcase on lower end of inclined accessory drive shaft.**



Oil Pressure—30-60 lbs. at normal driving speeds.
Oil Pressure Relief Valve—Operates at 45-55 lbs. Located under plug on left hand side of crankcase. Adjustable by replacing spring. Standard springs unpainted. Heavy spring (to increase oil pressure) painted green. Lighter spring (to decrease oil pressure) painted red.

Capacity and Oil—5 qts. Use SAE. #30 (summer), #20-W or 10-W (winter).

CARBURETION: — (Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, Gasoline Gauge, and Automatic Choke (special equipment).

Carburetor:—Carter, Model C6B1, 1¼" plain tube, downdraft type.

Automatic Choke—Sisson (special equipment).

Fuel Pump:—A.C., Type B, on right hand side of crankcase.

Gasoline Gauge:—Motometer, Electric type.

BATTERY:—Willard, Type WS-1-13, 6 volt, 13 plate, 86 A.H. capacity (5 ampere rate).
Starting Capacity—105 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Under left hand front seat.

STARTER:—Model 734-H. Armature No. 823881.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—175-200 amperes at 5.0 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	65
15 "	Lock	3.15	570

Starting Switch:—Manual pinion shift connected to starting switch lever. Switch mounted on starter field frame. Shift pedal and accelerator linkage interconnected so that throttle is opened ¼-1/3 when pedal is depressed to start engine. See Equipment Section Starter Controls for adjustment.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out flange mounting screws.

GENERATOR:—Model No. 937-P. Armature No. 1234. Third brush current control with external voltage regulator (regulator combined with relay cut-out in case on generator field frame). Third brush setting should be adjusted by using test ammeter or by 'Commutator Bar' method.

Charging Rate Adjustment (Ammeter)—Use test ammeter to check generator output. Connect jumper wire from 'F' generator terminal to ground (this is important as voltage regulator must be shorted out while adjustment is being made). With generator at room temperature, remove commutator cover band, loosen small round lock screw on commutator end plate, shift third brush by hand, counter-clockwise to increase, or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts, tighten lock screw, remove jumper from voltage regulator. See Equipment Section for compelte data on Voltage Regulator.

Commutator Bar Method—Remove generator from car, mount so that commutator can be seen, loosen lock screw on commutator end plate, shift third brush by hand so there are exactly 2½ commutator bars exposed between edge of third brush and nearest main brush, tighten lock screw. This setting provides maximum safe output and must not be exceeded.

Performance Data

	Amperes	Volts	R.P.M.
Cold—	19-22	8.3-8.7	2400
Hot—	12-15	7.6-8.0	2600

Rotation—Counter-clockwise at commuttor end.
Shunt Field Current—3.5-4.5 amperes at 6.0 volts.
Brush Spring Tension—22-26 ounces (main brushes), 16-20 ounces (third brush).
Field Fuse—6 ampere capacity (in regulator case).

Mounting:—Pivot mounting at left front of engine. Driven by fan belt. To remove, take out two hinge bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, use spring scale to pull generator horizontally away from engine until belt tension (scale reading) is 45-50 lbs., tighten clamp bolt and pivot bolts before slacking off scale.

RELAY REGULATOR (CONTROL UNIT):—Model 5540. Control unit consists of relay cut-out and voltage regulator in case on generator field frame. See Equipment Section for complete data on Voltage Control Relay.

Relay Cut-out

Cuts in—6.4-6.8 volts.
Cuts out—3 amperes discharge (max.).
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70°F.
Contact Close—7.3-7.7 volts at 70°F.
Contact Gap—.008-.013".
Air Gap—.028-.040" between armature and core (armature down against lower stop), armature travel (between armature and stop).

LIGHTING:—Clum Switch, Model 13786, Delco-Remy
Foot Control Switch, Model 465-Z. Foot control switch on toeboard used to control driving and passing light (upper and lower beams).

Bulb Sizes

Position	Candlepower	Mazda No.
Headlights	32-21	A1116
Parking, Instrument	3	63
Stop and Tail	21-2	1158
Dome	15	87

FUSES:—**Lighting**—20 ampere capacity on back of ammeter.
Generator Field—6 ampere capacity (under regulator cover on generator.

HORNS:—Klaxon, Model K-31 or K-26M (matched set blended tone). Vibrator type. Current draw, 4.0-6.5 amperes at 6.0 volts (K-31), 5.0-6.5 amperes at 6.0 volts (K-26 high note), 6.0-8.5 amperes at 6.0 volts (K-26 low note).

SERIAL NUMBER:—First number—(Detroit) 1,039,101, (Los Angeles) 3,151,501, (Canada) 9,396,076. On right front door hinge pillar post.

NOTE—Series PJ(E) do not have separate serial numbers. This series may be distinguished by letter 'E' inserted in engine number, thus:—PJ-E-1001. This letter 'E' should not be confused with letters 'A', 'B' etc., following engine number.

COMPRESSION:—Ratio—6.7-1. No optional ratios.
Pressure—140-150 lbs. at 1000 R.P.M. or approx. 113 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 6 M.P.H.

IGNITION:—Coil Model IG-4610. Mounted on dash
Ignition Switch—Mitchellock Mod. 24-R, Type 6515.

Distributor Model IGS-4003. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set at .020". Limits .018-.020".
Cam Angles—Closed 38°. Open 22° (distributor).
Breaker Arm Spring Tension—16-20 ounces.
Manual Advance—20° (engine) adjustment only.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	350	0	700
3	400	6	800
6	860	12	1720
9	1320	18	2640
11	1600	22	3200

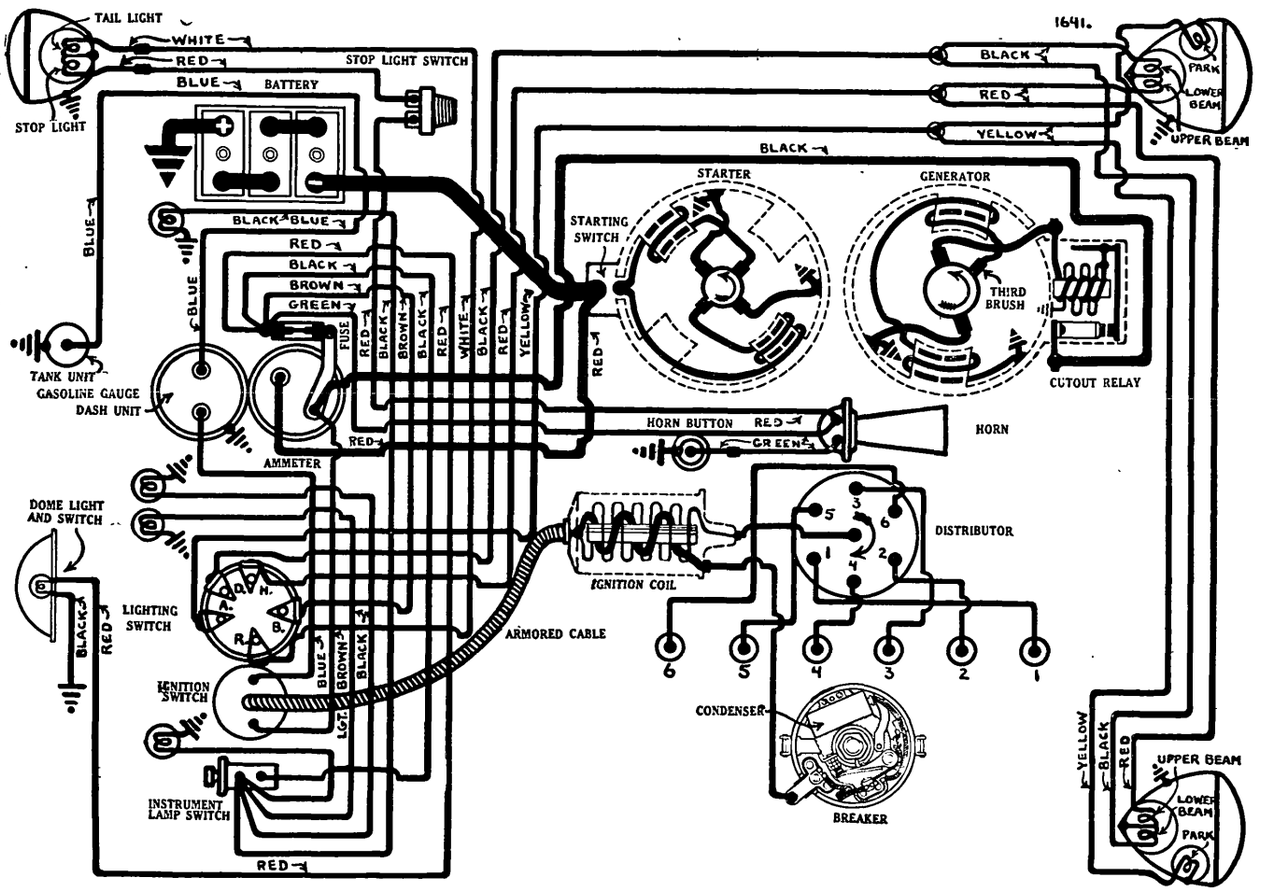
Vacuum Spark Control—Provides additional advance for intermediate speeds above idling. Spark is retarded by return spring in unit when engine is accelerated or operated with wide-open throttle.

Vacuum Spark Advance

Distributor Degrees	Vacuum
½°	4-5" of HG.
11° Max.	14" of HG.

Removal:—Distributor mounted on left side of engine. To remove disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Posi.
All engines ..... 4° ATDC. ..... .007" ATDC.
Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression turn engine over until piston is 4° or .007" past top dead center, stop when fourth graduation to left of center '0' mark on fan pulley at front of engine lines up with pointer on chain case cover. Loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until lamp goes out, tighten clamp bolt.



Timing (Using Synchroscope)—Engines can be timed with a Synchroscope by directing light on fan pulley. See Equipment Section for directions.
Timing (Using Motor Gauge)—Engines can be timed with a motor gauge installed in timing hole over #6 piston. Use Weidenhoff Adapter #103. Rod #12.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type K-9. 14 MM. Metric.
Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for data.
Carburetor:—Carter (Ball & Ball), Model C6D1, C6D2, 1¼, downdraft type, with Fast Idle (series PJ). Model B6D1, 1" downdraft type (series PJE).
Automatic Choke—Sisson (optional).
Fuel Pump:—A.C., Type B-1521789 diaphragm type.
Gasoline Gauge:—Motometer electric type.

VALVE TIMING:—To Check Timing—Install regular timing gauge in timing plug hole over #6 piston,

set tappet clearance #6 valves at .011" (intake), .012" (exhaust). Intake valve should open with piston .015" past top dead center, and exhaust valve close with piston .027" past top dead center. Reset tappet clearance at .006" (intake), .008" (exhaust) with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Tappet Clearance:—.006" Int., .008" Exh., with engine warm. .010" Exh. recommended for sustained high speed driving. Adjustment accessible by removing housing cover under right front fender.

Valve Spring Pressure:—34-38 lbs. at 1¾" (valve closed). 77-83 lbs. at 1 7/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—30-60 lbs. at driving speeds.

BATTERY:—Willard, Type WS-1-13. 6 volt, 13 plate, 86 A.H. capacity (20 hour rate).
Starting Capacity—105 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under drivers seat.

STARTER:—MAW-4002, MAW-4004 (Export). Armature No. MAW-2030.
Starter Drive—Positive shift outboard pinion.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—31-42 ozs. (new brushes).
Cranking Engine—Approx. 175 amperes at 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900 Min.	5.5	65
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
12.0 "	Lock	3.0	505
18.0 "	Lock	4.0	670

NOTE—See Equipment Section for method of correcting burnt commutators on these starters whenever this trouble is encountered.

Starting Switch:—SW-2677-A (MAW-4002). Mounted on starter field frame and operated by pinion shift (starting pedal). See Equipment Section for adjustment of pedal and Type SS-4101 solenoid switch (MAW-4004).

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting capscrews.

GENERATOR:—Model GBM-4603-1. Armature No. GBM-2006-F. Air-cooled. Third brush control.
Charging Rate Adjustment (Using Meters)—Use test meters to check generator output. Shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate until output is 17-19 amperes at 8.25 volts, with generator at room temperature (70°F). Third brush held in position by friction.
Commutator Bar Method—Shift third brush until there are exactly 4 commutator bars exposed between edge of third brush and nearest main brush.
Maximum Charging Rate—Above settings provide maximum safe output for generator and must not be exceeded.

Cold — Performance Data — Hot

Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	800	0	6.4	850
4	6.8	950	4	6.9	1050
8	7.25	1125	8	7.4	1250
12	7.7	1375	12	7.9	1680
16	8.1	1800	15.2	8.3	2500
18	8.3	2400			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24 ozs. minimum (old brushes), 36 ozs. maximum (new brushes).
Field Current—3.80-4.20 amperes at 6.0 volts.
Motoring Current—5.32-5.88 amperes at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot and clamp bolts, pull generator out or away from engine until tension as measured on spring scale is 45-50 lbs.

CUTOUT RELAY:—Model CB-4014. Mounted on generator. See Equipment Section for data.
Cuts In—6.75-7.5 volts.
Cuts Out—.5-2.5 amperes discharge current.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

LIGHTING:—Douglas Switch Model 5409. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Ig.Sw.Lamp	1½	55
Instrument	3	63
Stop and Tail	21-3	1158
Dome	15	87

NOTE—Lighting switch button and shaft are integral. See article on Chrysler Model C-6 for instructions on removing switch.

FUSES:—Lighting—20 ampere on back of ammeter.

HORNS:—Auto-Lite Model HA-4001. Vibrator type. See article and diagram on PJ Deluxe model for data on twin horns when these units are used.

SERIAL NUMBERS: — First number, 2,397,601 (Detroit), 3,019,401 (Los Angeles), 9,326,551 (Windsor, Canada). On right front door hinge pillar post.

COMPRESSION:—Ratio—6.7-1. No optional ratios. **Pressure**—140-150 lbs. at 1000 R.P.M. or approx. 113 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 6 M.P.H.

IGNITION:—Coil Model IG-4622. Mounted on dash. **Ignition Switch**—Mitchellock Model 24-R, Type 6515 (7 pass. Sedan), Type 6516 (all others).

Distributor Model IGS-4003. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set at .020". Limits .018-.020".
Breaker Arm Spring Tension—16-20 ounces.
Cam Angles—Closed 38°. Open 22° (distributor).
Manual Advance—20° (engine) adjustment only.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	350	0	700
3	400	6	800
6	860	12	1720
9	1320	18	2640
11	1600	22	3200

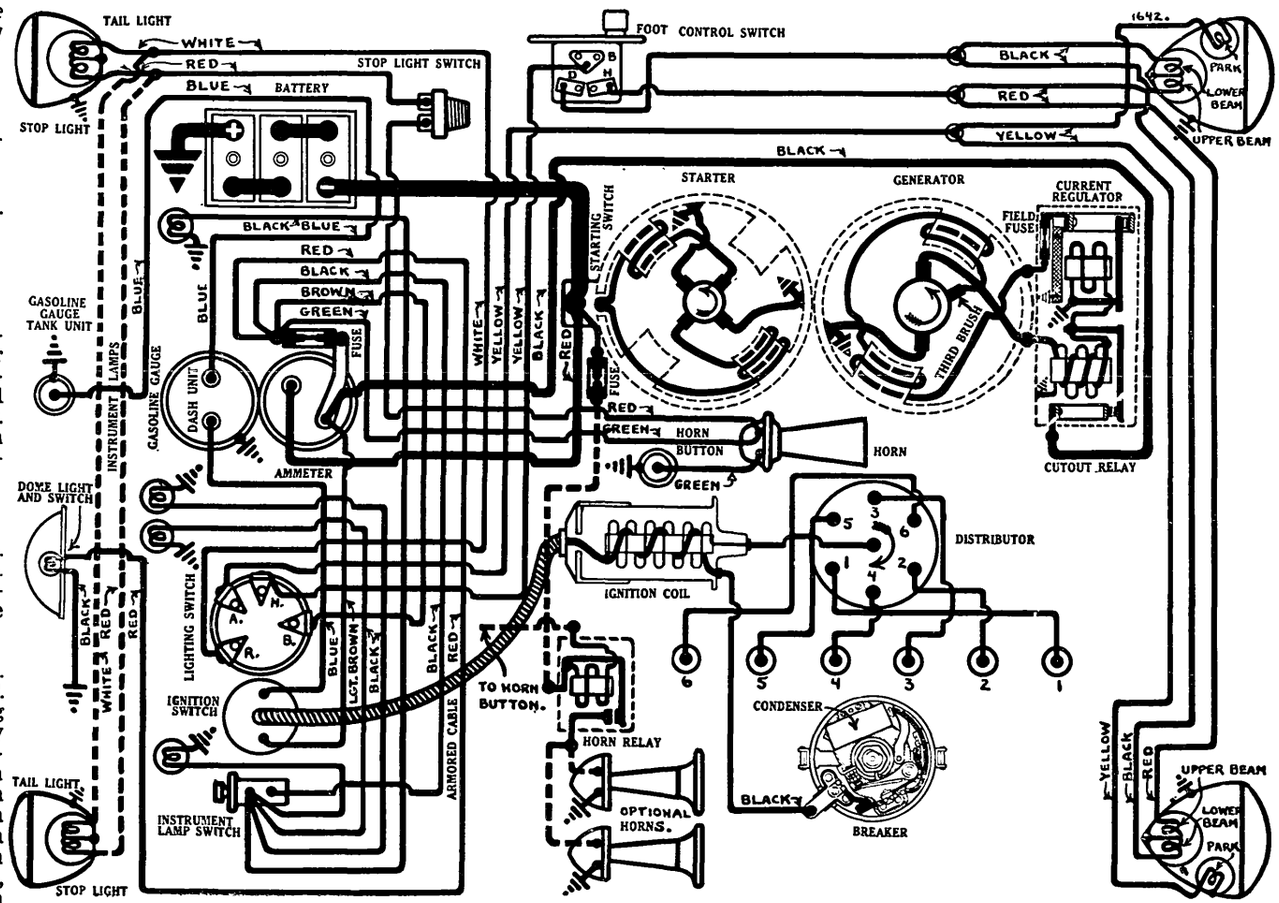
Vacuum Spark Control—Mounted on side of distributor, advances spark by rotating breaker plate through link coupling (breaker plate grounded by pig-tail connection). Provides additional advance for intermediate speeds above idling. Spark is retarded by return spring in unit when engine is accelerated or operated with wide-open throttle.

Vacuum Spark Advance

Distributor Degrees	Vacuum
½°	4-5" of HG.
11° Max.	14" of HG.

Removal:—Distributor mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Posi.
All engines ..... 4° ATDC. ..... .007" ATDC.
Timing (using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression turn engine over until piston is 4° or .007" past top dead center, stop when fourth graduation to left of center '0' mark on fan pulley at front of engine lines up with pointer on chain case cover. Loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until lamp goes out, tighten clamp bolt.



Timing (Using Synchroscope)—Engines can be timed with a Synchroscope by directing light on fan pulley. See Equipment Section for directions.
Timing (Using Motor Gauge)—Engines can be timed with a motor gauge installed in timing hole over #6 piston. Use Weidenhoff Adapter #103. Rod #12.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type K-9. 14 MM. Metric.
Spark Plug Gaps—Set at .025".

CARBURETION:—See Carburetion Section for data.
Carburetor:—Carter (Ball & Ball), Model C6D1, C6D2, 1¼", downdraft type, with Fast Idle.
Automatic Choke—Sisson (optional).
Fuel Pump:—A.C., Type B-1521789 diaphragm type.
Gasoline Gauge:—Motometer electric type.

VALVE TIMING:—To Check Timing—Install regular timing gauge in timing plug hole over #6 piston, set tappet clearance #6 valves at .011" (intake), .012" (exhaust). Intake valve should open with piston .015" past top dead center, and exhaust valve close with piston .027" past top dead center. Reset

tappet clearance at .006" (intake), .008" (exhaust) with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.
Tappet Clearance:—.006" Int., .008" Exh., with engine warm. .010" Exh. recommended for sustained high speed driving. Adjustment accessible by removing housing cover under right front fender.
Valve Spring Pressure:—34-38 lbs. at 1¾" (valve closed). 77-83 lbs. at 1 7/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—30-60 lbs. at driving speeds.

BATTERY:—Willard, Type WS-1-13, 6 volt, 13 plate, 86 A.H. capacity (20 hour rate).
Starting Capacity—105 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under dirver's seat.

STARTER:—MAW-4002, MAW-4004 (Export). Armature No. MAW-2030.
Starter Drive—Positive shift outboard pinion.
Cranking Engine—Approx. 175 amperes at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—31-42 ozs. with new brushes.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900 Min.	5.5	65
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
12.0 "	Lock	3.0	505
18.0 "	Lock	4.0	670

NOTE—See Equipment Section for method of correcting burnt commutators on these starters whenever this trouble is encountered.

Starting Switch:—SW-2677-A (MAW-4002). Mounted on starter field frame and operated by pinion shift (starting pedal). See Equipment Section for adjustment of pedal and Type SS-4101 solenoid switch (MAW-4004).

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange mounting capscrews.

GENERATOR:—Model GAR-4608. Armature No. GAR-2116-F. Air-cooled. Third brush control in conjunction with Current Regulator (two-rate charging control). See Equipment Section for complete data on Regulator.
Charging Rate Adjustment (Using Meters)—Use test meters to check generator output. Connect jumper wire from fuse cup on regulator case to ground on generator frame. Shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts with generator at room temperature (70°F). Brush held in position by friction. Remove jumper wire.
Commutator Bar Method—Shift third brush by hand until there are exactly 4 commutator bars exposed between the edge of the third brush and the nearest main brush.
Maximum Charging Rate—Above settings provide maximum safe output for generator and must not be exceeded.

Performance Data

Cold—Regulator Contacts Closed—Hot					
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	800	0	6.4	825
4	6.8	950	4	6.8	1000
8	7.25	1100	8	7.25	1200
12	7.7	1275	12	7.7	1440
16	8.1	1525	16	8.1	1825
21	8.6	2400	18.5	8.35	2500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24 ozs. minimum (old brushes), 36 ozs. maximum (new brushes).
Field Current—3.51-3.89 amperes at 6.0 volts.
Motoring Current—5.03-5.57 amperes at 6.0 volts (½ ampere additional if relay and regulator in circuit).
Field Fuse—5 ampere in knurled cup on side of regulator case.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot and clamp bolts, pull generator out or away from engine until tension as measured on spring scale is 45-50 lbs.

RELAY-REGULATOR:—Model TC-4301-A. Mounted on generator. Consists of Cutout Relay and Current Regulator in a single case. See Equipment Section for complete data on these units.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Relay Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.25-8.75 volts at 70°F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Douglas Switch Model 5374. Clum Foot Control Switch Model 9579. Foot control switch is used to control upper and lower beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Ig. Sw. Lamp	1½	55
Instrument	3	63
Stop and Tail	21-3	1158
Dome	15	87

NOTE—Switch button and shaft are integral. See note on Chrysler Model C-6 for removal.

FUSES:—Lighting—20 ampere on back of ammeter.
Twin Horns—20 ampere in horn lead near starter.
Generator Field—5 ampere in regulator.

HORNS:—Auto-Lite Model HA-4001 Std. Klaxon Model K-33-D, Type 1959 (low note), 1960 (high note) Optional. Optional horns are matched tone, twin horns operated by horn relay.

Horn Relay:—Model 266-TK. Relay requires .25 amperes at 2.0 volts (min.) to close contacts. Current draw .8 amperes.
Relay Contact Gap—.015-.025"
Air Gap—.012-.017" with contacts closed.

NOTE—Economy Model equipped with smaller carburetor, intake manifold and 3.7-1 ratio rear axle. This series may be distinguished by letter 'E' inserted in engine number: thus P2-E241409. This letter 'E' should not be confused with letters 'A', 'B', etc., following engine number. This series does not have separate serial numbers.

SERIAL NUMBER:—On right front door hinge pillar post. First number:

	Detroit	Los Angeles	Evansville	Canada
P1	1,111,701	3,151,151	9,000,101	9,397,351
P2	2,641,401	3,040,601	9,025,101	9,332,286

COMPRESSION:—Ratio—6.7-1 Std. cast-iron head, 6.07-1 cast-iron head (available for export only).
Pressure—(6.7-1 Std. head) 140-150 lbs. at 1000 R.P.M. or approx. 113 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 16-18" with engine idling at 6 M.P.H.

IGNITION:—Coil Model IG-4629. Service Winding (coil less switch and cable) IG-3224S. Coil mounted on dash.

Ignition Current—2.5 amperes idling, 5.5 stopped.

Ignition Switch:—Mitchellock Model 24-R, Type 6517. Connected to coil by armored cable.

Ignition Lock—Yale & Towne Model DP-108, Mitchell No. 6286.

Distributor Model IGS-4003-1, IGS-4003A-1, IGS-4003B-1. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—Set at .020".

Cam Angle or Dwell—38° closed, 22° open.

Breaker Arm Spring Tension—16-20 ounces.

Condenser—Part No. IG-2671F. Capacity .20-.25 mfd

Automatic Advance—IGS-4003-1, IGS-4003A-1

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
11	1600	22	3200

Automatic Advance—IGS-4003B-1

Start	350	0	700
3	400	6	800
6	950	12	1900
9	1500	18	3000
11	1850	22	3700

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance for all speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

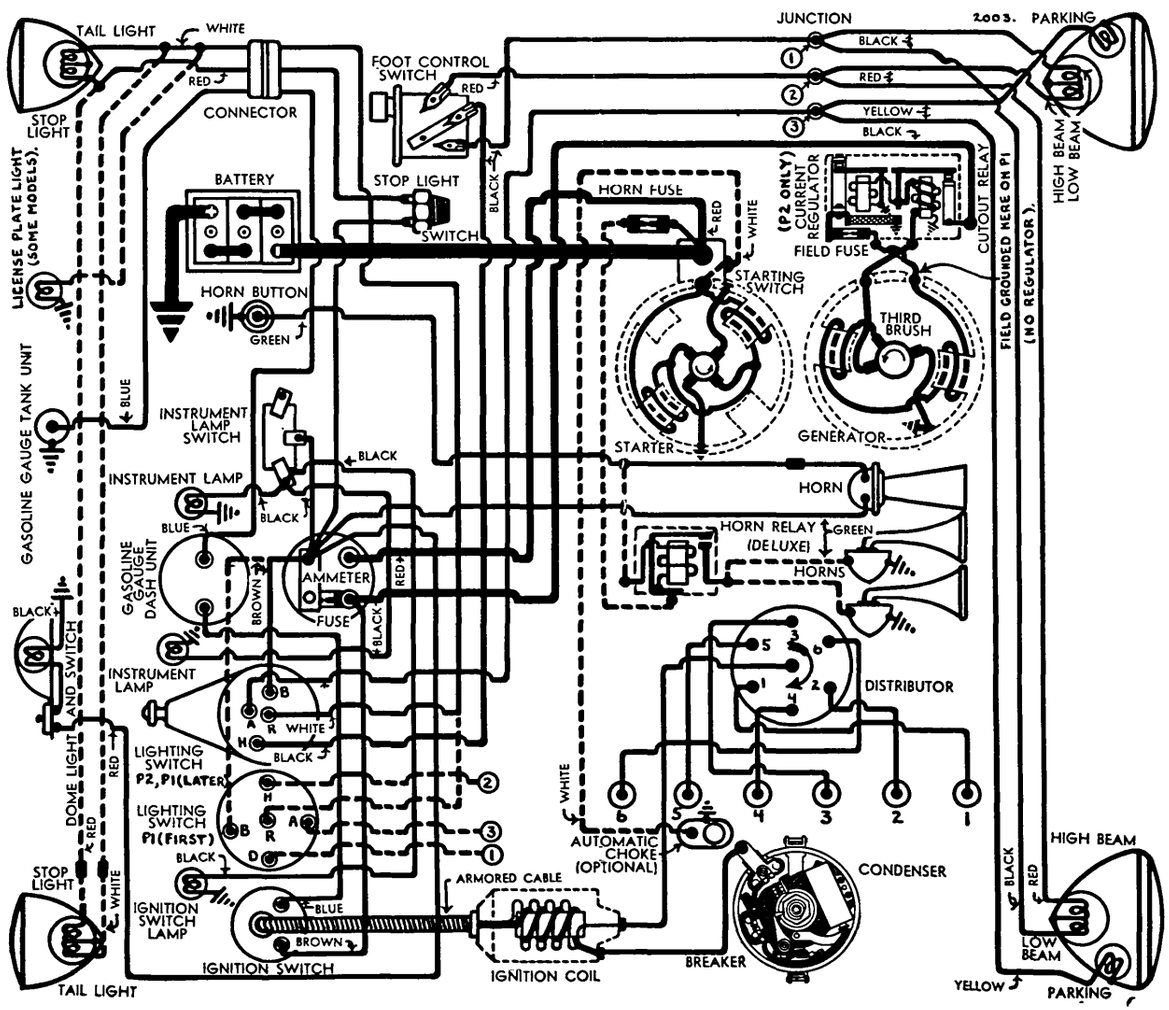
Vacuum Advance

Engine Degrees	Vacuum (" of HG)
Start	5"
10	9-10"
20	14"

Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING:—Flywheel Degrees Piston Pos.
6.7-1 Std. head .....4° ATDC.....0068" ATDC.
6.07-1 Export .....4° ATDC.....0068" ATDC.

Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression, turn engine over until piston is 4° (or .0068") past top dead center, stop when fourth graduation to left of center '0' mark on fan pulley at front of engine lines up with pointer on chain case cover. Loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until lamp goes out, tighten clamp bolt.



Timing (Using Synchroscope)—Clip lead to #1 spark plug, direct light at fan pulley, fill in 4° mark to left of center '0' mark with chalk or white paint. See Equipment Section.

Timing (Motor Gauge—Weidenhoff Adapter #103, Rod #12. Timing hole located over #6 piston.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type K-9 superseded by Champion Type J-8. 14MM. Metric.
Spark Plug Gap—Set at .025".

CARBURETION:—Carburetor—Carter (Ball & Ball) Model C6E1 (Motor No. P2-1001 to P2-269322 inclusive), C6E2 (P2-269323 and up), 1¼" downdraft type with Fast Idle. Model B6F1, 1" downdraft type (No. P2-E241409 and up—Economy Model). See Carburetion Section for complete adjustment, overhaul, and Jet Specifications.
NOTE—Do not make carburetor adjustments until engine is warmed up with choke valve wide open and fast idle inoperative.
Idle Adjustment—Adjust throttle stopscrew so that idle speed is 300 R.P.M. or 6 M.P.H. Turn idle adjusting screw in until engine begins to lag or miss, then out until engine begins to roll, finally turn screw in until engine fires smoothly. Final setting should be ⅛-¾ (C6E1, 2), ¼-¾ (B6F1) turn of screw from inner closed or seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:

Inner Hole (Min. stroke)—Extremely warm weather

Center Hole—Normal summer setting.

Outer Hole (Max. stroke)—Extremely cold weather.

NOTE—5% and 10% lean main metering screws (high altitude calibration) may be used at lower altitudes for maximum fuel economy although with considerably reduced speed and power. See Carter (B & B) Jet Specifications in Carburetion Section.

Fast Idle:—Integral with carburetor (C6E1, C6E2 only) No adjustment.

Automatic Choke:—Sisson Type AC-751B available as optional equipment on C6E1, C6E2 carburetors. See article in Carburetion Section for complete data.

Air Cleaner:—AC. #1526642 oil-wetted type standard, #1526712 heavy duty oil-bath type optional.

Fuel Pump:—AC. Type B #1522237 (early cars), #1522995 (later cars). Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—Motometer Electric. Dash unit—NG-7762-D (P1), NG-7642-D (P2). Tank unit—NG-7687-T (all). See article in Carburetion Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .011". This valve should open with piston 6° (.0153") past top dead center, when sixth graduation to left of center '0' mark on fan pulley at front of engine lines up with pointer on chain case cover. Rest tappet clearance at .006" hot.

Motor Gauge—Weidenhoff Adapter #103, Rod #12. Timing hole over #6 piston.

Tappet Clearance:—.006" Int., .008" Exh., with engine hot. .010" Exh., recommended for sustained high speed.

Valve Spring Pressure:—34-38 lbs. at 1¾" (valve closed), 77-83 lbs. at 1 7/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).

Normal Oil Pressure—30-40 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WHT 1-90, R 1-90 (Export). 6 volt, 13 plate, 90 ampere hour capacity(20 hour rate).

Starting Capacity—114, 109 (Exp.) amps. for 20 min.

Zero Capacity—300 amperes for 3.0, 2.3 (Exp.) mins.

Willard, Type WT 1-90 (Radio). 6 volt, 15 plate, 90 ampere hour capacity (20 hour rate).

Starting Capacity—117 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.1 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under front seat.

STARTER:—MAW-4009, MAW-4011 (RHD). Armature MAW-2030.

Drive—Positive shift outboard pinion.

Cranking Engine—Approx. 175 amperes at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
.60 "	3300	5.5	100
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
11.5 "	Lock	3.0	505
18.0 "	Lock	4.0	670

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out two flange mounting screws.

Starting Switch:—SW-2677A. Mounted on starter field frame and operated by pinion shift (starting pedal). See Equipment Section for pedal adjustment.

GENERATOR:—Model P1—Model GBM-4603-B. Armature No. GBM-2006F. Air cooled, third brush control.

Charging Rate Adjustment—Use test meters to check generator output. Shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate until output is 17-19 amperes at 8.25 volts, with generator at room temperature (70° F.). Third brush held in position by friction.

Commutator Bar Method—Shift third brush until there are exactly 4 commutator bars exposed between edge of third brush and nearest main brush.

Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Cold			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	800	0	6.4	850
4	6.8	950	4	6.9	1050
8	7.25	1125	8	7.4	1250
12	7.7	1375	12	7.9	1680
16	8.1	1800	15.2	8.3	2500
18	8.3	2400			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24 ozs. min. (old brushes), 36 ozs. max. (new brushes).

Field Current—3.80-4.20 amps. at 6.0 volts.

Motoring Current—5.32-5.88 amps. at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Swing generator away from engine until 40-50 lb. reading indicated on scale attached to generator frame.

GENERATOR:—Model P2—Model GAR-4608E-5. Armature No. GAR-2116F. Third brush control in conjunction with Current Regulator (two-rate charging control). Ventilated by fan on drive pulley.

Charging Rate Adjustment—Use test meters. Connect jumper between fuse cup on regulator and ground. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate until output is 21 amperes at 8.6 volts with generator at room temperature (70°F.). Third brush held in position by friction. Remove jumper.

Commutator Bar Method—Shift third brush until exactly 4 commutator bars are exposed between brush and nearest main brush.

Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Field Current—3.51-3.89 amps. at 6.0 volts.

Motoring Current—5.03-5.57 amps. at 6.0 volts.

Field Fuse—5 ampere in plug on regulator case.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Swing generator away from engine until 40-50 lb. reading indicated on scale attached to generator frame.

CUTOUT RELAY:—Model P1—Model CB-4014. Mounted on generator. See article in Equipment Section.

Cuts In—6.75-7.5 volts.

Cuts Out—.5-2.5 amperes discharge current.

Relay Contact Gap—.025-.035".

Air Gap—.010-.030" with contacts closed.

RELAY-REGULATOR:—Model P2—Model TC-4301A. Mounted on generator. Consists of Cutout Relay and Current Regulator (two-rate charging control). See article in Equipment Section for complete data.

Cutout Relay—See above. Data same except for Cut In at 6.5-7.25 volts and Contact Gap which is .015-.045".

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.

Contacts Close—1.2-1.4 volts below opening point.

Contact Gap—.005" minimum.

Air Gap—.045" with contacts closed.

LIGHTING—Headlamps—Corcoran Brown Pre-focused type. Headlamps aimed straight ahead (upper beam with lenses in place). Lower beam deflected slightly to right. Upper and lower beams controlled by foot selector switch except for early P1 models.

Switches

Lighting—Plymouth Part No. 659631 (early P1), 635451 (P2 and later P1 models). Douglas switch which is available only through Plymouth Parts Dpt

Foot Selector—Clum Model 9654.

Stop Light—R.B.M. No. 910. Hydraulic type mounted on brake master cylinder.

Bulb Specifications

Location	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Ign.Sw.	1½	55
Stop and Tail	21-3	1158
Instrument	3	63
Dome	15	87

FUSES:—Lighting—20 ampere on back of ammeter.

Generator Field—5 ampere in plug on regulator (P2 only).

Twin Horns—20 ampere in connector near starter.

HORNS:—Auto-Lite Model HA-4001 (P1), HB-4001 (P2), Std. Klaxon Model K-33-F Type 2101 (low note), 2102 (high note) Optl. Vibrator type, blended tone, twin horns operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
2101	11-13	.040-.044"
2102	9-11	.032-.036"

Horn Relay:—Model 266-TK. Requires .25 amperes at 2 volts min. to close contacts. Current draw .8 amps.

Contact Gap—.015-.025".

Air Gap—.012-.017" with contacts closed.

NOTE—Economy Model equipped with smaller carburetor, intake manifold and 3.7-1 ratio rear axle. This series may be distinguished by letter 'E' inserted in engine number: thus P4-E-478653. This letter 'E' should not be confused with letters 'A', 'B', etc., following engine number. This series does not have separate serial numbers.

SERIAL NUMBER:—On right front door hinge pillar post. First number as follows:

	Detroit	Los Angeles	Evansville	Canada
P-3	1,184,001	3,101,401	9,085,551	9,376,676
P-4	10,101,001	3,162,501	9,950,001	9,339,691

COMPRESSION:—Ratio—6.7-1 Std. cast-iron head.
Pressure—(6.7-1 Std. head) 140-150 lbs. at 1000 R.P.M. or approx. 113 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-21" with engine idling at 6 M.P.H.

IGNITION:—Coil Models IG-4641 or CL-4601. Service winding (coil less switch and cable) IG or CL-3224S. Coil mounted on dash.
Ignition Current—2.5 amperes idling, 5.5 stopped.
Ignition Switch:—Mitchellock Model 24-R, Type 7061. Connected to coil by armored cable.
Ignition Lock—Yale & Towne, Mitchell No. 6286.
Distributor Model IGS-4003B-1. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set at .020".
Breaker Arm Spring Tension—16-20 ounces.
Cam Angle or Dwell—38° (closed), 22° (open).
Condenser—Part No. IG-2671F. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	350	0	700
3	400	6	800
6	950	12	1900
9	1500	18	3000
11	1850	22	3700

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance for all speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

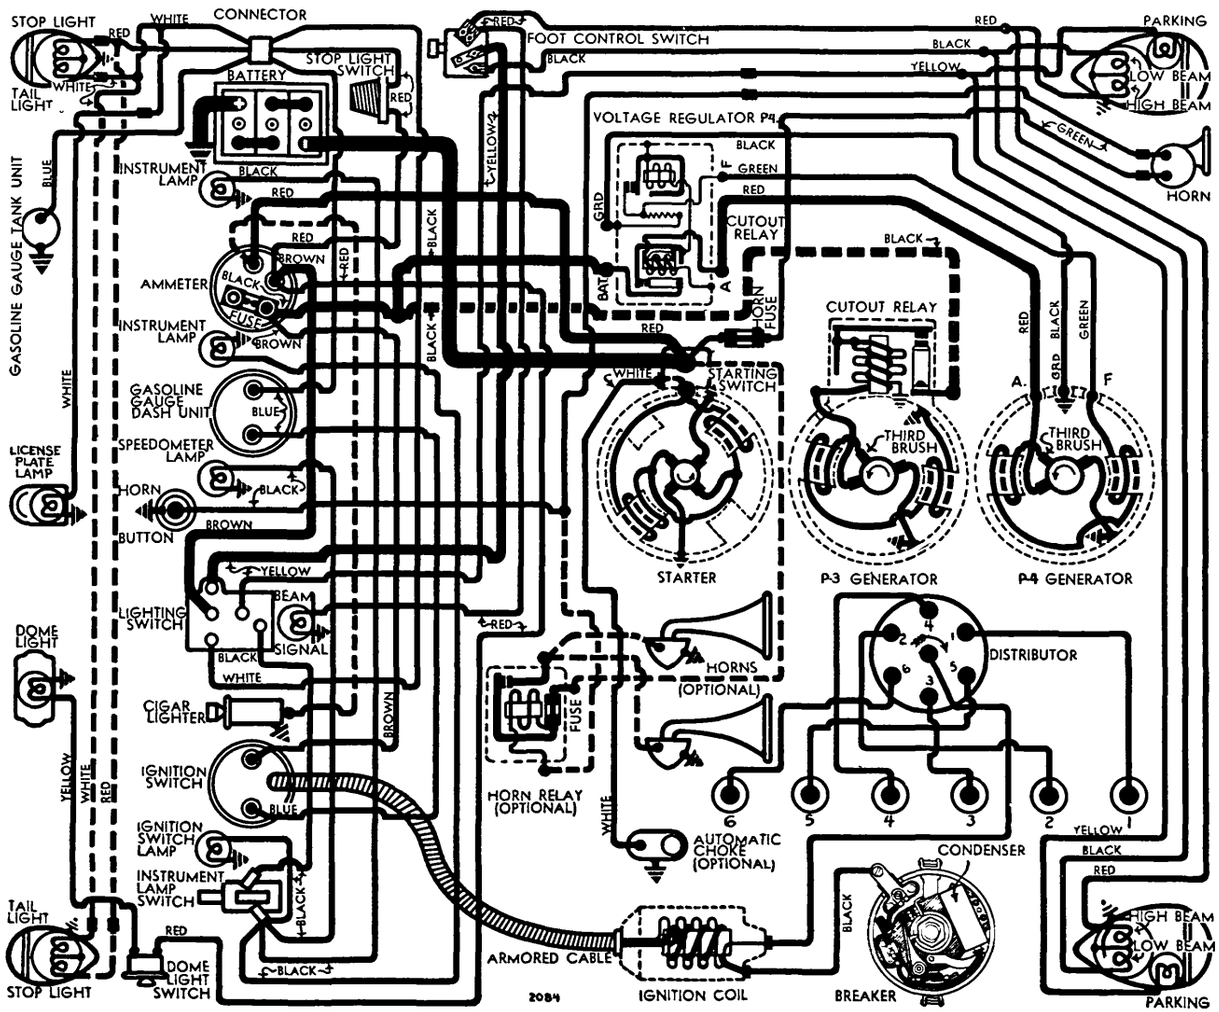
Engine Degrees	Vacuum (" of HG)
Start	5"
10	9-10"
20	14"

Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

IGNITION TIMING:—Flywheel Degrees **Piston Pos.**
6.7-1 Std. head .....4° ATDC.....0068" ATDC.
Timing (Using Timing Light)—Connect timing light between distributor terminal and battery terminal on generator control unit. With #1 piston on compression, turn engine over until piston is 4° (or .0068") past top dead center, stop when fourth graduation to left of center '0' mark on fan pulley at front of engine lines up with pointer on chain case cover. Loosen hold-down screw in advance arm, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until lamp goes out, tighten clamp bolt.
Timing (Using Synchroscope)—Clip lead to #1 spark plug, direct light at fan pulley, fill in 4° mark to left of center '0' mark with chalk or white paint. See article in Electrical Equipment Section.
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-8. 14 MM. Metric.
Spark Plug Gap—Set at .025".



CARBURETION:—Carburetor—Carter (Ball & Ball) Models C6F1 (Motor No. P-4-1001 to 10497), C6F2 (P4-10498 to 88610), C6F3 (P4-88611 to 96179), C6F4 (P4-96180 to 136611), C6F5 (P4-136612 and up). 1¼" downdraft type with Fast Idle.
NOTE—See recommended changes for early carburetors for improved performance in article in Carburetion Section.
Chandler-Groves Model A-2:—Used on late Model P-3 and Commercial Model PT-50. 1¼" downdraft type with Fast Idle.
Economy Carburetor—Carter (Ball & Ball) Model B6F1, 1" downdraft type.
See Article in Carburetion Section.

Idle Adjustment—With engine warm, choke valve wide open and fast idle inoperative, adjust throttle stopscrew so that idle speed is 300 R.P.M. or 6 M.P.H. Turn idle adjusting screw in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting (Carter) should be ½-1¼ turns of screw from closed or seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Engage pump link in proper hole in throttle lever for seasonal requirements as follows:
Inner Hole (Min. stroke)—Extremely hot climate.
Center Hole (Med. stroke)—Normal setting.
Outer Hole (Max. stroke)—Extremely cold weather.

Fast Idle:—On standard carburetors only. Integral with carburetor. No adjustment.

Automatic Choke:—Sisson Type AC-751B available as special equipment on standard carburetors. See

article in Carburetion Equipment Section for complete data.

Air Cleaner:—AC. #1528196 oil-wetted type standard, #1528197 heavy duty oil-bath type optional.

Fuel Pump:—AC. Type B #1522995 diaphragm type. Type AL #1523137 combination Fuel-and-Vacuum pump optional.

Gasoline Gauge:—Motometer Electric. Dash unit—NG-8279D. Tank unit—NG-8257T. See article in Carburetion Equipment Section for complete data.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .011". This valve should open with piston 6° (.0153") past top dead center, when sixth graduation to left of center '0' mark on fan pulley at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .006" hot.

Motor Gauge—Weidenhoff Adapter #103, Rod #12. Timing hole over #6 piston.

Tappet Clearance:—.006" Int., .008" Exh., hot.

Valve Spring Pressure:—34-38 lbs. at 1¾" (valve closed), 77-83 lbs. at 1 7/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill). **Normal Oil Pressure**—30-45 lbs. at 30 M.P.H.

BATTERY:—(Standard)—Willard, Type WHT-1-90. 6 volt, 13 plate, 90 ampere hour capacity (20 hr. rate).

Starting Capacity—114 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.0 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Left side under drivers seat.

(Radio)—Willard, Type WHT-2-105. RHT-2-105 (Exp. Radio).—6 volt, 15 plate, 105 ampere hour capacity (20 hr. rate).

Starting Capacity—133 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.9 minutes.

Grounded terminal and Location as above.

STARTER:—MAW-4009, MAW-4011 (RHD). Armature No. MAW-2030.

Drive—(MAW-4009) Positive pinion shift. (MAW-4011) magnetic pinion shift type.

Cranking Engine—Approx. 175 amperes at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
.60 "	3300	5.5	100
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
11.5 "	Lock	3.0	505
18.0 "	Lock	4.0	670

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out two flange mounting screws.

Starting Switch (MAW-4009):—SW-2677-A. Mounted on starter field frame and operated by pinion shaft (starting pedal). See article in Electrical Equipment Section for pedal adjustment.

(MAW-4011)—Solenoid Switch Type SS-4104. Controlled through relay by pushbutton on dash. Operative with ignition turned 'on.'

Solenoid Switch

Closes against 105 lb. pull with ⅜" air gap drawing 65 amperes. Holds switch closed with draw of 15 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.5-4.5 volts. **Open**—1.5-2.5 volts. **Contact Gap**—.025-.030". **Air Gap**—.005-.007" (closed). **Se Article in Electrical Equipment Section.**

GENERATOR (P-3):—Model GBM-4606C-1. Armature No. GBM-2065F. Third brush control, air cooled type.

Charging Rate Adjustment—Use test meters to check generator output. Shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate until output is 18 amperes at 8.3 volts, with generator at room temperature (70° F.). Third brush held in position by friction.

Commutator Bar Method—Shift third brush until there are exactly 4 commutator bars exposed between edge of third brush and nearest main brush.

Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Cold			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	800	0	6.4	850
4	6.8	950	4	6.9	1050
8	7.25	1125	8	7.4	1250
12	7.7	1375	12	7.9	1680
16	8.1	1800	15.2	8.3	2500
18	8.3	2400			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—50-60 ozs. (new brushes).

Field Current—3.90-4.20 amperes at 6.0 volts.

Motoring Current—5.32-5.88 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove ,take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Swing generator away from engine until 40-50 lb. reading indicated on scale attached to generator frame.

GENERATOR (P-4):—Model GCJ-4802A. Armature GCJ-2006F. Third brush control type with external voltage regulation. Ventilated by fan on drive pulley.

Charging Rate Adjustment—Disconnect wire on generator at 'F' terminal, ground terminal. Connect ammeter in line at 'A' terminal. Connect voltmeter between 'A' terminal and ground. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate until output is 25 amperes at 8.0 volts with generator at room temperature (70° F). Third brush held in position by friction. Actual charging rate controlled by regulator setting. See Regulator Section below.

Commutator Bar Method—Shift third brush until 2 to 2⅛ commutator bars are exposed between brush and nearest main brush.

Maximum Charging Rate—As given above. Do not exceed.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850
4	6.65	920	4	6.7	1020
8	6.9	1080	8	7.0	1240
12	7.2	1240	12	7.3	1400
16	7.45	1400	16	7.6	1650
20	7.7	1580	20	7.9	2100
25	8.0	2500	22	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—27-53 ozs (new brushes).

Field Current—1.9-2.1 amperes at 6.0 volts.

Motoring Current—4.0-4.4 amperes at 6.0 volts.

NOTE—Removal and Belt Adjustment as given above.

GENERATOR (P-3, 4 EXPORT):—Models GBW-4803A, C (Bolivia). Two brush, straight shunt type with external voltage and current regulation. See Chrysler Model C-16 page for specifications and adjustm'ts.

CUTOUT RELAY (P-3):—Model CB-4014. Mounted on generator. See article in Electrical Equipment Sect.

Cuts In—6.75-7.5 volts.

Cuts Out—.5-2.5 amperes discharge current.

Relay Contact Gap—.025-.035".

Air Gap—.010-.030" with contacts closed.

REGULATOR (P-4):—Model VRD-4002A. Voltage Type. Consists of Cutout Relay and Vibrating Voltage Regulator in case on dash. See article in Electrical Equipment Section.

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum.

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—7.4-7.9 volts hot.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads), connect voltmeter between regulator 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 M.P.H. car speed until voltage is steady. Voltmeter reading should be within 7.4-7.8 volts (high limit cold, low limit hot). If outside these limits regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.060" Min., .062" Max. contacts just opening.

REGULATOR (P-3, 4 EXPORT):—Model VRB-4005-A, Voltage-Current Type. Consists of Cutout Relay, Vibrating Voltage Regulator and Vibrating Current Regulator in case on dash. See Chrysler C-16 page for specifications and adjustments.

LIGHTING:—Headlamps—Corcoran-Brown, pre-focused type. Aim headlamps straight ahead (lenses in place, upper beams lighted, car unloaded) with center of hot spot of beam 3" below center horizontal line of headlamps, at 25 feet. Upper and lower beams (lower beam deflected slightly to right) controlled by foot selector switch with lighting switch in full out position.

Headlamp Beam Indicator—Located in light switch knob. Lighted whenever upper beams in use.

Switches

Lighting—Plymouth Part No. 667044.

Instrument Light—Plymouth Part No. 667043.

Foot Selector—Plymouth Part No. 659512.

Stop Light—Plymouth Part No. 661721.

Bulb Specifications

Location	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking	1½	55
Stop and Tail	21-3	1158
Instruments, Indicator	1	51
Rear License	3	63
Dome	15	87

FUSES:—Lighting—20 amperes on back of ammeter. **Horn**—Single horn—20 ampere in connector near starter. Dual horns—30 ampere in horn relay.

HORNS:—Auto-Lite Model HA-4020. Single horn standard. Model HC-5103 dual horns with HR-4002 horn relay optional.

PONTIAC

'BIG SIX' MODEL 6-29 (1929)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type RSB-13, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted on the left frame member under the front floor boards.

IGNITION:—Coil Model 528-C. Coil is mounted on the dash. Ignition current is 1.5-3 amperes at 6 volts with engine running and 4.5 amperes at 6 volts with engine stopped.

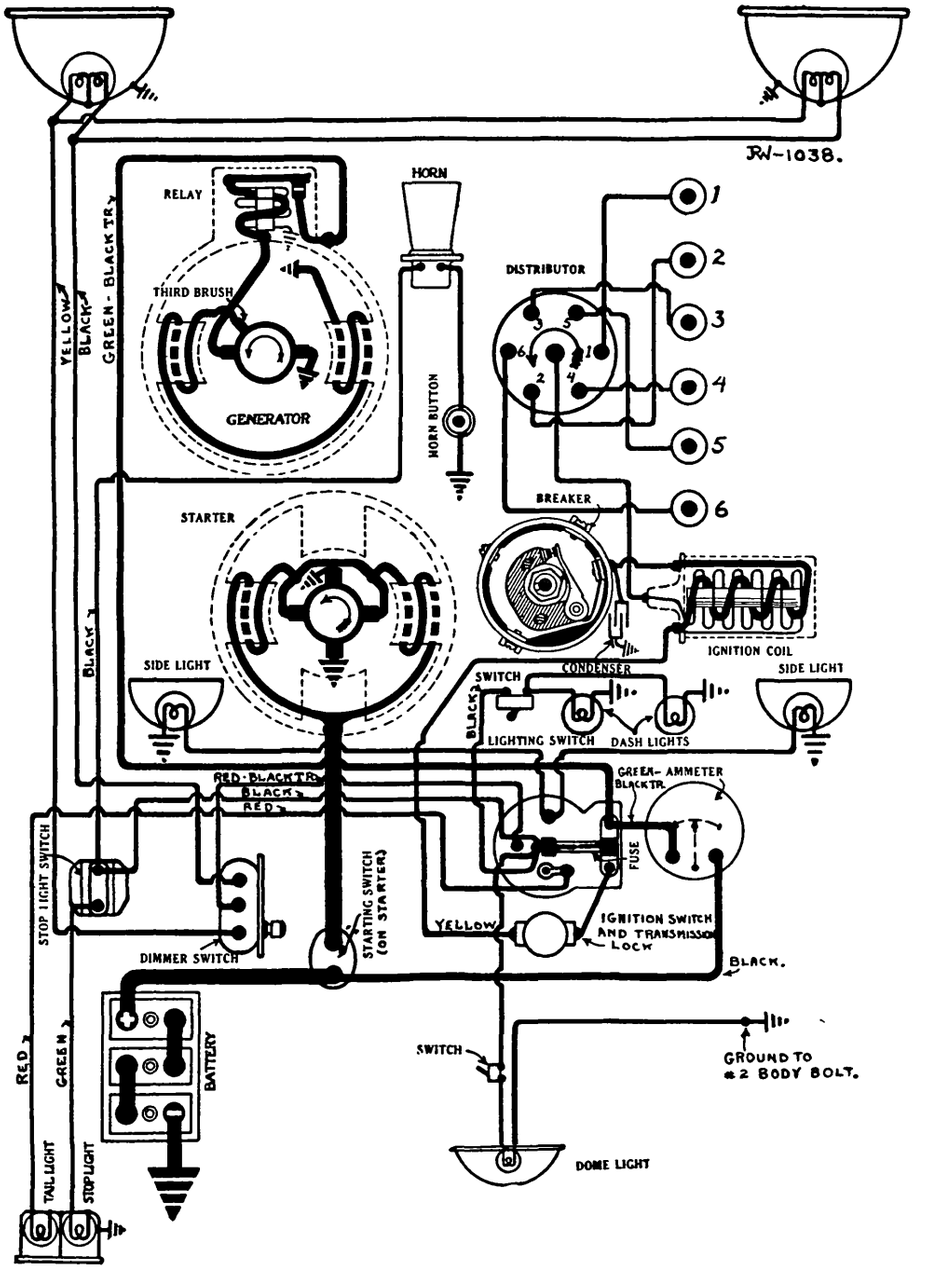
Distributor Model 639-U. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is full automatic. Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 24.5 degrees (engine) reached at 2600 R.P.M. Ignition switch is Delco-Remy Dual-Lock Model 425-L or 425-N (open cars).

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then loosen advance arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one half turn every month or each 1000 miles. At the same time remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil and put one drop of oil on the breaker arm pivot pin. Put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 4 degrees on the flywheel before top dead center. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Crank engine over until piston reaches firing position with flywheel mark 'IGN.-1-6' opposite the indicator in the inspection hole at the right of the engine. Then loosen the advance arm clamp screw and rotate the distributor until breaker contacts begin to open. Tighten the clamp screw and connect the segment opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 counter-clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.



Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 13/32 inches. Valve lift, 5/16 inch. Tappet clearance, .007-.009 inch. Inlet valves open 7 degrees after top dead center and close 39 degrees after lower dead center.

EXHAUST VALES:—Head diameter, 1 13/32 inches. Valve lift, 5/16 inch. Tappet clearance, .007-.009 inch. Exhaust valves open 42 degrees before lower dead center and close 7 degrees after top dead center.

Valve Setting. The camshaft drive is by a 'Two Sprocket' non-adjustable chain drive. To set the camshaft, mesh the chain with the marks on the two sprockets lined up with the center line drawn between the two shaft centers.

STARTER:—Model 714-F. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

PONTIAC

'BIG SIX' MODEL 6-29 (1929)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless.

GENERATOR:—**Model 943-J.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 17 amperes (cold) reached at 1700 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Ampers	Volts	R.P.M.
16-18	8.2	1700	11-13	7.55-7.85	1750-1850

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-5.9 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted at left of engine by special swinging bracket. To remove generator, disconnect lead and loosen adjustment clamp arm bolt. Swing generator toward engine and slip off drive belt. Then take out two bolts holding generator on bracket and lift from place.

Belt Adjustment. To tighten fan belt, loosen adjustment clamp arm bolt and swing generator out from engine until proper belt tension is secured. Then tighten bolt. Be careful not to get the belt too tight or it will cause excessive wear of generator bearings.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every month or each 1000 miles.

RELAY:—**Model 265-B.** Relay is mounted on the generator. Relay contacts close when the generator voltage reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—**Clum Switch, Model 10741 (5192). Delco-Remy Dimmer Switch, Model 465-B.** Switch is mounted on the instrument panel. Double filament headlights are used. They are controlled by the dimmer switch mounted on the toeboard. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Side, dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

Stop light switch is Clum Model 9100.

FUSES:—Lighting fuse mounted on the switch is 20 ampere capacity.

PONTIAC

MODEL P/6 (1930) SERIAL NUMBERS 591,501-P UP
MODEL 401 (1931) SERIAL NUMBERS 649,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

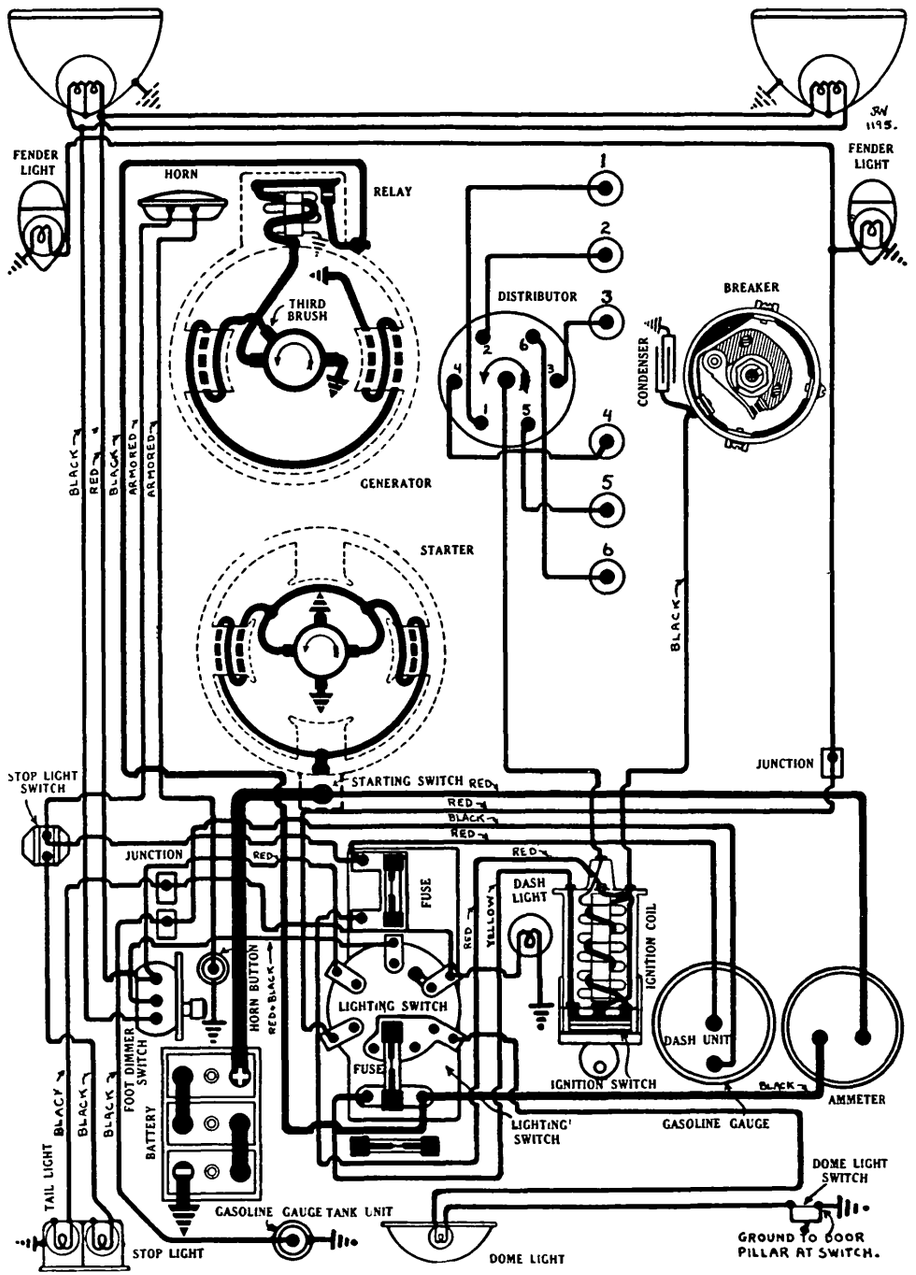
BATTERY:—Various batteries are used. They are 6 volt, 86 ampere hour. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted on the left frame member under the floor boards of the front compartment.

IGNITION:—**Coil Model 526-R.** The ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 2 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.

Distributor Model 639-U. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until breaker gap is .022 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is of the full automatic type. Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 24 degrees reached at 3200 R.P.M. of the engine.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then take out the lock nut and mounting screw on the side of the engine block between cylinders Nos. 3 and 4 and remove and hold-down screw in the advance arm. Then lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor with No. 3 soft cup grease and turn down one full turn every two weeks or each 500 miles of operation. Every 1000 miles remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil and put one drop of oil on the breaker arm pivot pin. Put a small bit of vaseline on the face of the breaker cam.



Timing:—Breaker contacts begin to separate when piston entering power stroke reaches a position 4 degrees (on the flywheel) before top dead center. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Turn engine over until piston reaches firing position when the ignition mark '1&6/IGN' on the flywheel is directly opposite the indicator on the flywheel case. This mark is 4 degrees before the top dead center mark '1&6/UDC'. Then loosen the advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and see that the rotor is directly opposite the segment connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. A.C. Type G-14. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 13/32 inches. Stem diameter, 5/16 inch. Stem length, 3⅞ inches. Valve lift. 5/16 inch. Spring pressure, 32-37 pounds (spring length, 1¾ inches). Tappet clearance, .007-.009 inch (hot). Inlet valves open 7 degrees past top dead center and close 39 degrees past lower dead center. The flywheel is marked 'IN.OP./1&6' at the point of inlet opening of cylinder No. 1.

EXHAUST VALVES:—Head diameter, 1 11/32 inches. Stem diameter, 5/16 inch. Stem length, 3⅞ inches. Valve lift, 5/16 inch. Spring pressure, 32-

PONTIAC

MODEL P/6 (1930) SERIAL NUMBERS 591,501-P UP
MODEL 401 (1931) SERIAL NUMBERS 649,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

37 pounds (spring length, 1¾ inches). Tappet clearance, .007-.009 inch (hot). Exhaust valves open 42 degrees before lower dead center and close at top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Check tappet clearance No. 1 intake valve. This valve should open with piston slightly past top dead center on intake stroke when flywheel mark 'IN.OP/1&6' lines up with indicator on housing.

T Set Valve Timing:—Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—Model 714-R. Starter is connected to the engine through manual pinion shift. The first movement of the starting pedal compresses two springs within a sleeve mounted on the starter shaft. These springs force the starter drive pinion in mesh with the flywheel gear. The further movement of the pedal closes the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless.

GENERATOR:—Model 943-J. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 17 amperes (cold) reached at 1700 R.P.M. or 25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
16-18	8.2	1700	11-13	7.55-7.85	1750-1850

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 3.5-4.5 amperes at 6 volts. Brushs pring tension is 14-18 ounces.

Mounting:—Generator is mounted at left of engine by special swinging bracket. To remove generator, disconnect lead and loosen adjustment clamp arm bolt. Swing generator toward engine and slip off drive belt. Then take pivot bolt holding generator on bracket and lift from place.

Belt Adjustment. To tighten fan belt, loosen adjustment clamp arm bolt and swing generator out from engine until proper belt tension is secured. Then tighten bolt. Be careful not to get the belt too tight or it will cause excessive wear of generator bearings.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every month or each 1000 miles.

RELAY:—Model 265-H. Relay is mounted on the generator. Relay contacts close at 575 R.P.M. or 7-10 M.P.H. when the generator voltage reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .015-.025 inch. Air gap is .012-.017 inch with contact closed.

LIGHTING:—Clum Switch Model 9067 ('30), 9191 ('31). Switch mounted on instrument panel. Double filament headlights are used. They are controlled by the dimmer switch mounted on the toeboard. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Side, dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

FUSES:—Lighting fuse mounted on the back of the switch is 20 ampere capacity. A spare fuse is also mounted on the switch. The small fuse at the top of the switch (in the gasoline gauge line) is 20 ampere capacity.

PONTIAC

SIX MODEL 402 (1932), SERIAL NUMBERS 729,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on left frame member under left front fender.

ENGINE NUMBER:—Stamped on left side cylinder block above generator.

BATTERY:—**Delco, Type 13-D,** 6 volt, 13 plate, 86 ampere hour (5 ampere rate). Starting capacity 102 amperes for 20 minutes. Negative (—) terminal grounded. Battery mounted on left frame member under front compartment floor boards.

IGNITION:—**Coil Model 534-W.** Coil lock type with ignition switch in base. Coil mounted on back of instrument board with ignition switch at center of instrument panel. Ignition current 2 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped).

Distributor Model 639-U. Single breaker arm, 6-lobe cam type with full automatic advance. Breaker gap set at .022 inch. Hold within limits of .018-.024 inch. To set gap, loosen lock screw on crescent shaped stationary contact plate, turn eccentric adjusting screw, tighten lock screw. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface).

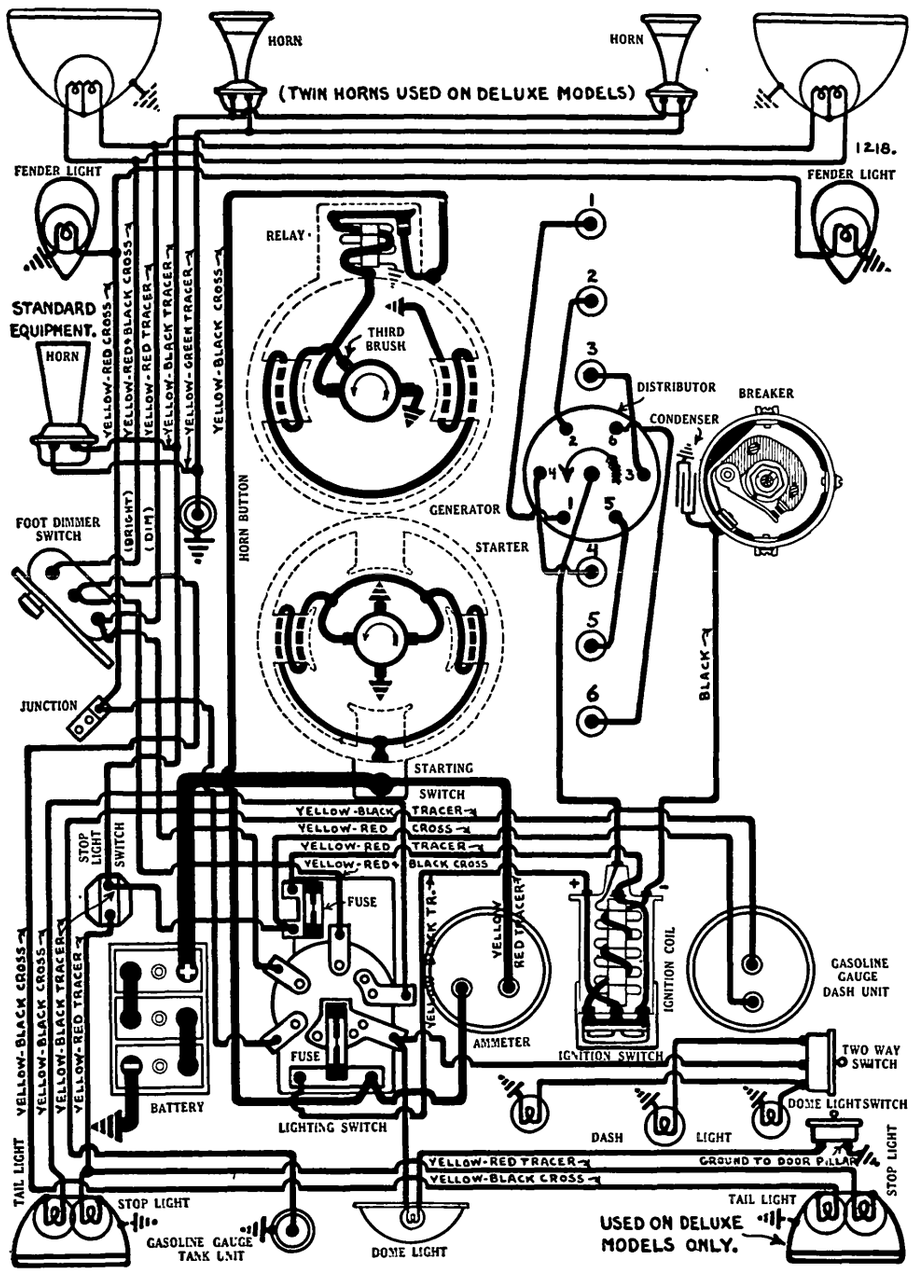
Cam Angles—Closed 36°. Open 24° (distributor degrees).

	Automatic Advance				
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		300	2.5		600
8.25		1000	16.5		2000
12		1600	24		3200

Mounting:—Distributor mounted on cylinder head. To remove, disconnect primary lead, take off distributor cap, loosen lock nut and set screw on left side of engine block, take out hold-down screw in advance arm, lift distributor out.

Oiling:—**1000 Miles.** Turn down grease cup under distributor head one full turn. Keep cup filled with No. 3 cup grease. Take off distributor cap and rotor, oil wick oiler in center of shaft, put one drop oil on breaker arm pivot pin, apply thin film vaseline to face of breaker cam.

Timing:—Standard setting 8° on flywheel before top dead center. To set timing, with No. 1 piston on compression stroke, turn engine over until first line of ignition mark on flywheel '/IGN.1 & 6/' (which is 8° before top dead center mark 'IN.OP.UDC/1 & 6') is directly opposite indicator on housing at left front of flywheel housing, loosen advance clamp screw, rotate distributor until contacts begin to open, tighten clamp screw, connect spark plugs as indicated on diagram (No. 1 terminal as designated). The second line of the ignition mark which is 4° before top dead center indicates the allowable variation in timing. Manufacturer recommends that timing always be set on first mark.



Firing Order:—**1-5-3-6-2-4.** No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. Metric. A.C. Type K-12. Set gaps at .022 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

DELCO-REMY SYSTEM

Timing

Intake valves open at top dead center. Close 42° after lower dead center. Exhaust valves open 40° before lower dead center. Close 10° after top dead center.

To Check Valve Timing. Check tappet clearance No. 1 intake valve (.009-.011"). With No. 6 piston on compression turn engine over until piston is at top dead center with flywheel mark 'IN.OP.UDC/1 & 6' at indicator in inspection hole left front face flywheel housing. No. 1 intake valve should begin to open at this point.

To Set Valve Timing. Turn crankshaft and camshaft until marks on sprockets are directly opposite and in line with straightedge across shaft centers. Mesh chain.

STARTER:—Model 734-A. Manual pinion engagement connected to starting switch pedal (switch mounted on starter field frame). Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces. Starter switch Part No. 820005.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
12 "	Lock	3.63	475

Mounting:—Starter flange mounted on left front face flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take out flange mounting cap screws, pull starter forward to clear drive, lift out.

Oiling:—1000 Miles. Put 8-10 drops engine oil in commutator end oiler.

GENERATOR:—Model 943-Y. Third brush regulation. To adjust charging rate, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate, tighten locking screw. Rotation counter-clockwise at commutator end. Maximum charging rate 16-18 amperes (cold) at 8.2 volts reached at 1700 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
16-18	8.2	1700	11-13	7.5-7.8	1750-1850

Brush spring tension 14-18 ounces. Shunt field current 3.5-4.5 amperes at 6 volts. Motoring generator draws 5.5 amperes at 6 volts.

Mounting:—Generator mounted on swinging bracket at left front of engine driven by fan belt. To remove, disconnect lead, loosen mounting bolts and adjustment clamp bolt, swing generator toward engine, slip off drive belt, take out clamp bolt and two bolts forming bracket hinge, lift generator out.

Belt Adjustment. To tighten drive belt, loosen mounting bolts and adjustment bolt, pull generator away from engine, tighten bolts.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler at each end of generator.

RELAY:—Model 265-G. Relay mounted on generator. Contacts close with generator voltage of 6.75-7.5 volts and open with discharge current of 0-2.5 amperes. Contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9191. Delco-Remy Dimmer Switch, Model 465-J. Lighting switch mounted on back of instrument board controlled by push-pull button on instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated switch on toeboard.

Lamp Sizes

FUSES:—20 ampere capacity lighting fuse mounted on back of switch. 20 ampere capacity accessory fuse mounted on switch bracket. Spare fuse also mounted on switch bracket.

GASOLINE GAUGE:—A.C. electric type (see Carburetion Section).

FUEL PUMP:—A.C. Type 'B' mechanical pump mounted at right of engine—(see Carburetion Section).

HORNS:—Klaxon Model K-18-C vibrator type. Current draw 5.5-6.5 amperes. Model K-26-B (matched set), Low note Type 1401, High note Type 1402 furnished as optional equipment. Current draw (Type 1401) 6.0-8.5 amperes, (Type 1402) 5.0-6.5 amperes.

PONTIAC

EIGHT MODEL 302 (1932), SERIAL NUMBERS 310,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on left frame member under left front fender.

ENGINE NUMBER:—Stamped on top of cylinder block in front of left front intake manifold.

BATTERY:—**Delco, Type 15-A,** 6 volt, 15 plate, 100 ampere hour (5 ampere rate). Starting capacity 137 amperes for 20 minutes. Negative (—) terminal grounded. Battery mounted on right frame member under front compartment floor boards.

IGNITION:—**Coil Model 534-W.** Lock coil type with ignition switch in base. Coil mounted on back of instrument board with ignition switch in center of instrument panel. Ignition current 2 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped).

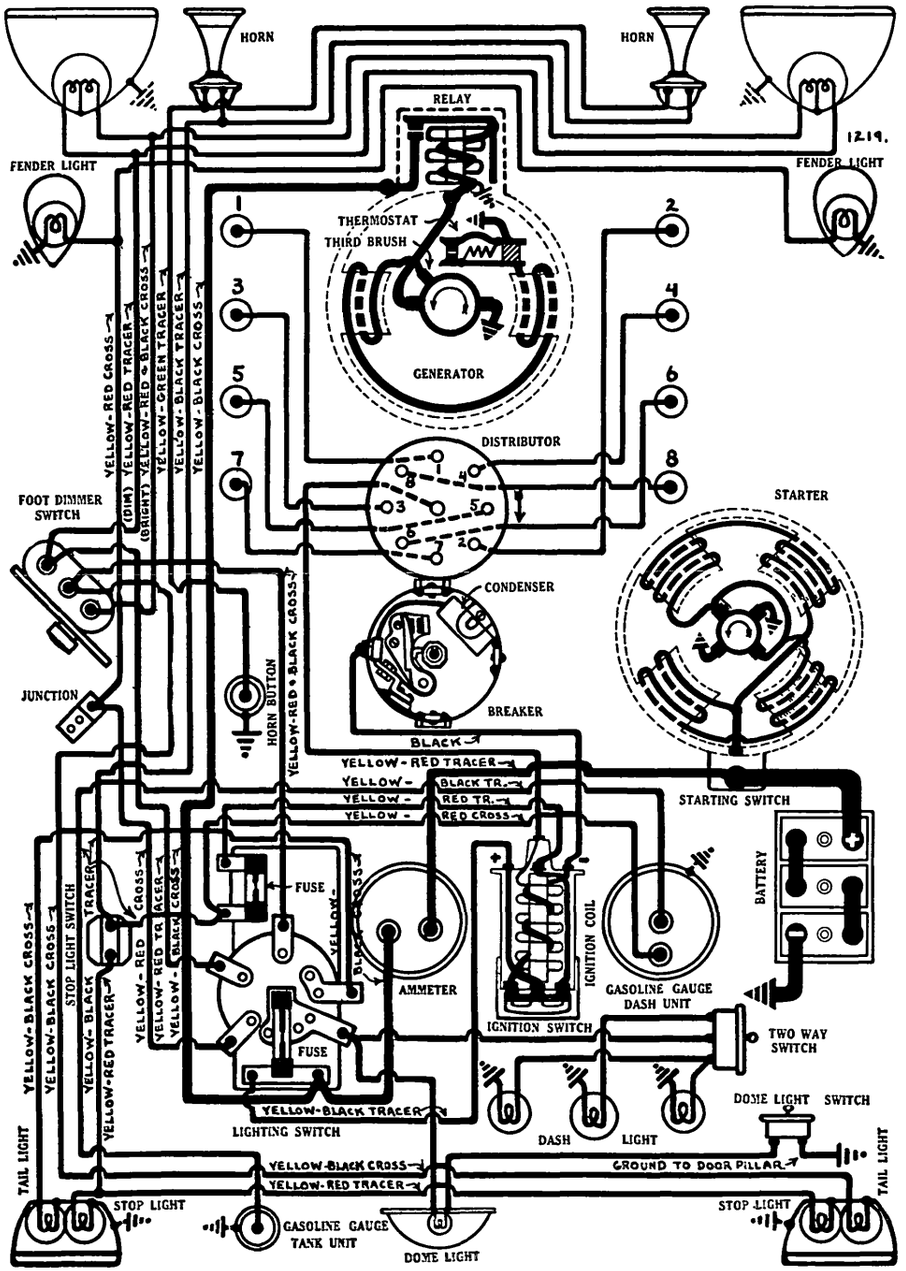
Distributor Model 661-C. Single breaker arm, 8 lobe cam type with full automatic advance. No synchronization necessary. Breaker gap set at .016 inch. Hold within limits of .0125-.0175 inch. To set gap, loosen lock screw on stationary contact plate (directly behind breaker arm), turn eccentric adjusting screw, tighten lock screw. Breaker arm spring tension 19-23 ounces (measured directly behind breaker contacts with spring scale at right angles to back of breaker arm).

Cam Angles—Closed 31°. Open 14° (distributor degrees).

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	4.5		600
6.75		1000	13.5		2000
13.5		1300	27		2600

Mounting:—Distributor mounted between cylinder banks at rear of engine. To remove, disconnect primary lead, take off distributor cap, loosen advance arm clamp screw, lift distributor out.



Oiling:—**1000 Miles.** Turn down grease cup under distributor head one full turn. Keep cup filled with No. 3 grease. Take off distributor cap and rotor, oil wick oiler in center of shaft, apply thin film vaseline to face of breaker cam.

Timing:—Standard setting 11° before top dead center. To set timing, with No. 1 piston (left hand bank) on compression, turn engine over until first line of ignition mark on flywheel '/IGN.1 & 7' (which is 11° before the top dead center mark 'IN.OP./1 & 7') is directly opposite indicator in inspection hole in left side flywheel housing, loosen advance arm clamp screw, rotate distributor until contacts begin to open (use test lamp), tighten clamping screw, connect spark plugs as indicated on diagram (No. 1 terminal as designated). The second line of the ignition mark, which is 7° before top dead center indicates allowable variation in timing. When setting ignition the first mark should be used.

Firing Order:—**1-4-5-2-7-6-3-8** with cylinders numbered as indicated on diagram, or 1L-2R-3L-1R-4L-3R-2L-4R with cylinder banks numbered right (R) and left (L) as viewed from driver's seat. No. 1 cylinder nearest radiator in each case.

Spark Plugs:—14 MM. Metric. A.C. Type K-12. Set gaps at .022 inch.

VALVE TIMING:—Valves mounted horizontally between cylinder banks operated by vertical rocker arms from single camshaft mounted directly above crankshaft. Camshaft driven from crankshaft by two-sprocket non-adjustable chain drive.

PONTIAC

EIGHT MODEL 302 (1932), SERIAL NUMBERS 310,001 UP
DELCO-REMY SYSTEM

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1.500"	.341"	5 13/16"	45°	5/16"
Exhaust	1.375"	.341"	5 13/16"	45°	5/16"

Tappet Clearance		Spring Pressure	
Intake	.012" (hot)	Closed	71 pounds
Exhaust	.012" (hot)	Open	105 pounds

Timing

Intake valves open at top dead center. Close 40° after lower dead center. Exhaust valves open 45° before lower dead center. Close 15° after top dead center.

To Check Valve Timing. Check tappet clearance No. 1 intake valve (.012 inch hot). With piston No. 7 (rear cylinder left hand block) on compression, turn engine over until piston reaches top dead center with flywheel mark 'IN.OP./1 & 7' directly opposite indicator in inspection hole in left side flywheel housing. No. 1 intake valve should begin to open at this point.

To Set Valve Timing. Turn crankshaft and camshaft until sprocket marks are directly opposite and in line with straightedge across shaft centers. Mesh chain.

STARTER:—Model 726-K. Manual pinion engagement connected to starting switch pedal (switch mounted on starter field frame). Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces. Starter switch Part No. 820005.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5.0	65
15 "	Lock	3.15	570

Mounting:—Starter flange mounted on right front face flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take out 2 flange mounting screws, take off nut on flange mounting bolt, pull starter forward to clear drive, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in one oiler.

GENERATOR:—Model 959-Z. Third brush regulation, thermostat control. Thermostat operates at 165°F. (contacts open, cuts in resistance) reducing charging rate by approximately 40%. To adjust charging rate, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw. Rotation counter-clockwise at commutator end. Maximum charging rate 19-21 amperes (cold) at 8.35-8.5 volts reached at 1550 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.7	1550	9-12	7.3-7.6	1890-2000

Brush spring tension 14-18 ounces. Shunt field current 4.0-6.1 amperes at 6 volts. Motoring generator draws 5 5-6 amperes at 6 volts.

Mounting:—Generator flange mounted between cylinder banks at front of engine, driven by the fan belt (fan mounted on forward end of generator shaft). To remove, disconnect lead, take out 3 flange mounting screws, lower generator, slip off drive belt, lift out generator and fan.

Belt Adjustment. Loosen mounting screws, rotate generator to left (around left hand mounting screw as a pivot) until belt tension is sufficient to drive generator and fan without slipping, tighten mounting screws.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler at each end of generator.

RELAY:—Model 265-G. Relay mounted on generator field frame. Contacts close with generator voltage of 6.75-7.5 volts and open with discharge current of 0-2.5 amperes. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9191. Delco-Remy Dimmer Switch, Model 465-J. Lighting switch mounted on back of instrument board controlled by push-pull button at right of instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated switch on toe-board.

Lamp Sizes

Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome and Corner Lights	6-8	6	S.C.	81

FUSES:—20 ampere capacity lighting fuse mounted on back of switch. 20 ampere capacity accessory fuse mounted on switch bracket. Spare fuse also mounted on switch bracket.

GASOLINE GAUGE:—A.C. electric type (see Carburetion Section).

FUEL PUMP:—A.C. Type 'B' mechanical pump mounted on flywheel housing—(see Carburetion Section).

HORNS:—Klaxon Model K-26-B (matched set), Low Note Type 1401, High Note Type 1402. Current draw (Type 1401) 6.0-8.5 amperes, (Type 1402) 5.0-6.5 amperes.

PONTIAC

EIGHT CYLINDER MODEL 601 (1933), SERIAL NUMBERS 770001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on left hand frame side rail under left front fender. First number this series 770,001.

ENGINE NUMBER:—Stamped on left hand front top corner of engine block.

ENGINE:—Eight cylinder 'in line', 'L' head type, 3 3/16x3½" bore and stroke, 223.4 cubic inch displacement, rated at 32.52 H.P., develops 75 H.P. at 3600-3800 R.P.M. Standard compression ratio 5.71. Standard compression pressure 128-131 pounds.

BATTERY:—Delco, Type 15-KW, 6 volt, 15 plate, 94 ampere hour capacity (20 hour rate). Starting capacity 115 amperes for 20 minutes.
Type 17-G (late cars). 6 volt, 17 plate, 107 A.H. capacity (20 hour rate). Starting capacity 131 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—Battery mounted on left hand side of car under front floor.

IGNITION:—Coil Model 539-W. Mounted on dash (unit with ignition switch).
Ignition Current:—2 amperes at 6 volts (engine running), 4.5 amperes at 6 volts (engine stopped).
Ignition Switch:—Unit with coil (primary lead from switch to coil armored). Ignition switch mounted at lower center of instrument panel.

Distributor Model 661-M. Single breaker arm, 8-lobe cam, full automatic advance type. No synchronization necessary. To adjust contact gap, loosen lock screw on stationary contact mounting plate, turn eccentric adjusting screw, tighten locking screw.

Breaker Gap:—Set at .016". Hold within limits of .0125-.0175".

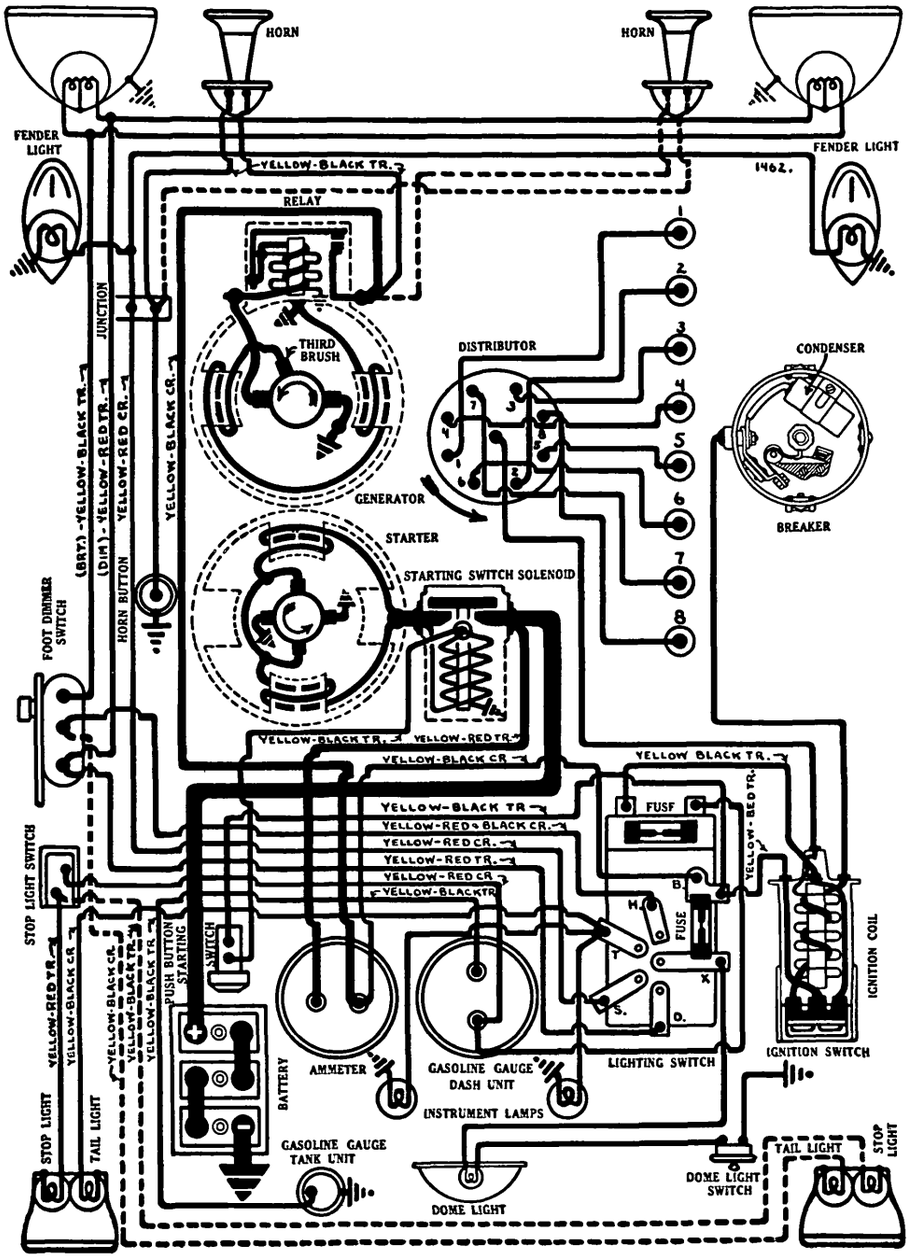
Breaker Arm Spring Tension:—19-23 ounces (measured at point directly behind contacts with spring scale at right angles to back of arm).

Cam Angles—Closed 31°. Open 14° (distributor degrees).

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		300	2		600
13		1800	26		3600

Mounting:—Mounted at left center of crankcase and driven by inclined shaft from the camshaft. To remove, disconnect primary lead, take off distributor cap, take out two hold-down screws in advance arm, lift out.

Oiling:—1000 Miles. Turn down grease cup one full turn. Keep cup filled with No. 3 cup grease. Take off distributor cap and rotor, fill wick oiler in center of breaker cam, apply thin film of vaseline to face of breaker cam.



Timing:—Standard setting 9° (flywheel) or .0264" (piston travel) before top dead center with automatic advance mechanism retarded.

To Set Ignition Timing. Loosen hold-down screws in advance arm, center arm so that '0' of scale on advance arm is opposite reference line on crankcase, tighten hold-down screws. With No. 1 piston on compression turn engine over until first line of ignition mark '/1&8-IGN/' (which is 9° before top dead center mark 'UDC/1&8') registers with pointer on housing in inspection hole in left hand front face of flywheel housing under the starter. Then loosen clamp bolt in advance arm, rotate distributor until contacts begin to open (use test lamp), tighten clamp bolt. See that rotor is directly opposite No. 1 terminal in distributor cap (see diagram), connect spark plugs as indicated.

The second line of the ignition mark '/1&8-IGN/' is 4° before top dead center and represents the allowable range over which spark may be retarded to prevent a spark knock due to fuel or carbon deposits in the engine. In setting ignition always use first line of ignition mark, which is 9° before top dead center.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—14 MM. Metric. A.C., Type K-10 (Std. Comp. Head), K-9 (High Comp Head). Set gaps at .018-.023".

PONTIAC

EIGHT CYLINDER MODEL 601 (1933), SERIAL NUMBERS 770001 UP
DELCO-REMY SYSTEM

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine and driven by two-sprocket non-adjustable chain drive from crankshaft. Both sprockets are marked. Mesh chain with marks on sprockets adjacent and in line with straightedge laid across shaft centers.

To Check Valve Timing. With piston No. 1 on top dead center entering power stroke, set tappet clearance No. 1 exhaust valve at .010 inch. Turn engine over one complete revolution and stop with flywheel mark '1-8/E.C.' (which is 5° after top dead center mark 'UDC/1&8') at indicator on housing in inspection hole in left front face of flywheel housing. No. 1 exhaust valve should close at this point.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Seat Angle	Lift

Open	74-82 pounds

Timing

Intake Valves	Exhaust Valves
Open—5° before top dead center.	Open—45° before lower dead center.
Close—39° after lower dead center.	Close—5° after top dead center.

CARBURETION:—Carter Downdraft Carburetor, Model W-1, Types 255-S and 266-S (see Carburetor Section for complete data). Manifold heat control automatic.

Air Cleaner:—Oil-wetted wire gauze type. Remove at 2000-mile intervals, take off felt silencer pad, clean wire gauze by dipping in gasoline, dry thoroughly re-oil by dipping in engine oil, drain before reassembling.

Fuel Pump:—A.C. Mechanical type mounted at right front of crankcase (see Carburetion Section for complete data). Remove sediment bowl on pump when necessary, empty water and sediment, clean filter screen (directly above bowl) before reassembling.

Gasoline Gauge:—A.C. electric type (see Carburetion Section for complete data).

STARTER:—Model 734-G, 738-B Optl. Starter drive (734-G) Bendix Type A-1569. (738-B) solenoid pinion shift and overrunning clutch. Rotation is counter-clockwise at commutator end. Brush spring tension 24-28 ozs.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
12 "	Lock	3.63	475

Starter Switch:—(734-G) Type 1503 magnetic switch or solenoid controlled by Type 1379 pull switch. (738-B) solenoid switch and pinion shift mounted on starter field frame. See articles in Equipment Section for complete data.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, disconnect wiring on starting switch, take out two flange mounting cap screws, pull starter straight forward to clear Bendix, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in commutator end oiler.

GENERATOR:—Model 937-B, 967-D (cars with radio). Third brush regulation, thermostat control on Model 967-D only. Maximum charging rate 17 amperes (937-B), 22 amperes (967-D), cold, reached at 2000 R.P.M.

Charging Rate Adjustment. Loosen small round lock screw on end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data—Model 937-B

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
16-18	8.05-8.25	2000	11-13	7.5-7.8	2000-2100

Generator Data—Model 967-D

19-22	8.3-8.7	2000	11-14	7.5-7.9	2200-2600

Brush Spring Tension—14-18 ozs. (937-B), 23-27 ozs. (967-D).
Field Current—3.5-4.5 amperes (937-B), 2.1-2.5 amperes (967-D) at 6 volts.
Motoring:—Approximately 5 amperes at 6 volts.

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, slip off drive belt, take out bolts forming bracket hinge, lift generator out.

Belt Adjustment. Loosen adjustment clamp bolt and munting bolts, pull generator away from engine until proper belt tension is secured, tighten adjustment clamp bolt before slacking off on generator, tighten mounting bolts.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler at each end.

RELAY:—Model 265-G. Mounted on generator field frame. Contacts close when generator voltage reaches 6.75-7.5 volts and open with 0-2.5 ampere discharge current.

Contact Gap:—.015-.025". **Air Gap:**—.012-.017" (contacts closed).

LIGHTING:—Delco-Remy Lighting Switch, Model 487-Z. Dimmer Switch Model 465-Z, Y. Lighting switch mounted on back of instrument board and operated by push-pull button on instrument panel. Double filament headlight bulbs are used for 'depressed beam' dimming and are controlled by foot-operated switch on toeboard.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	32-21	D.C.	1116

Instrument Lights	6-8	3	S.C.	63
Tail Lights	6-8	3	S.C.	63
Stop Lights	6-8	3	S.C.	63
Dome Light	6-8	3	S.C.	63

FUSES:—Three 20 ampere capacity fuses mounted on lighting switch bracket in back of instrument board. One fuse is connected in lighting circuits. Fuse on end of switch is connected in gasoline gauge and stop light circuit. Third fuse (nearest instrument board) is a spare.

HORNS:—Klaxon Model K-26, Type 1415 (low note), Type 1416 (high note) matched tone twin horns are mounted under headlights. Current draw 6.0-8.5 amperes at 6 volts (Type 1415), 5.0-6.5 amperes at 6 volts (Type 1416).

SERIAL NUMBER:—First number 838,501. On left frame side rail under left front fender.

COMPRESSION:—**Ratio**—Std. 6.2-1. No optl. ratios.
Pressure—137-139 lbs. at 1000 R.P.M. or approximately 104 lbs. at cranking speed.

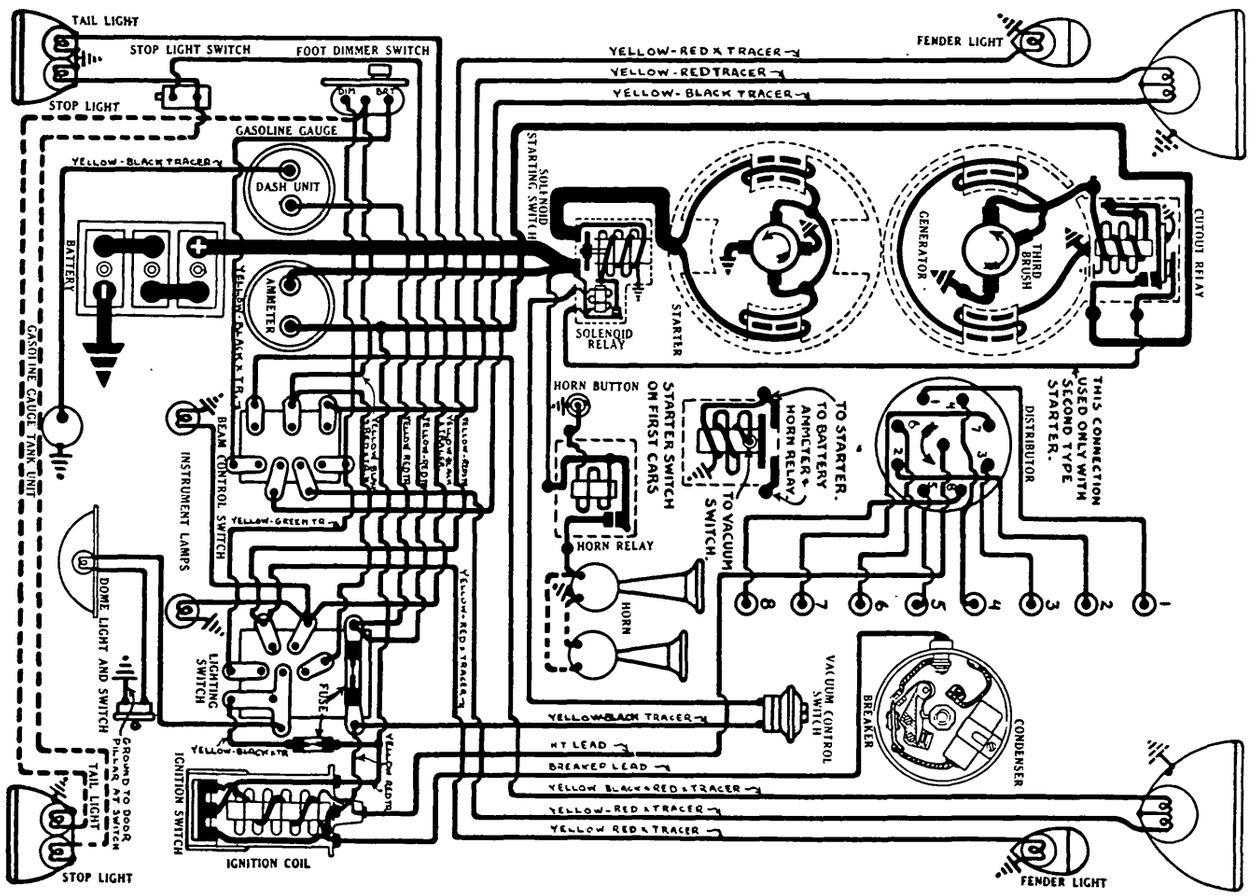
VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model 539-Z.** Lock coil type mounted on back of instrument panel.
Ignition Current—3.5 amperes at 6.2 volts.
Ignition Switch—Part of coil assembly. Switch has special position (key turned to left and held against spring) which allows engine to be cranked by starter with ignition 'off'. Regular running position with ignition 'on' secured by turning key to right.
Distributor Model 663-B. Single breaker, 8 lobe cam, full automatic advance type with auxiliary Vacuum Spark Advance and Gaselector.
Breaker Gap—Set at .018". Limits .015-.020".
Breaker Arm Spring Tension—19-23 ozs.
Cam Angles (Distributor Degrees)—Closed 31°. Open 14°.
Manual Adjustment (Gaselector)—20° (engine)—See Gaselector data.

Automatic Advance

Distributor Degrees	Distributor R.P.M.
Start	300
5	600
11	1700
Engine Degrees	**Engine R.P.M.**
3	600
10	1200
22	3400

Gaselector:—Consists of manual adjustment at distributor with graduated scale marked for 10° advance and retard from center '0' position. Should be used to compensate for special fuels or driving conditions, such as high altitude (Gaselector must always be set at '0' when checking or setting ignition timing).
Vacuum Spark Control:—Vacuum unit on distributor provides additional advance except when engine is accelerated or is pulling heavily when spark will be retarded by return spring in unit. Maximum vacuum advance, 20° (engine).



IGNITION TIMING:—

Flywheel Degrees	Piston Position
All engines ..... 9° BTDC.	..... .0264" BTDC.

Timing (using Timing Light):—Use a timing light connected across contacts to check contact opening (connect light between distributor terminal and ground). Turn on ignition. Set Gaselector at '0' by loosening thumbnut and moving indicator (tighten thumbnut after adjusting). Turn engine over with #1 piston on compression, stop when first line of ignition mark '/IGN.1&8/' is in line with pointer on flywheel housing (inspection hole in left front face of flywheel housing). Loosen advance arm clamp bolt, rotate distributor until timing lamp just lights (contacts opening), tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram). The two lines of the ignition mark on the flywheel indicate the allowable timing range (first mark 9° BTDC., second mark 4° BTDC.).
Timing (using Synchroscope):—See Equipment Section for complete data. Ignition mark on flywheel (9° line) should be marked with white chalk or paint so as to be easily distinguished. Idle engine at 6 M.P.H.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.
Firing Order:—1-6-2-5-8-3-7-4 (see diagram).
Spark Plugs:—A.C., Type K-7. 14 MM. Metric type.
Spark Plug Gaps—.025" (cars with radio, .022").

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.
Carburetor:—Carter, Model 283-S, 1¼" plain tube, downdraft type.
Fuel Pump:—A.C., Type R.
Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—**To Check Timing**—Set #1 intake valve tappet clearance at .0125". This valve should open with piston 5° (.0082") before top dead center with first straight line of ignition mark on flywheel 'IGN. 1&8/' slightly past indicator. Reset tappet clearance at .010" with engine hot.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.
Tappet Clearance:—.009-.011" all valves, engine hot. Use .009" and .011" as 'go' and 'no go' feelers.
Valve Spring Pressure:—45-51 lbs. at 1 29/32" (valve closed). 74-82 lbs. at 1 19/32" (valve open).

LUBRICATION:—Crankcase Capacity—7 qts. (refill).
Normal Oil Pressure—20-30 lbs. at normal driving speeds.

BATTERY:—Delco, Type 17-GW, 6 volt, 17 plate, 107 A.H. capacity (20 hour rate).
Starting Capacity—131 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Under front floor boards on left side.

STARTER:—Model 734-W. Armature No. 1847432. Model 738-B. Armature No. 123456.
Model 734-W with Bendix drive and magnetic switch used on approximately first 5000 cars. Model 738-B with solenoid switch pinion shift) used on later cars. See Starting Switch data.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—175-200 amperes at 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Starting Switch:—734-W—Magnetic Switch, Type 1503. Vacuum Switch Type 1588, 1593 (RHD.). Magnetic switch mounted on starter field frame controlled by vacuum switch on manifold operated by accelerator pedal with ignition turned 'on'.

738-B—Solenoid Switch, Type 1513. Vacuum Switch Type 1588, 1593 (RHD.). Solenoid (switch and pinion shift) mounted on starter field frame controlled by vacuum switch operated by accelerator pedal. Generator relay (265-T) has extra set of contacts for solenoid relay circuit (see diagram). See Equipment Section for complete data on Starter controls.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out two cap screws.

GENERATOR:—Model 935-C. Armature No. 1854856. Third brush control type. No thermostat.

Charging Rate Adjustment—Take off commutator cover band, loosen small round lock screw on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Maximum Charging Rate—14 amperes (hot) maximum, 7.7 volts, 3000 R.P.M. or 28 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	17-20	8.2-8.5	2400
Hot	13-15	7.7-8.0	3000

Rotation—Counter-clockwise at commutator end.

Shunt Field Current—2.3-2.6 amperes at 6.0 volts.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

SPECIAL GENERATORS:—Model 931-R. See Equipment Section for complete data on this type generator when installed as special equipment.

Mounting:—Pivot mounted at left front of engine. Driven by fan belt. To remove, take out two pivot bolts, one clamp bolt.
Belt Adjustment—Loosen pivot bolts and clamp bolt, pull generator out or away from engine, tighten mounting bolts.

RELAY CUT-OUT:—Model 265-H (734-W Starter), 265-T (738-B Starter). Mounted on generator field frame. Model 265-T has an extra set of contacts used to control starter solenoid relay (738-B starter only).
Cuts in—6.75-7.5 volts.
Cuts out—0-2.5 amperes discharge.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

LIGHTING:—Light Switch Model 478-W. Headlight Selector Switch Model 1384. Foot Control Switch Model 465-Z, 465-Y (RHD.). Light switch (right hand button on panel) controls instrument, fender indicator, tail and headlamps (on and off only). Selector switch (left hand button on panel) and foot control switch control headlamps providing city and country driving and passing beams (passing beam is assymmetrical and 'dims' right hand lamp only). Fender indicator lamps are lighted with switch in city passing and country passing positions. Headlight bulbs are prefocused type.

Bulb Specifications

Lamps	Candlepower	Mazda No.
Headlights	32-21	2320-C
All others	3	63

FUSES:—Lighting—20 ampere capacity fuse (on lighting switch) for stop light and gas gauge circuit. 20 ampere capacity (in wiring harness at left of coil) in Instrument, Fender, and Tail Lamp circuit.

HORNS:—Klaxon, Model 33-B. One horn standard. Twin set matched tone optional. Horns operated by horn relay mounted on horn bracket under engine hood. Horn current, 12-14 amperes (each) at 6.0 volts.

Horn Relay Model 266-T, 268-L:—Relay requires .25 amperes to close contacts. Current draw, .8 amperes.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

SERIAL NUMBER:—First number (701-A) 6AA-1001, (701-B) 6AB-1001. On left hand frame side rail under front fender.

COMPRESSION:—**Ratio**—6.2-1. No optional ratios. **Pressure**—148-150 lbs. at 1000 R.P.M. or approx. 106 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 360 R.P.M. or 6 M.P.H.

IGNITION:—**Coil Model 539-L.** On engine side of dash. **Ignition Current**—3.5 amperes at 6.2 volts. **Ignition Switch—Model 431-L** (switch and cable). Connected to coil by armored cable.

Distributor Model 647-A. Single breaker, 6 lobe cam, full automatic advance type with auxiliary 'Vacuumatic' spark advance and Gaselector. **Breaker Gap**—Set at .020". Limits .018-.024". **Breaker Arm Spring Tension**—17-21 ounces. **Cam Angles**—Closed 36°. Open 24° (distributor). **Manual Adjustment**—20° (engine). See Gaselector.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	275	2	550
5.5	800	11	1600
11	1900	22	3800

Vacuumatic Spark Advance—Vacuum unit on distributor provides additional advance except when engine is accelerated or is pulling heavily when spark is retarded by return spring in unit. Vacuum unit linked directly to breaker plate.

Advance (Engine°)	Vacuum (Ins. of HG)
Start	9-11"
15	16-18"

Gaselector—Consists of manual adjustment at distributor, with graduated scale and pointer (locked by thumbnut) providing 10° advance and retard from center '0' position. Should be used to compensate for special fuels or driving conditions.

Removal:—Distributor on left hand side of crankcase. Disconnect vacuum connection, take out hold-down screws in advance arm, lift out.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....6° BTDC. ..... .0133" BTDC.

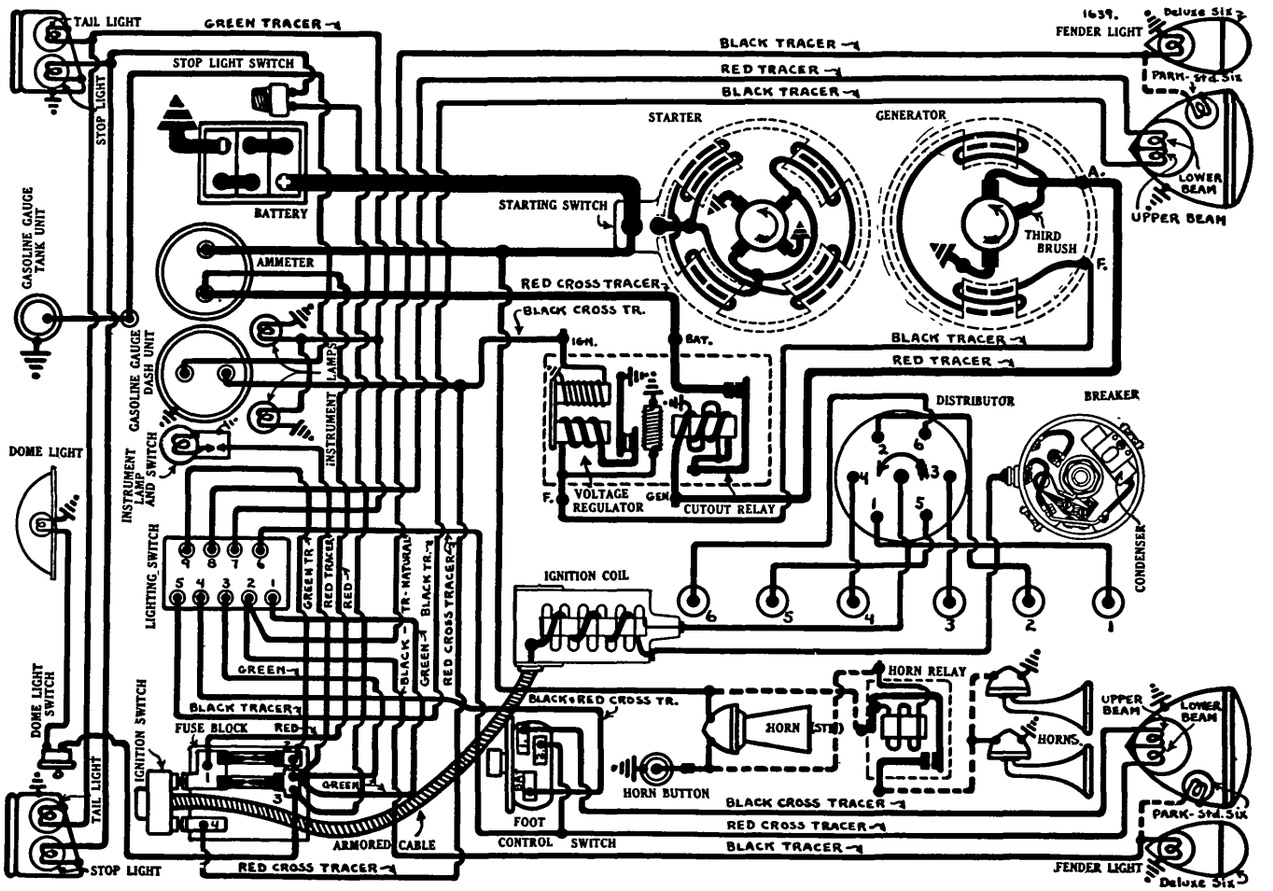
NOTE—The two straight lines of the ignition mark '/IGN.1&6/' indicate the allowable timing range, lower mark 6° BTDC., upper mark 2°BTDC. Set ignition at lower mark or 6° BTDC.

Timing (using Timing Light)—Connect timing light between distributor terminal and ground, turn on ignition, remove cover plate over inspection hole in left front face of flywheel housing, loosen thumbnut on Gaselector, center pointer on scale (opposite '0' mark). With #1 piston on compression, turn engine over until first line of ignition mark on flywheel '/IGN.1&6/' lines up with pointer, loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts just opening, tighten clamp bolt.

Timing (using Synchroscope)—See Equipment Section for complete instructions. Ignition mark on flywheel (6° line) should be filled in with white paint or chalk so as to be distinguishable. Idle engine at 6 M.P.H.

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Firing Order:—1-5-3-6-2-4 (see diagram).



Spark Plugs:—A.C., Type K-7. 14 MM. Metric type. **Spark Plug Gaps**—.025" (.022" cars with radio).

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.

Carburetor:—Carter, Model 306-S, 314-S, 1¼" downdraft type.

Fuel Pump:—A.C., Type R-1521783 diaphragm type.

Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .0125". This valve should open with piston 5° or .0092" BTDC and first straight line of ignition mark '/IGN.1&6/' slightly past indicator. Reset tappet clearance at .010" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Tappet Clearance:—.009-.011" all valves engine hot. Use .009" and .011" feelers as 'go' and 'no go' gauges. Hood sill must be removed to adjust clearance of valves in front cluster.

Valve Spring Pressure:—52 lbs. at 1 29/32" (valve closed). 82 lbs. at 1 39/64" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts.
Normal Oil Pressure—5 to 40 lbs.

BATTERY:—Delco, Type 15-T, 15-TF (Export), 6 volt, 15 plate, 94 A.H. capacity (20 hour rate).
Starting Capacity—115 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Left hand side under front floor boards.

STARTER:—Model 727-T, 727-S (RHD). Armature No. 823881. Manual pinion shift with overrunning clutch operated by foot pedal (727-T) or by solenoid switch with accelerator pedal control (727-S).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—200-225 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	60
15 "	Lock	3.0	600

Starting Switch:—(727-S for RHD). Solenoid Switch Type 1516. Vacuum Switch Type 1588. See wiring diagram and data on Eight Cylinder Model 605.

Removal:—Starter on left front of flywheel housing. Take out flange cap screws.

GENERATOR:—Model 935-W. Armature No. 1854856. Ventilated. Fixed third brush with external voltage regulation. Vibrating type voltage regulator combined with Cutout Relay in case on dash. See Equipment Section for complete data on Voltage Regulator.
Charging Rate Adjustment—Third brush is fixed and cannot be adjusted. Voltage regulator is sealed and seals must be broken (voiding warranty) before adjustment can be made to regulator or cutout relay. See data below.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22-26	8.7-9.1	3300
Hot	18-21	8.2-8.7	3500

Above figures correct with ammeter connected in charging line at 'Bat' terminal of Relay-Regulator with 'F' terminal grounded. Do not operate generator on open circuit.
Rotation—Counter-clockwise at commutator end.
Field Current—2.3-2.6 amperes at 6.0 volts.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Removal:—Pivot mounted at left front of engine with fan belt drive. Take out two pivot bolts and one clamp bolt.

Belt Adjustment—Loosen pivot bolts and clamp bolt, move generator out or away from engine to take up stretch or slack in belt.

RELAY REGULATOR:—Model 5588, 5557 (RHD). Consists of Cutout Relay and vibrating Voltage Regulator in case on dash. See Equipment Section for complete data on these units. Cutout Relay has special ground contacts (5557 only).

Cutout Relay

Cuts In—6.5-7.0 volts.
Cuts Out—3 amperes max. discharge at 6.3 volts
Relay Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Adjustment—Operate generator at 2800-3000 R.P.M. charging battery at not less than 8 amperes. Adjust regulator so that voltage is 7.55-7.85 volts at 70°F. and 7.45-7.55 volts at 150°F. Regulator is over-compensated for temperature and adjustments must be made at these temperatures. Do not operate generator on open-circuit.

Regulator Contact Gap—.015-.025".

Contact Spring Tension—2.7-3.5 ounces.

Air Gap—.060-.070" between armature and core (armature down so that fibre bumper just touches stop. .008-.013" (between fibre bumper and stop with armature up).

LIGHTING:—Delco-Remy Switch, Model 479-Z (701B), 479-S (701A). Foot Control Switch Model 465-V. Control switch on toeboard provides assymetrical passing beam (lower beam right hand headlamp, upper beam left hand headlamp). Headlamp beams are crossed. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights	32-21	2320-C
Fender, Instrmnt., Tail	3	63
Stop	15	87
Dome	6	81

Parking lamps (instead of fender lamps) used on Model 701B Standard Six.

FUSES:—Fuse Block Model 1050-X. On back of instrument panel. Two 20 ampere capacity fuses, one spare fuse. Left hand fuse protects left hand headlamp circuit. Right hand fuse protects all other lighting circuits.

HORNS:—Klaxon, Model K-26-L (standard), K-33-B twin horns (optional). Vibrator type. Horn relay used with Model K-33-B.

Horn Relay:—Model 266-T. Relay requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.

Contact Gap—.015-.025".

Air Gap—.012-.017".

Armature Spring Tension—6-8 ounces.

SERIAL NUMBER:—First number, 8AA-1001. On left hand frame side rail under front fender.

COMPRESSION:—**Ratio**—6.2-1. No optional ratios. **Pressure**—137-139 lbs. at 1000 R.P.M. or approx. 104 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 6 M.P.H.

IGNITION:—**Coil Model 539-L.** On engine side of dash. **Ignition Current**—3.5 amperes at 6.2 volts. **Ignition Switch—Model 431-L** (switch and cable). **Distributor Model 663-B.** Single breaker, 8 lobe cam, full automatic advance type with auxiliary 'Vacuumatic' spark advance and Gaselector. **Breaker Gap**—Set at .018". Limits .015-.020". **Breaker Arm Spring Tension**—19-23 ounces. **Cam Angles**—Closed 31°. Open 14° (distributor). **Manual Adjustment**—20° (engine). See Gaselector.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	3	600
5	600	10	1200
11	1700	22	3400

Vacuumatic Spark Control—Vacuum unit on distributor provides additional advance except when engine is accelerated or is pulling heavily (low vacuum) when spark is retarded by return spring.

Advance (Engine °)	Vacuum (Ins. of Hg.)
Start	4-6"
20	16-21"

Gaselector—Consists of manual adjustment at distributor, with graduated scale and pointer (locked by thumbnut), providing 10° advance and retard from center '0' position. Should be used to compensate for special fuels or driving conditions. **Removal:**—Distributor on left hand side of crankcase. Disconnect vacuum connection, take out hold-down screws in advance arm, lift out.

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....6° BTDC. ..... .0117" BTDC.

NOTE—The two straight lines of the ignition mark '/IGN.1&8/' indicate the allowable timing range, lower mark 6° BTDC., upper mark 2° BTDC. Set ignition at lower mark or 6° BTDC.

Timing (using Timing Light)—Connect timing light between distributor terminal and ground, turn on ignition, remove cover plate over inspection hole in left front face of flywheel housing, loosen thumbnut on Gaselector, center pointer on scale (opposite '0' mark). With #1 piston on compression, turn engine over until first line of ignition mark on flywheel '/IGN.1&8/' lines up with pointer, loosen advance arm clamp bolt, rotate distributor until lamp lights, tighten clamp bolt. **Timing (using Synchroscope)**—See Equipment Section for complete instructions. Ignition mark on flywheel (6° line) should be filled in with chalk Idle engine at 6 M.P.H.

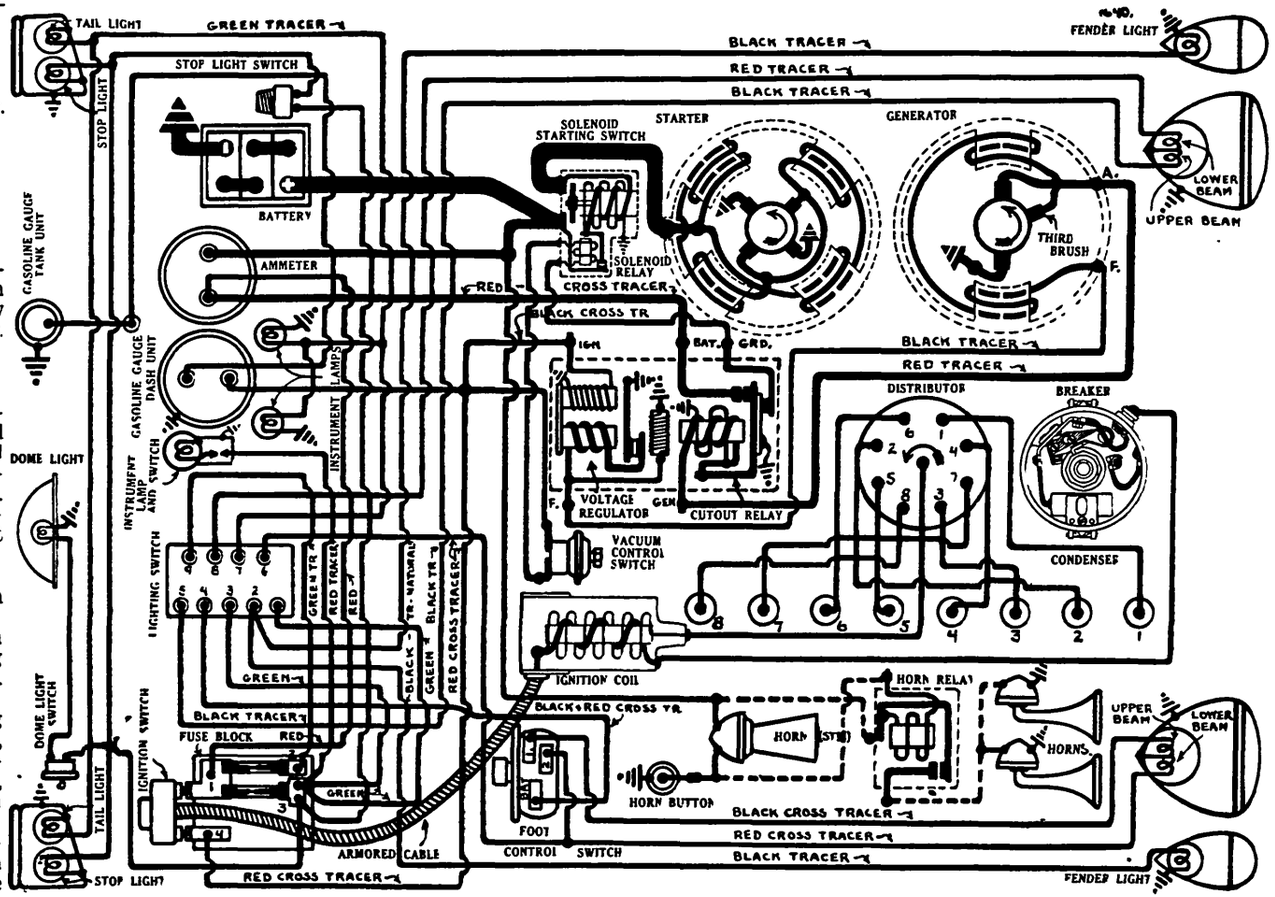
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—A.C., Type K-7. 14 MM. Metric type. **Spark Plug Gaps**—.025" (.022" cars with radio).

CARBURETION:—See Carburetion Section for data. **Carburetor:**—Carter, Model 298-S, 315-S, 1¼" downdraft type.

Automatic Choke—Carter Climatic Control.



Fuel Pump:—A.C., Type R-1521783 diaphragm type.

Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—**To Check Timing**—Set #1 intake valve tappet clearance at .0125". This valve should open with piston 5° or .0082" BTDC. with first straight line of ignition mark on flywheel '/IGN. 1&8/' slightly past indicator. Reset tappet clearance at .010" with engine hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Tappet Clearance:—.009-.011" all valves, engine hot. Use .009" and .011" as 'go' and 'no go' feelers. Hood

sill must be removed to adjust clearance of valves in front cluster.

Valve Spring Pressure:—52 lbs. at 1 29/32" (valve closed). 82 lbs. at 1 39/64" (valve open).

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—5 to 40 lbs.

BATTERY:—Delco, Type 17-K, 17-KF (Export), 6 volt, 17 plate, 107 A.H. capacity (20 hour rate).
Starting Capacity—131 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Left hand side under front floor boards.

STARTER:—727-S. Armature No. 823881. Manual pinion shift type (solenoid operated).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—200-225 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
15 "	Lock	3.0	600

Starting Switch:—Solenoid switch Type 1516. Vacuum Switch Type 1588. Solenoid switch mounted on starter field frame is combination starting switch and pinion shift and is controlled by vacuum switch operated by accelerator pedal. Generator cutout relay has extra ground contacts for solenoid relay control. See Equipment Section.

Removal:—Starter on left front of flywheel housing. Take out flange cap screws.

GENERATOR:—Model 935-W. Armature No. 1854856. Ventilated. Fixed third brush with external voltage regulation. Vibrating type voltage regulator combined with Cutout Relay in case on dash. See Equipment Section for complete data.

Charging Rate Adjustment—Third brush is fixed and cannot be adjusted. Voltage regulator is sealed and seals must be broken (voiding warranty) before adjustment can be made to regulator or cutout relay. See data below on Relay Regulator.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22-26	8.7-9.1	3300
Hot	18-21	8.2-8.7	3500

Above figures correct with ammeter connected in charging line at 'Bat' terminal of Relay-Regulator with 'F' terminal grounded.

Rotation—Counter-clockwise at commutator end.
Field Current—2.3-2.6 amperes at 6.0 volts.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Removal:—Pivot mounted at left front of engine with fan belt drive. Take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, move generator out or away from engine to take up stretch or slack in belt.

RELAY REGULATOR:—Model 5557. Consists of Cutout Relay and vibrating Voltage Regulator in case on dash. See Equipment Section for complete data on these units. Cutout Relay has special ground contacts.

Cutout Relay

Cuts In—6.5-7.0 volts.
Cuts Out—3 amperes max. discharge at 6.3 volts.
Relay Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Adjustment—Operate generator at 2800-3000 R.P.M. charging battery at not less than 8 amperes. Adjust regulator so that voltage is 7.55-7.85 volts at 70°F. and 7.45-7.55 volts at 150°F. Regulator is over-compensated for temperature and adjustments must be made at these temperatures. Do not operate generator on open-circuit.

Regulator Contact Gap—.015-.025".

Contact Spring Tension—2.7-3.5 ounces.

Air Gap—.060-.070" between armature and core (armature down so that fibre bumper just touches stop. .008-.013" (between fibre bumper and stop with armature up).

LIGHTING:—Delco-Remy Switch, Model 479-Z. Foot Control Switch Model 465-Z. Control switch on toeboard provides assymetrical passing beam (lower beam right hand headlmp, upper beam left hand headlamp). Headlamp beams are crossed. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No
Headlights	32-21	2320-C
Fender, Instrmnt., Tail	3	63
Stop	15	87
Dome	6	81

FUSES:—Fuse Block Model 1050-X. On back of instrument panel. Two 20 ampere capacity fuses, one spare fuse. Left hand fuse protects left hand headlamp circuit. Right hand fuse protects all other lighting circuits.

HORNS:—Klaxon, Model K-26-L (standard), K-33-B twin horns (optional). Vibrator type. Horn relay used with Model K-33-B.

Horn Relay:—Model 266-T. Relay requires .25 amperes at 2.0 volts (minimum) to close contacts. Current draw .8 amperes.

Contact Gap—.015-.025".

Air Gap—.012-.017".

NOTE:—Models 36-26A Deluxe Six and 36-26B Master Six are similar except that 'Knee Action' standard only on Model 36-26A. All data below applies to both models.

SERIAL NUMBER:—First number (36-26A) 6BA-1001, (36-26B) 6BB-1001. On top of left frame siderail in front of steering gear under engine hood.

COMPRESSION:—Ratio 6.2-1. Pressure 149 lbs. at 1000 R.P.M. or approx. 106 lbs. at cranking speed.
NOTE—Special thick head gasket which may be installed to correct ping due to low altitude or use of low-octane fuel reduces compression ratio to 5.7-1

VACUUM READING:—Gauge should show steady reading of 18-20" of HG. with engine idling at 360 R.P.M. or 6 M.P.H.

IGNITION:—Coil Model 539-L. Mounted on engine side of dash
Coil Draw—3.5 amperes at 6.2 volts.

Ignition Switch:—Delco-Remy Model 431-L. Switch and cable assembly. Connected to coil by armored cable.
Ignition Lock—Briggs & Stratton.

Distributor:—Model 647-B. Single breaker, 6 lobe cam, full automatic advance type with vacuum spark control and Gaselector adjustment at distributor.
Breaker Gap—.020". Limits .018-.024".
Cam Angle or Dwell—36° (closed), 24° (open).
Breaker Arm Spring Tension—17-21 ozs.
Condenser—Part No. 1858571. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	275	2	550
5.5	800	11	1600
11	1900	22	3800

Vacuum Spark Control—Integral with distributor. Mounted on housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port above throttle in carburetor) except when engine accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	9-11"
15° Max.	16-18"

Gaselector—Consists of adjustment at distributor providing 10° advance or retard from center 'O' position. See Ignition Timing for setting.

Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Standard setting as shown. See Gaselector Setting below.

	Flywheel Degrees	Piston Position
All engines	6° BTDC	.0133" BTDC.

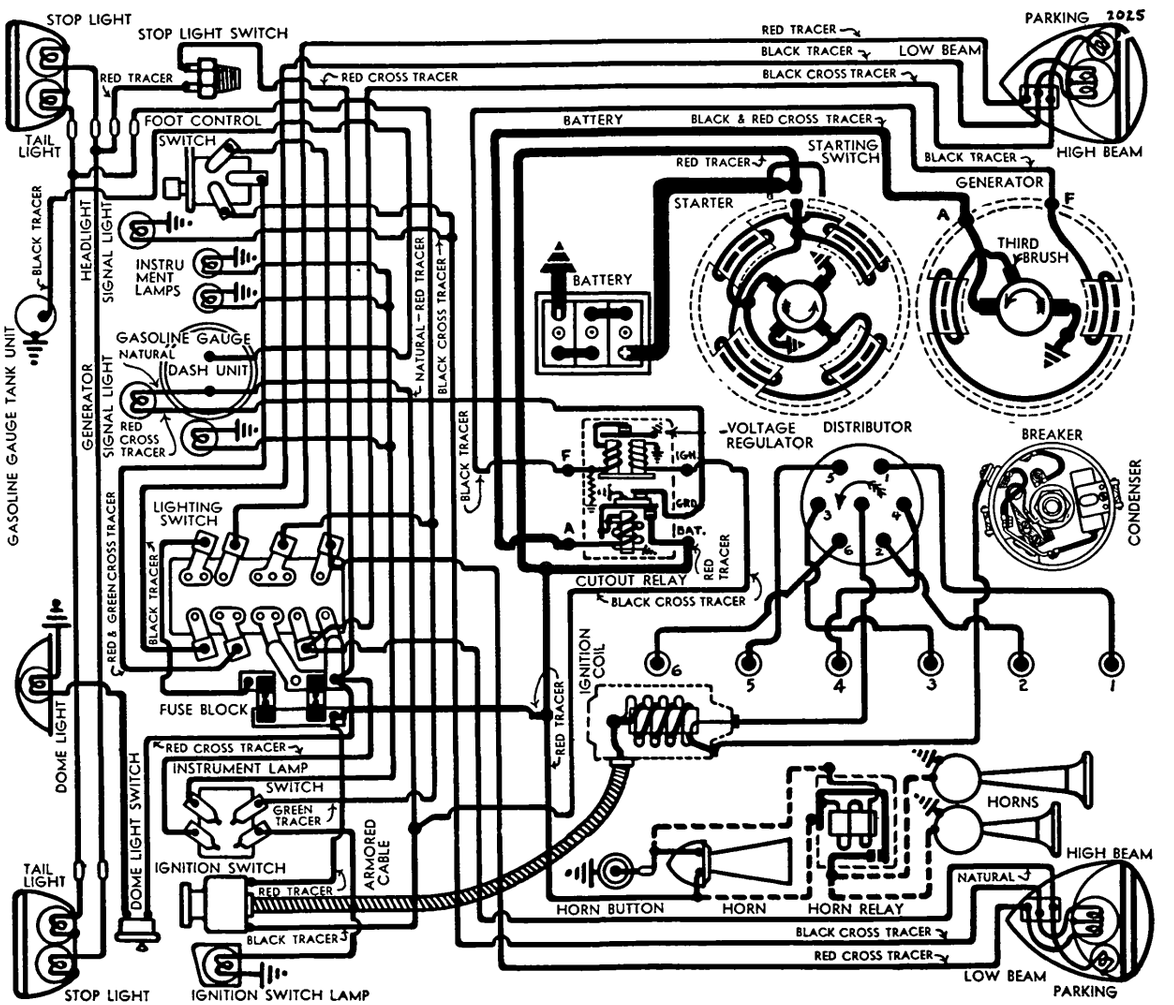
NOTE—The two straight lines of the ingnition mark 'IGN.1-6/' indicate allowable timing range of 4° on flywheel. Use first or 6° line in setting ignition.

To Set Timing (Using Timing Light)—Connect timing light between distributor terminal and ground, turn on ignition. With #1 piston on compression, turn engine over until piston is 6° or .0133" before top dead center, stop when first line of ignition mark '/IGN.1-6/' lines up with pointer in inspection hole in left front face of flywheel housing. Loosen Gaselector thumbnut, center pointer on scale, tighten thumbnut, loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts opening), tighten clamp bolt.

Timing (Synchroscope)—Connect Synchroscope between #1 spark plug cable and distributor cap, fill in first line of flywheel mark '/IGN.1-6/' with white paint or chalk, idle engine at 360 R.P.M., adjust distributor as directed above until line coincides with pointer on housing.

Timing (Motor Gauge)—Weidenhoff #114 Adapter, #42 Rod.

Gaselector Setting—Should be set to provide best performance without spark knock or ping for particular operating conditions and octane rating of fuel used. To adjust, loosen thumbnut, move pointer clockwise to advance, or counter-clockwise to retard spark.



Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type K-7. 14 MM. Metric type.
Spark Plug Gaps—.025" (.022" on cars with radio).

CARBURETION:—Carburetor—Carter Mod. 324-S Standard, Model 340-S Taxicab. 1¼" downdraft type. See Carburetion Section for adjustment, overhaul, and Jet Specifications.

NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at hot or slow idling speed.

Idle Adjustment—Vacuum Gauge (Tool J-89) recommended. With engine hot, adjust idle adjusting screw to give steady vacuum reading of 18-20" of HG. at idling speed of 360 R.P.M. or 6 M.P.H. To adjust without gauge, set throttle stopscrew for correct idling speed, turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Setting should be ½-1¼ turn open of the screw from the inner seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever under dust cover at top of carburetor has three holes for pump link engagement. Change for seasonal requirement: Outer Hole—Ordinary temperatures, std. gasoline. Upper Hole (Max. stroke)—Extremely cold weather. Inner Hole (Min. stroke)—Extremely hot weather.

Fast Idle:—Integral with carburetor. No adjustment. See article on Carter Fast Idle in Carburetion Sect.

Accelerator Linkage Adjustment:—Must be maintained to provide correct 'throttle cracking' action for starting. To adjust, after setting carburetor idle speed at 6 M.P.H., loosen hand throttle wire lockscrew, pull button ⅛" out from instrument board, position hand throttle lever so that no clearance exists between lever and throttle cross shaft, tighten lockscrew. Turn throttle stopscrew in 3 turns, see that fast idle bar is up or in slow idle position and that stopscrew contacts carburetor casting, disconnect battery cable at starting motor to prevent cranking, fully depress starting pedal, adjust length of throttle cracking rod so that all clearance between cross shaft lever and accelerator pedal lever is taken up. Reset throttle stopscrew for correct idling speed.

Automatic Choke:—Carter Climatic Control. See article in Carburetion Sec. for servicing directions.

Air Cleaner:—AC. #1525996 oil-wetted type standard, #1525998 heavy duty oil-bath type optional.

Fuel Pump:—AC. Type R #1522221. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—AC. Electric. #1515304 (dash unit), 1515258 (tank unit). See article in Carburetion Section.

VALVE TIMING:—Tappet Clearance—.009-.011" for all valves with engine hot. Use .009" and .011" felers as 'go' and 'no go' gauges. Set exhaust clearances at .011" for sustained high speed driving.

NOTE—Hood sill must be removed to check or adjust front valves.

Valve Spring Pressure—52 lbs. at 1 29/32" (valve closed), 82 lbs. at 1 19/32" (valve open).

To Check Valve Timing—Set tappet clearance #6 intake valve at .0125". This valve should open with piston 5° or .0092" before top dead center with first straight line of flywheel mark '/IGN.1-6/' slightly past indicator in inspection hole in left front face of housing. Rest tappet clearance at .010" with engine hot.

Using Motor Gauge—Weidenhoff Adapter #114, Rod #42.

LUBRICATION:—Crankcase Capacity—6 qts. refill.
Normal Oil Pressure—45 lbs. at 35 M.P.H.

BATTERY:—Delco, Type 15-T. 6 volt, 15 plate, 94 amp. hour capacity (20 hour capacity).
Starting Capacity—115 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.3 minutes.
Delco, Type 17-J (Special Equipment). 6 volt, 17 plate, 125 ampere hour capacity (20 hr. rate).
Grounded Terminal—Negative (—) terminal.
Location—Left hand side under front floor board.

STARTER:—Model 727-Y. Armature No. 823881. Model 737-C (RHD). Armature No. 1847432.
Drive—Overrunning clutch and manual pinion shift operated by starting pedal (727-Y), Bendix Drive (737-C).
Cranking Engine—200-225 amperes at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ouces each.

Performance Data—727-Y

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	60
15 ft. lbs.	Lock	3	600

Performance Data—737-C

0 ft. lbs.	6000	5	65
15 ft. lbs.	Lock	3.15	570

Removal:—Mounted on left front face of flywheel housing. To remove, take out capscrews.

Starting Switch (727-Y):—Part No. 820052. Mounted on starter. Operated by starting pedal.

Starting Switch (737-C):—Magnetic Switch Type 1528. Vacuum Switch Type 1588.

Magnetic Switch

Closes contacts with 7.5-8.5 amperes draw at 3 volts and holds contacts closed with .85-.95 amperes draw at 1.5 volts (hold-in coil only).

Vacuum Switch

Contacts Close—10-14° rotation counter-clockwise from latch position.
Unlatch Action—3.4-4.6" of HG. approximately 30° from latch position.

GENERATOR:—Model 935-W, 936-R (taxicab). Armature No. 1854856. Fixed third brush control type with external vibrating voltage regulator. Ventilated by fan on drive pulley.

NOTE—Third brush is clamped in position for maximum safe output and must not be disturbed.

Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data below and special article in Equipment Section for procedure and setings. Do not operate generator on open-circuit.

Maximum Charging Rate—19-21 amperes at 8.2 volts (cold), 16-18 amperes at 7.6 volts (hot). Reached at car speed of 40 M.P.H. To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action.

Generator Charge Indicator—Red jewel light at bottom of right group of instruments on instrument board. Lights when ignition key is turned on and remains lighted until generator begins to charge, then it goes out. If lamp does not light when ignition key is turned on, ground 'GRD' terminal on Cutout Relay, if lamp still does not light replace bulb. See Bulb Specifications below.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22-26	8.7-9.1	3300
Hot	18-21	8.2-8.7	3500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third).
Field Current—2.3-2.6 amperes at 6 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, move generator out or away from engine to take up stretch or slack in belt.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5557. Mounted on engine side of dash. Consists of Cutout Relay and Vibrating type Voltage Regulator. See article in Equipment Section for complete data on these units.

Cutout Relay

Cuts In—6.5-7.25 volts, 830 R.P.M., 10 M.P.H.
Cuts Out—3 amperes maximum at 6.3 volts.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.65 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.

Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.

NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open-circuit.

Contact Gap—.015-.025".

Contact Spring Tension—2.7-3.5 ounces.

Air Gap—.060-.070" between armature and center of core with armature down and fibre bumper touching stop; .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, pre-focused, cross-beam type with special non-interchangeable lenses. Headlamps aimed straight ahead with lenses removed. Special assymetrical 'Passing' beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in driving or third position.

Headlamp Beam Indicator—Located at bottom of speedometer dial. Lighted whenever driving or upper headlamp beams are lighted.

Switches

Lighting—Delco-Remy Model 479-S, 479-J Export.
Foot Beam Selector—Delco-Remy Model 471-T.
Instrument Lamp—Delco-Remy Model 1406.
Stop Lamp—Hydraulic type on brake master cyl.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-L
Parking	1½	55
Speedometer, Dash, Indicators 1		51
Oil, Gas, Temp., Tail	3	63
Stop	15	87
Dome	6	81

NOTE—Headlamps are Pre-focused 'Long-Life' type

FUSES:—Fuse Block Model 1050-Z. On lighting switch on back of instrument panel. Two 20 ampere capacity fuses, one spare fuse. Fuse toward rear protects left hand headlamp circuit. Fuse toward engine protects all other lighting circuits.

HORNS:—Klaxon Model K-26-L Type 1601 Std., Model K-33-B, Type 1857 (low note), 1858 (high note) blended tone twin horns operated by horn relay Opt. All horns are vibrator type.

Horn Type	Current at 6 Volts	Air Gap
K-26-L, 1601	6.5-8.5	.025-.029"
K-33-B, 1857	12-14	.045-.050"
K-33-B, 1858	11-13	.036-.040"

NOTE—Twin horns are stamped 'L' (low note—long horn), 'S' (high note—short horn), on motor shell.

Horn Relay:—Model 266-T. Requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.
Contact Gap—.015-.025". **Spring Tension—6-8 ozs.**
Air Gap—.012-.017" with contacts closed.

2757 — MANUAL — 4250

SERIAL NUMBER—First number—8-BA-1001. On left hand frame side rail under front fender.

COMPRESSION:—Ratio 6.2-1. Pressure 144 lbs. at 1000 R.P.M. or aprox. 106 lbs. at cranking speed.
NOTE—Special thick head gasket which may be installed to correct ping due to low altitude or use of low-octane fuel reduces compression ratio to 5.7-1

VACUUM READING:—Gauge should show steady reading of 18-20" of HG. with engine idling at 360 R.P.M. or 6 M.P.H.

IGNITION:—Coil Model 539-L. Mounted on engine side of dash.
Coil Draw—3.5 amperes at 6.2 volts.
Ignition Switch:—Delco-Remy Model 431-L. Switch and cable assembly. Connected to coil by armored cable.
Ignition Lock—Briggs & Stratton.
Distributor Model 663-H. Single breaker, 8 lobe cam, full automatic advance type with 'Vacuumatic' spark advance and Gaselector adjustment at distributor.
Breaker Gap—Set at .018". Limits .015-.020".
Cam Angle or Dwell—31° (closed), 14° (open).
Breaker Arm Tension—19-23 ozs.
Condenser—Part No. 1855968. Capacity .20-.25 mfds.

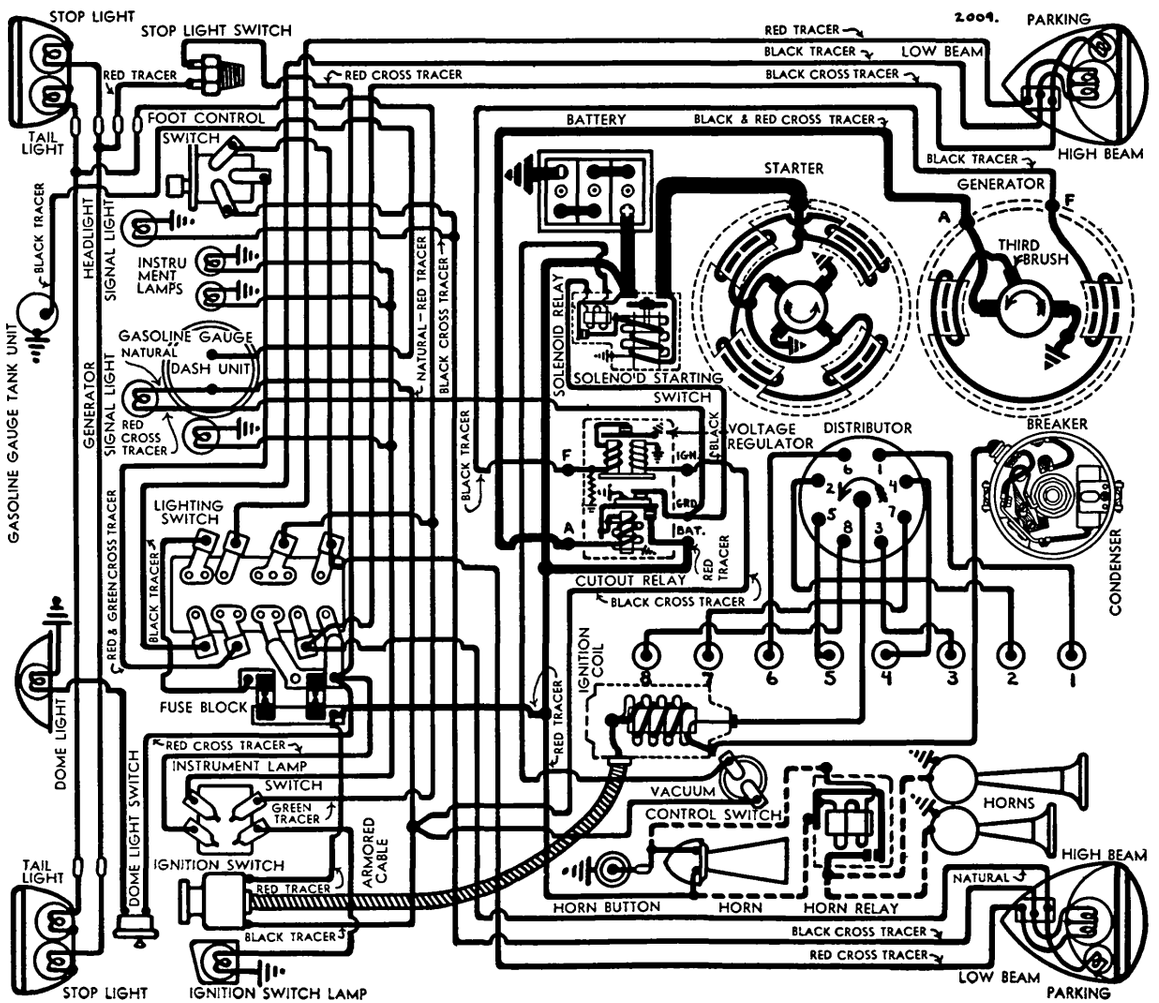
Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	3	600
5	600	10	1200
11	1700	22	3400

Vacuum Spark Control—Integral with distributor. Mounted on housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port above throttle in carburetor) except when engine accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	4-6"
20°	16-21"



Gaselector—Consists of adjustment at distributor providing 10° advance or retard from center 'O' position. See Ignition Timing for setting.
Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Standard setting as shown. See Gaselector Setting below.

	Flywheel Degrees	Piston Position
All engines	6° BTDC	.0117" BTDC.

NOTE—The two straight lines of the ignition mark '/IGN.1-8/' indicate allowable timing range of 4° on flywheel. Use first or 6° line in setting ignition.
To Set Timing (Using Timing Light)—Connect timing light between distributor terminal and ground, turn on ignition. With #1 piston on compression, turn engine over until piston is 6° or .0117" before top dead center, stop when first line of ignition mark '/IGN.1-8/' lines up with pointer in inspection hole in left front face of flywheel housing. Loosen Gaselector thumbnut, center pointer on scale, tighten thumbnut, loosen advance arm clamp bolt, rotate distributor until timing light lights (contacts opening), tighten clamp bolt.
Timing (Synchroscope)—Connect Synchroscope between #1 spark plug cable and distributor cap, fill in first line of flywheel mark '/IGN.1-8/' with white paint or chalk, idle engine at 360 R.P.M., adjust distributor as directed above until line coincides with pointer on housing.
Timing (Motor Gauge)—Weldenhoff #114 Adapter, #42 Rod.
Gaselector Setting—Should be set to provide best performance without spark knock or ping for particular operating conditions and octane rating of fuel used. To adjust, loosen thumbnut, move pointer clockwise to advance, or counter-clockwise to retard spark.
Firing Order:—1-6-2-5-8-3-7-4. See diagram.
Spark Plugs:—AC. Type K-7. 14 MM. Metric type.
Spark Plug Gaps—.025" (.022" on cars with radio).

CARBURETION:—Carburetor—Carter Mod. 322-S Std., Model 340-S Taxicab. 1¼" downdraft type. See Carburetion Section for adjustment, overhaul, and Jet Specifications.
NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at hot or slow idling speed.
Idle Adjustment—Vacuum Gauge (Tool J-89) recommended. With engine hot, adjust idle adjusting screw to give steady vacuum reading of 18-20" of HG. at idling speed of 360 R.P.M. or 6 M.P.H. To adjust without gauge, set throttle stopscrew for correct idling speed, turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Setting should be ½-1¼ turn open of the screw from the inner seated position. Readjust throttle stopscrew for correct idling speed.
Accelerating Pump Setting—Pump lever under dust cover at top of carburetor has three holes for pump link engagement. Change for seasonal requirement:
Outer Hole—Ordinary temperatures, std. gasoline.
Upper Hole (Max. stroke)—Extremely cold weather.
Inner Hole (Min. stroke)—Extremely hot weather.
Fast Idle:—Integral with carburetor. No adjustment. See article on Carter Fast Idle in Carburetion Sect.
Accelerator Linkage Adjustment:—Adjust rod connecting bell cranks on side of manifold so that accelerator pedal just touches floor board with carburetor throttle valve wide open. Release accelerator pedal and with throttle valve in closed position, set

adjusting screw in lever at forward end of this connecting rod so that clearance between this lever and lever which operates carburetor throttle valve rod is .235-.265" (use gauge #J-635-1). Disconnect vacuum switch operating rod at switch lever, turn switch lever so that pointer lines up with line on switch body, adjust length of rod by turning trunnion on rod until rod can be connected to switch lever without disturbing position of lever. See that hand throttle is fully closed, loosen set screw in throttle cable trunnion (at lower end of cable), adjust cable length so that clearance between lever at forward end of hand throttle operating rod and carburetor throttle valve rod lever is 1/16" minimum (use gauge #J-635-2). Check setting after opening and closing hand throttle. These clearances are important.

Automatic Choke:—Carter Climatic Control. See article in Carburetion Sec. for servicing directions.

Air Cleaner:—AC. #1525997 oil-wetted type standard, #1525998 heavy duty oil bath type optional.

Fuel Pump:—AC. Type R #1522221. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—AC. Electric. #1515304 (dash unit), #1515258 (tank unit). See article in Carburetion Section.

VALVE TIMING:—Tappet Clearance—.009-.011" for all valves with engine hot. Use .009" and .011" felers as 'go' and 'no go' gauges. Set exhaust clearances at .011" for sustained high speed driving.
NOTE—Hood sill must be removed to check or adjust front valves.

Valve Spring Pressure—52 lbs. at 1 29/32" (valve closed), 82 lbs. at 1 19/32" (valve open).

To Check Valve Timing—Set tappet clearance #8 intake valve at .0125". This valve should open with piston 5° or .0082" before top dead center with first straight line of flywheel mark '/IGN.1-8/' slightly past indicator in inspection hole in left front face of housing. Rest tappet clearance at .010" with engine hot.

Using Motor Gauge—Weidenhoff Adapter #114, Rod #42.

LUBRICATION:—Crankcase Capacity—7 qts. (refill).
Normal Oil Pressure—45 lbs. at 35 M.P.H.

BATTERY:—Delco, Type 17-K. 6 volt, 17 plate, 110 amp. hour capacity (20 hour rate).
Starting Capacity—131 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.4 minutes.

Delco, Type 17-J (Special Equipment). 6 volt, 17 plate, 125 ampere hour capacity (20 hr. rate).
Grounded Terminal—Negative (—) terminal.
Location—Left hand side under front floor boards.

STARTER:—Model 727-S. Armature No. 823881.
Drive—Overrunning clutch and manual pinion shift operated by solenoid switch.
Cranking Engine—220-225 amperes at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	550	5	65
15 ft. lbs.	Lock	3	600

Removal:—Mounted on left front face of flywheel housing. To remove, take out capscrews.

Starting Switch:—Solenoid Switch Type 1516. Vacuum Switch Type 1588. Solenoid switch controlled thru relay by vacuum switch operated by accelerator pedal with ignition switch turned on. See article in Equipment Section.

Solenoid Switch

Close against 70 lbs. with .5" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—4 volts. **Open**—1.6-2.0 volts.
Contact Gap—.030-.045". **Air Gap**—.010-.014" closed.

Vacuum Switch

Contacts Close—10-14° rotation counter-clockwise from latch position.
Unlatch Action—3.4-4.6" of HG. approximately 30° from latch position.

GENERATOR:—Model 935-W, 936-R (taxicab). Armature No. 1854856. Fixed third brush control type with external vibrating voltage regulator. Ventilated by fan on drive pulley.
NOTE—Third brush is clamped in position for maximum safe output and must not be disturbed.
Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data and special article in Equipment Section for procedure and settings. Do not operate generator on open-circuit.

Maximum Charging Rate—19-21 amperes at 8.2 volts (cold), 16-18 amperes at 7.6 volts (hot). Reached at car speed of 40 M.P.H. To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action.

Generator Charge Indicator—Red jewel light at bottom of right group of instruments on instrument board. Lights when ignition key is turned on and remains lighted until generator begins to charge, then it goes out. If lamp does not light when ignition key is turned on, ground 'GRD' terminal on Cutout Relay, if lamp still does not light replace bulb. See Bulb Specifications below.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22-26	8.7-9.1	3300
Hot	18-21	8.2-8.7	3500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third).
Field Current—2.3-2.6 amperes at 6 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, move generator out or away from engine to take up stretch or slack in belt.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5557. Mounted on engine side of dash. Consists of Cutout Relay and Vibrating Voltage Regulator. See article in Equipment Section for complete data on these units.

Cutout Relay

Cuts In—6.5-7.25 volts, 835 R.P.M., 10 M.P.H.
Cuts Out—3 amperes maximum at 6.3 volts.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.65 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.

Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.
NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open-circuit.
Contact Gap—.015-.025".
Contact Spring Tension—2.7-3.5 ounces.
Air Gap—.060-.070" between armature and center of core with armature down and fibre bumper touching stop; .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, pre-focused, cross-beam type with special non-interchangeable lenses. Headlamps aimed straight ahead with lenses removed. Special assymetrical 'Passing' beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in driving or third position.

Headlamp Beam Indicator—Located at bottom of speedometer dial. Lighted whenever driving or upper headlamp beams are lighted.

Switches

Lighting—Delco-Remy Model 479-S, 479-J Export.
Foot Beam Selector—Delco-Remy Model 471-T.
Instrument Lamp—Delco-Remy Model 1406.
Stop Lamp—Hydraulic type on brake master cyl.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-L
Parking	1½	55
Speedometer, Dash, Indicators	1	51
Oil, Gas, Temp., Tail	3	63
Stop	15	87
Dome	6	81

NOTE—Headlamps are Pre-focused 'Long-Life' type

FUSES:—Fuse Block Model 1050-Z. On lighting switch on back of instrument panel. Two 20 ampere capacity fuses, one spare fuse. Fuse toward rear protects left hand headlamp circuit. Fuse toward engine protects all other lighting circuits.

HORNS:—Klaxon Model K-26-L Type 1601 Std., Model K-33-B, Type 1857 (low note), 1858 (high note) blended tone twin horns operated by horn relay Opt. All horns are vibrator type.

Horn Type	Current at 6 Volts	Air Gap
K-26-L, 1601	6.5-8.5	.025-.029"
K-33-B, 1857	12-14	.045-.050"
K-33-B, 1858	11-13	.036-.040"

NOTE—Twin horns are stamped 'L' (low note—long horn), 'S' (high note—short horn), on motor shell.

Horn Relay:—Model 266-T. Requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.
Contact Gap—.015-.025". **Spring Tension—6-8 ozs.**
Air Gap—.012-.017" with contacts closed.

SERIAL NUMBER:—First number 6CA-1001. Top left frame siderail under engine hood.

COMPRESSION:—Ratio—6.2-1. **Pressure**—140-143 lbs. at 1000 R.P.M. or approx. 115 lbs. at cranking speed.

VACUUM READING:—Steady reading of 18-20" with engine idling at 376 R.P.M. or 7 M.P.H.

IGNITION:—Coil Model 539-L. Mounted on engine side of dash.

Coil Draw—2 amperes idling, 3.5 stopped.

Ignition Switch:—Delco-Remy Model 435-G. Switch and cable assembly. Connected to coil by armored cable.

See Article in Electrical Equipment Section.

Ignition Lock—Briggs & Stratton. #45792 (cylinder), #80203 (case). **Key Series**—8000-9499.

Distributor:—Model 647-D. Single breaker, 6 lobe cam, full automatic advance type with vacuum spark control and Gaselector adjustment at distributor.

Breaker Gap—.020". Limits .018-.024".

Cam Angle or Dwell—36° (closed), 24° (open).

Breaker Arm Spring Tension—17-21 ounces.

Condenser—Part No. 1865972. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	4.0	800
7.5	1000	15.0	2000
8.5	1450	17.0	2900
11.25	2000	28.5	4000

Vacuum Spark Control—Integral with distributor. Mounted on housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port above throttle in carburetor) except when engine accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	9-11"
15° Max.	16-18"

Gaselector—Consists of adjustment at distributor providing 10° advance or retard from center '0' position. See Ignition Timing (below) for setting.

Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line and take out hold-down screw in advance arm.

IGNITION TIMING:—Standard setting as shown. See Gaselector Setting below.

	Flywheel Degrees	Piston Position
All engines	6° BTDC	.0138" BTDC.

NOTE—The two straight lines of the ignition mark '/IGN.1-6/' indicate allowable timing range of 4° on flywheel. Use first or 6° line in setting ignition.

To Set Timing (using Timing Light)—Connect timing light between distributor terminal and ground, turn on ignition. With #1 piston on compression, turn engine over until piston is 6° or .0138" before top dead center, stop when first line of ignition mark '/IGN.1-6/' lines up with pointer in inspection hole in left front face of flywheel housing. Loosen Gaselector thumbnut, center pointer on scale, tighten thumbnut, loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts opening), tighten clamp bolt.

Timing (Synchroscope)—Connect Synchroscope between #1 spark plug cable and distributor cap, fill in first line of flywheel mark '/IGN.1-6/' with white paint or chalk, idle engine at 376 R.P.M. or 7 M.P.H. in high gear, adjust distributor as directed above until line coincides with pointer on housing.

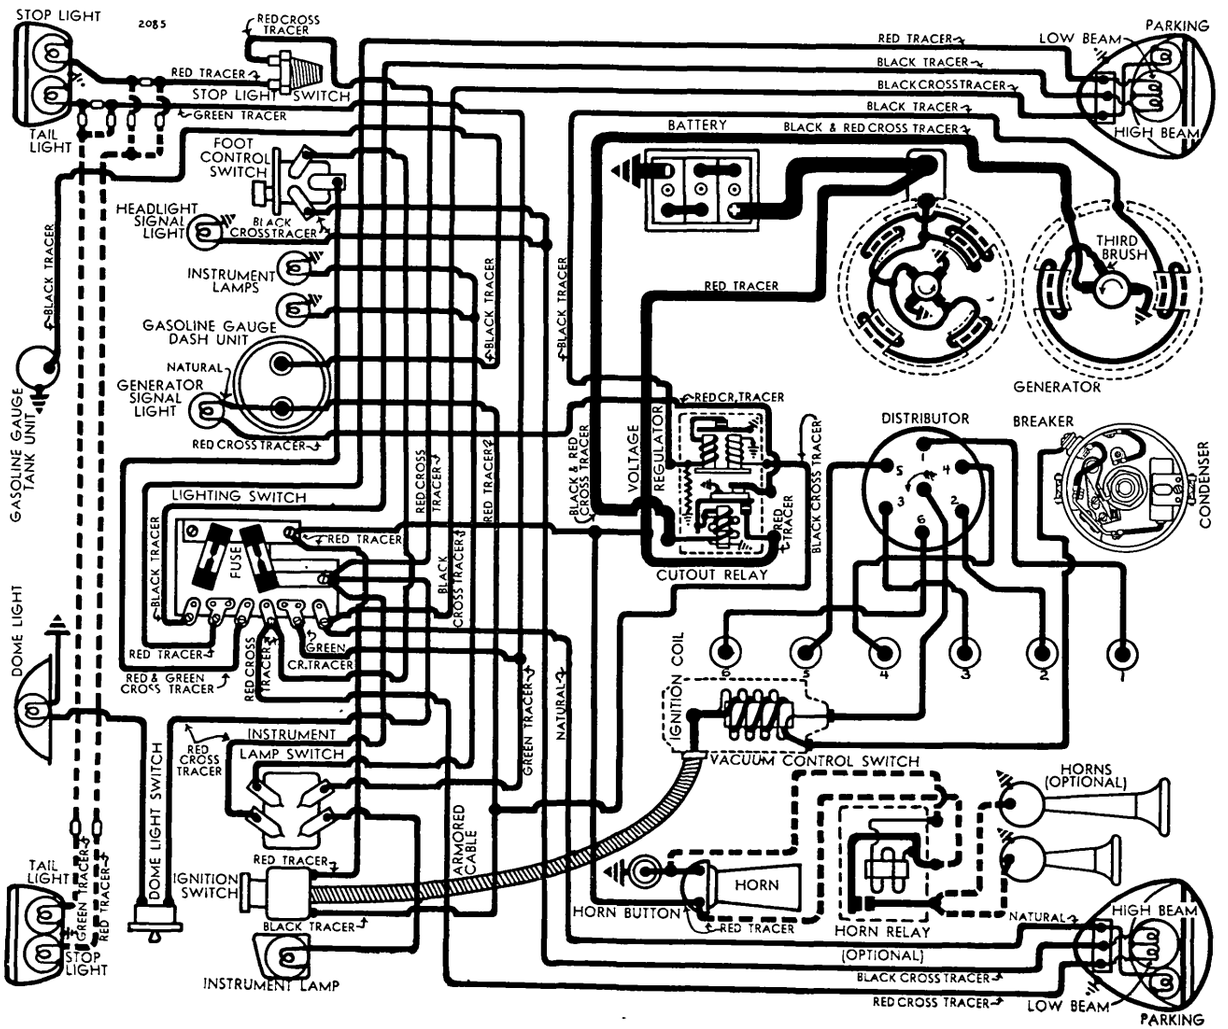
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Gaselector Setting—Should be set to provide best performance without spark knock or ping for particular operating conditions and octane rating of fuel used. To adjust, loosen thumbnut, move pointer clockwise to advance, or counter-clockwise to retard spark.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type K-7. 14 MM. Metric type. NOTE—K-7 discontinued by AC. Use No. 45.

Spark Plug Gaps—.025" (.022" on cars with radio).



CARBURETION:—Carburetor—Carter Models 352-S, 364-S (Taxicab). 1¼" downdraft type.

See Article in Carburetion Section for data.

NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at hot or slow idling speed.

Idle Adjustment—Vacuum Gauge (Tool J-89) recommended. With engine hot, adjust idle adjusting screw to give steady vacuum reading of 18-20" of HG. at idling speed of 376 R.P.M. or 7 M.P.H. To adjust without gauge, set throttle stopscrew for correct idling speed, turn idling adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Setting should be ¾-1½ turns open of the screw from the inner seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever under dust cover at top of carburetor has three holes for pump link engagement. Change for seasonal requirement: Outer Hole (Max. stroke)—Extremely cold weather.

Lower Hole—Ordinary temperatures, std, gasoline.
Inner Hole (Min. Stroke)—Extremely hot weather.

Fast Idle:—Consists of fast idle cam linked to choke mechanism which acts as throttle lever stop. Should not require adjustment. See Carburetion article in Carburetion Section and special article in Carburetion Equipment Section for complete data.

Accelerator Linkage Adjustment:—Must be maintained to provide correct 'throttle cracking' action for starting. To adjust, after setting carburetor idle speed at 6-7 M.P.H., loosen hand throttle wire lockscrew, pull button ⅛" out from instrument board, position hand throttle lever so that no clearance exists between lever and throttle cross shaft, tighten lockscrew. Turn throttle stopscrew in 2 turns (with throttle stopscrew on high point of cam or 'cold' position), disconnect battery cable at starting motor to prevent cranking, fully depress starting pedal, adjust throttle cracking pin so that all clearance between cross shaft lever and accelerator pedal lever is taken up. Connect starting motor cable, reset engine idle speed.

Automatic Choke:—Carter Climatic Control.
See Article in Carburetion Equipment Section.

Air Cleaner:—AC. #1528150 oil-wetted type standard, #1525998 (1st 1038 jobs), #1528304 (after 1038) heavy duty oil-bath type optional.

Fuel Pump:—AC. Type AH #1523109. Diaphragm type. AJ #1523110 (combination fuel and vacuum pump) optional.
See Article in Carburetion Equipment Section.

Gasoline Gauge:—AC. Electric #1515325 (dash unit), #1515450 (tank unit).
See Article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #6 intake valve at .0125". This valve should open with piston 5° or .0096" before top dead center with first straight line of flywheel mark '/IGN.1-6/' slightly past indicator in inspection hole in left front face of housing.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Tappet Clearance:—.011-.013" all valves (hot). For sustained high speed driving .013" exhaust setting is recommended. Use .011" and .013" feelers as 'go' and 'no go' gauges. Remove hood side panel by unfastening two wing nuts at rear and one at top front.

Valve Spring Pressure:—56 lbs. at 1 29/32" (valve closed), 96 lbs. at 1 39/64" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. (refill).
Normal Oil Pressure—35-45 lbs. with warm oil.

BATTERY:—Delco, Type 15-AA. 6 volt, 15 plate, 94 amp. hour capacity (20 hour rate).
Starting Capacity—115 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.3 minutes.

Delco, Type 17-J (Special Equipment). 6 volt, 17 plate, 125 ampere hour capacity (20 hour rate).
Starting Capacity—149 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.5 minutes.
Grounded Terminal—Negative (—) terminal.
Location—Left hand side under front floor board.

STARTER:—Model 729-E. Armature No. 823881. Model 737-C (RHD). Armature No. 1847432.
Drive—Overrunning clutch and manual pinion shift operated by starting pedal (729-E), Bendix Drive (737-C).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—Approx. 200 amperes at 5.0 volts.

Performance Data—729-E

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	60
15 "	Lock	3.0	600

Performance Data—737-C

0 ft. lbs.	6000	5.0	65
15 "	Lock	3.15	570

Removal:—Mounted on left front face of flywheel housing. To remove, take out capscrews.

Starting Switch (729-E):—Part No. 820052. Mounted on starter. Operated by starting pedal.

Starting Switch (737-C):—Magnetic Switch Type 1528. Vacuum Switch Type 1588.

Magnetic Switch

Closes contacts with 7.5-8.5 amperes draw at 3 volts and holds contacts closed with .85-.95 amperes draw at 1.5 volts (hold-in coil only).

Vacuum Switch

Contacts Close—10-14° rotation counter-clockwise from latch position.
Unlatch Action—3.4-4.6" of HG. approximately 30° from latch position.

GENERATOR:—Mod. 948-S. Armature No. 1854856. Mod. 948-Y (Taxicab). Armature No. 1854856. Fixed third brush control with external vibrating voltage regulator. Ventilated by fan on drive pulley.
NOTE—Third brush is clamped in position for maximum safe output and must not be disturbed.
Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data below.
Maximum Charging Rate—22 amperes at 8.0 volts (cold), 18 amperes at 8.0 volts (hot). Reached at car speed of 30-35 M.P.H. To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'GEN' and ground, ground 'F" terminal to eliminate regulator action.
Generator Charge Indicator—Red jewel light at lower left corner of instrument group. Lights when ignition key is turned 'on' and remains lighted until generator begins to charge, then it goes out. If lamp does not light when ignition key is turned 'on', ground 'GRD' terminal on Cutout Relay, if lamp still does not light replace bulb. See Bulb Specifications below.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22	8.0	3000
Hot	18	8.0	3500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces (main), 16-20 ounces (third).
Field Current—2.3-2.6 amperes at 6 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, move generator out or away from engine to take up stretch or slack in belt.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5808. Mounted on engine side of dash. Consists of Cutout Relay and Vibrating type Voltage Regulator.
See Article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5-7.0 volts.
Cuts Out—3 amperes maximum at 6.3 volts.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.
Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.
NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open-circuit.
Contact Gap—.015-.025".
Contact Spring Tension—2.7-3.5 ounces.
Air Gap—.060-.070" between armature and center of core with armature down and fibre bumper touching stop; .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, pre-focused, cross-beam type with special non-interchangeable lenses. Special asymetrical 'Passing' beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in driving or third position.
Headlamp Adjustment—Headlamps must be adjusted with lenses in place (beam with lenses removed is approximately 4° to right). Aim left hand headlamp (by loosening bracket bolt nut) so that upper edge of hot spot is on horizontal line (at lamp center height) and left edge just touches vertical car center line (not lamp center line). Aim right hand headlamp for same beam height but center hot spot on lamp vertical center line (hot spot right cut-off approximately 8" to right of vertical line).
Headlamp Beam Indicator—Located to left of speedometer dial. Lighted whenever driving or upper headlamp beams are lighted.

Switches

Lighting—Delco-Remy Model 480-V, T (Export).
Foot Beam Selector—Delco-Remy Model 471-T.
Dash Lamp—Delco-Remy Model 1406.
Stop Lamp—Hydraulic type on brake master cyl.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-L
Parking, Instrument	1½	55
Dash, Indicators	1	51
Dome	6	81
Tail	3	63
Stop	15	87

FUSES:—Fuse block mounted on lighting switch in back of instrument panel. Two 20 ampere capacity fuses and one spare. Fuse toward rear protects left hand headlamp circuit. Fuse toward engine protects all other lighting circuits.

HORNS:—Klaxon Model K-26-L, Type 1601 std. equipt. Model K-33-B, Type 1857 (low note), 1858 (high note) blended tone twin horns operated by horn relay optional equipment.

Horn Type	Current at 6 Volts	Air Gap
K-26-L, 1601	6.5-8.5	.025-.029"
K-33-B, 1857	12-14	.045-.050"
K-33-B, 1858	11-13	.036-.040"

NOTE—Twin horns are stamped 'L' (low note—long horn), 'S' (high note—short horn), on motor shell.

Horn Relay:—Model 271-C.
Points Close—2.7-4.0 volts.
Contact Gap—.015-.030".
Air Gap—.010-.025" with contacts closed.

SERIAL NUMBER:—First number 8-CA-1001. On left hand frame side rail under hood.

COMPRESSION:—Ratio 6.2-1. Pressure 140-143 lbs. at 1000 R.P.M. or approx. 115 lbs. at cranking speed.

VACUUM READING:—Steady reading of 18-20" with engine idling at 376 R.P.M. or 7 M.P.H.

IGNITION:—Coil Model 539-L. Mounted on engine side of dash.

Coil Draw—3.5 amperes at 6.2 volts.

Ignition Switch:—Delco-Remy Model 435-G. Switch and cable assembly. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton. #45792 (cylinder), #80203 (case). **Key Series**—8000-9499.

Distributor Model 663-X. Single breaker, 8 lobe cam, full automatic advance type with vacuum spark control and Gaselector adjustment at distributor.

Breaker Gap—.0125-.0175" (limits), set at .015".

Cam Angle or Dwell—31° (closed), 14° (open).

Breaker Arm Spring Tension—19-23 ounces.

Condenser—Part No. 1865972. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	4.0	800
5.0	1100	10.0	2200
6.5	1550	13.0	3100
14.0	2100	28.0	4200

Vacuum Spark Control—Integral with distributor. Mounted on housing and linked directly to breaker plate. Provides additional advance at speeds above idling (vacuum port above throttle in carburetor) except when engine accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	4-6"
18-22°	16-21"

Gaselector—Consists of adjustment at distributor providing 10° advance or retard from center '0' position. See Ignition Timing for setting.

Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line and take out hold-down screw in advance arm.

IGNITION TIMING:—Standard setting as shown. See Gaselector Setting below.

	Flywheel Degrees	Piston Position
All engines	6° BTDC	.0128" BTDC

NOTE—The two straight lines of the ignition mark '/IGN.1-8/' indicate allowable timing range of 4° on flywheel. Use first or 6° line in setting ignition.

To Set Timing (using Timing Light)—Connect timing light between distributor terminal and ground, turn on ignition. With #1 piston on compression turn engine over until piston is 6° or .0128" before top dead center, stop when first line of ignition mark '/IGN.1-8/' lines up with pointer in inspection hole in left front face of flywheel housing. Loosen Gaselector thumbnut, center pointer on scale, tighten thumbnut, loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts opening), tighten clamp bolt.

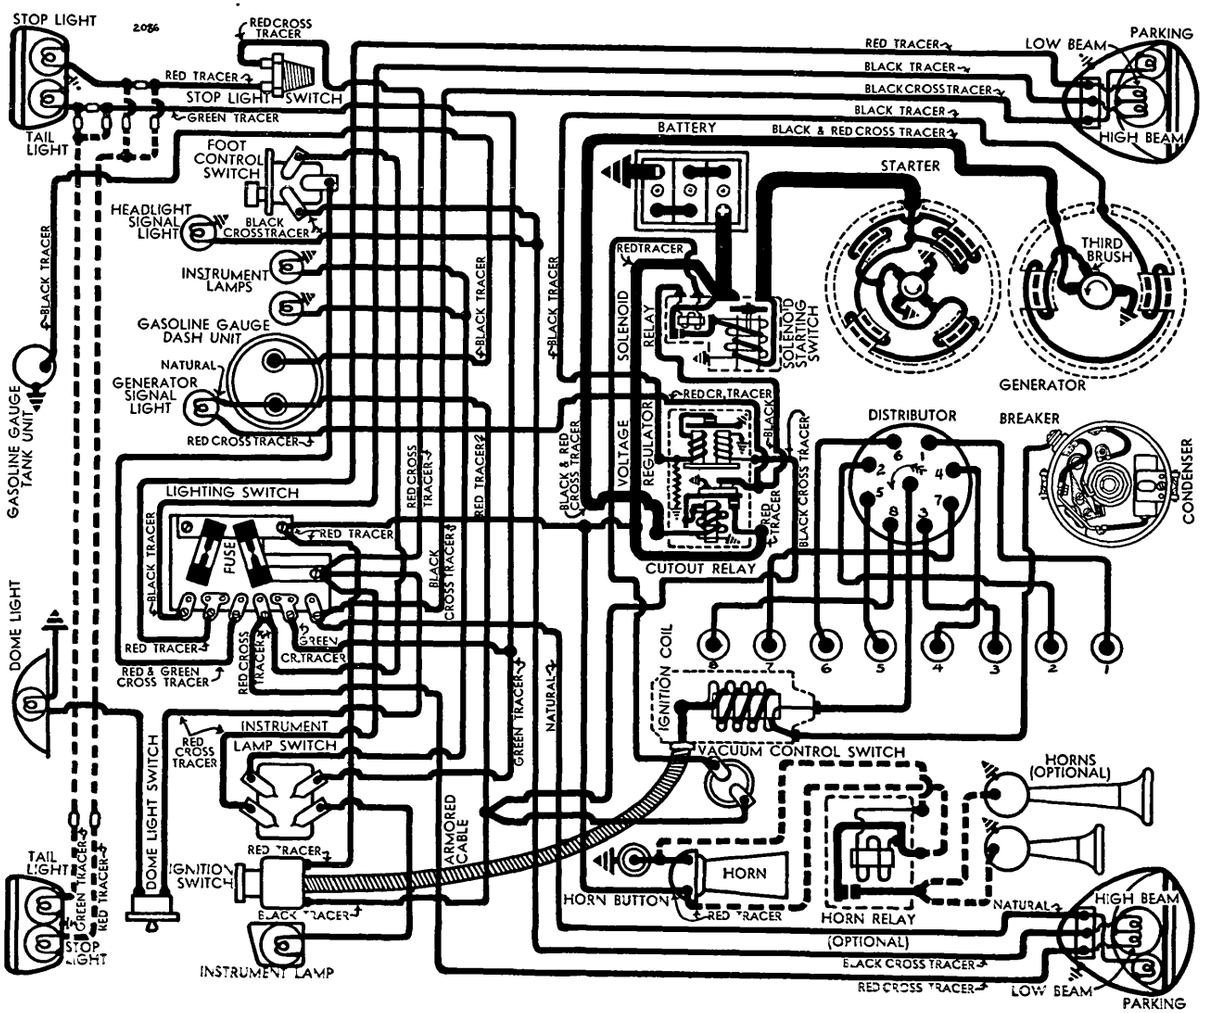
Timing (Synchroscope)—Connect Synchroscope between #1 spark plug cable and distributor cap, fill in first line of flywheel mark '/IGN.1-8/' with white paint or chalk, idle engine at 376 R.P.M. or 7 M.P.H. (in high gear), adjust distributor as directed above until line coincides with pointer on housing.

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Gaselector Setting—Should be set to provide best performance without spark knock or ping for particular operating conditions and octane rating of fuel used. To adjust, loosen thumbnut, move pointer clockwise to advance or counter-clockwise to retard spark.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—AC. Type K-7. 14 MM. Metric type.
NOTE—K-7 discontinued by AC. Use No. 45.



Spark Plug Gaps—.025", (.022" on cars with radio).

CARBURETION:—Carburetor—Carter Model 350-S. 1¼" downdraft type with Carter Climatic Control. **See article in Carburetion Section for data.**

Idle Adjustment—Vacuum Gauge (Tool J-89) recommended. With engine hot, choke valve wide open (fast idle inoperative), set throttle stopscrew to idle engine at 376 R.P.M. or 7 M.P.H., then adjust idle adjusting screw to give steady reading of 18-20" (at average altitudes). To adjust without gauge, proceed as above turning idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in until engine fires smoothly. Readjust throttle stopscrew for correct idling speed if necessary.

Accelerating Pump Setting—Pump lever under dust cover at top of carburetor has three holes for pump link adjustment. Change for seasonal requirements:

Outer Hole (Max. stroke)—Extremely cold weather.
Lower Hole (Med. stroke)—Standard setting.
Inner Hole (Min. stroke)—Extremely hot weather.

Fast Idle:—Consists of fast idle cam linked to choke mechanism which acts as throttle lever stop. Should not require adjustment. See Carburetor article in Carburetion Section and special article in Carburetor Equipment Section for complete data.

Accelerator Linkage Adjustment:—Adjust rod connecting bell cranks on side of manifold so that accelerator pedal just touches floor board with carburetor throttle valve wide open. Release accelerator pedal and with throttle valve in closed position (fast idle inoperative), set adjusting screw in lever at forward end of this connecting rod so that clearance between this lever and lever which operates carburetor throttle valve rod is 5/32-3/16" (1/16" min.), secure locknut. Disconnect vacuum switch operating rod at switch lever, turn switch lever so that pointer lines up with line on switch body, adjust length of rod by turning trunnion on rod until rod can be connected to switch lever without disturbing position of lever. See that hand throttle is fully closed, loosen set screw in throttle cable trunnion (at lower end of cable), adjust cable length so so that clearance between lever at forward end of hand throttle operating rod and carburetor throttle valve rod lever is 1/16" minimum. Check setting after opening and closing hand throttle. These clearances are important.

Automatic Choke:—Carter Climatic Control.
See article in Carburetion Equipment Section.

Air Cleaner:—AC. #1528128 oil-wetted type standard. #1525998 (1st 1038 models), #1528304 (after 1038 models) heavy duty oil-bath type optional.

Fuel Pump:—AC. Type AH #1523109. Diaphragm type. AJ #1523110 combination fuel-and-vacuum pump optional.
See article in Carburetion Equipment Section.

Gasoline Gauge:—AC. Electric. #1515325 (dash unit), #1515450 (tank unit).
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check—Set tappet clearance #1 intake valve at .0125". This valve should open with piston 5° or .0089" before top dead center and first straight line of ignition mark '/IGN.1&8/' slightly past indicator (left front face of housing).
Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Tappet Clearance:—.011-.013" all valves (hot). For sustained high speed set exhaust clearance at .013". Use .011" and .013" feelers at 'go' and 'no go' gauges.
NOTE—Remove hood side panels by unfastening two wing nuts at rear and one at top front (on inside).

Valve Spring Pressure:—56 lbs. at 1 29/32" (valve closed), 96 lbs. at 1 39/64" (valve open).

LUBRICATION:—Crankcase Capacity—7 qts. (refill).
Normal Oil Pressure—35-45 lbs. with warm oil.

BATTERY:—Delco, Type 17-K. 6 volt, 17 plate, 110 amp. hour capacity (20 hour rate).
Starting Capacity—131 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.4 minutes.

Delco, Type 17-J (Police). 6 volt, 17 plate, 125 ampere hour capacity (20 hour rate).
Grounded Terminal—Negative (—) terminal.
Location—Left hand side under front floor boards.

STARTER:—Model 727-S. Armatur No. 823881.
Drive—Overrunning clutch and manual pinion shift operated by solenoid switch.
Cranking Engine—220-225 amperes at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	550	5	65
15 "	Lock	3	600

Removal:—Mounted on left front face of flywheel housing. To remove, take out capscrews.

Starting Switch:—Solenoid Switch Type 1516. Vacuum Switch Type 1605. Solenoid switch controlled through relay by vacuum switch operated by accelerator pedal with ignition switch turned on. See article in Electrical Equipment Section.

Solenoid Switch

Close against 70 lbs. with .5" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—4 volts. **Open**—1.6-2.0 volts.
Contact Gap—.030-.045". **Air Gap**—.010-.014" closed.

Vacuum Switch

Contacts Close—10-14° rotation counter-clockwise from latch position.
Unlatch Action—3.4-4.6" of HG. approximately 30° from latch position.

GENERATOR:—Model 948-S. Armature No. 1854856. Model 948-Y (Taxicab). Armature No. 1854856. Fixed third brush control with external vibrating voltage regulator. Ventilated by fan on drive pulley.
NOTE—Third brush is clamped in position for maximum safe output and must not be disturbed.
Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data below.
NOTE—Do not operate generator on open circuit.
Maximum Charging Rate—22 amperes at 8.0 volts (cold), 18 amperes at 8.0 volts (hot). Reached at car speed of 30-35 M.P.H. To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'GEN' and ground, ground 'F' terminal to eliminate regulator action.
Generator Charge Indicator—Red jewel light at lower left corner of instrument group. Lights when ignition key is turned 'on' and remains lighted until generator begins to charge, then goes out. If lamp does not light when ignition key is turned 'on', ground 'GRD' terminal on Cutout Relay, if lamp still does not light replace bulb. See Bulb Specifications below.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22	8.0	3000
Hot	18	8.0	3500

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces (main), 16-20 ounces (third).
Field Current—2.3-2.6 amperes at 6 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, move generator out or away from engine to take up stretch or slack in belt.

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5808. Mounted on engine side of dash. Consists of Cutout Relay and Vibrating type Voltage Regulator.
See Article in Electrical Equipment Section.

Cutout Relay

Cut In—6.5-7.0 volts.
Cuts Out—3 amperes maximum at 6.3 volts.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 volts at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.
Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ameter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 R.P.M., adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.
NOTE—Regulator cover must be in place when tests are made. Do not operate generator on open-circuit.
Contact Gap—.015-.025".
Contact Spring Tension—2.7-3.5 ounces.
Air Gap—.060-.070" between armature and center of core with armature down and fibre bumper touching stop; .008-.013" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide, Multi-beam, pre-focused, cross-beam type with special non-interchangeable lenses. Special asymetrical 'Passing' beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in driving or third position.
Headlamp Adjustment—Headlamps must be adjusted with lenses in place (beam with lenses removed is approximately 4° to right). Aim left hand head lamp (by loosening bracket bolt nut) so that upper edge of hot spot is on horizontal line (at lamp center height) and left edge just touches vertical car center line (not lamp center line). Aim right hand head lamp for same beam height but center hot spot on lamp vertical center line (hot spot right cut-off approximately 8" to right of vertical line).
Headlamp Beam Indicator—Located to left of speedometer dial. Lighted whenever driving or upper headlamp beams are lighted.

Switches

Lighting—Delco-Remy Model 480-V, T (Export).
Foot Beam Selector—Delco-Remy Model 471-T.
Dash Lamp—Delco-Remy Model 1406.
Stop Lamp—Hydraulic type on brake master cyl.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-L
Parking, Instrument	1½	55
Dash, Indicators	1	51
Dome	6	81
Tail	3	63
Stop	15	87

FUSES:—Fuse block mounted on lighting switch in back of instrument panel. Two 20 ampere capacity fuses and one spare. Fuse toward rear protects left hand headlamp circuit. Fuse toward engine protects all other lighting circuits.

HORNS:—Klaxon Model K-26-L, Type 1601 std. equipt. Model K-33-B, Type 1857 (low note), 1858 (high note) blended tone twin horns operated by horn relay Optl. equipment.

Horn Type	Current at 6 Volts	Air Gap
K-26-L, 1601	6.5-8.5	.025-.028"
K-33-B, 1857	12-14	.045-.050"
K-33-B, 1858	11-13	.036-.040"

NOTE—Twin horns are stamped 'L' (low note—long horn), 'S' (high note—short horn), on motor shell.

Horn Relay:—Model 271-C.
Points Close—2.7-4.0 volts.
Contact Gap—.015-.030".
Air Gap—.010-.025" with contacts closed.

REO

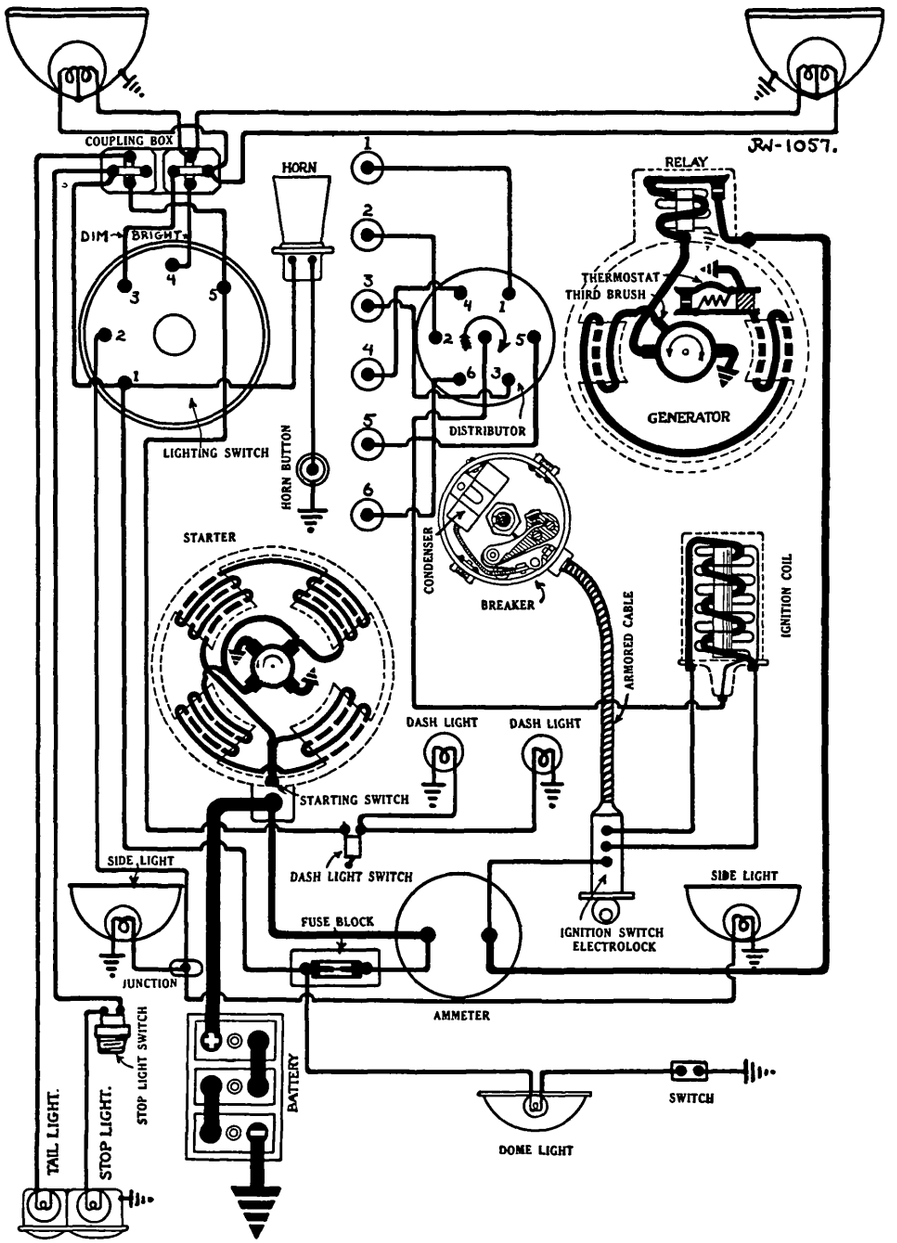
FLYING CLOUD MATE MODEL B2 (1929) MODEL 15 (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type RSB-13, 6 volt, 90 ampere hour. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted on the left frame member.

IGNITION:—Coil Model 528-E. Coil is mounted on the dash. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model 641-D. Breaker contacts separate .020 inch. Set contact gap by loosening lock screw on stationary contact mounting plate directly behind breaker arm and turning eccentric adjusting screw until correct gap is obtained with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 22 degrees reached at 2200 R.P.M. The ignition switch is a Type 5-B Electrolock.

Mounting:—The Electrolock must be disconnected at the dash and removed as a unit with the distributor whenever the distributor is taken off the engine. To remove distributor, disconnect manual advance rod and primary lead and remove distributor head with cables intact. Then take out the stop screw in the manual advance arm and lift the distributor from place. This will not disturb the timing and it will only be necessary in reassembling to make certain the tongue on the distributor shaft enters the groove in the drive shaft. The tongue is offset so that it can not be assembled incorrectly.



Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every month or each 1000 miles. Every 2000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position one-half inch (on the flywheel) before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark control. Remove the inspection cover on the flywheel case and continue to crank engine until the flywheel mark 'UDC' is one half inch before the mark on the housing. Then take off distributor cap and loosen the advance arm clamp screw. Rotate the distributor until the contacts begin to separate. Tighten the clamp screw and connect the segment opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head. There is a small plug in the cylinder head directly above piston in cylinder No. 6. If a timing gauge is available this plug should be removed and the timing gauge screwed into the opening. The engine can then be timed with piston No. 1 on compression stroke but piston position is gauged in cylinder No. 6.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. Gaps are .025 inch.

VALVE TIMING:—Inlet valves open at top dead center. To set valve timing, first check tappet clearance. This should be .005 inch (inlet) and .007 inch (exhaust) with engine hot. Then crank engine over until piston No. 6 enters compression stroke. Take out the small pipe plug in the cylinder head

REO

FLYING CLOUD MATE MODEL B2 (1929) MODEL 15 (1930)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

directly over piston No. 6 and determine compression stroke by holding the thumb over the hole until compression is felt. Then insert a wire in the hole and crank engine over until piston reaches top dead center when the upward movement of the wire will cease or remove inspection hole cover in flywheel housing and crank engine until the flywheel mark 'UDC' is directly opposite the mark in the housing. Inlet valve in cylinder No. 1 should begin to open at this point. The crankshaft sprocket and the camshaft sprocket are marked to aid in setting valve timing. There should be eleven links in the timing chain between the marks on the two sprockets.

STARTER:—Model 726-E. Starter is connected to the engine through a mechanical pinion shift interconnected to the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect pedal rod linkage and cable and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of oil in the bearing oiler every month or each 1000 miles.

GENERATOR:—Model 955-L. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting maximum charging rate is 19 amperes (cold) reached at 1550 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.7	1550	9-12	7.35-7.65	1800-2000

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and take out two flange mounting cap screws. Then pull generator to rear and lift from place.

Adjustment of Timing Chain:—Timing chain is adjusted by shifting the generator. To adjust chain, loosen the flange mounting screws and turn up the adjusting set screw until the chain begins to hum with the engine running. Then back off the set screw until the chain runs noiselessly and tighten the mounting screws.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 8-10 M.P.H. when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 3 amperes. Contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 482-F. Lighting switch is mounted at lower end of steering column. Headlights are double filament using the second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 3 cp. D.C. Mazda 64.

FUSES:—Lighting fuse mounted on block on dash is 20 ampere capacity.

REO

FLYING CLOUD MASTER MODEL C (1929)
MODELS 20 AND 25 (1930)
DELCO-REMY SYSTEM

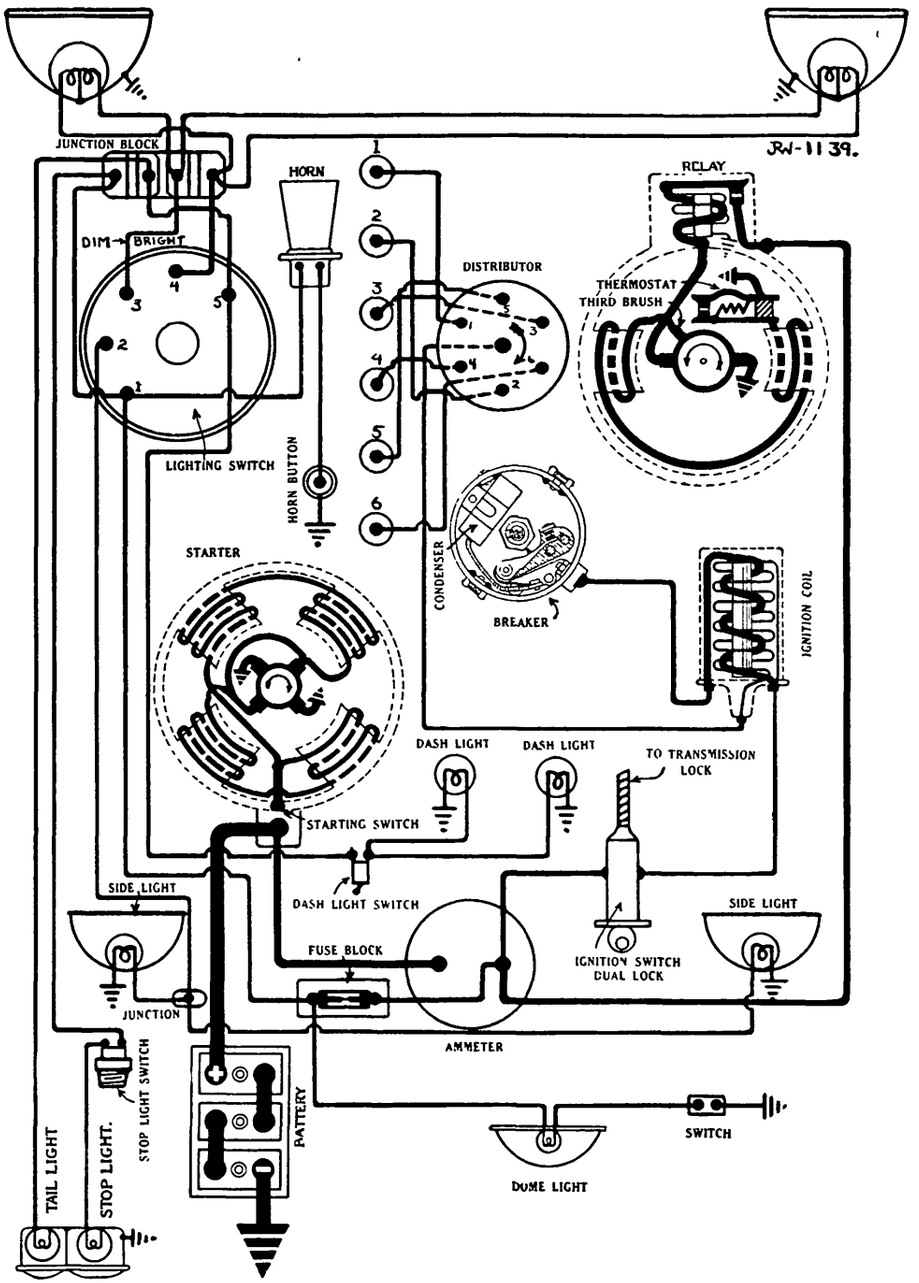
BATTERY:—Willard, Type SJRR-4, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours.

IGNITION:—Coil Model 528-E. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes at 6 volts with engine stopped. Ignition coil is mounted on the dash.

Distributor Model 640-G ('29), S ('30). Contact gap .018-.024". Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until proper clearance is secured with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 19 degrees reached at 3000 R.P.M. (640-G), 2200 R.P.M. (640-S). Ignition Switch—Delco-Remy Dual lock Model 425-C ('29), 425-R ('30).

Mounting:—Ignition coil is mounted on the dash. Distributor is mounted on cylinder head and is driven by spiral gears from the camshaft. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with high tension cables intact. Then loosen distributor clamp screw and lift distributor from place.

Oiling:—Refill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles. Put a small amount of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.



Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position 1¼ inches (on the flywheel) before top dead center with the manual spark control in the fully advanced position (pushed all the way in). To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance manual spark control by pushing spark button all the way in. Remove inspection hole cover in flywheel case and continue to turn engine over until a point on the flywheel 1¼ inches before the top dead center mark 'UDC #1' is directly in line with the indicator on the flywheel case. Then loosen advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and see that the segment in the distributor head directly opposite the rotor is connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs as shown on the diagram.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18MM. Metric. Gaps are .030 inch.

VALVE TIMING:—Specifications:—Head diameter, 1 13/16 inches. Stem diameter, 11/32 inch. Valve lift, 5/16 inch. Spring pressure, 58 pounds (valve (closed) and 90 pounds (valve open). Tappet clearance, .008" (both intake and exhaust valves).

Timing:—Inlet valves open at TDC. and close 40° ('29), 50° ('30) after lower dead center. Exhaust valves open 48 degrees before lower dead center and close 2 degrees after top dead center. The flywheel is marked 'UDC #1. Int. Open' at point of inlet opening of cylinder No. 1.

REO

FLYING CLOUD MASTER MODEL C (1929)
MODELS 20 AND 25 (1930)
DELCO-REMY SYSTEM

To Set Valve Timing:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. See Generator Mounting for chain adjustment.

STARTER:—Model 724-M & V. Starter is connected to engine through a mechanical pinion shift and an overrunning clutch. The direction of rotation of the armature shaft is clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3500	5	70
22 "	Lock	3	600

Mounting:—Starter is mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles. Every six months or each 5000 miles, remove the grease plug in the gear case and repack the reduction gears with medium cup grease.

GENERATOR:—Model 955C (20), 955-G (C, 25). Direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 160°F. cutting a resistance in the field circuit and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 18-19 amperes (cold) reached at 1550 R.P.M. or 25-26 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.7	1550	9-12	7.35-7.65	1800-2000

Motoring freely, generator draws 5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension should be 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine at rear of timing chain case. To remove generator, disconnect generator lead and remove flange mounting cap screws. Then slide generator to the rear. Generator drive is by slotted tongue from chain sprocket. Adjustment of timing chain is provided by loosening the generator mounting screws and moving the generator sideways. The chain should be loose enough to run noiselessly.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is 3 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed.

LIGHTING:—Delco-Remy Switch Model 482-F. Switch is mounted at lower end of steering column. Headlights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash and tail lights are each 6-8 volt, 3 cp.

FUSES:—Lighting fuse on block mounted on the dash is 20 amperes.

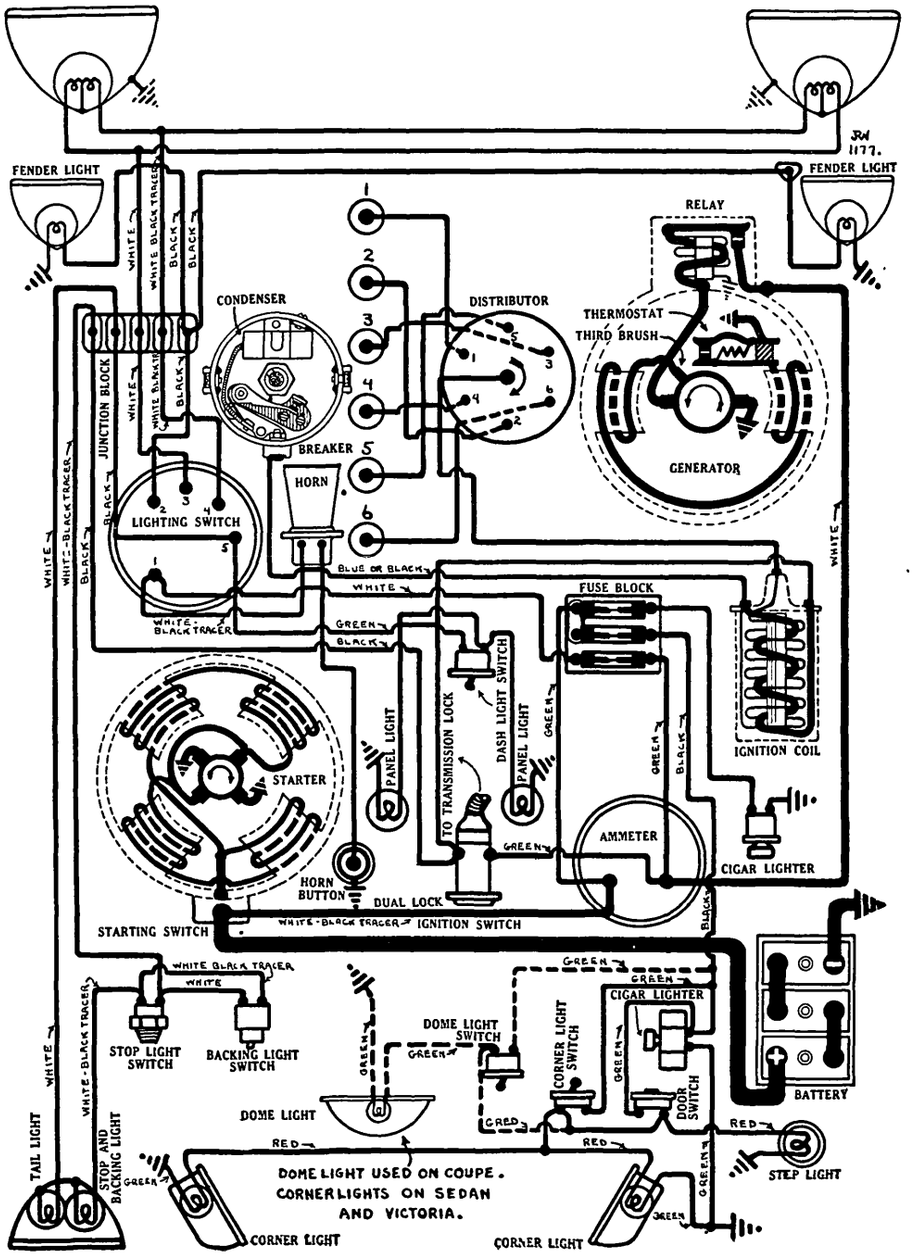
BATTERY:—Willard, Type SJRR-4. 6 volt, 111 ampere hour. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Battery is mounted on the right frame member.

IGNITION:—Coil Model 528-E. Coil is mounted on the dash. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped. The ignition switch is a Delco-Remy Dual-lock Model 425-R.

Distributor Model 640-S. Breaker contacts separate .018-.024 inch. Set the contact gap by loosening lock screw on stationary contact mounting plate and turning up eccentric adjusting screw until gap is .020 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 400 R.P.M. of the engine. Maximum automatic advance is 19 degrees reached at 2200 R.P.M.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles of operation. Remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil. Put one drop of oil on the breaker arm pivot pin and place a small bit of vaseline on the face of the breaker cam.



Timing:—Breaker contacts begin to open when the piston entering the power stroke reaches a position 1¼ inches (measured on the flywheel) before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance the manual spark control (push the button in toward the dash) and remove the timing inspection cover over the inspection hole in the flywheel case. Then turn engine over until a point on the flywheel 1¼ inches before the top dead center mark 'UDC#1' is opposite the indicator on the housing. Loosen the advance arm clamp screw and rotate the distributor until the contacts begin to open. Tighten the clamp screw and see that the segment in the distributor head opposite the rotor is connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18 MM. Metric. Champion No. 11. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 13/16 inches. Stem diameter, .3437 inch. Stem length, 5¾ inches. Valve lift, 5/16 inch. Spring pressure, 58-60 pounds (spring length, 2⅜ inches), 90 pounds (spring length, 2 1/16 inches). Tappet clearance, .007 inch. Inlet valves open at top dead center and close 50 degrees after lower dead center. The flywheel is marked 'UDC#1' at inlet opening point for cylinder No. 1.

EXHAUST VALVES. Head diameter, 1 13/16 inches. Stem diameter, .3437 inch. Stem length, 5¾ inches. Valve lift, 5/16 inches. Spring pres-

sure, 58-60 pounds (spring length, 2⅜ inches), 90 pounds (spring length, 2 1/16 inches. Tappet clearance, .007 inch. Exhaust valves open 48 degrees before lower dead center and close 2 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Set Valve Timing:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—Model 728-M. Starter is connected to the engine through a set of reduction gears and overrunning clutch by means of a mechanical pinion shift interconnected with the starting switch. The direction of rotation is clockwise (armature shaft), viewed from the commutator end. Starter cranks the engine at 150 R.P.M. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3	600

Mounting:—Starter is flange mounted at left of engine on the forward face of the flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out three flange mounting capscrews. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter oilers every month or each 1000 miles of operation. Every six months or each 5000 miles remove the grease plug in the reduction gear case and repack gears with graphite grease.

GENERATOR:—Model 955-G. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round lock screw on the outside of the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting the maximum charging rate is 18-19 amperes reached at 1550 R.P.M. or 25-26 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.7	1550	9-12	7.5	2000

Generator, motoring, draws 5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on the rear face of the timing chain case. To remove generator, disconnect lead and take out flange mounting cap screws. Then slide generator to the rear to disengage drive coupling and lift from place. Generator is driven through a slotted tongue coupling by the accessory sprocket which is mounted independently in the chain case. The timing chain tension is adjusted by shifting the generator. To take up timing chain, loosen the three mounting screws and shift the generator away from the engine. Tighten the mounting screws and operate the engine. If the chain hums, the adjustment is too tight and the generator must be backed off slightly. With proper adjustment the chain should run noiselessly. Do not operate the engine unless the generator mounting screws are tight.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator field frame. Relay contacts close at 575 R.P.M. when the generator voltage reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap should be .014-.020 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 482-F. Lighting switch is mounted at the base of the steering column and is controlled by a lever on the steering wheel. Double filament headlight bulbs are used. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights (on fenders) are 6-8 volt, 3 cp. S.C. Mazda 63. Stop and backing lights are each 6-8 volt, 15 cp. S.C. Mazda 87. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 3 cp. D.C. Mazda 64.

FUSES:—Lighting fuses mounted on the dash fuse block are 20 ampere

CAR SERIAL NUMBER:—Stamped on left frame member near steering gear housing.

ENGINE NUMBER:—Stamped on nameplate on left side of crankcase behind oil filler.

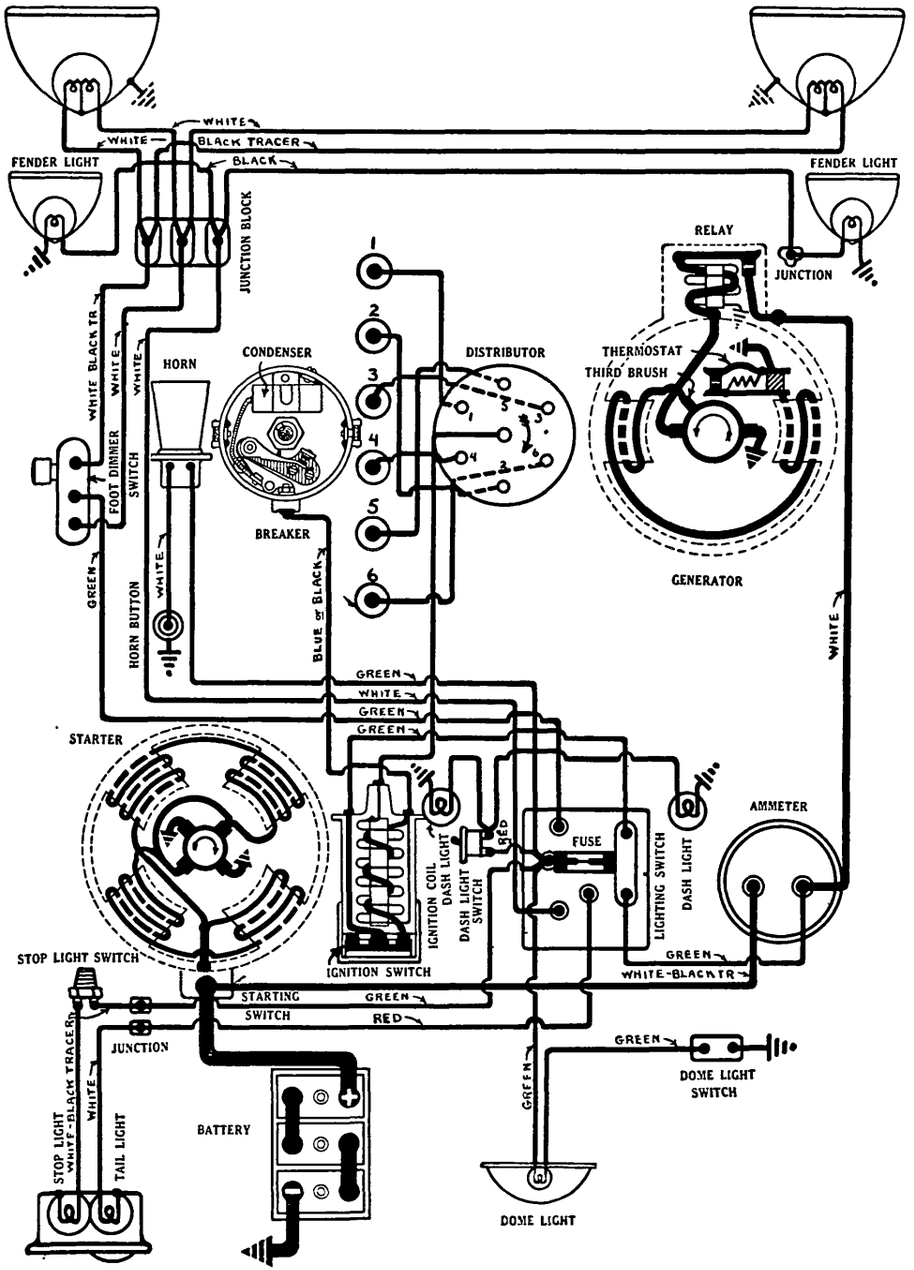
BATTERY:—**Willard, Type WH-2-15,** 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate). Starting capacity 140 amperes for 20 minutes. Negative (—)terminal grounded. Battery mounted on left frame member under driver's seat. Battery size 7 1/6 inches wide, 10 5/16 inches long, 9 5/16 inches high.

IGNITION:—**Coil Model 533-R.** The ignition switch is built in the base of the coil. Coil is mounted on the dash with the ignition switch extending through to the face of the instrument panel. Ignition current is 2.5 amperes at 6 volts with engine running and 4.5-5 amperes at 6 volts with engine stopped.

Distributor Model 640-S. Breaker contacts separate .018-.024 inch. Set the contact gap by loosening lock screw on stationary contact mounting plate and turning up eccentric adjusting screw until gap is .020 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a flat contact file or on a medium hard oilstone. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). Distributor is semi-automatic. Maximum manual advance 25 degrees (engine).

Cam Angles—Closed 36°. Open 24° (distributor degrees).

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start	.....	200	1	.....	400
5	.....	400	10	.....	800
9.5	.....	1100	19	.....	2200



Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles of operation. Remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil. Put one drop of oil on the breaker arm pivot pin and place a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position 1¼ inches (measured on the flywheel) before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance the manual spark control (push the button in toward the dash) and remove the timing inspection cover over the inspection hole in the flywheel case. Then turn engine over until a point on the flywheel 1¼ inches before the top dead center mark 'UDC#1' is opposite the indicator on the housing. Loosen the advance arm clamp screw and rotate the distributor until the contacts begin to open. Tighten the clamp screw and see that the segment in the distributor head opposite the rotor is connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18 MM. Metric. Champion Type C-7. Gaps are .025 inch.

REO

FLYING CLOUD SIX MODEL 6-21 (1931-32)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

VALVE TIMING:—Valves at right of engine. Camshaft chain driven in tandem with generator sprocket. Chain adjusted manually—see Generator mounting.

Valve Specifications

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 13/16"	3437"	5¾"	45°	5/16"
Exhaust	1 13/16"	3437"	5¾"	45°	5/16"

Tappet Clearance		Spring Pressure	
Intake	.007" (hot)	Closed	58-60 pounds (2⅜")
Exhaust	.007" (hot)	Open	90 pounds (2 1/16")

Timing

Intake valves open at top dead center. Close 50° after lower dead center. Flywheel marked 'UDC.#1' at point of inlet opening of No. 1 cylinder. Exhaust valves open 45° before lower dead center. Close 2° after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing. Check tappet clearance No. 1 intake valve (set at .007 inch). With No. 6 piston on compression stroke turn engine over until piston reaches top dead center with flywheel mark 'UDC.#1' opposite indicator on flywheel housing. No. 1 intake valve should begin to open at this point.

To Set Valve Timing:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. See Generator Mounting for chain adjustment.

STARTER:—**Model 722-J.** Starter is connected to the engine through a set of reduction gears and a Bendix drive. The direction of rotation is clockwise (armature shaft), viewed from the commutator end. Starter cranks the engine at 150 R.P.M. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	R.P.M.
0 lb. ft	3500	5	70
22 "	Lock	3	600

Mounting:—Starter is flange mounted at left of engine on forward face of the flywheel housing. To remove starter, disconnect cable and starting switch control and take out three flange mounting cap screws. Then pull starter forward to clear Bendix drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter oilers every month or each 1000 miles of operation. Every six months or each 5000 miles remove the grease plug in the reduction gear case and repack gears with graphite grease.

GENERATOR:—**Model 955-G.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed lock screw on the outside of the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. With standard car setting, the maximum charging rate is 18-19 amperes reached at 1550 R.P.M. or 25-26 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.7	1550	9-12	7.3-7.6	1800-2000

Generator motoring draws 5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on the rear face of the timing chain case. To remove generator, disconnect lead and take out flange mounting cap screws. Then slide generator to the rear to disengage drive coupling and lift from place. Generator is driven through a slotted tongue coupling by the accessory sprocket which is mounted independently in the chain case.

Chain Adjustment. The timing chain tension is adjusted by shifting the generator. To take up timing chain, loosen the three mounting screws and shift the generator away from the engine. Tighten the mounting screws and operate the engine. If the chain hums, the adjustment is too tight and the generator must be backed off slightly. With proper adjustment the chain should run noiselessly. Do not operate the engine unless the generator mounting screws are tight.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles of operation.

RELAY:—**Model 265-B.** Relay is mounted on the generator field frame. Relay contacts close at 575 R.P.M. when the generator voltage reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap should be .014-.020 inch with contacts closed.

LIGHTING:—**Soreng-Manegold Switch, Model 5670-AA. Delco-Remy Dimmer Switch, Model 465-H.** Lighting switch is mounted on the instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated dimmer switch on toeboard.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda Number
Headlights	6-8	21-21	DC	1110
Fender lights	6-8	3	SC	63
Dash and tail lights	6-8	3	SC	63
Stop and backing lights	6-8	15	SC	87
Dome light	6-8	3	DC	64

FUSES:—Lighting fuse mounted on the back of the lighting switch is 20 ampere capacity.

GASOLINE GAUGE:—K-S Telegauge hydrostatic type (see Carburetion Section).

FUEL PUMP:—Van Sicklen mechanical fuel pump mounted on left side of crankcase.

HORNS:—Klaxon Model K-18-C vibrator type. Current draw 5.5-6.5 amperes at 6 volts.

REO

FLYING CLOUD EIGHT MODEL 8-21 AND 8-25 (1931-32)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

CAR SERIAL NUMBER:—Stamped on left frame member near steering gear housing.

ENGINE NUMBER:—Stamped on nameplate on left side crankcase behind oil filler.

BATTERY:—**Willard, Type WH-2-15.** 6 volt, 15 plate, 119 ampere hour capacity (20 hour rate). Starting capacity 140 amperes for 20 minutes. Negative (—) terminal grounded. Battery mounted on left frame member under driver's seat. Battery size 7 1/16 inches wide, 10 5/16 inches long, 9 5/16 inches high.

IGNITION:—Coil Model 533-R. The ignition switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the switch extending through to the face of the instrument panel. Ignition current is 2.5 amperes at 6 volts with engine running and 4.5-5 amperes at 6 volts with engine stopped.

Distributor Model 660-S. Breaker contacts separate .018-.024 inch. Set contacts by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until gap is .020 inch. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). Breaker has two sets of contacts on a four lobe cam. Contacts open alternately at 45 degree intervals corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized—see Timing. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine).

Cam Angles—Closed 34°. Open 11° (distributor) when synchronized.

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		400	2		800
10		1250	20		2500

Mounting:—Distributor is mounted on the generator at the right of the engine. To remove distributor, disconnect primary lead and manual spark control and take off distributor cap with cables intact. Then take out mounting screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup under the distributor cup with medium cup grease and turn down two turns every 1000 miles of operation. Once each month remove the distributor head and rotor and oil the wick oiler in the center of the shaft, put one drop of oil on the breaker pivot posts and place a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section. Contacts can be synchronized directly after distributor has been timed to the engine by cranking engine over 90 degrees to firing position of piston No. 6. Then loosen the lock screws on the movable sub-plate (on which the second set of contacts are mounted) and turn the eccentric adjusting screw until contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position 5 degrees before top dead center with the manual spark control fully advanced. To set timing, crank engine over until No. 1 piston enters compression stroke (the up stroke with both valves close). Remove the cover over the flywheel inspection hole and fully advance manual spark control (push spark button all the way in toward the dash). Turn engine over until the flywheel mark 'Intake Opens' (which is 5 degrees before the top dead center mark 'UDC.1-8') is opposite

REO

FLYING CLOUD EIGHT MODEL 8-21 AND 8-25 (1931-32)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

the indicator. Then loosen the advance arm clamp screw and rotate the distributor until the first set of contacts (mounted on the base plate) begin to open. Tighten the clamp screw and connect the spark plugs as indicated on the diagram. The second set of contacts (mounted on the movable sub-plate) begin to open 45 degrees after this point when piston No. 6 reaches firing position.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—18MM. Metric. Champion Type C-7. Set gaps at .025 inch.

VALVE TIMING:—Valves at right of engine. Camshaft chain driven from crankshaft in tandem with generator drive sprocket. Chain adjusted manually (see Generator Mounting).

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 33/64"	5/16"	5 59/64"	45°	.344"
Exhaust	1⅜"	5/16"	5 57/64"	45°	.344"

Tappet Clearance		Spring Pressure	
	Operating Timing		
Intake	.007" (hot)-.012" (cold)	Closed	45.6 pounds (2¼")
Exhaust	.007" (hot)-.012" (cold)	Open	108 pounds (1 29/32")

Timing

Intake valves open 5° before top dead center . Close 40° after lower dead center. Flywheel marked 'Intake Opens' at point of intake opening for cylinder No. 1.

Exhaust valves open 50° before lower dead center. Close 5° after top dead center. Valve stem guides removable. Valves are made with oversize stems.

To Check Valve Timing. Turn engine over until piston No. 1 is on top dead center entering power stroke. Set tappet clearance of No. 1 inlet valve at .012 inch. Turn engine over one complete revolution and stop with the piston 5 degrees before top dead center when the flywheel mark 'Intake Opens' (which is 5 degrees before the top dead center mark 'UDC.1-8') is opposite the indicator on the flywheel housing. The No. 1 inlet valve should begin to open at this point. Reset tappet clearance at .007 inch running clearance with engine hot.

To Set Valve Timing. It is necessary to lift the engine from the chassis in order to get at the timing chain. To remove the chain, first crank engine over until No. 1 piston is at firing position. Then loosen generator mounting bolts and back off generator toward the engine. The chain can then be lifted off the generator sprocket and removed endless. When the chain is reinstalled, the distributor rotor should be turned to position opposite No. 1 segment and it will not be necessary to retime the engine.

To assemble timing chain, turn crankshaft until No. 1 piston is on top dead center. Mesh timing chain so that there are thirteen links or fourteen pins between the marks on the camshaft sprocket and crankshaft sprocket (inclusive of the chain teeth meshed opposite the marks). Timing chain is adjusted by shifting generator. See Generator Mounting.

STARTER:—Model 722-K. Starter is connected to the engine through a set of reduction gears and a Bendix drive. The direction of rotation (armature shaft) is clockwise, viewed from the commutator end. Starter cranks the engine at 80 R.P.M. Brush spring tension should be 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	R.P.M.
0 lb. ft	3500	5	70
22 "	Lock	3	600

Mounting:—Starter is flange mounted at the left of the engine on the forward face of the flywheel housing. To remove starter, disconnect cable and starting switch control and take out three flange mounting cap screws. Pull starter forward to clear Bendix drive and lift from place.

GENERATOR:—Model 940-X. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed lock screw on the outside of the end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting the maximum charging rate is 20 amperes reached at 1550 R.P.M. or 25-26 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.7	1550	9-12	7.5	2000

Generator motoring draws 5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on the rear face of the timing chain case. To remove generator, disconnect all ignition wiring or remove distributor. Loosen generator adjusting screw and remove cover plate on front face of chain case. Then take out two generator flange mounting bolts. Shift generator toward engine and lift off timing chain. The generator can then be lifted out. Tie up the chain and do not crank engine over with the generator out.

Timing Chain Adjustment. Timing chain is adjusted by shifting the generator. To take up timing chain, loosen the two flange mounting bolts and turn up the adjusting screw until there is ½ inch up and down play in the chain between the generator sprocket and the camshaft sprocket. Tighten the mounting bolts. If the chain hums the adjustment is too tight. Do not make this adjustment with the engine running and do not run engine until generator bolts have been tightened.

Oiling:—Put 8 or 10 drops of light engine oil in the generator bearing oilers on the commutator end every month or each 1000 miles of operation. Fill distributor drive gear compartment with fibre grease.

RELAY:—Model 265-B. Relay is mounted on the generator field frame. Relay contacts close at 575 R.P.M. when the generator voltage reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap should be .014-.020 inch with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 5670-AA. Delco-Remy Dimmer Switch, Model 465-H. Lighting switch is mounted on the instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot operated dimmer switch on toeboard.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda Number
Headlights	6-8	21-21	DC	1110
Fender lights	6-8	3	SC	63
Dash and tail lights	6-8	3	SC	63
Stop and backing light	6-8	15	SC	87
Dome lights	6-8	3	DC	64

FUSES:—Lighting fuse mounted on the back of the switch is 20 ampere capacity.

GASOLINE GAUGE:—K-S Telegauge hydrostatic type (see Carburetion Section).

FUEL PUMP:—AC Type 'B' mechanical fuel pump mounted on right side of crankcase (see Carburetion Section).

HORNS:—Klaxon Model K-18-C vibrator type. Current draw 5.5-6.5 amperes at 6 volts.

ROYALE EIGHT, MODELS N-35, N-52 (1931-32), SERIAL NUMBERS 35N-1 UP
ROYALE EIGHT, MODEL N-31 (1931-32)
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—Stamped on left frame member near steering gear housing.

ENGINE NUMBER:—Stamped on plate on left side of crankcase.

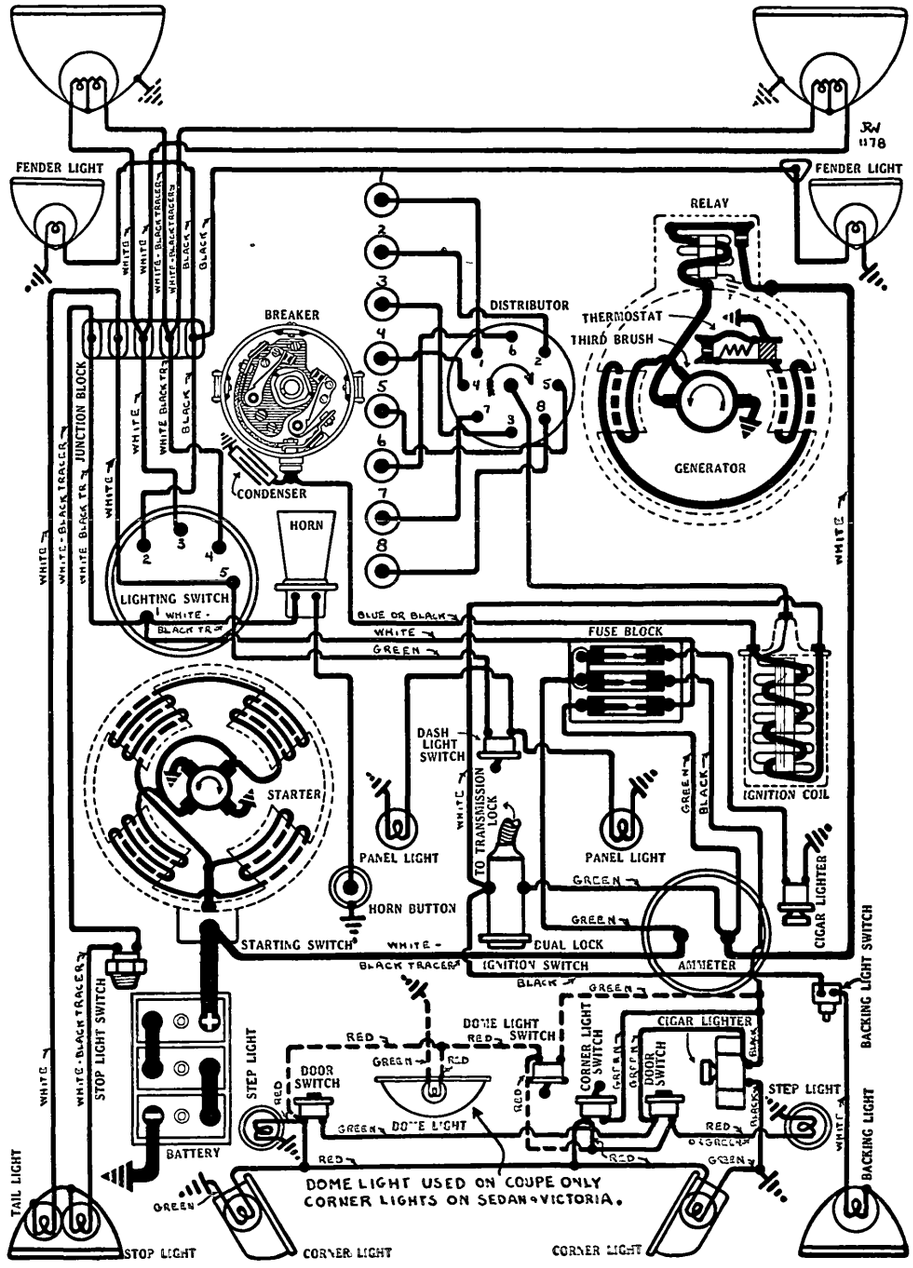
BATTERY:—Willard, Type RJ-4-15. 6 volt, 15 plate, 128 ampere hour capacity 20 hour rate). Negative (—) terminal grounded. Battery mounted on right frame member under right front fender (accessible after taking out 4 screws and removing battery box cover in fender). Battery size 7 1/16 inchs wide, 11 11/16 inches long, 9¾ inches high.

IGNITION:—Coil Model 528-E. Coil is mounted on the dash. Ignition current is 2.5 amperes at 6 volts with engine running and 4.5-5 amperes at 6 volts with engine stopped. The ignition switch is a Delco-Remy Dual-lock, Model 425-R or 425-T (four speed transmission).

Distributor Model 660-K. Breaker contacts separate .020 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning up eccentric adjusting screw. Resurface contact when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). Breaker has two sets of contacts operating on a four lobe cam. Contacts open alternately at 45 degree intervals corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized (see Timing). Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine).

Cam Angles—Closed 34°. Open 11° (distributor) when synchronized.

Automatic Advance



Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	3		800
11		1600	22		3200

Mounting:—Distributor is mounted on the cylinder head and can be removed from the left side. To remove distributor, disconnect primary lead and manual spark control and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles of operation. Once each month remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil. Put one drop of oil on the breaker arm pivot pins and place a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over exactly 90 degrees when piston No. 6 will reach firing position (¾ inch before top dead center with manual spark control fully advanced). If the second set of contacts (mounted on the movable sub-plate) do not begin to open at this point, loosen the lock screws and turn the eccentric adjusting screw until contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position ¾ inch before top dead center (measured on the flywheel) with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance the manual spark control (push the spark button all the way in toward the dash) and remove the timing inspection cover plate over the inspection hole in the flywheel housing. Turn engine over until

a point ¾ inch before the top dead center mark for cylinders Nos. 1 and 8 is directly opposite the indicator on the flywheel housing. Then loosen the advance arm clamp screw and rotate the distributor until the first set of contacts (mounted directly on the breaker plate) begin to open. Tighten the clamp screw and see that the distributor head segment opposite the rotor is connected to the spark plug in cylinder No. 1. The second set of contacts open 45 degrees after this point when piston No. 6 reaches firing position.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18 MM. Metric. Champion Type C-7. Gaps are .025 inch.

VALVE TIMING:—Valves at right of engine. Camshaft chain driven from crankshaft in tandem with generator drive sprocket. Chain adjusted manually by shifting generator—see Generator Mounting.

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 13/16"	.3437"	5¾"	45°	11/32"
Exhaust	1 11/16"	.3437"	5¾"	45°	11/32"

Tappet Clearance		Spring Pressure	
Operating	Timing		
Intake .008" (hot)	-.012" (cold)	Closed 90 pounds	(2⅜")
Exhaust .008" (hot)	-.012" (cold)	Open 85 pounds	(2 1/32")

Timing

Intake valves open at top dead center. Close 50° after lower dead center. Exhaust valves open 48° before lower dead center. Close 2° after top dead center. Valve stem guides are removable. Valves with oversize stems not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .012 inch. With No. 8 piston on compression stroke turn engine over until piston is on top dead center with dead center mark on flywheel at indicator on flywheel housing. No. 1 intake valve should open at this point. Reset tappet clearance at .008 inch with engine hot.

To Set Valve Timing:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers. See Generator Mounting for chain adjustment.

STARTER:—Model 728-M. Starter is connected to the engine through a mechanical pinion shift and a set of reduction gears. Pinion shift is interconnected with the starting switch pedal. The direction of rotation is clockwise (armature shaft), viewed from the commutator end. Brush spring tension is 24-28 ounces. Starter cranks the engine at 80 R.P.M. drawing 200 amperes.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3.25	550

Mounting:—Starter is flange mounted at the left of the engine on the forward face of the flywheel housing. To remove starter, disconnect cable and starting pedal linkage and take out three flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles of operation. Every six months or each 5000 miles remove the grease plug in the reduction gear case and repack gears with medium cup grease.

GENERATOR:—Model 955-G. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round lock screw on the outside of the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting the maximum charging rate is 19-21 amperes at 8.4 volts reached at 1550 R.P.M. or 38-42 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.7	1550	9-12	7.5	2000

Generator, motoring, draws 5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on the rear face of the timing chain case. To remove generator, disconnect lead and take out flange mounting cap screws. Then slide generator to the rear to disengage drive coupling and lift from place. Generator is driven through a slotted tongue coupling by the accessory sprocket which is mounted independently in the chain case. The timing chain tension is adjusted by shifting the generator. To take up timing chain, loosen the three mounting screws and turn up the adjusting set screw until the chain begins to hum with the engine running. Then back off the set screw until the chain runs noiselessly and tighten the mounting screws.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator field frame. Relay contacts close at 575 R.P.M. when the generator voltage reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contact gap is .015-.025 inch. Air gap should be .014-.020 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 482-F. Lighting switch mounted at lower end of steering column and controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda Number
Headlights	6-8	21-21	DC	1110
Fender lights	6-8	3	SC	63
Dash and tail lights	6-8	3	SC	63
Stop and backing lights	6-8	15	SC	87
Dome and corner lights	6-8	3	DC	64

FUSES:—Light fuses on fuse block on the dash are 20 ampere capacity.

GASOLINE GAUGE:—K-S Telegauge hydrostatic type (see Carburetion Section).

FUEL PUMP:—AC mechanical fuel pump mounted at right of engine (see Carburetion Section).

HORN:—Klaxon Model K-18-C. Vibrator type mounted under engine hood Current draw 5.5-6.5 amperes at 6 volts.

REO

NEW FLYING CLOUD SIX, MODEL S (1932)
DELCO-REMY SYSTEM

ENGINE NUMBER:—Stamped on boss on left side of engine block under water header.

BATTERY:—**Willard, Type WH-1-13,** 6 volt, 13 plates, 102 ampere hour capacity (20 hour rate). Starting capacity 120 amperes for 20 minutes. Negative (—) terminal grounded. Battery mounted on left frame member under front compartment floor boards. Battery size 7 1/16 inches wide, 9 1/16 inches long, 9 5/16 inches high.

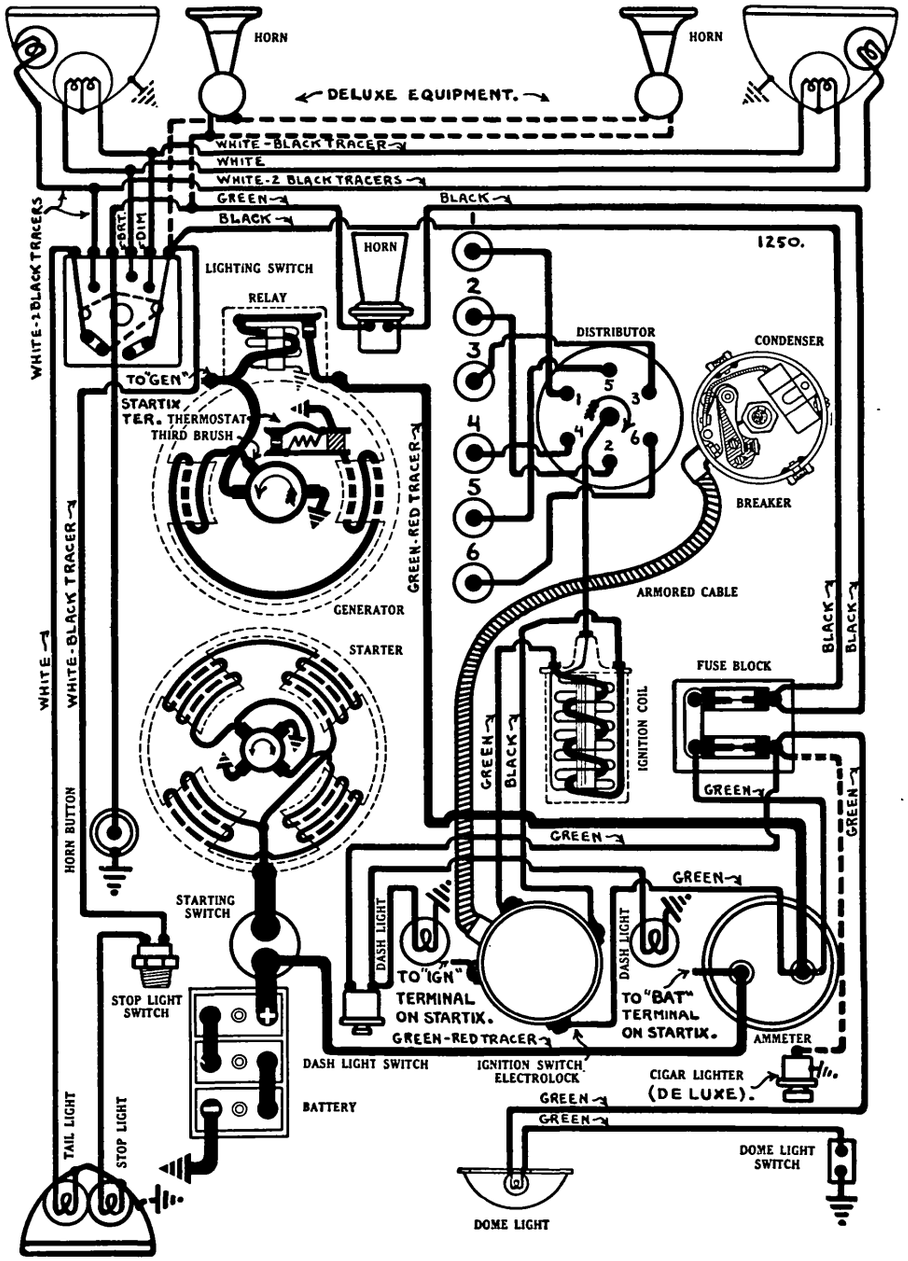
IGNITION:—**Coil Model 528-E.** Coil mounted through dash with terminals on engine side (under engine hood). Ignition current 1-3 amperes at 6 volts (engine running), 3.4-5 amperes at 6 volts (engine stopped. Ignition switch is a Type 15-S Electrolock. See Equipment Section for complete data on this type Electrolock.

Distributor Model 641-H. Single breaker arm, 6 lobe cam type with semi-automatic advance. Breaker contact gap set at .020 inch. Hold within limits of .018-.024 inch. To set gap, loosen lock screw on stationary contact mounting plate, turn eccentric adjusting screw, tighten lock screw. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). Manual advance controlled by button on dash. Ordinary running position with button pushed in—full advance, pull out button to retard spark. Distributor is semi-automatic.

Manual Advance:—**Maximum—25° engine.**

Cam Angles—Closed 36°. Open 24° (distributor degrees).

Automatic Advance



Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	2.0		600
7½		800	15		1600
12		1275	24		2550

Mounting:—Distributor mounted on cylinder head and driven by vertical shaft from the camshaft. Electrolock must be removed as a unit with the distributor whenever the distributor is taken off the car. To remove distributor, disconnect ignition wiring on Electrolock, free Electrolock at dash, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—**1000 Miles.** Turn down grease cup on side of shaft housing two turns. Keep cup filled with medium cup grease. Take off distributor cap and rotor, oil wick oiler in center of shaft, put one drop oil on breaker arm pivot pin, apply thin film vaseline to face of breaker cam.

Timing:—Standard setting 1" or 2 teeth on flywheel or .012" piston travel before top dead center with manual spark control advanced. To set timing, fully advance manual spark control, see that distributor is rotated counter-clockwise to end of advance arm slot, take off cover plate on flywheel housing. With No. 1 piston on compression stroke, turn engine over until a point on the flywheel 2 teeth before the top dead center mark 'UDC.#1' is directly opposite the indicator on the flywheel housing. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, connect spark plugs as indicated on diagram (No. 1 terminal as designated). Use a test lamp to determine contact opening or turn on ignition (on cars with Startix use special position of ignition switch with key turned to left to avoid automatic cranking).

Manufacturer recommends that ignition setting be varied if necessary to avoid detonation or spark knock with various gasolines. The setting should be barely under the detonating point and the setting may be varied from

REO

NEW FLYING CLOUD SIX, MODEL S (1932)
DELCO-REMY SYSTEM

the standard setting above to an advance limit of not more than 3 teeth (on flywheel), or .031 inch (actual piston travel) before top dead center.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set gaps at .025 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Stem Length	Lift
Intake	1 13/16"	.3437"	5¾"	5/16"
Exhaust	1 13/16"	.3437"	5¾"	5/16"

Tappet Clearance			Spring Pressure	
	Operating	Timing		
Intake	.007" (hot)	.012" (cold)	Valves closed	58-60 pounds
Exhaust	.007" (hot)			

Timing

Intake valves open at top dead center. Intake valves close 50° after lower dead center.

Exhaust valves open 48° before lower dead center. Exhaust valves close 2° after top dead center.

To Check Valve Timing. Set tappet clearance of No. 1 intake valve at .012 inch. With No. 6 piston on compression stroke turn engine over until piston reaches top dead center with flywheel mark 'UDC.#1' directly opposite indicator on housing. No. 1 intake valve should begin to open at this point. Reset tappet clearance at .007 inch.

To Set Valve Timing. Turn crankshaft to top dead center position for piston No. 1 with flywheel mark 'UDC.#1' at indicator. With tappet clearance of .012 inch rotate camshaft in direction of rotation until No. 1 intake valve is about to open. Mesh camshaft sprocket in chain so that '0' marks on camshaft sprocket and crankshaft sprocket are adjacent and in line with a straightedge laid across the shaft centers. Mount camshaft sprocket on camshaft flange. One of the camshaft sprocket cap screws is offset so that sprocket can only be mounted in correct position. This cap screw is used as a dowel to locate camshaft sprocket and must be installed first. **The plunger on the camshaft sprocket (which controls camshaft endplay)** must be in place before the chain case cover is installed.

STARTER:—Model 718-H. Starter drives engine through Bendix drive. Rotation is counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5.0	65
15 "	Lock	3.15	570

Startix:—Startix automatic starting switch is optional equipment on these cars. For complete details on Startix and wiring, see article in Equipment Section. It will not be necessary to disconnect Startix in setting ignition timing if special timing position of the igniton switch (key turned left) is used.

Mounting:—Starter flange mounted on front face of flywheel housing at left of engine. To remove, disconnect cable, take out 3 flange mounting screws, pull starter straight forward to clear Bendix, lift out.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in commutator end oiler.

GENERATOR:—Model 955-R. Third brush regulation, thermostat control. Thermostat operates at 165°F. (contacts open cutting resistance in field circuit) reducing output approximately 40%. To adjust generator charging rate, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush counter-clockwise to increase or clockwise to decrease charging rate, tighten locking screw. Rotation counter-clockwise at commutator end. With standard setting maximum charging rate is 20 amperes (cold) at 8.5 volts reached at 1550 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.7	1550	9-12	7.3-7.6	1800-2000

Brush spring tension 14-18 ounces. Shunt field current 4.0-6.1 amperes at 6.0 volts. Motoring generator draws 5 amperes at 6 volts.

Mounting:—Generator mounted on swinging bracket at left front of engine and driven by the fan belt. To remove generator, disconnect lead, loosen adjustment clamp bolt, swing generator toward engine, slip off drive belt, take out 2 bolts forming bracket hinge under generator, lift generator out.

Belt Adjustment. To take up fan belt, loosen generator hinge mounting bolts and adjustment clamp bolt, pull generator away from engine to secure correct belt tension, tighten adjustment bolt and mounting bolts. Belt tension should be just sufficient to drive fan and generator without slipping.

Oiling:—1000 Miles. Put 8-10 drops light engine oil in oiler at each end of generator.

RELAY:—Model 265-B. Relay mounted on generator field frame. Relay contacts close with generator voltage of 6.75-7.5 volts and open with 0-2.5 ampere discharge current. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Delco-Remy Switch, Model 486-X. Lighting switch mounted at lower end of steering column controlled by lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch. Instrument panel lights controlled by push-pull button at lower left of instrument panel.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.

Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Body Lights	6-8	3	S.C.	63

FUSES:—Lighting fuse mounted on fuse block on dash 20 ampere capacity.

GASOLINE GAUGE:—K-S Telegauge hydrostatic type (see Carburetion Section).

FUEL PUMP:—A.C. mechanical fuel pump mounted on right side of crankcase (see Carburetion Section).

HORN:—E.A. Model 'S' horn standard equipment. Twin horns optional equipment.

REO

ROYALE EIGHT, MODEL N-2 (1933-34)
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On top of left hand frame side rail near steering gear.

ENGINE NUMBER:—Stamped on front left hand engine support.

ENGINE:—Eight cylinder 'in line', 'L' head type, 3⅜x5″ bore and stroke, 358 cubic inch displacement, rated at 36.48 H.P., develops 135 H.P. at 3300 R.P.M. Standard compression ratio 5.3-1. No optional high compression ratios offered.

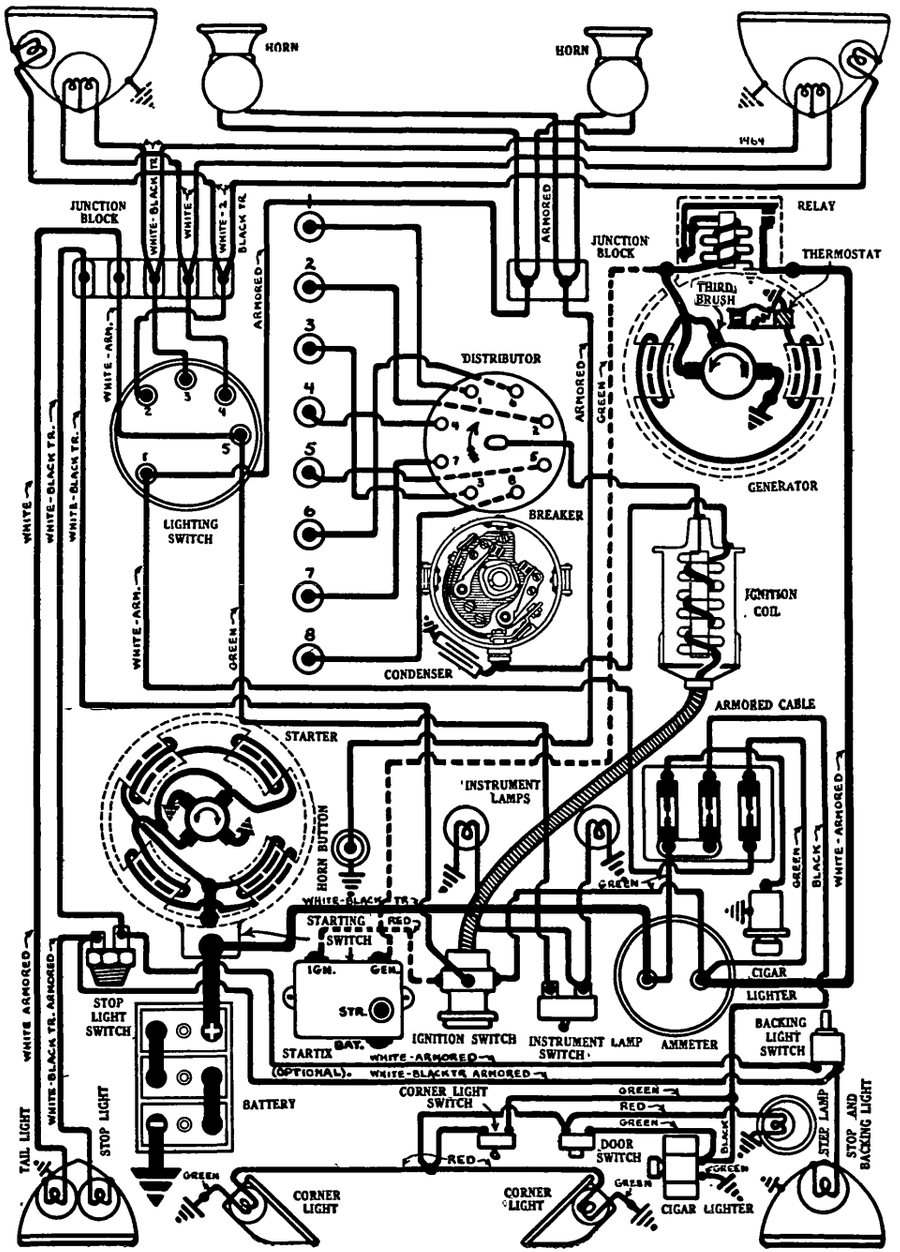
BATTERY:—Willard, Type RH-4-17, 6 volt, 17 plate, 136 ampere hour capacity (20 hour rate). Starting capacity 160 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—In box on left hand side of car under driver's seat.
Dimensions:—Width, 7 1/16″. Length, 11 11/16″. Height, 9 5/16″.

IGNITION:—Coil Model 536-T, ('33), 538-E, F ('34). Coil mounted on dash. Assembled as a unit with ignition switch (primary lead protected by armored cable).
Ignition Current:—2.0 amperes at 6 volts (engine running), 4 amperes at 6 volts (engine stopped).
Ignition Switch:—Electrolock, Type 16-S. Assembled as unit with coil. Switch has two 'on' positions both to right of vertical 'off' position. On cars equipped with Startix (optional), turn key to first 'on' position (approximately ⅛ turn to right) for timing or when automatic cranking is not desired. The second 'on' position (key turned to extreme right) is the regular running position with ignition on and Startix operative.
Distributor Model 660-K. Two breaker, 4 lobe cam, semi-automatic advance type. Breaker contacts open alternately at 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized (see Timing).
Breaker Gap:—Set contact gap at .022″. Hold within limits of .018-.024″.
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.
Manual Advance—25° (engine). Controlled by button on dash.
Cam Angles—Closed 34°. Open 11° (distributor) when synchronized.

Automatic Advance

Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	400	3	800
11	1600	22	2200

Distributor Model 663-D (Special Equipment). Single breaker, 8 lobe cam, semi-automatic advance type with auxiliary vacuum spark control. No synchronization is required for this type distributor.
Breaker Gap—Set at .015″. Limits .0125-.0175″.
Breaker Arm Spring Tension—19-23 ounces.
Manual Advance—20° (engine).
Vacuum Unit Advance—15° (engine).



Automatic Advance

Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	300	2	600
6	1500	12	3000

Mounting:—Distributor mounted on right hand side of cylinder head. To remove, disconnect primary lead, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—1000 Miles. Turn down grease cup on side of shaft housing two turns.

IGNITION TIMING:—Standard setting, ¾″ (flywheel) or .014″ (piston travel) before top dead center with manual spark control fully advanced.
To Set Ignition Timing. Fully advance manual spark control (push button in toward dash) and see that distributor is rotated counter-clockwise to limit of advance arm slot, take off cover plate over inspection hole in top of flywheel housing. With No. 1 piston on compression stroke, turn engine over by hand until piston reaches firing position with the ignition mark on the flywheel (which is ¾″ before the UDC. mark) directly under the reference mark on the edge of the inspection hole. Then loosen clamp bolt in advance arm, rotate distributor until first or 'fixed' set of contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 segment in distributor cap, connect spark plugs as indicated. **The second or 'movable' set of contacts must then be synchronized.**

REO

ROYALE EIGHT, MODEL N-2 (1933-34)
DELCO-REMY SYSTEM

Synchronization of Contacts. No marks on flywheel are provided for synchrnoization of contacts directly on the engine. Special Delco-Remy synchronizing tool, Part No. 1838182, must be used. See Equipment Section for complete data on Synchronization of Contacts. If timing gauge is used to time engine and special adaptor is available so that gauge can be mounted in No. 6 cylinder, contacts can be synchronized by turning engine to firing position of No. 6 piston (.014" before top dead center—this position is exactly 90° or ¼ revolution after firing position of piston No. 1). Then loosen lock screws on movable sub-plate (on which second set of contacts are mounted), turn eccentric adjusting screw until contacts begin to open, tighten locking screws.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set gaps at .025 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is driven by chain from the crankshaft in tandem with generator sprocket. Engine front supports are on timing chain cover and it is necessary to remove radiator and engine hood and take off wiring, fuel connections, exhaust pipe and controls, and jack up front end of engine before chain case cover can be removed. Sprockets are marked. To set timing, with crankshaft turned so that piston No. 1 is on top dead center and camshaft turned so that No. 1 intake valve is about to open with .012" tappet clearance, mesh chain so that marks on sprockets are directly opposite and in line with a straightedge across the shaft centers.

To Check Valve Timing. With No. 1 piston on top dead center entering power stroke, set tappet clearance of No. 1 intake valve at .012". Turn engine over one complete revolution and stop with piston top dead center with flywheel 'UDC' mark directly under indicator on edge of inspection hole in top of flywheel housing. No. 1 intake valve should begin to open at this point. Reset tappet clearance at .008" with engine warm.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 13/16"	.3437"	5¾"	45°	11/32"
Exhaust	1 11/16"	.3437"	5¾"	45°	11/32"

Tappet Clearance

	Operating	Timing
Intake	.008" (hot)	.012" (cold)
Exhaust	**.008" (hot).**	

Valve Springs

Closed	60 pounds—2⅜"
Open	80 pounds—2 1/32"

Timing

Intake Valves	Exhaust Valves
Open—At top dead center.	Open—48° before lower dead center.
Close—50° after lower dead center.	Close— 2° after top dead center.

CARBURETION:—Schebler Duplex Updraft Carburetor (1933), Stromberg Model EE-23 Dual, downdraft Carburetor (1934). See Carburetor Section for complete data.

Fuel Pump:—A.C. Mechanical type fuel pump mounted on right hand side of crankcase and driven by eccentric on camshaft. Remove glass sediment bowl under pump occasionally, empty water and sediment, clean filter screen (located directly above sediment bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—Model 728-M, 724-W (Startix R.H.D.). Starter drive, reduction gears and overrunning clutch with mechanical pinion shift connected to starting switch pedal linkage (728-M), or reduction gears and Bendix drive (724-W). Startix automatic starting switch is optional equipment. See diagram for connections of Startix switch. Complete data is given in Equipment Section on Startix. Rotation of armature shaft is clockwise at commutator end. Brush spring tension is 24-28 ounces.

Starter Data—Model 728-M

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5.0	70
28 "	Lock	3.0	600

Starter Data—Model 724-W

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3500	5.0	70
22 "	Lock	3.0	600

Mounting:—Flange mounted on left hand forward face of flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage (728-M only), take out 3 flange mounting cap screws, pull starter forward to clear pinion housing, lift out.

Oiling:—1000 Miles. Put 5-6 drops light engine oil in oiler at each end of armature.

5000 Miles or Six Months. Take out grease plug in reduction gear case and repack gears with graphite grease.

GENERATOR:—Model 955-G. Third brush regulation, thermostat control. Thermostat contacts open at 165°F. reducing charging rate approximately 40%. Rotation is counter-clockwise at commutator end. Maximum charging rate is 20 amperes (cold) at 8.4 volts reached at 1550 R.P.M. or 25 M.P.H.

Charging Rate Adjustment. Loosen small round lock screw on commutator end plate, take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.7	1550	9-12	7.3-7.6	1800-2000

Brush Spring Tension:—14-18 ounces on each brush.

Field Current:—4.0-6.1 amperes at 6 volts across field terminals.

Motoring:—Approximately 5 amperes at 6 volts.

Mounting:—Flange mounted on right hand rear face of timing chain case To remove, disconnect lead, take out flange mounting screws, pull generator to rear to disengage drive coupling, lift out. Generator is driven through tongue-and-slot coupling by accessory sprocket which is mounted independently in chain case. Do not crank engine with generator out.

Timing Chain Adjustment. Loosen flange mounting screws, pull generator away from engine until chain is tight, tighten mounting screws, run engine to check adjustment. If chain hums, adjustment is too tight and engine should be stopped and chain backed off slightly. Mounting screws should not be loosened with engine running. With correct adjustment chain should run noiselessly.

Oiling:—1000 Miles. Put 5-6 drops light engine oil in oiler at each end.

RELAY:—Model 265-B. Mounted on generator field frame. Relay contacts close at approximately 575 R.P.M. or 8-10 M.P.H. when generator voltage reaches 6.75-7.5 volts and open with 0-2.5 ampere discharge current.

Contact Gap:—.015-.025". Air Gap:—.012-.017" with contacts closed.

LIGHTING:—Delco-Remy Switch Model 482-F. Lighting switch mounted at lower end of steering column and controlled by lower lever on steering wheel. Double filament headlamp bulbs are used for 'depressed beam' dimming and are controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking Bulbs	6-8	3	S.C.	63
Instrument and Tail Lights	6-8	3	S.C.	63
Backing and Stop Lights	6-8	15	S.C.	87
Corner and Step Lights	6-8	3	S.C.	63

FUSES:—Fuses on fuse block under cowl directly in back of instrument board are 20 ampere capacity.

HORNS:—Klaxon Model K-18-C twin horns are standard equipment. Current draw, 5.5-6.5 amperes at 6 volts (each).

SERIAL NUMBER:—First number, 100. On front end of left frame side rail.

COMPRESSION:—**Ratio**—7.0-1 Std. aluminum head. **Pressure**—115 lbs. at 1000 R.P.M. or 90 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model 536-G.** Mounted on the dash. **Ignition Current**—2 amperes idling, 5 stopped. **Ignition Switch:**—Model 431-W (switch and cable). Connected to coil by armored cable.

Distributor Model 645-K (644-M on first cars). Single breaker, 6 lobe cam, full automatic advance type. Manual advance consists of adjustment at distributor.
Breaker Gap—Set at .020". Limits .018-.024".
Breaker Arm Spring Tension—17-21 ozs.
Cam Angles—Closed 36°. Open 24° (distributor).
Manual Advance—20° (engine—adjustment only).

Automatic Advance—Model 645-K

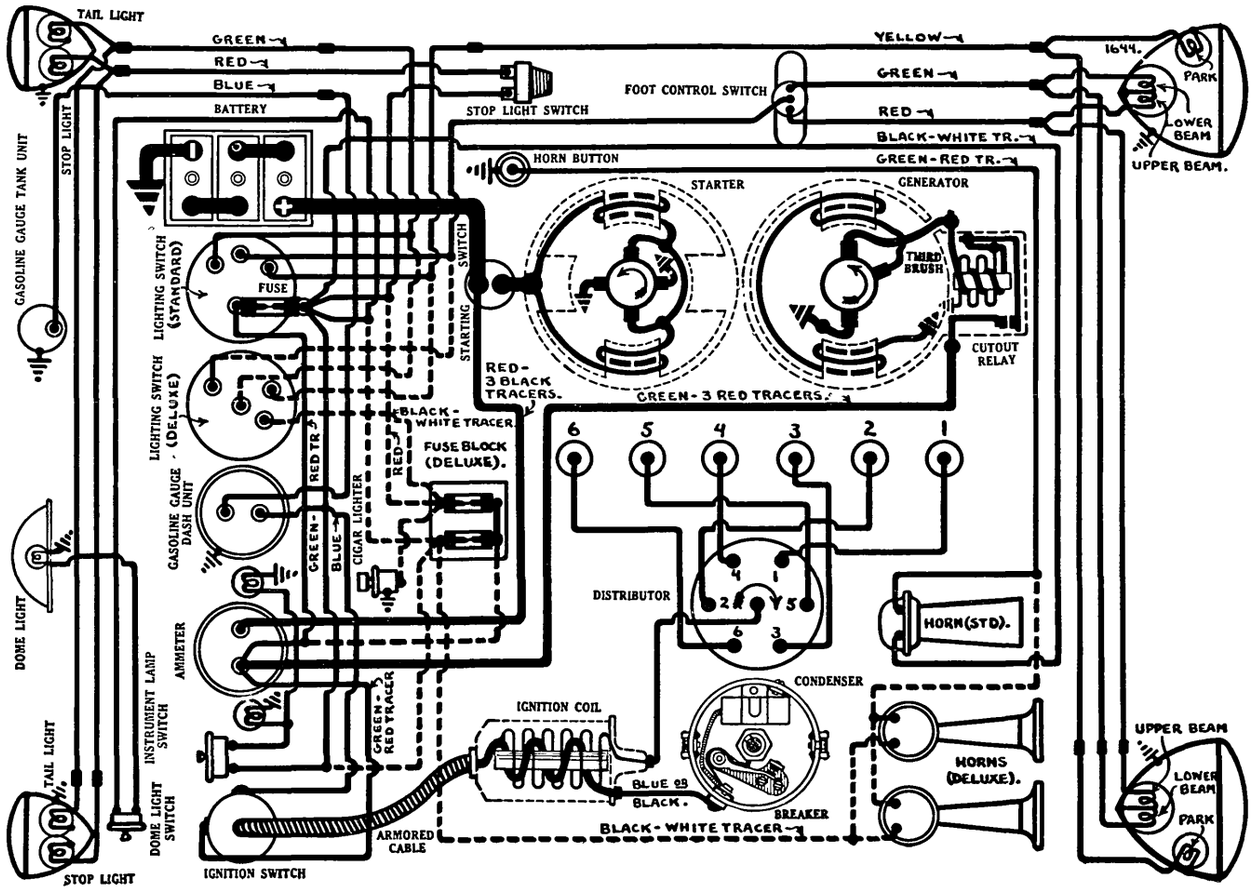
Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	2	600
4.5	800	9	1600
7	1600	14	3200

Automatic Advance—Model 644-M

Start	300	2	600
9	1450	18	2900

Removal:—Distributor mounted on right hand side of cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— Flywheel Degs. Piston Posi.
All engines .....10° or ¾" BTDC..... .0388" BTDC
Timing—With #1 piston on compression, turn engine over until piston is 10° before top dead center, stop when prick-punch mark on flywheel lines up with pointer in inspection hole in right front face of flywheel housing. The punch mark is ¾" before top dead center mark 'UDC.#1'. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.
Timing (Using Motor Gauge)—All engines can be timed with a motor gauge installed in #1 spark plug port. See table above for setting. Use Weidenhoff Adapter #104, Rod #2.



Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type C-7 A. 18 MM. Metric.
Spark Plug Gaps—Set at .025"

CARBURETION:—See Carburetion Section for complete data on Carburetor, Fuel Pump, and Gasoline Gauge.
Carburetor:—Carter (Ball & Ball) 303-S (Serial No. 100 to 251), 304-S (252 to 2038), 320-S (2039 up), 1½" downdraft type.
Fuel Pump:—A.C., Type P-1521772 diaphragm type.
Gasoline Gauge:—K-S electric type.

VALVE TIMING:—**To Check Timing**—Set tappet clearance #1 intake valve at .012". This valve should open with piston #1 on top dead center when flywheel mark 'UDC.#1' lines up with indicator in inspection hole in flywheel housing at right of engine. Reset tappet clearance at .007" with engine warm.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Tappet Clearance:—.007" Int., .008" Exh., engine hot.
Valve Spring Pressure:—50-54 lbs. at 2⅜" (valve closed). 140 lbs. plus or minus 5 lbs. at 2 1/16" (valve open).

LUBRICATION:—**Crankcase Capacity**—6 quarts.
Normal Oil Pressure—30 lbs. at 1200 R.P.M. when hot.

BATTERY:—Willard, Type WH-1-13. 6 volt, 13 plate, 102 A.H. capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—On left side under driver's seat.

STARTER:—Model 738-K. Armature No. 1847432.
Starter Drive—Barrel Type Bendix. Type A-1718.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—150 R.P.M., 130 amperes, 5.4 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Starting Switch:—Model 405-C. Operated by depressing clutch pedal.

Removal:—Starter flange mounted on left front face of flywhel housing. To remove, take out flange mounting capscrews.

GENERATOR:—Model 937-Z. Armature No. 1838448. Third brush control type.
Charging Rate Adjustment—Loosen locking screw on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.
Maximum Charging Rate—18 amperes, 8.3 volts, 2000 R.P.M., 24.5 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	15-18	7.9-8.3	2000
Hot	13-15	7.7-8.0	2400

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—23-27 ounces each.
Field Current—3.5-4.5 amperes at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot mounting bolts and one clamp bolt.

Belt Adjustment:—Belt tension adjusted in usual manner by loosening pivot bolts and clamp bolt and swinging generator out or away from engine.

SPECIAL GENERATORS:—Model 936-M. Used on cars with radio. See Equipment Section for complete data.

CUTOUT RELAY:—Model 265-H. Mounted on generator field frame. See article in Equipment Section.
Cuts In—6.75-7.5 volts, 7 M.P.H.
Cuts Out—0-2.5 ampere discharge current.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

LIGHTING:—Douglas Switch Model 5399 (Std.), 5400 Deluxe). R.B.M. Foot Control Switch Model 1050. Foot control switch on toeboard used to control upper and lower headlamp beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking	1.5	55
Tail, Instrument, Dome	3	63
Stop	15	87

FUSES:—Lighting—One 20 ampere capacity on back of switch (std.) or two 20 ampere on fuse block under cowl back of instrument board (Deluxe).

HORNS:—Sparton. Vibrator Type. Single horn (std.), or twin horns (Deluxe). Horn current 8 amperes (single horn), 17 amperes (twin horns).

SERIAL NUMBER:—First number 100 (1935). On top of left frame side member near steering gear.

COMPRESSION:—Ratio—5.4-1 Std. cast-iron head. **Pressure**—95 lbs. at 1000 R.P.M. or 78-82 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 536-S (1933), 538-B (1934-35). Assembled as unit with ignition switch.
Ignition Current—1½-2 amperes (idling), 5 amperes (stopped).
Ignition Switch—Mitchellock Mod. 16-S, Type 6718, Delco-Remy Model 430-C or 429-Z. Connected to coil by armored cable.
Distributor Model 644-M. Single breaker, 6 lobe cam, full automatic advance type. Manual advance consists of adjustment at distributor only.
Breaker Gap—Set gap at .020". Limits, .018-.024".
Breaker Arm Spring Tension—17-21 ozs. (at tip of breaker arm).
Manual Advance—25° (engine—adjustment only).
Cam Angles (Distributor Degrees)—Closed 36°. Open 24°.

Automatic Advance

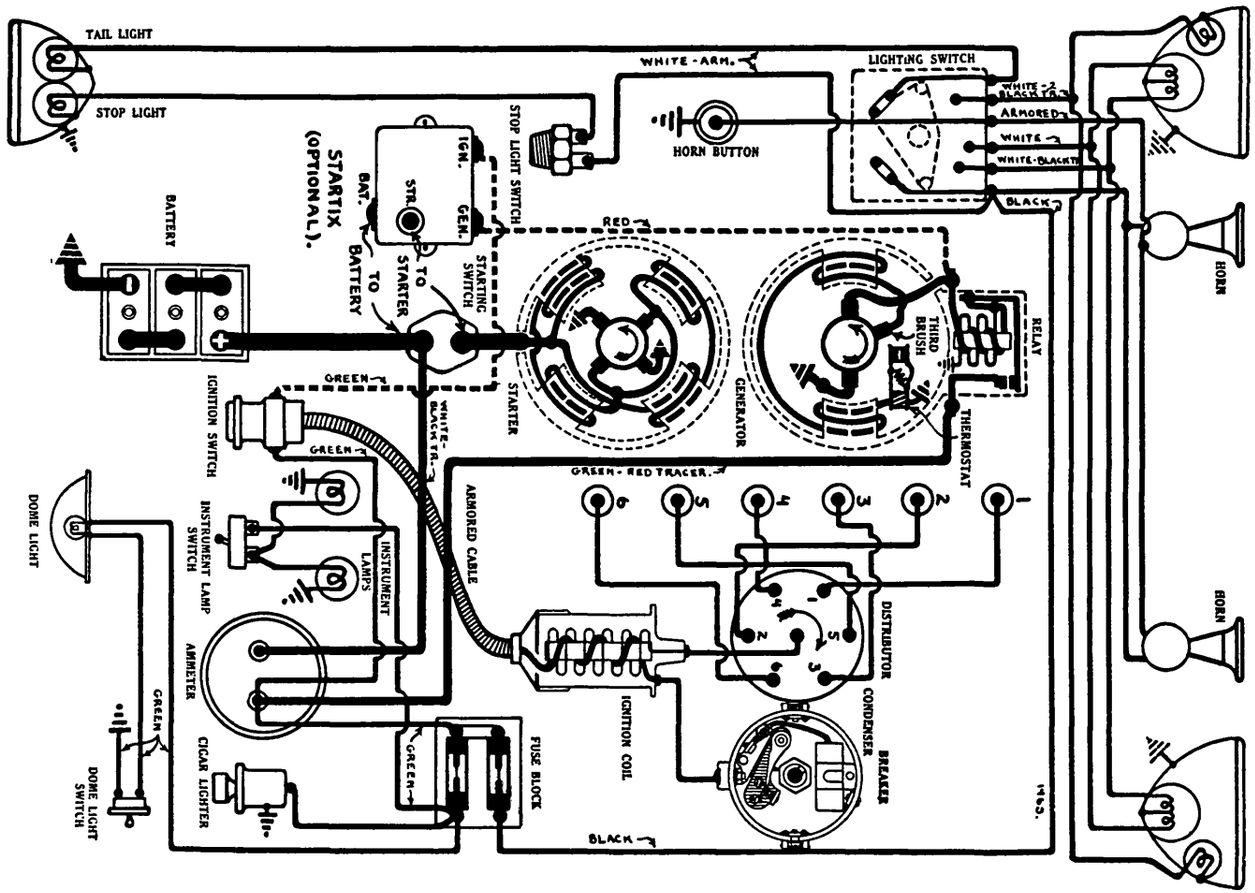
Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	2	600
9	1450	18	2900

IGNITION TIMING:—Flywheel Degs. Piston Position
All engines.....8½° or 3 teeth BTDC. .... .032" BTDC.
Timing (using Timing Light):—Connect timing light between distributor terminal and ground, turn on ignition, turn engine over with #1 piston on compression, stop when ignition mark on flywheel, which is 8½° or three teeth before top dead center mark 'UDC.#1' lines up with reference mark on flywheel housing (right hand side of engine), loosen advance arm clamp bolt, rotate distributor until timing light just lights, indicating that contacts are opening, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).

NOTE:—Car can be road tested and ignition timing changed slightly for best performance in accordance with special fuel characteristics or operating conditions of the car. Setting should be just under the detonating or spark knock point (in general this will be 2-3 teeth or .012-.031" piston travel before top dead center).
Timing (using Gauge):—All engines can be timed using a motor gauge installed in #1 cylinder spark plug hole. See above for settings. Use Weidenhoff Adapter #104, Rod #2.

Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—Champion, Type C-7. 18 MM. Metric.
Spark Plug Gaps—Set gaps at .025".



CARBURETION: — (Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EX-32, 1½" plain tube, downdraft type.
Automatic Choke—Stromberg (standard on De Luxe models only).

Fuel Pump:—A.C., Type P-1521772 diaphragm type.

Gasoline Gauge:—K-S Telegauge, hydrostatic type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .012". This valve should open with piston on top dead center when flywheel mark 'UDC.#1' lines up with indicator in inspection hole in flywheel housing (right hand side of engine). Reset tappet clearance at .007" with engine warm.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.007" Int., .008" Exh., with engine warm.

Valve Spring Pressure:—58-62 lbs. at 2⅜" (valve closed). 90 lbs. at 2 1/16" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts.
Normal Oil Pressure—30 lbs. at 35 M.P.H.

BATTERY:—Willard, Type WH-1-13, 6 volt, 13 plate, 102 A.H. capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—On left hand side under driver's seat.

STARTER:—Model 718-H, 736-G. Armature No. 818002.
Starter Drive—Bendix Drive, Type RCD11FX-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—32-36 ounces each.
Cranking Engine—125 R.P.M., 200-225 amperes, 4.9 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	65
15 "	Lock	3.15	570

Starting Switch:—Delco-Remy Model 405-C. Mounted on top of brake master cylinder and operated by clutch pedal.
Startix—Type D optional. See article in Electrical Equipment Section.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out 3 flange mounting cap screws.

GENERATOR:—Model 955-R. Armature No. 817807. Third brush regulation, thermostat control. Thermostat contacts open at 200°F., reducing generator output approximately 40%.
Charging Rate Adjustment:—Take off commutator cover band, loosen small round lock screw on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.
Maximum Charging Rate:—18 amperes (cold), 8.5 volts, 1550 R.P.M.

Performance Data

	Amperes	Volts	R.P.M.
Cold	19-22	8.3-8.7	1550
Hot	9-12	7.3-7.7	1800-2000

Rotation—Counter-clockwise at commutator end.
Field Current—4.0-6.1 amperes at 6.0 volts.
Brush Spring Tension—14-18 ounces each.

Mounting:—Pivot mounted at left front of engine. Fan belt drive. To remove, take out two pivot bolts, and one clamp bolt.
Belt Adjustment—Loosen clamp bolt and pivot bolts, pull generator away from engine until belt is snug, tighten clamp bolt, and pivot bolts.

CUT-OUT RELAY:—Model 265-G. Mounted on generator field frame. See article in Equipment Section.
Cuts in—6.75-7.5 volts, 6.5-7 M.P.H.
Cuts out—0-2.5 ampere discharge.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

LIGHTING:—Switch Model 486-X. Lighting switch mounted at lower end of steering column controlled by lever on steering wheel. Double filament headlight bulbs controlled by lighting switch.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights (1933)	21-21	1110
Headlights (1934-35)	32-21	1116
Stop Light	15	87
All others	3	63

FUSES:—Lighting—Two 20 ampere capacity on fuse block in back of instrument board under cowl.

HORNS (1933):—Klaxon Model K-26 Type 1507 (low note), 1508 (high note). Matched tone, twin horns. Current draw 6.0-8.5 amperes (1507), 5.0-6.5 amperes (1508) at 6.0 volts.

HORNS (1934-35):—E. A. Vibrator type (standard). Sparton tuned, twin horns Model CL-5 (special De Luxe equipment). Horn current, 17 amperes total at 6 volts (Model CL-5).

SERIAL NUMBER:—First number 6D-100. On front end of left frame side rail under fender.

COMPRESSION:—Ratio—6.5-1 Std. aluminum head. No optl. **Pressure**—85 lbs. at cranking speed.

VACUUM READING:—Gauge should show steady reading of approx. 17" with engine idling at 350 R.P.M.

IGNITION:—Coil Model 536-G. Mounted on dash.

Ignition Current—2 amps. idling, 5 amps. stopped.

Ignition Switch:—Delco-Remy Model 435-C. Switch and cable assembly. Connected to coil by armored cable.

Distributor Model 623-D, 623-K. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum advance. Manual advance consists of adjustment at distributor.

Breaker Gap—Set at .018". Limits .018-.024".

Cam Angle or Dwell—36° (closed), 24° (open).

Breaker Arm Spring Tension—17-21 ounces.

Condenser—Part No. 829092. Capacity .20-.25 mfds.

Automatic Advance—623-D

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	3	600
10	1100	20	2200

Automatic Advance—623-K

Start	300	2	600
10	1800	20	3600

Vacuum Spark Control Model 681-D. Integral with distributor. Mounted on housing and linked directly to breaker plate. Provides additional advance at speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	7"
10°	9-13"

Distributor Removal:—Mounted on right hand side of cylinder head. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:— **Flywheel Deg.** **Piston Position**
All Engines ..... 4° BTDC ..... .0070" BTDC

To Set Timing—With #1 piston on compression, turn engine over until piston is 4° or .0070" before top dead center, stop when ignition mark on flywheel which is approximately .3" or 1 2/3 teeth before top dead center mark 'UDC.#1' lines up with pointer in inspection hole in right front face of flywheel housing. Losen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type 7. 18 MM. Metric.

Spark Plug Gap—Set at .025".

CARBURETION:—Carburetor—Carter Model 338-S. 1¼" downdraft type. See Carburetion Section for adjustment, overhaul and Jet Specifications.

NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at hot or slow idling speed.

Idle Adjustment—With engine hot, set throttle stopscrew for correct idling speed of 350 R.P.M. or 6 M.P.H.. Turn idle adjusting screw in until engine begins to miss, then trun screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Correct idle adjusting screw setting is ½-1¼ turns open. Reset throttle adjusting screw for correct idling speed.

Accelerating Pump Setting—Pump lever under dust cover at top of carburetor has three holes for pump link engagement. Change for seasonal requirements:

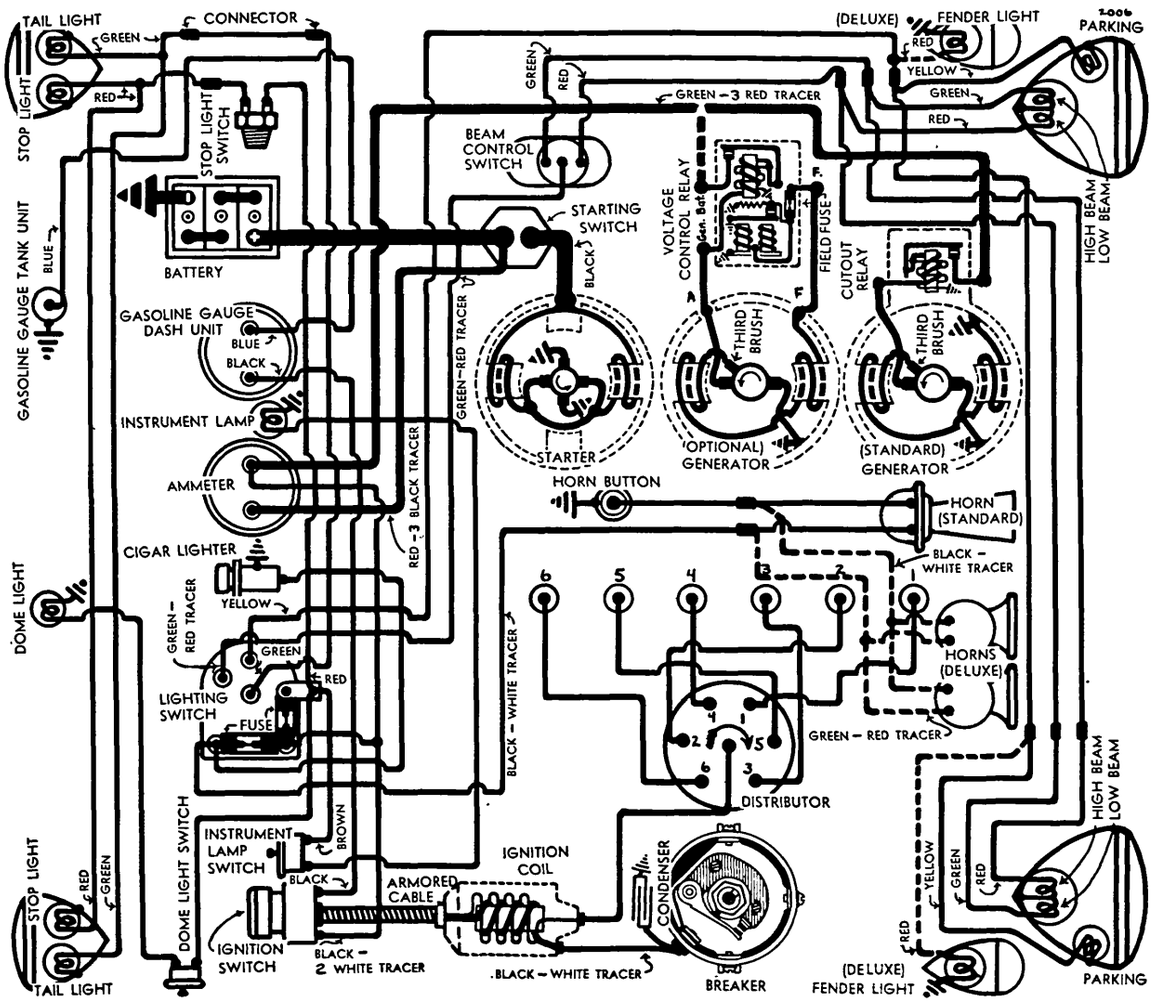
Outer Hole—Ordinary temperatures, std. gasoline.
Upper Hole—(Max stroke)—Extremely cold weath'r
Inner Hole—(Min. stroke)—Extremely hot weather.

Fast Idle:—Integral with carburetor. No adjustment. See article on Carter Fast Idle in Carburetion Sec.

Automatic Choke:—Carter Climatic Control. See article in Carburetion Section for service directions.

Air Cleaner:—AC. oil-wetted type standard. Heavy Duty Oil Bath type optional.

Fuel Pump:—AC. Type E #1521116. Diaphragm type. See article in Carburetion Section.



Gasoline Gauge—Motometer, electric. Dash unit—NG-7837-D, Tank unit—NG-7376-T.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .012". This valve should open with #1 piston 5° or .0100" BTDC when flywheel mark 'Intake Opens' lines up with indicator in inspection hole in right front face of flywheel housing. Reset tappet clearance at .007" with engine warm.

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.007" Int., .008" Exh., hot.

Valve Spring Pressure:—50-54 lbs. at 2⅜" (valve

closed), 140 lbs. + or — 5 lbs. at 21/16" (valve open).

LUBRICATION:—Crankcase Capacity—6 qts. (refill).
Normal Oil Pressure—40 lbs. at 40 M.P.H.

BATTERY:—Willard, Type WH-1-13, RH-1-13 (Export). 6 volt, 13 plate, 102 ampere hour capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.1 minutes.
Grounded Terminal—Negative(—) terminal.
Location—On left side under driver's seat.

STARTER:—Model 738-K. Armature No. 1847432.
Drive—Barrel Type Bendix. Type A-1718.
Cranking Engine—150 R.P.M., 130 amps., 5.4 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.63	475

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting capscrews.

Starting Switch:—Model 405-C. Operated by depressing clutch pedal.

GENERATOR (STANDARD):—Model 937-Z. Armature No. 1838448. Third brush control type. Ventilated by fan on drive pulley.
Charging Rate Adjustment—Loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten lockscrew.
Maximum Charging Rate—18 amperes, 8.3 volts, 2000 R.P.M., 24.5 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	15-18	7.9-8.3	2000
Hot	13-15	7.7-8.0	2400

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—23-27 ounces each.
Field Current—3.5-4.5 amperes at 6 volts.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot mounting bolts and one clamp bolt.

Belt Adjustment:—Belt tension adjusted in usual manner by loosening pivot bolts and clamp bolt and swinging generator out or away from engine.

GENERATOR (RADIO):—Model 936-M. Armature No. 1854856. Third brush control type with Voltage Control Relay (Step Voltage Control). Ventilated by fan on drive pulley.
Charging Rate Adjustment—Connect test ammeter in charging line at 'BAT' terminal, ground generator field 'F' terminal to frame. Loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Tighten lockscrew and remove generator field ground.
Maximum Charging Rate—23 amperes (cold), 20 amperes (hot), 8.8 volts, 2800 R.P.M.

Performance Data

	Amperes	Volts	R.P.M.
Cold	20-23	8.5-8.8	2800
Hot	16-20	8.1-8.5	3100

Field Current—2.3-2.6 amperes at 6 volts.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third).
Generator Field Fuse—6 amperes in Control Unit case.
Rotation, Removal, and Belt Adjustment same as for standard generator above.

CUTOUT RELAY:—Model 265-H. Used on 937-Z generator. Mounted on generator field frame. See article in Equipment Section for complete data.
Cuts In—6.75-7.5 volts, 7 M.P.H., 850 R.P.M.
Cuts Out—0-2.5 ampere discharge current.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

CONTROL UNIT (STEP-VOLTAGE TYPE):—Model 5542. Used on 936-M generator. Consists of Cutout Relay and Voltage Control Relay in case on generator. See article in Equipment Section.

Cutout Relay
Cuts In—6.4-6.8 volts.
Cuts Out—3 amperes maximum discharge current.
Contact Gap—.015-.025".
Air Gap—.012-.017" with contacts closed.

Voltage Control Relay
Contacts Open—8.35-8.65 volts at 70° F.
Contacts Close—7.3-7.7 volts at 70° F.
Contact Gap—.008-.013".
Contact Spring Tension—.7-.9 ounces.
Air Gap—.029-.038" between armature and core (armature down against lower stop). .029-.038" armature travel (between armature and lower stop).

LIGHTING:—Headlamps—Hall, Pre-focused type. Headlamps aimed straight ahead (upper beam, lenses in place). Upper and lower driving beams are controlled by foot selector switch.

Switches
Lighting—Douglas. Reo part number 18255.
Foot Selector—R.B.M. Model 1050.
Stop Lamp—Hydraulic type mounted on brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking	1½ (Tungsol)	T-55
Stop	15	87
Dome, Tail, Instrument	3	63

FUSES:—Lighting—Two 20 ampere fuses on lighting switch at rear of instrument panel.
Generator Field (Radio Generator only)—6 amperes in Control Unit case.

HORNS:—Sparton—Vibrator type. Single horn (std)., or twin horns (deluxe).

ROCKNE

MODEL 65 (1932), SERIAL NUMBERS 00001 UP
PRODUCTION STARTED FEBRUARY 15, 1932
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On plate riveted to frame under left front fender.

ENGINE NUMBER:—Stamped on left center cylinder block above distributor.

BATTERY:—**Willard, Type WH-1-13,** 6 volt, 13 plate, 102 ampere hour capacity (20 hour rate). Positive (+) terminal grounded. Battery mounted on left frame member under front compartment floor boards. Battery size, 7 1/16 inches wide, 9 1/16 inches long, 9 5/16 inches high.

IGNITION:—Coil Model IG-4307. Lock coil type with ignition switch in base. **Coil mounted on back of instrument board at lower right center of instrument panel. Ignition current .5-2.5 amperes (engine running), 4-5 amperes (engine stopped). Ignition switch has 3 positions, No. 1 vertical—off; No. 2 right—ignition on and Startix on—regular running position; No. 3 left—ignition on but Startix not operative—this position used for timing engine when automatic cranking feature not desired.**

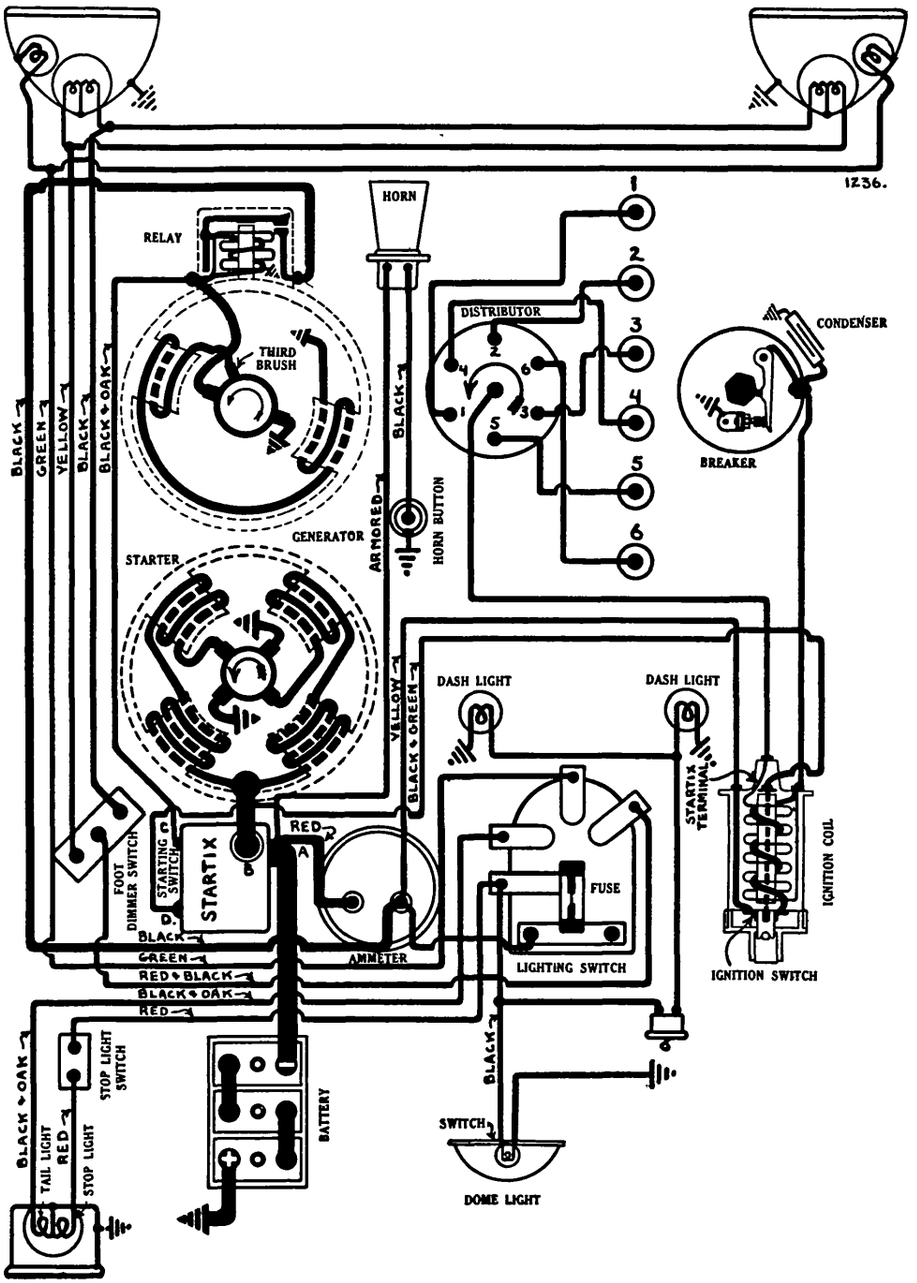
Distributor Model IGB-4070. Single breaker arm, 6-lobe cam type with **full automatic advance. Breaker contact gap set at .020 inch.** Hold within limits of .018-.020 inch. To set gap, loosen lock nut on stationary contact mounting stud, turn up stud, tighten lock nut. Resurface contacts when necessary with fine flat contact file. Breaker arm spring tension 16-22 ounces.

Cam Angles—Closed 34°. Open 26° (distributor degrees).

		Automatic Advance			
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	0		600
3		610	6		1220
6		920	12		1840
9		1230	18		2460
11.5		1500	23		3000

Mounting:—Distributor mounted at left center of engine, driven by inclined shaft from camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—1000 Miles. Put few drops light oil in oiler on side of distributor housing. Take off distributor cap and rotor. Put few drops oil in oiler in center of shaft, put one drop oil on breaker arm pivot pin, apply thin film vaseline to face of breaker cam.



Timing:—Standard setting 5° before top dead center. To set timing, with No. 1 piston on compression stroke, turn engine over until flywheel mark 'IN.O/No. 1' (which is 5° before top dead center mark 'UDC/1-6') is directly opposite indicator in inspection hole in right front face of flywheel housing. Loosen advance arm clamp screw, rotate distributor until contacts begin to open, tighten clamp screw, connect spark plugs as indicated on diagram. If ignition is turned on to check contact opening, turn key to left (this will cut out Startix operation).

Firing Order:—1-5-3-6-2-4. No. 1 cylinuder nearest radiator.

Spark Plugs:—7/8-18 S.A.E. Champion #2. Set gap at .025 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift

Exhaust	1 9/32"	.341-.342"	4 11/16"	45°	5/16"

ROCKNE

MODEL 65 (1932), SERIAL NUMBERS 00001 UP
PRODUCTION STARTED FEBRUARY 15, 1932
AUTO-LITE SYSTEM

Tappet Clearance

	Operating	Timing
Intake	.004 (hot)	.010" (cold)
Exhaust	.006" (hot)	

Spring Pressure

Closed	48-53 pounds (2 1/23")
Open	71-76 pounds (1 23/32")

Timing

Intake valves open 5 degrees before top dead center. Intake valves close 40 degrees after lower dead center.

Exhaust valves open 40 degrees before lower dead center. Exhaust valves close 5 degrees after top dead center.

To Check Valve Timing. Set tappet clearance No. 1 intake valve at .010 inch (cold). With No. 6 piston on compression stroke crank engine over until flywheel mark 'IN.O/No. 1' (which is 5° before the top dead center mark 'UDC/1-6') is directly opposite the indicator in the inspection hole in the right front face of the flywheel housing. No. 1 intake valve should open at this point. Reset tappet clearance at .004 inch with engine hot.

To Set Valve Timing. Camshaft sprocket and crankshaft sprocket are marked. Mesh chain with camshaft and crankshaft turned so that marks are directly opposite each other and in line with a straightedge across the two shaft centers.

STARTER:—Model MAJ-4026. Starter drives engine through outboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4200	6.0	67

10.3 "	225	3.5	500
12.6 "	Lock	3.0	575
19.0 "	Lock	4.0	800

Startix:—This model equipped with Startix automatic starting switch. Not necessary to disconnect Startix when setting ignition—use special position of ignition switch (key turned to left). For complete article on Startix see Equipment Section.

Mounting:—Starter flange mounted at left of engine on forward face of flywheel housing. To remove, disconnect cable, take out 2 flange mounting screws, pull starter straight forward to clear Bendix housing, lift from place.

Oiling:—1000 Miles. Put few drops light oil in oiler at each end of armature. Outboard bearing (outer end of Bendix housing) is oilless.

GENERATOR:—Model GAM-4401. Third brush regulation. To adjust charging rate, take off commutator cover band, shift third brush (by prying on brush mounting stud) counter-clockwise to increase or clockwise to decrease charging rate. Third brush held in position by friction. Maximum charging rate is 12.8 amperes (hot) at 7.9 volts reached at 2500 R.P.M. or 18 M.P.H.

Generator Data

17	8.0	2400	12.2	7.8	3200
15.2	7.9	3200			

Brush spring tension 17-20 ounces. Shunt field current 4.08-4.52 amperes at 6 volts. Generator motoring draws 4.94-5.46 amperes at 6.0 volts.

Mounting:—Generator mounted on swinging bracket at left front of engine, driven by fan belt. To remove, disconnect lead, loosen adjustment clamp bolt and mounting bolts, swing generator toward engine, slip off drive belt, take out adjustment clamp bolt and two mounting bolts (forming bracket hinge), lift generator out.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt, swing generator away from engine until fan can just be turned with belt held stationary, tighten clamp bolt and mounting bolts.

Oiling:—1000 Miles. Put few drops light engine oil in oiler at each end of generator.

RELAY:—Model CB-4022. Relay mounted on generator. Relay contacts close at 6.5 M.P.H. or 725 R.P.M. (generator) with generator voltage of 7-7.5 volts and open with discharge current of 0-2.5 amperes. Relay contact gap limits .025-.035 inch. Air gap limits .010-.030 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9236. Dimmer Switch Clum Model 9126. Lighting switch mounted behind instrument board at lower left of instrument panel, operated by push- pull button on instrument panel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by foot-operated switch on toeboard. Switch positions:

1. Button pushed in—All lights off.
2. Button pulled out one half—Headlights and tail light on.
3. Button pulled out—Parking bulbs (in headlights) and tail light on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.

Dome Light	6-8	6	S.C.	81

NOTE:—Stop and tail light equipped with double filament bulb. Connect tail light wire (black and oak wire) to 2 cp. filament.

FUSE:—20 ampere capacity mounted on lighting switch.

FUEL PUMP:—A.C. mechanical type fuel pump (see Carburetion Section).

GASOLINE GAUGE:—K-S Telegauge hydrostatic type (see Carburetion Section).

HORN:—Sparton motor driven type mounted under engine hood. Current draw, 6 amperes at 6 volts.

ROCKNE

MODEL 75 (1932), SERIAL NUMBERS 1,500,001 UP
PRODUCTION STARTED DECEMBER 15, 1931
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On plate riveted to left frame member under left front fender.

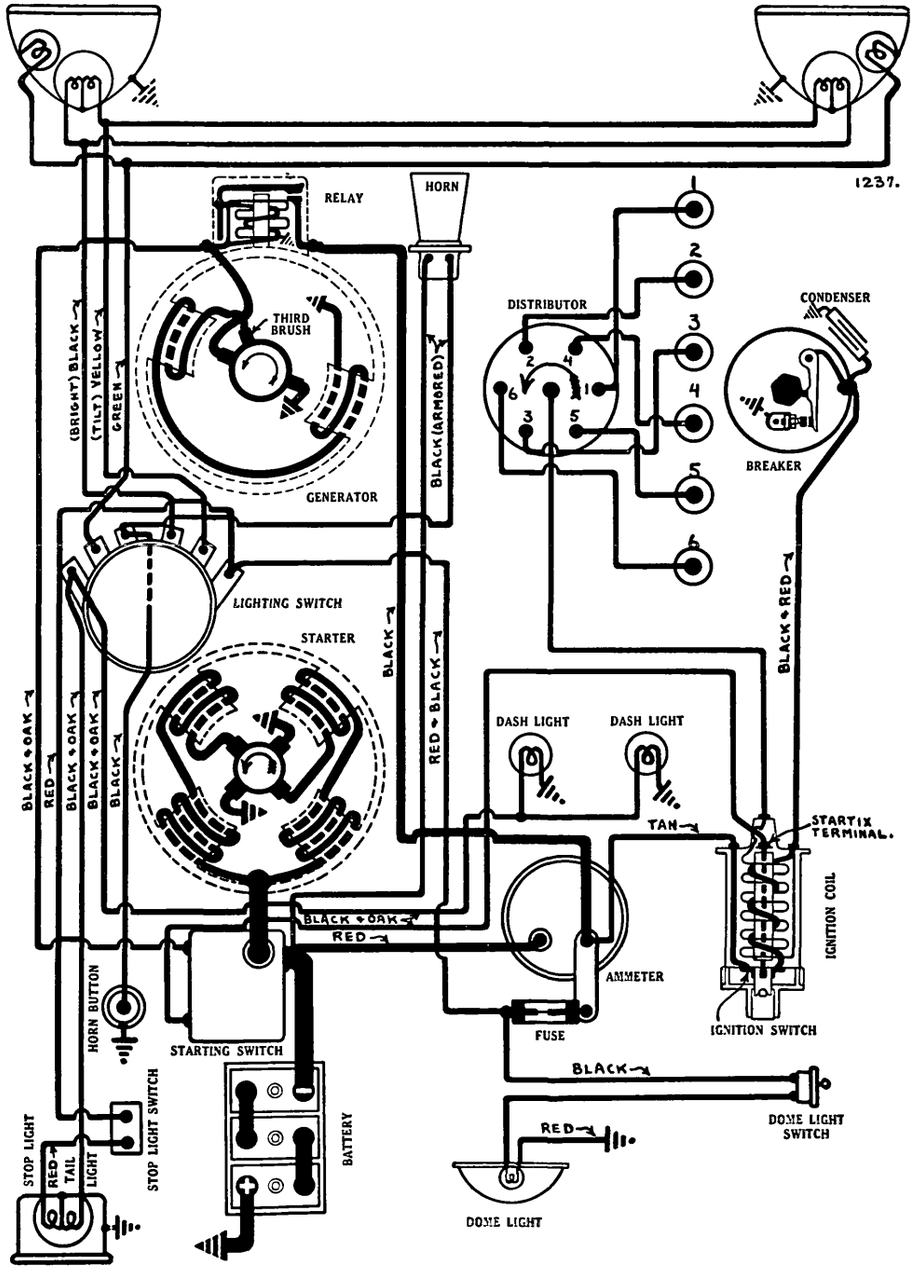
ENGINE NUMBER:—Stamped on left front of engine block back of water pump.

BAATERY:—Willard, Type WJ-1-13, 6 volt, 13 plate, 102 ampere hour capacity (20 hour rate). Positive (+) terminal grounded. Battery mounted on left frame member under front compartment floor boards. Battery size, 7 1/16 inches wide, 9 1/16 inches long, 9 5/16 inches high.

IGNITION:—Coil Model IG-4306, 4304. Lock coil type with switch at base of coil, equipped with terminal for Startix. Ignition switch has three positions, No. 1 Key vertical—ignition off—key can be removed; No. 2, right—ignition on and Startix on—regular running position; No. 3, left—ignition on but Startix not operative—this position used for cranking engine when automatic cranking not desired. Ignition current .5-1.5 amperes (engine running), 4-5 amperes (engine stopped).

Distributor Model IGB-4062. Single breaker arm, 6-lobe cam type with semi-automatic advance. Manual advance controlled by button on dash. Ordinary operating position, button pushed in toward instrument board, fully advanced spark, pull button out to retard spark. Breaker contact gap set at .020 inch. Hold within limits of .018-.020 inch. To set gap, loosen lock nut on stationary contact mounting stud, turn up stud, tighten lock nut. Resurface contacts when necessary with fine flat contact file. Breaker arm spring tension 16-22 ounces (measured at tip of breaker arm with spring scale in line with center of contacts and at right angles to arm). Maximum manual advance 15 degrees (engine).

Cam Angles—Closed 34°. Open 26° (distributor).



Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	0		600
3		610	6		1220
6		920	12		1840
9		1230	18		2460
11.5		1500	23		3000

Mounting:—Distributor mounted at left center of engine, driven by inclined shaft from camshaft. To remove, disconnect primary lead, disconnect manual spark control wire, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—1000 Miles. Put a few drops light oil in oiler on side of distributor housing. Take off distributor cap and rotor. Put few drops of oil in oiler in center of shaft, put one drop oil on breaker arm pivot pin, apply thin film vaseline to face of breaker cam.

Timing:—Standard setting 5° or 35/64" (on flywheel) before top dead center with full manual advance. To set timing, take off cover plate on inspection hole in top of flywheel housing at right of engine, fully advance manual spark control (push button in toward dash) and see that distributor is rotated clockwise to full extent of advance arm slot, turn ignition key to left (if ignition turned on to check contact opening). With No. 1 piston on compression stroke, turn engine over until punch marks on rim of flywheel (which are 35/64 inch before the top dead center mark 'UDC/1-6' are directly opposite indicator in inspection hole on housing. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open (use test lamp), tighten clamp bolt, connect spark plugs as indicated on diagram.

ROCKNE

MODEL 75 (1932), SERIAL NUMBERS 1,500,001 UP
PRODUCTION STARTED DECEMBER 15, 1931
AUTO-LITE SYSTEM

Firing Order:—1-4-2-6-3-5. No. 1 cylinder nearest radiator.

Spark Plugs:—⅞-18 S.A.E. Champion #2. Set gaps at .025 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1⅝"	.341-.342"	5⅜"	45°	5/16"
Exhaust	1½"	.341-.342"	5⅜"	45°	5/16"

Tappet Clearance			Spring Pressure	
	Operating	Timing		
Intake	.004" (hot)	.010" (cold)	Closed	48-53 pounds (2 1/32")
Exhaust	.006" (hot)		Open	71-76 pounds (1 23/32")

Timing

Intake valves open 5 degrees after top dead center. Intake valves close 53 degrees after lower dead center.

Exhaust valvs open 38 degrees before lower dead center. Exhaust valves close 10 degrees after top dead center.

To Check Valve Timing. Set tappet clearance No. 1 intake valve at .010 inch (cold). With No. 6 piston on compression stroke, turn engine over until piston is slightly past top dead center and stop when flywheel mark 'IN.O/No.1' (which is 5° or 35/64" past the top dead center mark 'UDC/1-6') is directly opposite indicator in inspection hole in flywheel housing at right of engine. No. 1 intake valve should begin to open at this point. Reset tappet clearance .004 inch with engine hot.

To Set Valve Timing. Camshaft sprocket and crankshaft sprocket are marked. Mesh chain so that marks are directly opposite each other and in line with a straightedge across the shaft centers (center the two crankshaft sprocket marks.

STARTER:—Model MAN-4001. Starter drives engine through outboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Dome Light	6-8	6	S.C.	81

NOTE:—Stop and tail light equipped with double filament bulb. Connect tail light wire (black and oak) to 2 cp. filament.

FUSE:—20 ampere capacity mounted on ammeter.

GASOLINE GAUGE:—K-S Telegauge hydrostatic type (see Carburetion Section).

FUEL PUMP:—A.C. mechanical fuel pump mounted at right of engine (see Carburetion Section).

HORN:—Sparton motor-driven type mounted under engine hood. Current draw, 6 amperes at 6 volts.

ROCKNE

SIX CYLINDER MODEL 10 OR 31 (1933), SERIAL NUMBERS 16,151 UP
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On plate on frame side rail under left hand front fender.

ENGINE NUMBER:—Stamped on cylinder block at left center above distributor.

ENGINE:—Six cylinder, 'L' head type, 3⅛x4⅛ bore and stroke, 189.8 cubic inch displacement, NACC. rating—23.4 H.P., develops 70 H.P. at 3200 R.P.M. Standard compression ratio 5.5-1, no optional compression ratios available.

BATTERY:—Willard, Type WH-1-13, 6 volt, 13 plate, 102 ampere hour capacity **(20 hour rate). Starting capacity 120 amperes for 20 minutes.**

Grounded Terminal:—Positive (+) terminal grounded.

Mounting:—Battery mounted under front floor boards on left hand side.

Dimensions:—Width, 7 1/16". Length, 9 1/16". Height, 9 5/16".

IGNITION:—Coil Model IG-4304, 4307. Lock coil type mounted on back of instrument board.

Ignition Current:—.5-2.5 amperes at 6 volts (engine running), 4-5 amperes at 6 volts (engine stopped).

Ignition Switch:—Ignition switch has two 'On' positions. With key turned to the right (regular running position), Startixe is operative. With key turned to the left (timing position), ignition is on but Startix is not connected.

Distributor Model IGB-4070-A. Single breaker arm, 6 lobe cam, full automatic advance type. No manual advance provided. To set breaker gap, loosen lock nut on stationary contact mounting stud, turn up stud, tighten lock nut.

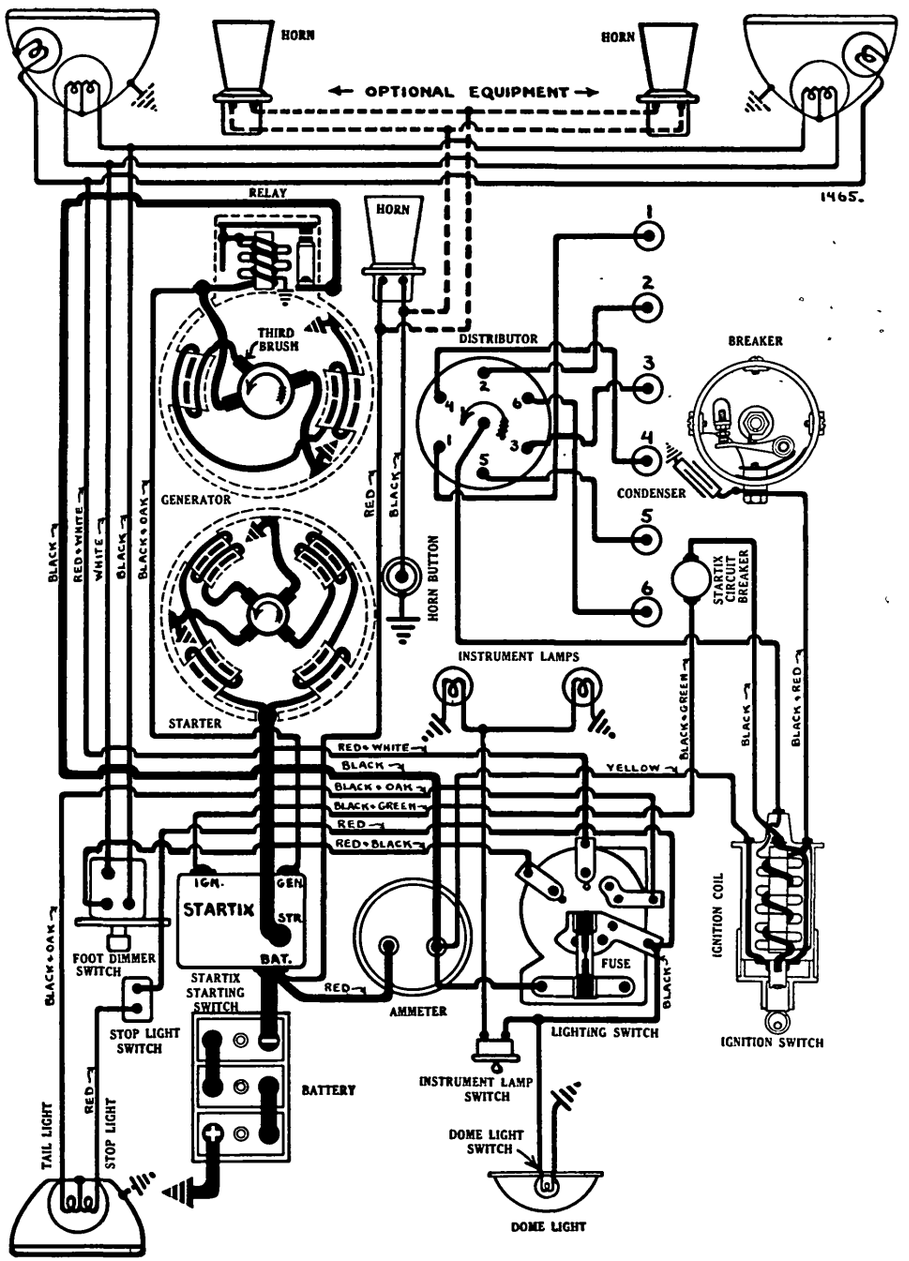
Breaker Gap:—Set gap at .020". Hold within limits of .018-.020".

Breaker Arm Spring Tension:——16-22 ounces (measured at tip of breaker arm with spring scale in line with center of contacts and at right angles to breaker arm).

Cam Angles—Closed 34°. Open 26° (distributor degrees).

		Automatic Advance			
Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	0		800
3		550	6		1100
6		700	12		1400
9		1150	18		2300
10.5		1400	21		2800

Mounting:—Distributor mounted at left center of engine and driven by inclined shaft from camshaft. To remove, disconnect primary lead, take off distributor cap, take out hold-down screw in advance arm, lift out.



Oiling:—1000 Miles. Put few drops of light engine oil in oiler on side of distributor shaft housing. Take off distributor cap and rotor, oil wick oiler in center of shaft, put one drop cil on breaker arm pivot pin, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting—Top dead center with automatic advance retarded.

To Set Ignition Timing:—With No. 1 piston on compression turn engine over until piston reaches top dead center with flywheel mark 'U.D.C./1-6' directly opposite pointer in inspection hole on left hand forward face of flywheel housing under the starter. Loosen advance arm clamp bolt, rotate distributor cup until contacts begin to open (if ignition is turned on to check contact opening, use left hand 'On' position of switch to avoid automatic cranking), tighten clamp bolt, see that rotor is opposite No. 1 terminal in distributor cap (see diagram), connect spark plugs as indicated.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Campion No. 7. Set spark gaps at .025 inch.

ROCKNE

SIX CYLINDER MODEL 10 OR 31 (1933), SERIAL NUMBERS 16,151 UR
AUTO-LITE SYSTEM

VALVE TIMING:—Camshaft Setting. Camshaft driven from crankshaft by two-sprocket non-adjustable chain drive. Both sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with straightedge across shaft centers.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010" cold. With No. 6 piston on compression turn engine over until flywheel mark 'IN.OP./1-6' (which is 5° or ½" before top dead center mark 'U.D.C. /1-6) registers with pointer in inspection hole in flywheel housing. No. 1 intake valve should begin to open at this point. Reset tappet clearance at .004" with engine warm.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 15/32" (overall)	11/32"	4 11/16"	45°	5/16"
Exhaust	1 9/32" "	11/32"	4 11/16"	45°	5/16"

Tappet Clearance (Operating Timing)		Spring Pressure		
Intake	.004" (hot) .010" (cold)	Closed	48-53 pounds	2 1/32"
Exhaust	.006" (hot) .010" (cold)	Open	71-76 pounds	1 23/32"

NOTE:—Install all valves with .001-.003" valve stem clearance in guide.

Intake Valves	Timing	Exhaust Valves
Open 5° before top dead center.		Open 40° before lower dead center
Close 40° after lower dead center		Close 5° after top dead center.

CARBURETION:—Stromberg Updraft Carburetor, Model UR-2 (see Carburetor Section for complete data). Intake manifold heat control is manually operated.

Fuel Pump:—A.C. mechanical fuel pump mounted on right side of crankcase (see Carburetion Section). Remove sediment bowl whenever necessary, empty water and sediment, remove filter screen (directly above bowl) and clean screen before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—Model MAJ-4030. Starter drive. Outboard Bendix drive and Startix switch. See Equipment Section for complete data on Startix and special Startix circuit breaker (Anti-backfire unit). Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces each. Starter cranks engine at 140 R.P.M. (1580 R.P.M. of armature) drawing 170 amperes.

Starter Data

Torque	R.P.M.	Volts	Amperes

17.0 "	Lock	4.0	750

Mounting:—Two-capscrew flange mounting on left hand forward face of flywheel housing. To remove, disconnect cable, take out 2 flange mounting screws, pull starter straight forward to clear Bendix housing, lift out.

Oiling:—1000 Miles. Put few drops light engine oil in oiler at each end of armature. Outer bearing (in end of Bendix housing) is oilless.

GENERATOR:—Model GAM-4501, 6. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate (standard setting), 18 amperes (cold) at 8.0 volts reached at 2400 R.P.M. or 22-24 M. P. H.

Charging Rate Adjustment:—Take off commutator cover band, shift third brush (by prying on brush mounting stud) counter-clockwise to increase, or clockwise to decrease charging rate. Third brush is held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	700	0	6.4	760

18	8.0	2400	12.2	7.8	3200
15.2	7.9	3200			

Brush Spring Tension:—18-22 ounces on each brush.
Shunt Field Current:—4.08-4.52 amperes at 6 volts across field terminals.
Motoring:—4.94-5.46 amperes at 6 volts.
Field Fuse—7½ ampere on generator frame (GAM-4506 only).

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine and slip off drive belt, take out two bolts forming bracket hinge, lift generator out.

Belt Adjustment. Loosen mounting bolts and adjustment clamp bolt, pull generator away from engine until belt can just be turned with fan held stationary, tighten adjustment bolt before releasing generator, tighten hinge bolts.

Oiling:—1000 Miles. Put few drops light engine oil in oiler at each end.

RELAY:—Model CB-4022. Mounted on generator field frame. Contacts close at 750 R.P.M. of generator or 7 M.P.H. with generator voltage of 7-7.5 volts and open with discharge current of .5-2.5 amperes.

Contact Gap:—.025-.035 inch. **Air Gap:**—.010-.030 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9236. Clum Dimmer Switch, Model 9126. Lighting switch mounted behind instrument board and controlled by push-pull button on instrument panel. Lighting system 'depressed beam' with double filament headlight bulbs controlled by foot-operated switch on toe-board. Lighting switch positions:

1. Button pushed in—All lights off.
2. Button pulled out halfway—Headlights and tail light on.
3. Button pulled out—Parking bulbs (in headlamps) and tail light on.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking Bulbs	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Stop and Tail Light	6-8	21-2	D.C.	1158
Dome Light	6-8	6	S.C.	81

NOTE:—Stop and tail light equipped with double filament bulb. Tail light lead (black and oak wire) must be connected to 2 cp. filament.

FUSE:—20 ampere capacity mounted on back of lighting switch.

HORNS:—Sparton vibrator type mounted under left hand headlight. Two horns furnished as special equipment. Current draw, 6 amperes at 6 volts.

ROLLS ROYCE

PHANTOM MODEL (1927-28-29)

ROLLS ROYCE GENERATING, STARTING AND LIGHTING SYSTEM

DE JON IGNITION

BATTERY:—Exide, Type 3-XC-21-1, 6 volts. Starting capacity (20 minute rate) is 164 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 30 hours. The positive (+) terminal is grounded at the starting motor.

IGNITION:—Coil Models CA-4019, 4024. Distributor Model BA-4001. Breaker contacts separate .018-.020 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. A double ignition unit with two heads and two coils is used. Both breakers must operate at the same instant for correct ignition. Distributor is semi-automatic. Manual advance is 15° (distributor). Automatic advance begins at 400 R.P.M. (distributor) and reaches a maximum of 11½° at 2000 R.P.M. Ignition current is 2.5 amperes at 6 volts with engine running and 7.5 amperes at 6 volts with engine stopped. On bench test, coil draws 2.5 amperes at 6 volts with distributor R.P.M. of 221. Spark between needle points at atmospheric pressure will be .800 inch.

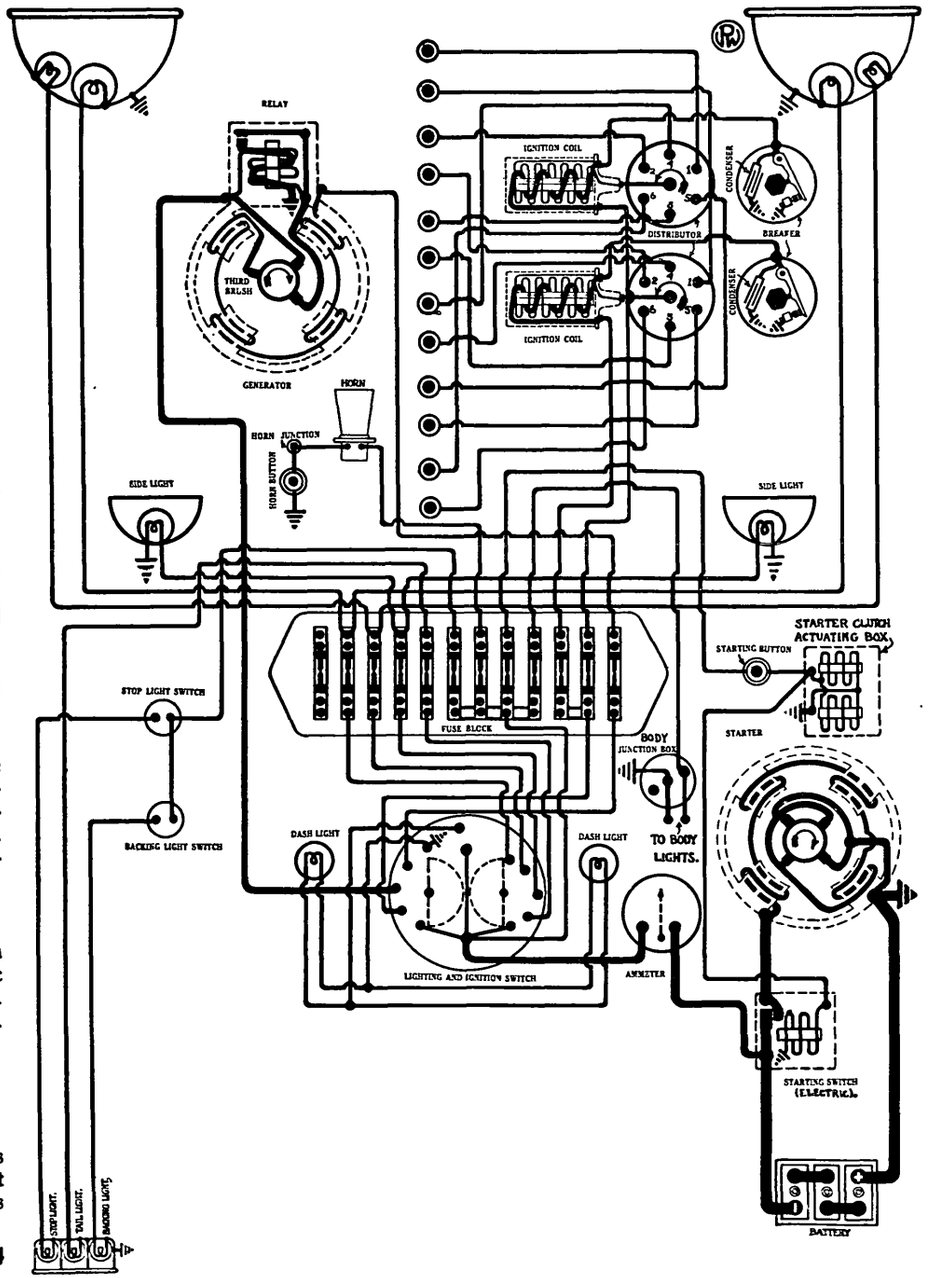
Mounting:—Ignition coils and distributor units are mounted on the left of the engine. To remove, disconnect manual advance rod and primary leads and remove distributor caps with cables attached. Then remove four hold-down nuts and lift unit from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of each distributor head every 2000 miles. Put one drop of oil on the breaker arm pivot pin after removing the rotor button every six months. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm every six months.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark lever in the fully retarded position. To set timing, crank engine until piston No. 1 reaches this position. The flywheel mark 'LI' will be opposite the line on the crankcase directly above the flywheel. Make certain that spark lever is fully retarded. If breaker contacts are not separating loosen advance arm clamp screw and rotate distributor housing until contacts begin to separate. Tighten the clamp screw. The contacts in each distributor head should open at the same instant.

Firing Order:—The firing order is 1-4-2-6-3-5. The forward distributor fires the spark plugs over the inlet valves and the rear distributor fires plugs over the exhaust valves. With spark plugs numbered from 1 to 12 (beginning at the radiator), connections on the forward distributor are: terminal No. 1 to spark plug No. 1, 4 to 8, 2 to 4, 6 to 12, 3 to 5, 5 to 9. Rear distributor is connected: Terminal No. 1 to spark plug No. 2, 4 to 7, 2 to 3, 6 to 11, 3 to 6, 5 to 10.

Spark Plugs:—Spark plugs are metric longbody. Gaps should be .030 inch.



STARTER:—Part No. A-9860. Starter is connected to the engine through a chain and drives through transmission. Starter is engaged through an electromagnetic clutch. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 86 R.P.M. Brush spring tension is 12-14 ounces. Main starter switch is Model A-2644. Push button switch is Model G-5560.

Starter Data

Torque	R.P.M.	Volts	Amperes
24 lb. ft.	Lock	3.8	750

Mounting:—Starter is mounted at right of transmission case under the floor boards of the front compartment. To remove starter, remove floor boards and disconnect battery cable and drive chain. Then remove caps from two mounting brackets and lift starter from place.

Oiling:—Starter front bearing is oiled from the chassis lubricating system. Put 4 or 5 drops of light oil in rear bearing oiler every six months.

ROLLS ROYCE

PHANTOM MODEL (1927-28-29)

ROLLS ROYCE GENERATING, STARTING AND LIGHTING SYSTEM

DE JON IGNITION

GENERATOR:—Part No. A-9547. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, rotate generator end plate in a clockwise direction increasing charging rate and in a counter-clockwise direction decreasing charging rate. With maximum third brush setting generator output is 26 amperes at 9 volts reached at 1450 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
20	8.25	1350	17	8.75	1460

Main brush tension is 8-10 ounces. Third brush spring tension is 6-8 ounces. Shunt field current is 2.5 amperes at 4 volts.

Mounting:—Generator is mounted at left of engine. To remove generator, disconnect leads and drive coupling and loosen mounting strap. Then lift generator from place.

Oiling:—Generator bearings are oiled from central chassis lubricating system.

CUTOUT:—Part No. A-10194. Cutout is mounted on the generator. Contacts close at 450-475 R.P.M. with a generator voltage of 6.75 volts and open at 400 R.P.M. with a discharge current of 3 amperes. Cutout contacts separate .030 inch. Air gap is .025 inch with contacts open and .012 inch with contacts closed. Cutout is adjusted by turning nut on armature spring.

LIGHTING:—Rolls Royce Part No. A-10257. Switch is mounted on the instrument board. Head lamps are 6-8 volt, 21 cp. double filament Mazda No. 1110. Side lamps are 6-8 volt, 3 cp. S.C. Mazda No. 63. Instrument board lamps are 6-8 volt, 2 cp. D.C. Mazda No. 62. Tail lamps are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop and backing lamps are 6-8 volt, 21 cp. S.C. Mazda No. 1129.

FUSES:—Generator field fuse is 10 amperes. Lighting fuses are 10 amperes.

ROLLS ROYCE

PHANTOM MODEL (1930-31)
ROLLS ROYCE GENERATING, STARTING SYSTEM
DE JON IGNITION

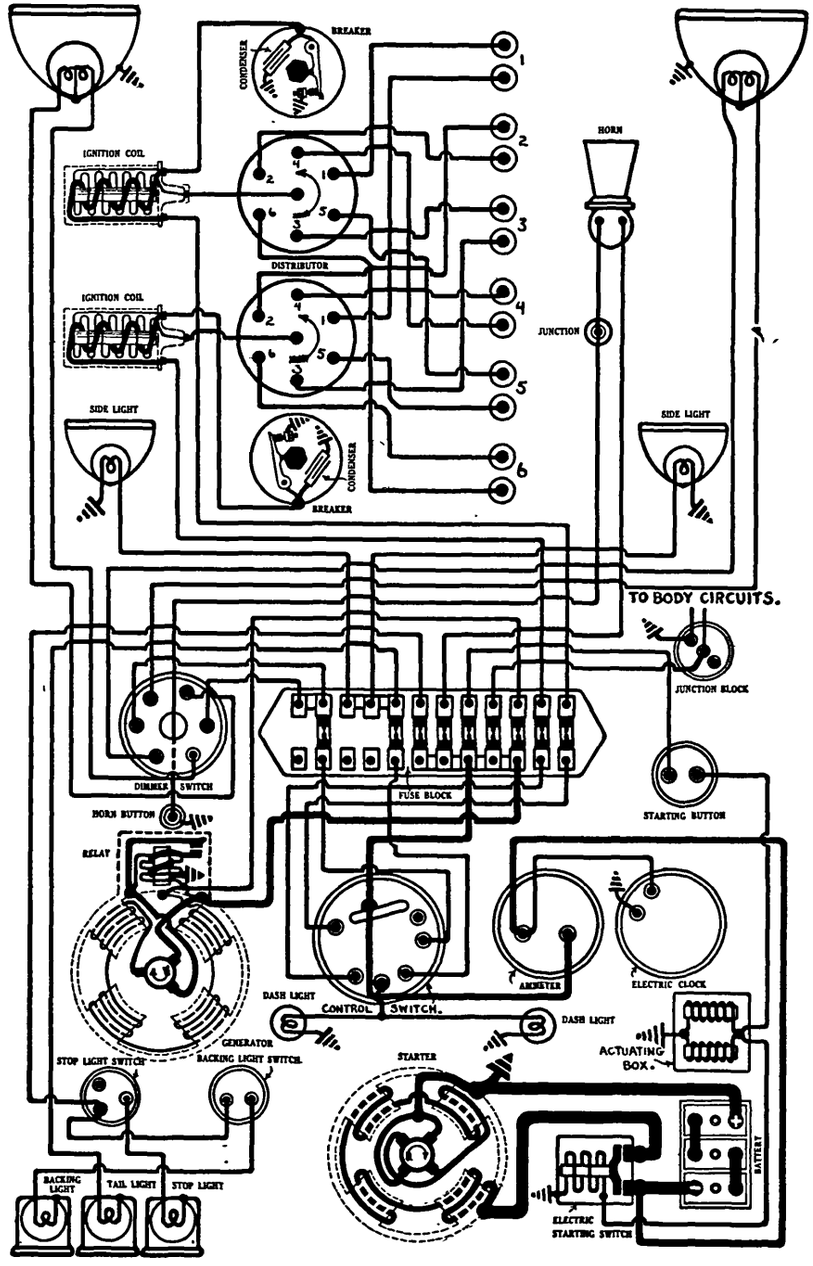
BATTERY:—Exide, Type 3-XC-21-1, 6 volt. The positive (+) terminal is grounded at the starting motor. Starting capacity (20 minute rate) is 164 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 30 hours.

IGNITION:—Coil Model CAA-4002 (2 used). Coils are mounted at the left of the engine. Ignition current is 2.5 amperes at 6 volts with engine running and 7.5 amperes at 6 volts with engine stopped. On bench test, each coil draws 2.5 amperes at 6 volts with a distributor R.P.M. of 221. The spark at atmospheric pressure should jump .800 inch between needle points.

Distributor Model IAA-4004. This is a special unit consisting of two complete distributors mounted on a unit base. The forward distributor fires the spark plugs over the exhaust valves and the rear distributor fires the plugs over the inlet valves. Breaker contacts separate .018-.020 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 10 degrees (distributor). Automatic advance begins at 400 R.P.M. of crankshaft. Maximum automatic advance is 42 degrees reached at 2500 R.P.M. Both sets of breaker contacts must open at the same instant for satisfactory engine performance.

Mounting:—Ignition coils and distributor units are mounted on the left of the engine. To remove, disconnect manual advance rod and primary leads and remove distributor caps with cables attached. Then remove four hold-down nuts and lift unit from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of each distributor head every 2000 miles. Put one drop of oil on the breaker arm pivot pin after removing the rotor button, every six months. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm every six months.



Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position 10 degrees before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke. Fully advance manual spark control and turn engine over until the flywheel mark 'MA' is directly opposite the reference mark on the crankcase above the flywheel. This is the firing position for piston No. 1. Then loosen advance arm clamp screw and rotate distributor housing until contacts begin to open. Both sets of contacts must open at the same instant. Tighten the clamp screw and connect the spark plugs as shown on the diagram.

NOTE:—The arrangement of the spark plugs as shown is correct for all Phantom engines with cast iron heads. The forward distributor fires the plugs over the inlet valves and the rear distributor fires the plugs over the exhaust valves (see diagram). Engines with the aluminum head have one set of spark plugs on each side of the engine. The forward distributor fires the plugs on the right side of the head (exhaust plugs) and the rear distributor fires the plugs on the left side of the head (inlet plugs).

Firing Order:—The firing order is 1-4-2-5-3-6.

Spark Plugs:—Spark plugs are 18 MM. Metric. Longbody. Gaps should be .030 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1.900 inches. Stem diameter, .433 inch. Stem length, 4.450 inches. Valve lift, .425 inch. Spring pressure, 75 pounds (valve closed). Tappet clearance, .004 inch hot (alumi-

ROLLS ROYCE

PHANTOM MODEL (1930-31)
ROLLS ROYCE GENERATING, STARTING SYSTEM
DE JON IGNITION

num heads). Inlet valves open 14 degrees after top dead center and close 30 degrees after lower dead center (with .020 inch tappet clearance).

EXHAUST VALVES. Head diameter, 1.900 inches. Stem diameter, .433 inch. Stem length, 4.450 inches. Valve lift, .425 inch. Spring pressure, 75 pounds (valve closed). Tappet clearance, .004 inch hot (aluminum head). Exhaust valves open 34 degrees before lower dead center and close 2 degrees before top dead center with a tappet clearance of .020 inch.

NOTE:—Tappet clearance should always be set at .020 inch in checking valve timing. The flywheel is marked 'TDC', 'BDC', 'IO', 'IC', 'EO', 'EC', the ignition mark 'MA'. The inlet closing point is recommended for use in checking valve setting. Valve stem guides are removable. Valves with oversize stems are not made.

STARTER:—Part No. A-9860. Starter is connected to the engine through a chain and drives through transmission. Starter is engaged through an electromagnetic clutch. The direction of rotation is clockwise, viewed from the commutator end. Starter cranks the engine at 86 R.P.M. Brush spring tension is 12-14 ounces. Main starter switch is Model A-2644. Push button switch is Model G-5560.

Starter Data

Torque	R.P.M.	Volts	Amperes
24 lb. ft.	Lock	3.8	750

Mounting:—Starter is mounted at right of transmission case under the floor boards of the front compartment. To remove starter, remove floor boards and disconnect battery cable and drive chain. Then remove caps from two mounting brackets and lift starter from place.

Oiling:—Starter front bearing is oiled from the chassis lubricating system. Put 4 or 5 drops of light oil in rear bearing oiler every six months.

GENERATOR:—Part No. A-9547. The direction of rotation is clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, rotate generator end plate in a clockwise direction to increase charging rate and in a counter-clockwise direction to decrease charging rate. With maximum third brush setting, generator output is 26 amperes at 9 volts reached at 1450 R.P.M.

Generator Data

Main brush spring tension is 8-10 ounces. Third brush spring tension is 6-8 ounces. Shunt field current is 2.5 amperes at 4 volts.

Mounting:—Generator is mounted at left of engine. To remove generator, disconnect leads and drive coupling and loosen mounting strap. Then lift generator from place.

Oiling:—Generator bearings are oiled from central chassis lubricating system.

CUTOUT:—Part No. A-10194. Cutout is mounted on the generator. Contacts close at 450-475 R.P.M. with a generator voltage of 6.75 volts and open at 400 R.P.M. with a discharge current of 3 amperes. Cutout contacts separate .030 inch. Air gap is .025 inch with contacts open and .012 inch with contacts closed. Cutout is adjusted by turning nut on armature spring.

LIGHTING:—Rolls Royce Part No. A-14527. Switch is mounted on the instrument board. There is a separate dimmer switch. Head lamps are 6-8 volt, 21 cp. double filament Mazda No. 1110. Side lamps are 6-8 volt, 3 cp. S.C. Mazda No. 63. Instrument board lamps are 6-8 volt, 2 cp. D.C. Mazda No. 64. Tail lamps are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop and backing lamps are 6-8 volt, 21 cp. S.C. Mazda No. 1129.

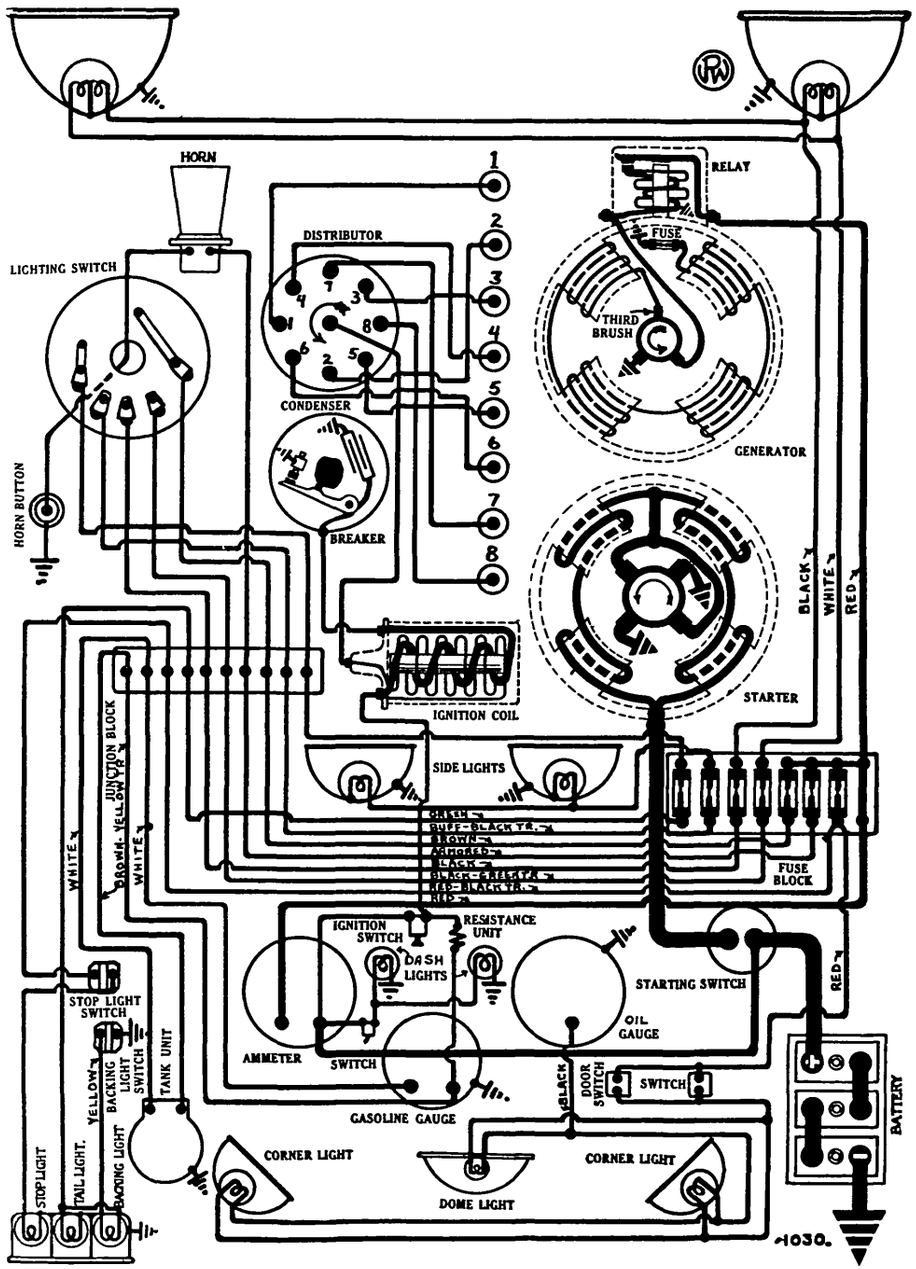
FUSES:—Generator field fuse is 10 amperes. Lighting fuses are 10 amperes.

STEARNS KNIGHT

MODELS H AND J 8-90 (1928-29-30)
DE JON GENERATING, STARTING SYSTEM
DE JON IGNITION

BATTERY:—U. S. L., Type 3-CVX-10X, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 192 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 38.4 hours. The battery is mounted under the front floor boards on the right frame member.

IGNITION:—Coil Model CA-4023. Coil is mounted on the right side of the crank case. Ignition current is 2 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.



Distributor Model IAA-4002 or IAB-4001. Breaker contacts separate .015-.018 inch (IAA-4002) or .020-.024 inch (IAB-4001). Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 20 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (distributor). Automatic advance begins at 500 R.P.M. of engine. Maximum automatic advance is 15 degrees (distributor) reached at 2000 R.P.M. The Model IAA-4002 distributor has two sets of contacts operating on an eight sided cam. Contacts must open simultaneously. The Model IAB-4001 distributor has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Both distributors must be synchronized for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted in bushing in crank case. To remove distributor, disconnect primary lead and manual advance rod. Remove head with high tension cables intact. Remove set screw and lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Every month put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. On Model IAA-4002 distributors, set both contact gaps at exactly the same figure and time engine with one set of contacts blocked open. Then block open the other set of contacts and repeat timing to determine if both sets open at the same time. If they do not, shift the position of the mounting plate slightly. On Model IAB-4001 distributors, time the engine with No. 1 piston entering power stroke with the first set of contacts open. Then crank engine over 90 degrees until piston No. 6 enters power stroke and loosen two lock screws on breaker plate and shift plate until the second set of contacts begin to open. Tighten the lock screws.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position 8 degrees or 1 inch (on the flywheel) before top dead center with the manual spark control fully advanced (1928-29 cars with 14.820 inch flywheel) or a position 10 degrees or 1¼ inches on the flywheel after top dead center with the manual spark control fully retarded (1929-30 cars with 16.076 inch flywheel). To set timing, crank engine over until piston No. 1 enters compression stroke. This may be determined by removing the spark plug in cylinder No. 1 and cranking the engine over until the air compressed in the cylinder is felt escaping through the plug port. Then fully advance manual spark control (1928-29 cars) or retard spark control (1929-30 cars). Turn engine over until a point on the flywheel 8 degrees or 1 inch before the top dead center mark is opposite the indicator on the flywheel housing (1928-29 cars) or until the ignition mark which is 1¼ inches past the top dead center mark is opposite the indicator. This ignition mark is a prick punch mark on the flywheel rim. Then loosen the taper lock screw in the center of the

STEARNS KNIGHT

MODELS H AND J 8-90 (1928-29-30)
DE JON GENERATING, STARTING SYSTEM
DE JON IGNITION

breaker cam, carefully locate the cam so that the contacts are beginning to open, and tighten the lock screw. Connect the spark plugs as indicated on the diagram.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4. No. 1 cylinder is nearest the radiator.

Spark Plugs:—Spark plugs are ⅞ inch Standard. Gaps are .028 inch.

VALVE TIMING:—1928-29). Inlet ports open 6 degrees after top dead center and close 48 degrees after lower dead center. Exhaust ports open 42 degrees before lower dead center and close at top dead center.

(1929-30). Inlet ports open 16 degrees before top dead center and close 48 degrees after lower dead center. Exhaust ports open 48 degrees before lower dead center and close at top dead center.

Valve Setting. The exhaust closing mark on the flywheel which is at upper dead center should be used in setting the eccentric shaft.

STARTER:—Model SD-4102. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 120 R.P.M. Brush spring tension is 2-3 pounds. Switch is Model SW-4001 and SW-4201.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	75
24.4 "	Lock	3	650

Mounting:—Starter is flange mounted at the right of the engine on the forward face of the flywheel housing. To remove starter, disconnect cable and take out three flange mounting bolts. Then pull starter forward to clear Bendix drive and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model DA-4016. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust charging rate, insert a screwdriver in the slotted end of the third brush shifting shaft on the commutator end plate and turn the shaft in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. With maximum setting, generator output is 14 amperes at 6 volts, reached at 1400 R.P.M. or 25 miles per hour.

Generator Data

Cold Test		Hot Test

12	2400	7	3200
10	3200		

Generator, motoring draws 5.25 amperes at 6 volts. Shunt field current is 4.41 amperes at 6 volts. Brush spring tension is 1½-2 pounds. A five ampere field fuse is mounted on the end plate.

Mounting:—Generator is base mounted at right of engine. To remove generator, disconnect lead and remove two bolts from drive coupling. Then remove four base mounting screws and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks or each 500 miles.

RELAY:Model RA-4001-A. Relay is mounted on the generator. Relay closes at 11 miles per hour or 550 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of .5-2.5 amperes. Relay contacts separate .025-.035 inch. Air gap between the relay armature and coil core is .015 inch with contacts closed.

LIGHTING:—Briggs and Stratton Switch Model 40701. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact) Mazda 1110. Side, dash and tail lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop and backing lights are 6-8 volt, 21 cp. S.C. Mazda 1129. Dome light and corner lights are 6-8 volt, 6 cp. S.C. Mazda 81. Lighting switch is mounted at the base of the steering column and is controlled by lever on steering wheel.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 20 amperes.

STUDEBAKER

"DICTATOR" MODEL GE (1928-29), SERIAL NUMBERS 1,410,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

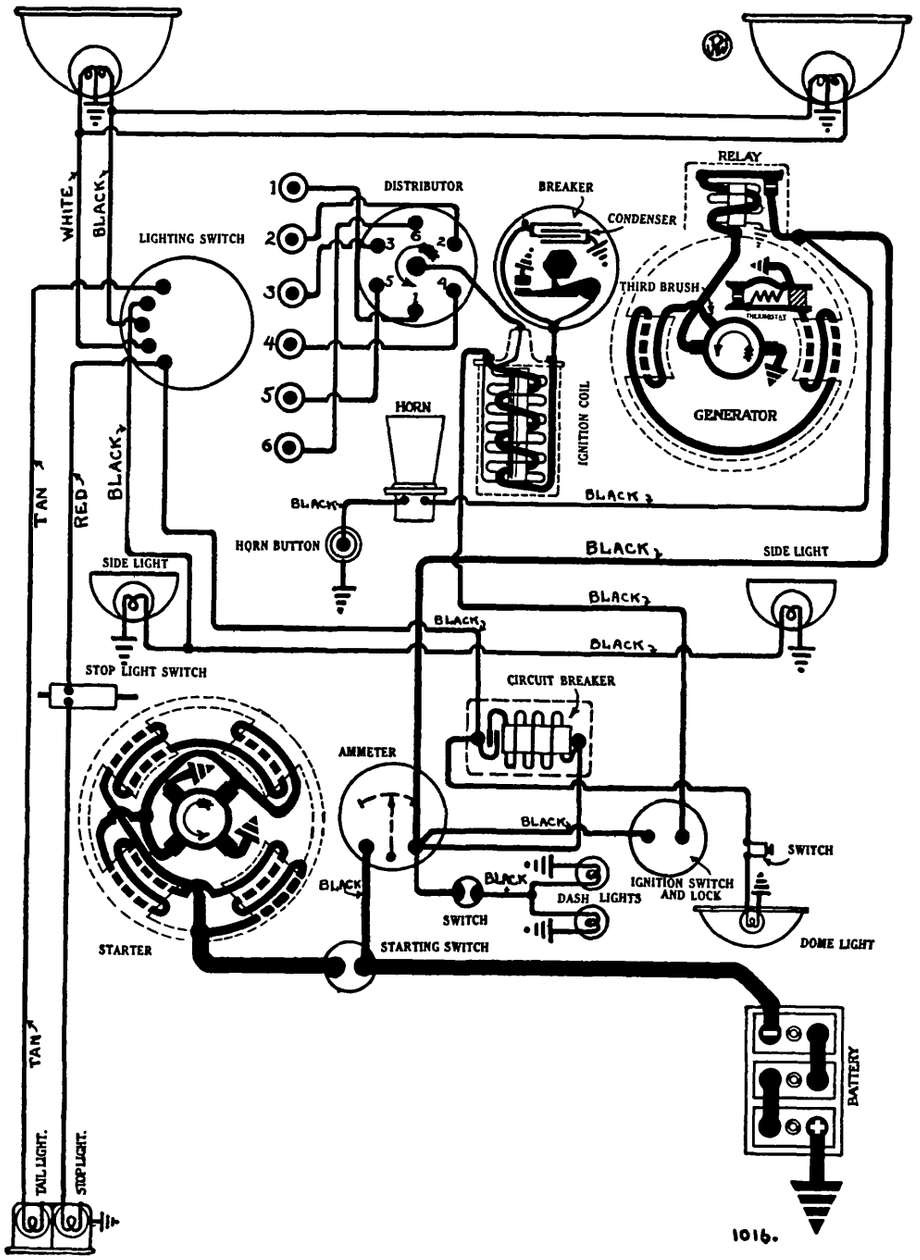
BATTERY:—Willard, Type SJWR-3. 6 volt, 11 plates. The positive (+) terminal is grounded. Starting capacity (20 ampere rate) is 104 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 18 hours. Battery is mounted under the floor boards on the right frame member.

IGNITION:—Coil Model 525-A and E. Ignition coil is mounted on the dash. Ignition current is ½-2 amperes at 6 volts with engine running, and 4 amperes at 6 volts with engine stopped.

Distributor Model 636-Y. Breaker contacts separate .018-.024 inch with contact arm on lobe of cam. Adjust contact opening by loosening lock nut on stationary contact stud and turning stud. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension should be 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 400 R.P.M. of the engine. Maximum automatic advance is 32 degrees reached at 3000 R.P.M.

Mounting:—Distributor is mounted on accessory bracket at right of engine. To remove distributor, disconnect manual advance rod and primary lead and remove head with high tension cables intact. Then loosen advance arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor housing and turn down one turn every 2500 miles or each six weeks. Every six weeks remove distributor head and rotor and put 3 or 4 drops of light oil in the wick oiler.



Timing:—Breaker contacts separate when the piston entering power stroke reaches a position 7½ degrees after top dead center with the manual spark advance fully retarded. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke. At this point the flywheel mark "UP-DC-1-6" will be opposite the indicator. Then advance spark lever exactly one half. Breaker contacts should begin to separate. If they do not, loosen advance arm clamp screw and rotate distributor housing until contacts begin to separate. Tighten the clamp screw. Make certain that segment directly opposite rotor is connected to spark plug in cylinder No. 1 and connect remaining plugs in order 4-2-6-3-5 counterclockwise around the distributor.

VALVE TIMING:—INLET VALVES:—Head diameter, 1⅝ inches; stem diameter, 5/16 inch; stem length, 5⅜ inches. Tappet clearance, .006 inch (cold). Spring pressure is 52-58 pounds. Valve lift is 5/16 inch. Inlet valves open 5 degrees after top dead center and close 53 degrees after lower dead center. Flywheel is marked "IN-OP-1-6" at point of inlet opening.
EXHAUST VALVES:—Head diameter, 1½ inches; stem diameter, 5/16 inch; stem length, 5⅜ inches. Tappet clearance is .008 inch (cold). Spring pressure is 52-58 pounds. Valve lift is 5/16 inch. Exhaust valves open 38 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

NOTE:—On cars before August, 1928, the valve stem length is 4⅞ inches.

To Set Valve Timing:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

Timing Chain Adjustment:—Loosen 3 bolts on accessory sprocket bracket, turn up adjusting screw until play on rim of fan pulley is ⅛", tighten mounting bolts.

STUDEBAKER

"DICTATOR" MODEL GE (1928-29), SERIAL NUMBERS 1,410,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model 720-N. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 100 R.P.M. drawing 275 amperes at 4.65 volts. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	60
4 "	1230	4.6	210
15 "	Lock	3.2	575

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light oil in the oiler on the commutator end of the starter every 2500 miles or each six weeks. The drive end bearing is oilless.

GENERATOR:—Model 949-J. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165 degrees F. putting the resistance across the contacts in series with the field and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 19.5 amperes (cold) at 8.5 volts reached at 1650 R.P.M. or 24.2 M.P.H.

Generator Data
Hot Test

Amperes	Volts	R.P.M.
0	6.4	710
7	7.1	1120
10	7.4	1500
12	7.6	1650
10	7.4	2800

Running as a motor, generator draws 5.5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 18 ounces.

Mounting:—Generator is flange mounted on rear of acessory bracket at right of engine. To remove generator, disconnect lead and remove 3 flange mounting cap screws. Then pull generator to the rear.

Oiling:—Put 4 or 5 drops of light oil in the oilers at each end of the generator every 2500 miles or each six weeks.

RELAY:—Model 265-B. Relay is mounted on the side of the generator. Relay closes at 650 R.P.M. or 9.4 M.P.H. when the generator voltage reaches 6.4 volts, and opens at 550 R.P.M. or 9 M.P.H. with a discharge current of 1 ampere. Relay contacts separate .015-.025 inch. Air gap is .014 inch with contacts closed.

LIGHTING:—Delco-Remy Switch, Model 484-D. Switch is mounted at base of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base) Mazda No. 1110. Dash and tail lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop and dome lights are 6-8 volt, 6 cp. S.C. Mazda No. 81. Side lights are 6-8 volt, 6 cp. S.C. Mazda No. 81 (first cars) or 6-8 volt, 3 cp. S.C. Mazda No. 63 on later cars.

CIRCUIT BREAKER:—Model 410-C. A vibrating circuit breaker protects the lighting circuits. The circuit breaker begins to vibrate with a current of 25-30 amperes. While vibrating the current is 15 amperes.

STUDEBAKER

"COMMANDER" MODEL GH (1928-29) AFTER AUGUST, 1928
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

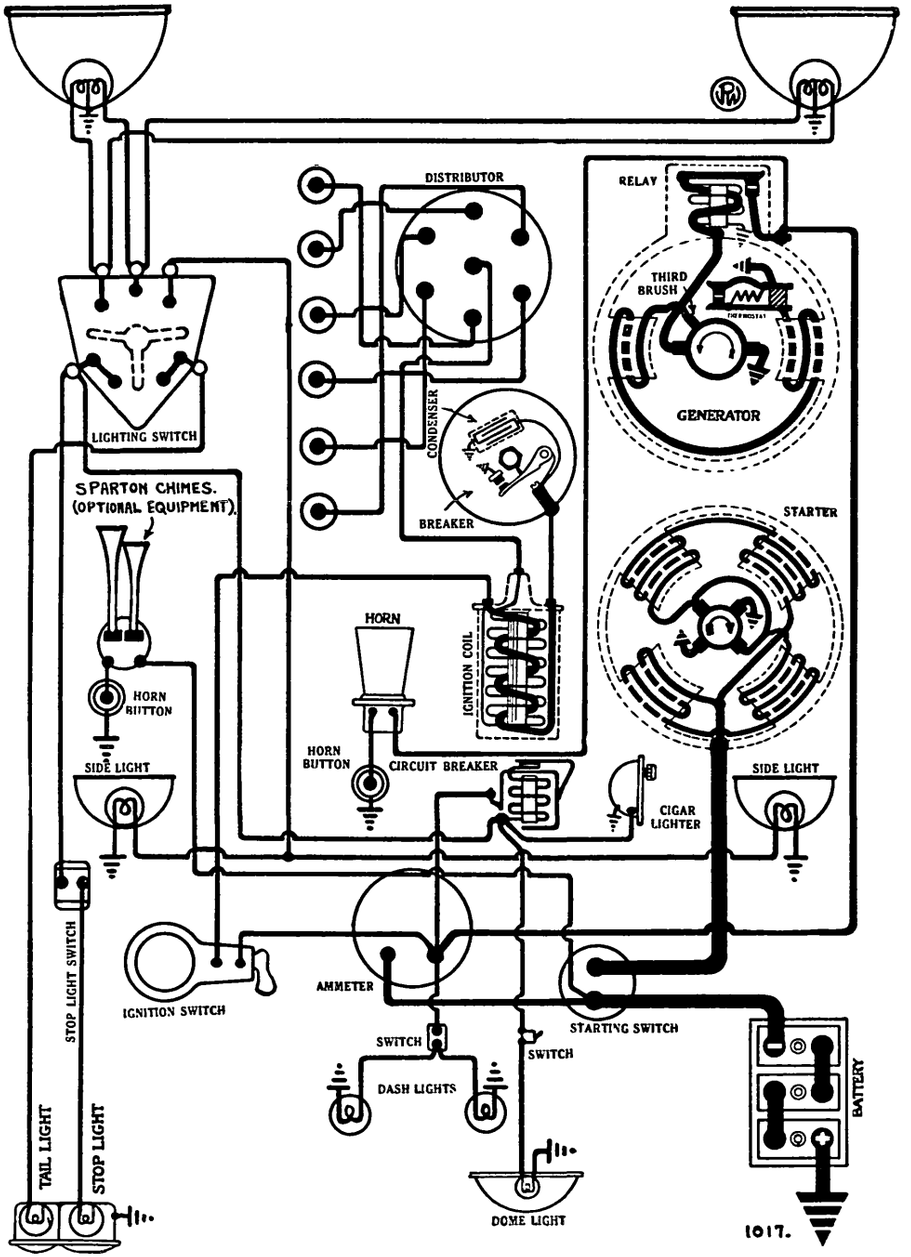
BATTERY:—Willard, Type SJWR-4. 6 volt, 13 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Battery is mounted under the front floor boards on the right frame member.

IGNITION:—Coil Model 525-A and E. Coil is mounted on the dash. Ignition current is ¼ to 2½ amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.

Distributor Model 636-X. Breaker contacts separate .018-.024 inch. Adjust contact opening by loosening lock nut on stationary contact stud and turning contact stud. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 550 R.P.M of engine. Maximum automatic advance is 28 degrees reached at 2600 R.P.M.

Mounting:—Distributor is mounted on special bracket at front of engine. To remove distributor, disconnect manual advance rod and primary lead and remove head with high tension cables intact. Then loosen advance arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor with medium cup grease and turn down one turn every 2500 miles or each six weeks. Every six weeks remove the distributor head and rotor and put 4 or 5 drops of light oil in the wick oiler.



Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 7½ degrees after top dead center on the flywheel with the manual spark fully retarded. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Continue to crank engine until piston reaches top dead center when the mark "UP-DC-1-6" on the flywheel will be directly under the pointer in the flywheel case. Advance spark lever exactly one half. If breaker contacts do not separate at this point, loosen advance arm clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw and make certain that the segment opposite the rotor button is connected to the spark plug in cylinder No. 1. Connect the remaining plugs in the order 5-3-6-2-4 counter-clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1⅞ inches; stem diameter, ⅜ inch; stem length, 6 9/16 inches. Tappet clearance, .007 inch (cold). Spring pressure, 55-60 pounds. Valve lift, 5/16 inch. Intake opens at top dead center and closes at 48 degrees after lower dead center. Inlet opening of cylinder No. 1 is marked on flywheel by mark "IN-OP-1-6".

EXHAUST VALVES:—Head diameter, 1⅞ inches; stem diameter, ⅜ inch; stem length, 6 9/16 inches. Tappet clearance, .009 inch (cold). Spring pressure, 55-60 pounds. Valve lift, 5/16 inch. Exhaust opens at 38 degrees before lower dead center and closes 10 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

STUDEBAKER

"COMMANDER" MODEL GH (1928-29) AFTER AUGUST, 1928
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

To Set Valve Timing:—Gears are marked. Mesh marked tooth on crankshaft gear between the two marked teeth on the camshaft gear.

STARTER:—Model 723-B. Starter is connected to the engine through a special chain and sprocket drive and overrunning clutch. The direction of rotation is clockwise (armature), looking at the commutator end. Starter cranks the engine at 100 R.P.M. drawing 125 amperes at 5.3 volts. Brush spring tension is 24-28 ounces. Starter switch is Model 406-B.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	1000	5	70
5 "	500	5.3	125
70 "	Lock	3.25	600

Torque and R.P.M. are measured at the sprocket shaft. Sprocket shaft rotation is clockwise, viewed from the drive end.

Mounting:—Starter is mounted by special bracket at forward end of engine on right side and drives through chain to forward end of crankshaft. To remove starter, remove master link in chain and remove chain. Disconnect starter cable. Remove bracket bolt and withdraw pin in hinge. Lift starter from place.

Oiling:—Put 4 or 5 drops of light oil in each of the starter oilers every 2500 miles or every six weeks. Every six weeks oil starter clutch through hole in case. Once each year remove plug in reduction gear case and repack gears with graphite grease.

GENERATOR:—Model 941-L. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165 degrees F. putting the resistance across the contacts in series with the field and cutting down the output approximately 40%. To adjust generator output, loosen the small round headed screw on the end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 11 amperes at 7.5 volts reached at 2096 R.P.M. (hot). or approximately 30 M.P.H.

Generator Data

Hot Test

Amperes	Volts	R.P.M.
0	6.4	750
7	7.1	1200
10	7.45	2000
10.5	7.5	2100
10	7.45	2500

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 3 amperes at 6 volts. Brush spring tension is 18 ounces.

Mounting:—Generator is flange mounted in a vertical position at the front of the engine and can be removed from the right side. To remove generator, disconnect lead and remove 3 flange mounting cap screws. Then lift generator straight up to disengage coupling.

Oiling:—Put 4 or 5 drops of light oil in each of the generator oilers every 2500 miles or every six weeks.

RELAY:—Model 265-B. Relay is mounted on the side of the generator. Relay closes at 550 R.P.M. or 7-9 M.P.H. when the generator voltage reaches 6.4 volts and opens with a discharge current of 1 ampere. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .015-.025 inch. Air gap is .014 inch with contacts closed.

LIGHTING:—Delco-Remy Switch, Model 484-D. Switch is mounted at lower end of steering column. The Tilt Ray headlight system is used. Head lights are each 6-8 volt, 21-21 cp (double filament-double contact). Mazda No. 1110. Side, dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop and dome lights are each 6-8 volt, 6 cp. S.C. Mazda No. 81.

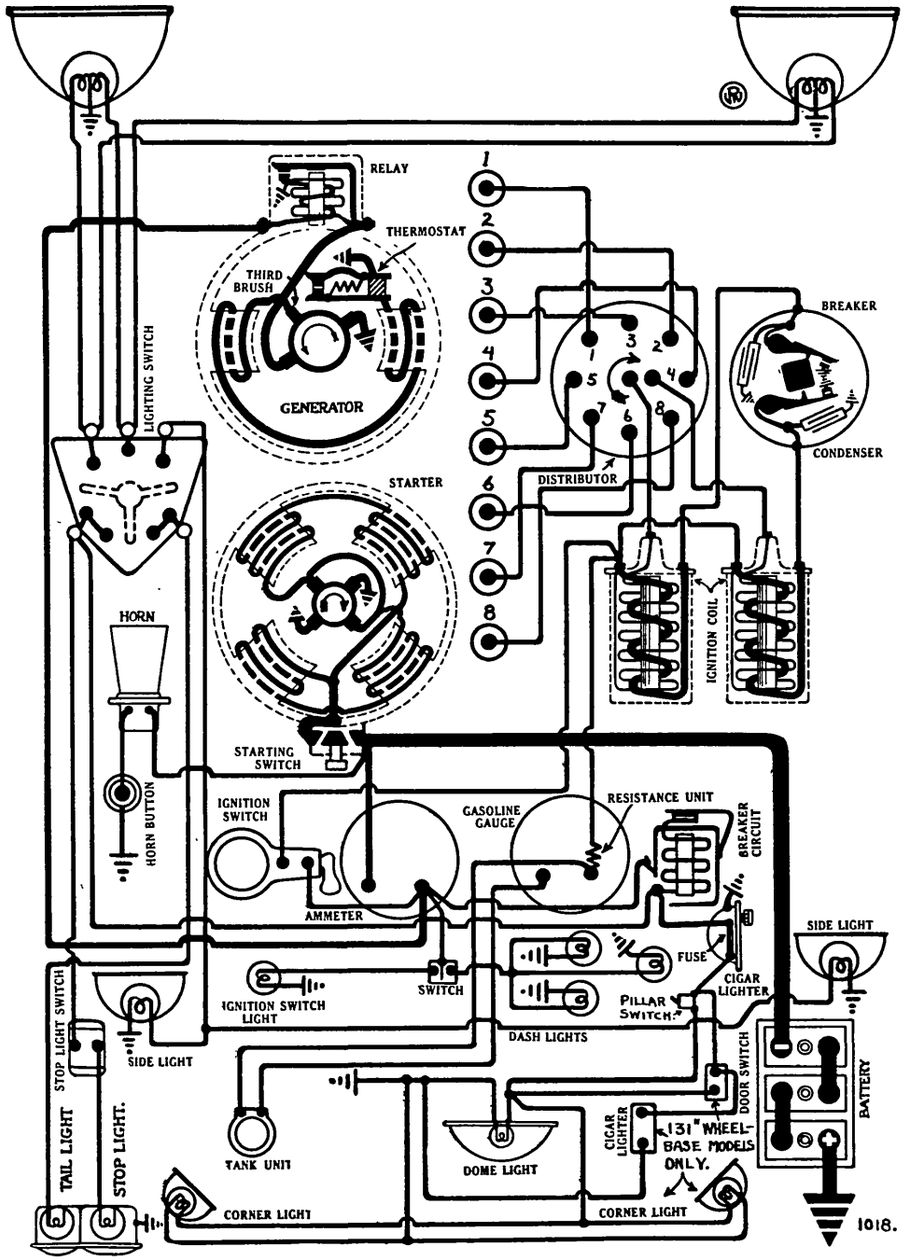
CIRCUIT BREAKER:—Model 410-C. A vibrating circuit breaker protects the lighting circuits. Circuit breaker begins to operate when current reaches 25-30 amperes and limits the current to 15 amperes while vibrating.

STUDEBAKER

"PRESIDENT" MODELS FA AND FB (1928-29)
PRODUCTION STARTED AUGUST, 1928
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type SJWR-4. 6 volt, 13 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Battery is mounted under front floor boards on right frame member.

IGNITION:—Coil Model 525-E. Coil is mounted on the dash. Ignition current is ½-2 amperes at 6 volts with engine running and 4-5 amperes at 6 volts with engine stopped.



Distributor:—Model 668-A. Breaker contacts separate .018-.024 inch. Adjust contacts by loosening lock screw and turning eccentric adjusting screw on stationary contact mounting plate. Resurface contacts with a fine flat file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 600 R.P.M. Maximum automatic advance is 26.5 degrees reached at 2700 R.P.M. of the engine. Breaker has two sets of contacts on a single four-sided cam opening alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft speed. This firing interval is important and must be correctly set. See Timing.

Mounting:—Distributor is mounted on cylinder head. To remove distributor disconnect primary lead and manual advance rod and remove head with high tension cables intact. Then loosen advance arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every 2500 miles or every six weeks. Remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil and put a small amount of vaseline on the face of the breaker cam every 2500 miles or every six weeks.

Timing:—There are two sets of breaker contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. Each set of contacts controls one coil and fires 4 spark plugs. The electrical circuit of each set of contacts is entirely separate. One set of breaker contacts begins to separate when the piston entering power stroke reaches top dead center with the manual advance lever advanced two-thirds. To set timing, crank engine over until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark lever and then move lever back one-third toward retarded position. Continue to crank engine until piston No. 1 reaches top dead center when the flywheel mark "UDC-1-8" will be opposite the indicator on the flywheel case. If one set of contacts are not opening loosen the advance arm clamp bolt and rotate the distributor housing until the first set of contacts mounted directly on the breaker plate begin to open. Tighten the clamp screw and connect the spark plugs as indicated on the diagram.

Synchronization of Contacts. Use special Delco-Remy tool, Part No. 1835009, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over exactly 90 degrees to firing position of piston No. 6 (upper dead center with manual spark control advanced two thirds and flywheel mark 'UDC-3-6' opposite the indicator). If the second set of contacts mounted on the movable sub-plate do not begin to open at this point, loosen the two lock screws and turn the eccentric adjusting screw on the mounting plate until contacts begin to open. Tighten the lock

PRODUCTION STARTED AUGUST, 1928
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 21/32 inches; stem diameter, 3/8 inch; stem length, 5 5/8 inches. Tappet clearance is .003 inch (cold). Spring pressure is 98-108 pounds. Valve lift is 11/32 inch. Intake valves opens 5 degrees after top dead center and closes 45 degrees after lower dead center. The point of inlet opening is marked on the flywheel by "IN-OP-1-8."

EXHAUST VALVES:—Head diameter, 1 9/16 inches; stem diameter, 3/8 inch; stem length, 5 5/8 inches. Tappet clearance is .007 inch (cold). Spring pressure is 98-108 pounds. Valve lift is 11/32 inch. Exhaust valves open 40 degrees before lower dead center and close 12 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

Valve Setting. The camshaft is driven from the crankshaft by gears at the forward end of the engine. Mesh the timing gears so that the marked tooth on the crankshaft gear is between the two marked teeth on the camshaft gear.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4. Spark plug cables are not connected in this order (see diagram).

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model 724-H. Starter is connected to the engine through a manual pinion shift. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 90 R.P.M. drawing 165 amperes at 5.2 volts. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	2850	5.65	70
3 "	1300	5.2	165
22 "	Lock	3.1	600

Mounting:—Starter is flange mounted at left of engine. To remove starter, disconnect cable and pedal rod and remove 3 flange mounting capscrews. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in starter bearing oilers every 2500 miles or every six weeks. Once each year remove grease plug in gear compartment and repack gears with medium grease.

GENERATOR:—Model 955-C. The direction of rotation is counter-clockwise, looking at the commutator end. The generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 160 degrees F. inserting the resistance across the contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, loosen the small round screw on the generator endplate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 9-12 amperes (hot) at 7.3-7.6 volts reached at 2000 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.7	1550	9-12	7.3-7.7	1800-2000

Motoring generator draws 5.5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Generator brush spring tension is 18 ounces.

Mounting:—Generator is mounted on left of engine at forward end by special strap mounting and is driven by the fan belt. To remove generator, disconnect lead and remove fan belt. Then remove mounting clamp band and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the generator bearing oilers every 2500 miles or every six weeks.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 12½ M.P.H. or 650 R.P.M. when the generator voltage reaches 6.4 volts and opens with a discharge current of 1 ampere. Relay contacts separate .015-.025 inch. Air gap is .014 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 484-D. Switch is mounted at lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact). Mazda No. 1110. Side, dash and tail lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop, dome and corner lights are 6-8 volt, 6 cp. S.C. Mazda No. 81.

CIRCUIT BREAKER:—Model 410-C. A vibrating circuit breaker is mounted on the dash to protect the lighting lines. The circuit breaker begins to operate with a current flow of 25-30 amperes. While vibrating it limits the current to 15 amperes.

STUDEBAKER

"DICTATOR" SIX MODEL GL (1930)

PRODUCTION STARTED JANUARY 1, 1930

DELCO-REMY GENERATING, STARTING SYSTEM

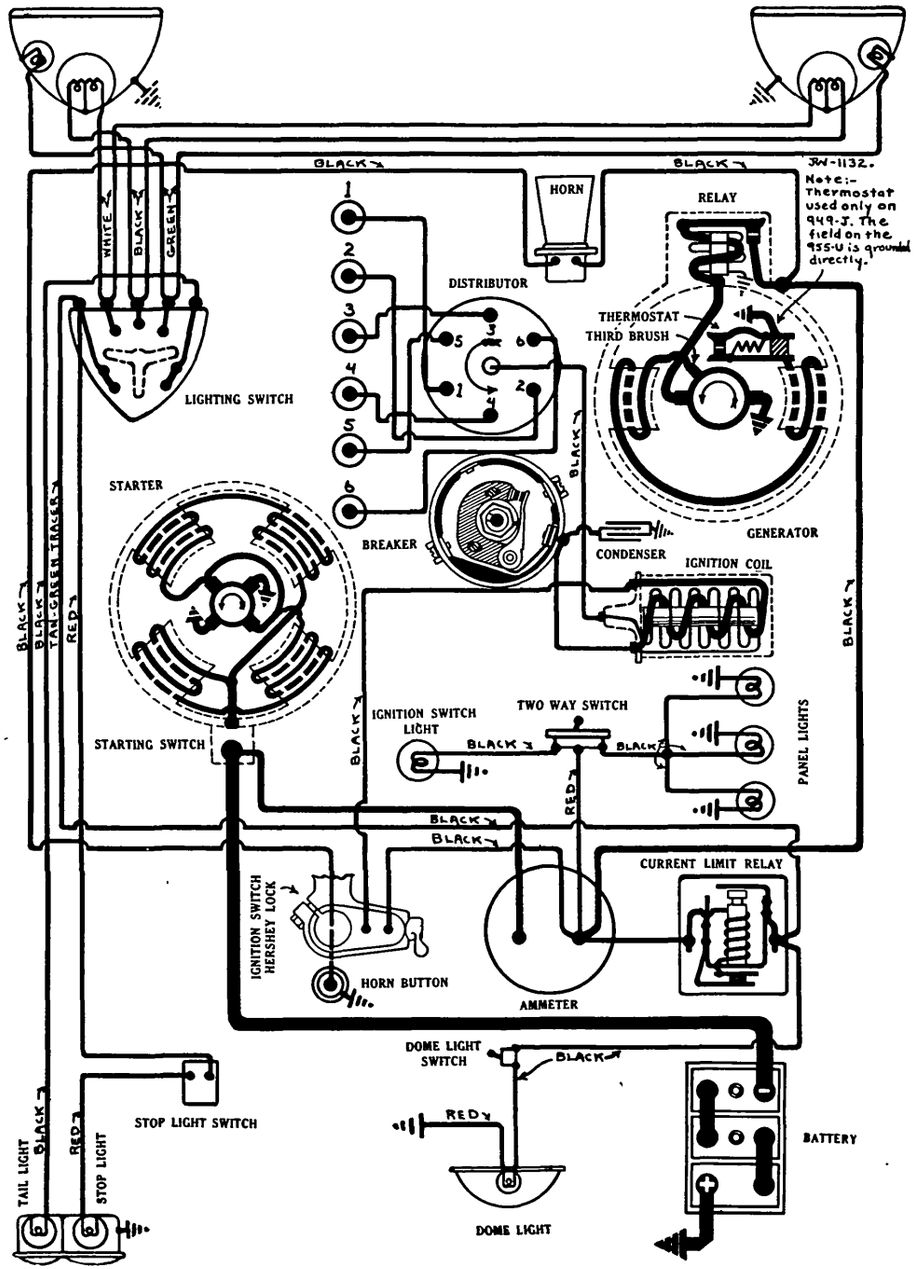
DELCO-REMY IGNITION

BATTERY:—Willard, Type WJ-1-11, 6 volt, 90 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16 hours. Battery is mounted on the right frame member under the floor boards of the front compartment.

IGNITION:—Coil Model 528-E. Coil is mounted on the dash. Ignition current is .5-2.5 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' type co-incidental steering post and ignition switch lock.

Distributor Model 639-J. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until gap is .020 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 30 degrees reached at 2400 R.P.M. of engine.

Mounting:—Distributor is mounted on accessory bracket at right of engine. To remove distributor, disconnect primary lead and manual advance rod remove distributor head with cables intact. Then loosen advance arm clamp screw and lift distributor from place.



Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one turn every six weeks or each 2500 miles. At the same time remove the distributor head and rotor and oil the felt oiler in the center of the shaft with light engine oil. Put a small bit of vaseline on the face of the breaker cam and a few drops of oil on the breaker arm pivot pin.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 7½ degrees after top dead center with the spark control lever and breaker assembly in the fully retarded position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Set the spark control lever in the half-way position between full retard and full advance. Continue to crank the engine over until the piston reaches top dead center when the flywheel mark 'UP-DC-1-6' will be directly opposite the indicator on the flywheel housing in the inspection hole at the right of the engine (this opening covered by a cover plate on the upper right flywheel housing). Then loosen advance arm clamp screw and rotate distributor until breaker contacts begin to open. Tighten the clamp screw and see that the segment in the distributor head directly opposite the rotor is connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 4-2-6-3-5 counter-clockwise around the distributor head.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1⅝ inches. Stem diameter, 5/16 inch. Stem length, 5⅜ inches. Valve lift, 5/16 inch. Spring pressure, 63-68 pounds. Tappet clearance, .004 inch (hot). Inlet valves open 5 degrees after top dead center and close 53 degrees after lower dead center.

STUDEBAKER

"DICTATOR" SIX MODEL GL (1930)
PRODUCTION STARTED JANUARY 1, 1930
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

EXHAUST VALVES:—Head diameter, 1½ inches. Stem diameter, 5/16 inch. Stem length, 5⅜ inches. Valve lift, 5/16 inch. Spring pressure, 63-68 pounds. Tappet clearance, .006 inch (hot). Exhaust valves open 38 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open with piston slightly past top dead center when flywheel mark 'IN.OP/1-6' lines up with indicator on housing. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and lined up with a straightedge across the shaft centers.

Timing Chain Adjustment:—To adjust chain, loosen accessory sprocket bracket mounting screws, turn up adjusting screw until play on rim of fan pulley is ⅛", tighten mounting screws.

STARTER:—Model 726-F. Starter is connected to the engine through a manual pinion shift interconnected with the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces. Starter draws 275 amperes cranking the engine.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
5.5 "	1050	5	275
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable, starting pedal linkage and pedal return spring. Then take out three flange mounting cap screws. Pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every six weeks or each 2500 miles of operation. The drive end bearing is oilless.

GENERATOR:—Model 955-U. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 10-12 amperes (hot) at 7.5 volts reached at 1650 R.P.M. or 19.3 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
15-17	8.0	1400	11-14	7.55-7.85	1700-1800

Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces. Generator motoring draws 5.5 amperes at 6 volts.

Model 949-J (used on all Export Models). This generator is similar to Model 955-U used on all domestic models except that the shunt field is grounded through a thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8 3-8.7	1550	9-12	7.35-7.65	1800-2000

Mounting:—Generator is flange mounted at right of engine on rear of accessory bracket. To remove generator, disconnect lead and take out three flange mounting cap screws. Then pull generator to the rear to disengage drive coupling and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator oilers every six weeks or each 2500 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 600 R.P.M. or 7.7 M.P.H. when the generator voltage reaches 6.4 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-E. Lighting switch is mounted at base of steering wheel column. Headlights are equipped with double filament bulbs and use a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights (in headlights) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

Stop light switch is Delco-Remy Model 466-A and H.

CURRENT LIMIT RELAY:—Model 410-C & F. This device consists of a vibrating circuit breaker connected in the lighting circuit. It is mounted on the dash. The circuit breaker begins to vibrate when the current reaches 25-30 amperes and continues to operate limiting the current to 2-15 amperes. Circuit breaker contact gap is .012-.030 inch. Air gap is .015-.025 inch with contacts closed.

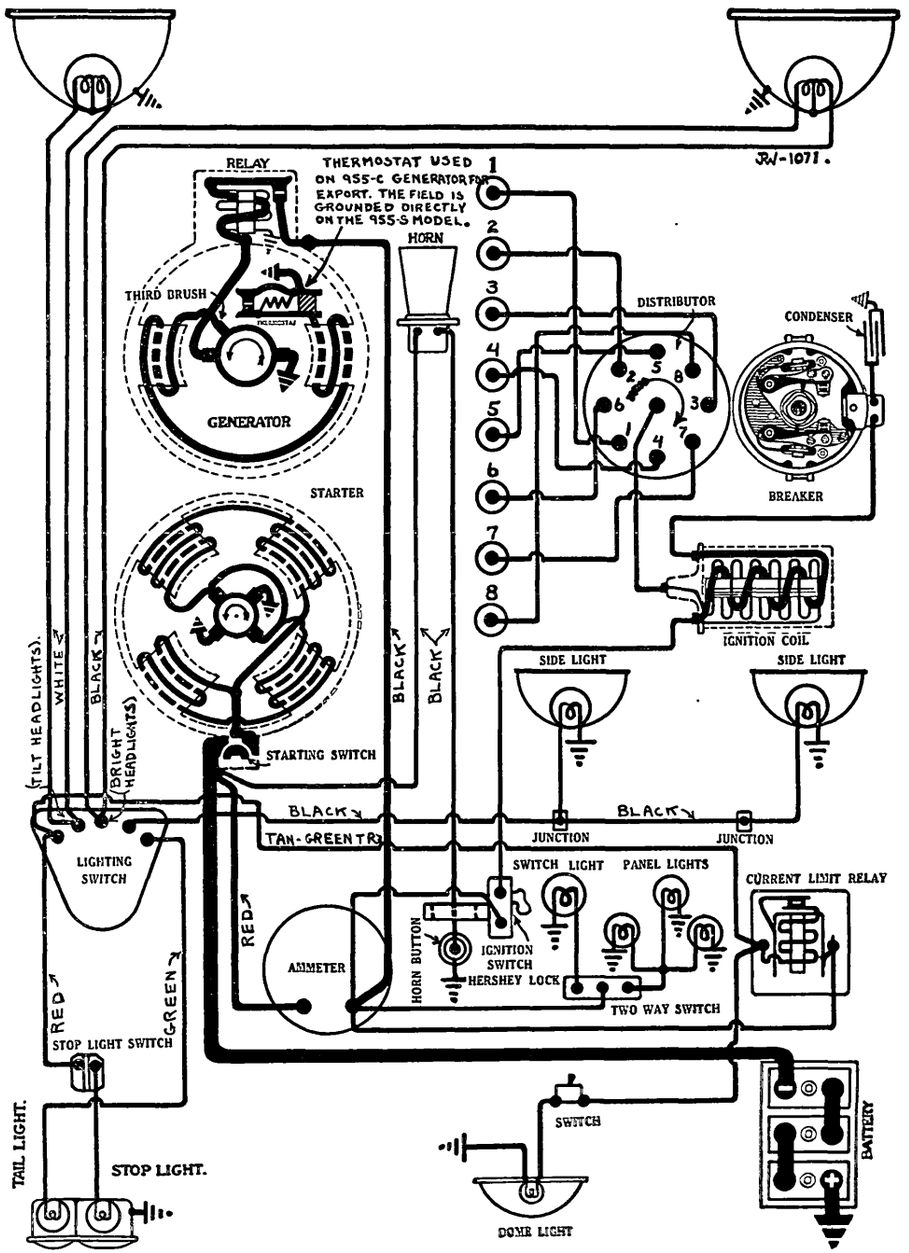
STUDEBAKER

DICTATOR EIGHT MODEL FC (1929-30)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WJ-1-11, 6 volt, 90 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16 hours. Battery is mounted on left frame member under the floor boards of the front compartment. This battery supersedes the Type SJWR-3 battery used on the first cars.

IGNITION:—Coil Model 528-E. Ignition coil is mounted on dash. Ignition current is ½-2½ amperes at 6 volts with engine running and 4-5 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' type co-incidental steering post and ignition switch lock.

Distributor Model 658-Z. Breaker contacts separate .022 inch. Set breaker gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until proper gap is secured with breaker arm on lobe of cam. Distributor has two sets of contacts and a four sided breaker cam. Contacts open alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This interval is correct and contacts must be synchronized for proper performance. See Timing. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 20 degrees reached at 2800 R.P.M. of engine. Breaker arm spring tension is 18-21 ounces.



Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and manual advance rod and remove head with cables intact. Then loosen advance arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft and turn down two turns every six weeks or each 2500 miles. At the same time remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 820738, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to engine by cranking engine over exactly 90 degrees when piston No. 6 will reach firing position (top dead center with spark control lever advanced two thirds). If the second set of contacts do not begin to open at this point, loosen the two lock screws on the movable sub-plate and turn the eccentric adjusting screw until contacts begin to open. Tighten the lock screws and check the breaker gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 17 degrees (on the flywheel) after top dead center with the manual spark control in the fully retarded position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully retard spark lever. Continue to crank engine until piston reaches firing position. Then loosen advance arm clamp screw and rotate distributor in a counterclockwise direction until one set of contacts begins to separate. Tighten the clamp screw.

The engine can be timed at upper dead center with the flywheel mark 'UDC1-8' at the indicator if the spark lever is fully retarded and then advanced two thirds. This method is advised if contacts are synchronized without special tool. To synchronize contacts, crank engine over 90 degrees

DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

when the flywheel mark 'UDC3-6' will be opposite the indicator with piston No. 6 on top dead center. The second set of contacts should be set to open at this point. Connect the spark plug cables in order 1-6-2-5-8-3-7-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are S.A.E. Standard ⅞-18 Champion No. 4. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 13/32 inches. Stem diameter, 5/16 inch. Stem length, 5 7/32 inches (over all). Valve lift, 9/32 inch. Spring pressure, 63-68 pounds. Tappet clearance, .004 inch (hot). Inlet valves open at top dead center and close 48 degrees after lower dead center on 1929 cars and 40 degrees after lower dead center on 1930 cars.

EXHAUST VALVES:—Head diameter, 1 9/32 inches. Stem diameter, 5/16 inch. Stem length, 5 7/32 inches (over all). Valve lift, 9/32 inch. Spring pressure 63-68 pounds. Tappet clearance .006 inch (hot). Exhaust valves open 43 degrees before lower dead center and close 5 degrees after top dead center (1929 cars) or open 45 degrees before lower dead center and close 11 degrees after top dead center (1930 cars). Valve stem guides are removable.

NOTE:—Valve lift on 1929 cars is 5/16 inch.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open with piston slightly past top dead center when flywheel mark 'IN.OP/1/8' lines up with indicator on housing. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Gears are marked. Mesh marked tooth on crankshaft gear between the two marked teeth on the camshaft gear.

STARTER:—**Model 726-G.** Starter is connected to the engine through a manual pinion shift interconnected to the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter draws 275 amperes cranking engine. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.2	575

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal rod. Remove flange mounting cap screws and pull starter forward.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every six weeks or each 2500 miles. The drive end bearing is oilless.

GENERATOR:—**Model 955-S, 955-C (Export).** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat on the Model 955-C. Model 955-S is not equipped with thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the commutator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the output. Tighten the screw. With standard car setting, the maximum charging rate is 12 amperes (hot) reached at 1800 R.P.M. or 27 miles per hour.

Generator Data (955-S)

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

Generator Data (955-C)

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8 35-8 7	1550	9-12	7.35-7.65	1800-2000

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is cradle mounted at left of engine and is driven by the fan belt. The water pump is driven by an extension of the generator shaft. To remove generator, disconnect pump coupling and relay lead and loosen mounting strap. Then slip off drive belt and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the generator oilers every six weeks or each 2500 miles.

RELAY:—**Model 265-B.** Relay is mounted on the generator. Relay contacts close at 550 R.P.M. or 6-8 M.P.H. when the generator voltage reaches 6.4 volts and open with a discharge current of 1-2.5 amperes. Contacts separate .015-.025 inch. Air gap is .014 inch with contacts closed.

LIGHTING:—**Delco-Remy Switch Model 486-E.** Switch is mounted at base of steering column. Double filament headlights are used instead of dimming. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

Stop light switch is Delco-Remy Model 466-D and H.

CURRENT LIMIT RELAY:—**Model 410-C & F.** This is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits. The circuit breaker begins to operate with a current flow of 25-30 amperes limiting the current to 15 amperes. Contact gap is .012-.030 inch. Air gap is .015-.025 inch with contacts closed.

COMMANDER SIX MODEL GJ (1929-30)
SERIAL NUMBERS 4,070,501 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

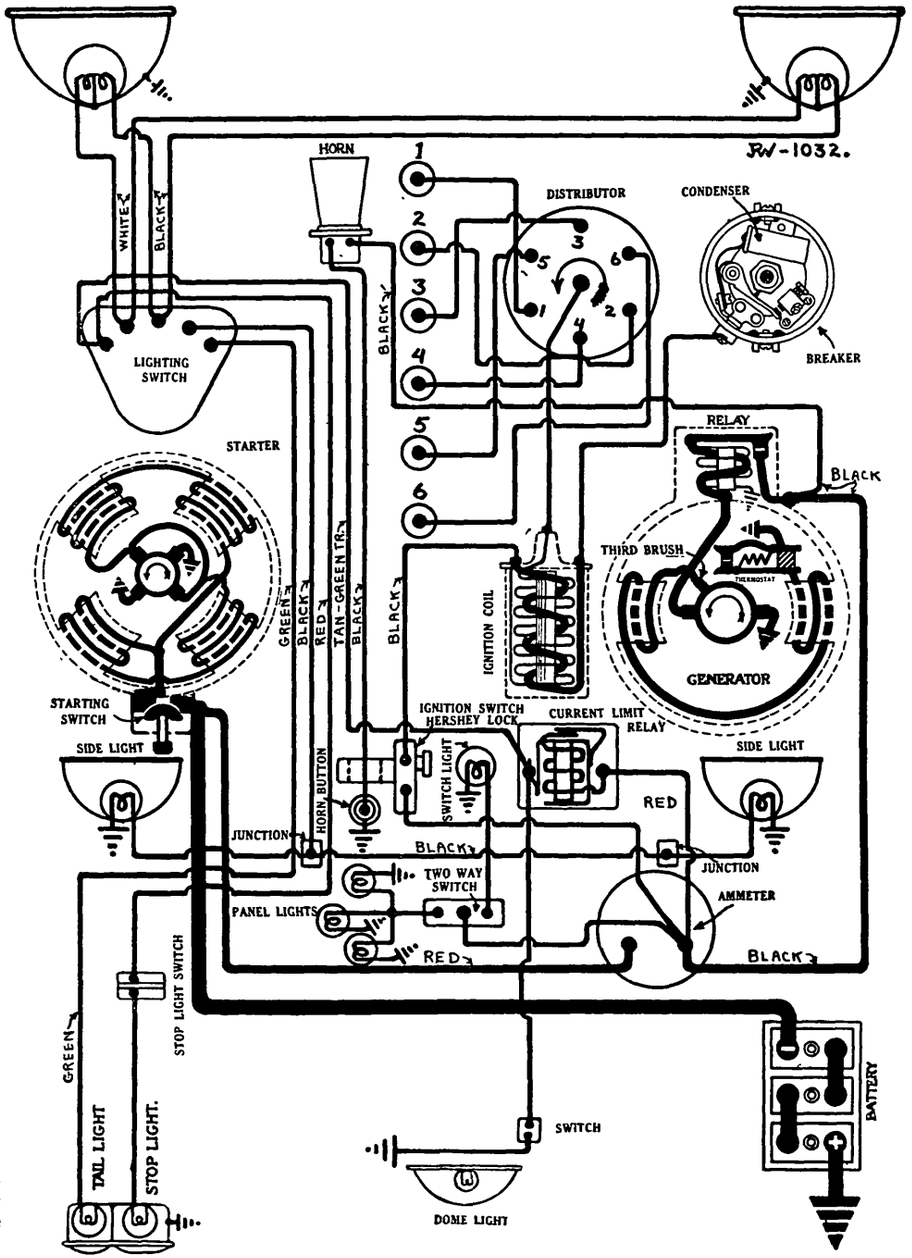
BATTERY:—Willard, Type SJWR-3. The positive (+) terminal is grounded. Starting capacity is 104 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 18 hours. Battery is mounted under front floor boards on right frame member.

IGNITION:—Coil Model 528-E. Ignition coil is mounted on the dash. Ignition current is ½-2½ amperes at 6 volts with engine running and 4-5 amperes at 6 volts with engine stopped.

Distributor Model 636-Y. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on stationary contact mounting bracket and turning up contact stud until proper gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 32 degrees at 3000 R.P.M. Breaker arm spring tension is 18-21 ounces.

Mounting:—Distributor is mounted on accessory bracket at right of engine. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with cables intact. Then loosen clamping plate screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every six weeks or each 2500 miles. At the same time remove the distributor head and rotor and put 3 or 4 drops of light engine oil in the wick oiler in the center of the shaft.



Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 7½ degrees after top dead center with the spark control lever in the fully retarded position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully retard spark lever and then advance it exactly one half. Continue to crank engine until piston reaches top dead center when the flywheel mark 'UDC1-6' will be opposite the indicator on the flywheel case. Loosen the advance arm clamp bolt and rotate the distributor until the contacts begin to separate. Tighten the clamp bolt and connect the terminal opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 4-2-6-3-5 counter-clockwise around the distributor head.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are S.A.E. Standard ⅞-18. Champion No. 4. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1⅝ inches. Stem diameter, 5/16 inch. Stem length, 5⅜ inches (over all). Valve lift, 5/16 inch. Tappet clearance, .003-.005 inch (cold). Spring pressure, 63 to 68 pounds. Inlet valves open 5 degrees after top dead center and close 53 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1½ inches. Stem diameter, 5/16 inch. Stem length, 5⅜ inches (over all). Valve lift, 5/16 inch. Tappet clearance, .005-.007 inch (cold). Spring pressure, 63 to 68 pounds. Exhaust valves open 38 degrees before lower dead center and close 10 degrees after top dead center. The flywheel is marked 'INT.OP1-6' at a point 5 degrees after the top dead center mark 'UDC1-6'. Valve stem guides are removable. Oversize valves are not made.

19-22	8.35-8.7	1550	9-12	7.3-7.7	1800-2000

Motoring, generator draws 6 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 12-18 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of accessory bracket. To remove generator, disconnect relay lead and remove flange mounting cap screws. Pull generator to rear and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every six weeks or each 2500 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 600 R.P.M. of generator armature or 9.4 M.P.H. when the generator voltage reaches 6.4 volts and open with a discharge current of 1-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-E. Switch is mounted at lower end of steering column. Double filament headlights are used instead of dimming. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

Stop light switch is Delco-Remy Model 466-D.

CURRENT LIMIT RELAY:—Model 410-C, F. This device is a vibrating circuit breaker mounted on the dash and connected in the lighting circuit. It begins to vibrate when the current reaches 29-35 amperes and continues limiting the current to 15 amperes.

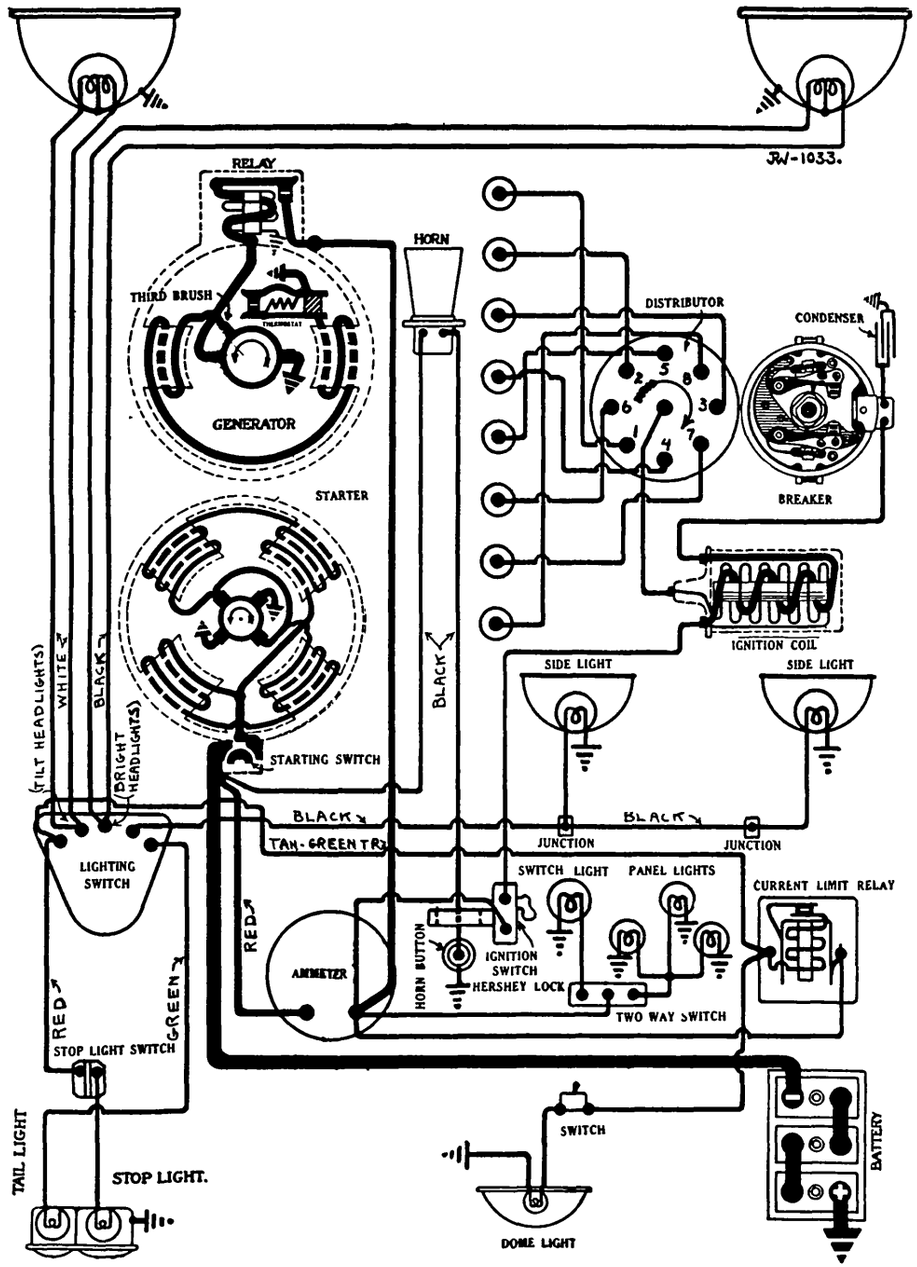
STUDEBAKER

COMMANDER EIGHT MODEL FD (1929-30)
SERIAL NUMBERS 8,000,000 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type SJWR-3, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 104 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 18 hours. Battery is mounted on left frame member under front floor boards.

IGNITION:—Coil Model 528-E. Ignition coil is mounted on dash. Ignition current is ½-2½ amperes at 6 volts with engine running and 4-5 amperes at 6 volts with engine stopped.

Distributor Model 658-V and Z. Breaker contacts separate .022 inch. Set breaker gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until proper gap is secured with breaker arm on lobe of cam. Distributor has two sets of contacts and a four sided breaker cam. Contacts open alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This interval is correct and contacts must be synchronized for proper performance. See Timing. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 20 degrees reached at 2800 R.P.M. Breaker arm spring tension is 17-21 ounces.



Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and manual advance rod and remove head with cables intact. Then loosen advance arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft and turn down two turns every six weeks or each 2500 miles. At the same time remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light engine oil.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 820738, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to engine by cranking engine over exactly 90 degrees when piston No. 6 will reach firing position (top dead center with manual spark control advanced two thirds). If the second set of contacts do not open at this point, loosen the two lock screws on the movable sub-plate and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the breaker gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position 8° or ¾ inch (on the flywheel) before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark lever. Continue to crank engine until piston reaches a position ¾ inch before top dead center when the punch marks on the flywheel (which are ¾ inch before the top dead center mark 'UDC1-8') will be opposite the indicator on the flywheel case. Then loosen advance arm clamp screw and rotate distributor in a counter-clockwise direction until one set of contacts begins to separate. Tighten the clamp screw.

The engine can be timed at upper dead center with the flywheel mark 'UDC1-8' at the indicator if the spark lever is fully advanced and then retarded one third. This method is advised if contacts are synchronized without special tool. To synchronize contacts crank engine over 90 degrees when the flywheel mark 'UDC3-6' will be opposite the indicator, with piston

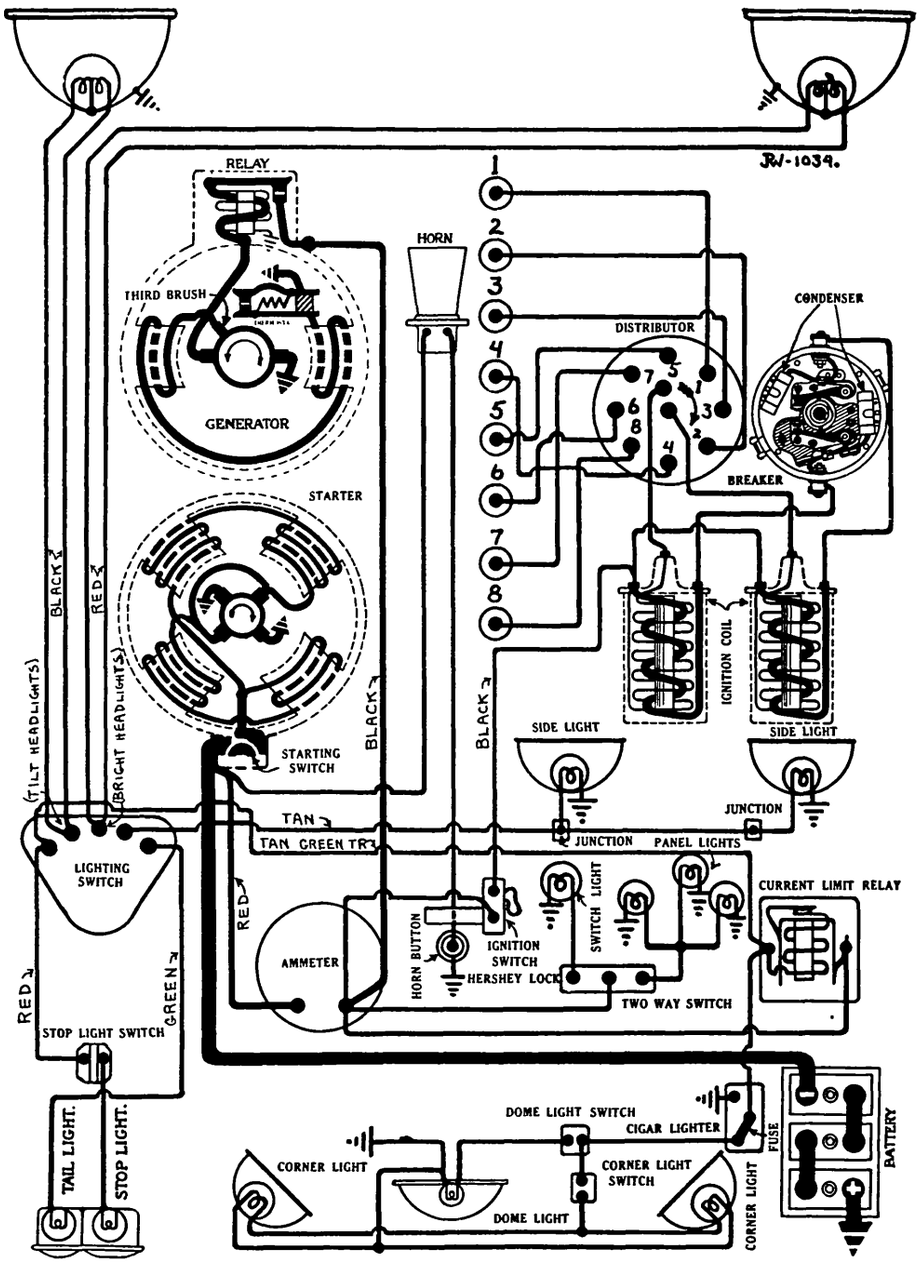
BATTERY:—Willard, Type SJWR-4, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Battery is mounted under front floor boards on right frame member.

IGNITION:—Coil Model 528-E. Coil is mounted on the dash. Ignition current is ½-2½ amperes at 6 volts with engine running and 4-5 amperes at 6 volts with engine stopped for each coil.



Distributor Model 668-C. Breaker contacts separate .018 to .022 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until proper gap is secured with breaker arm on lobe of cam. Breaker arm spring tension is 18-21 ounces. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker has two sets of contacts operating on a four sided cam. Each set of contacts controls one ignition coil and fires the spark plugs in four cylinders. Contacts separate alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This is the correct firing interval for the President engine. Contacts must be accurately synchronized for correct performance. See Timing. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 17 degrees reached at 3200 R.P.M. (engine).

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary leads and manual advance rod and remove distributor head with cables intact. Then loosen advance arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every six weeks or each 2500 miles. At the same time remove the distributor head and rotor and saturate the wick in the center of the shaft with light engine oil.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 1835009, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking the engine over exactly 90 degrees when piston No. 6 will reach firing position (top dead center with manual spark control advanced two thirds). If the second set of contacts do not open at this point, loosen the two lock screws on the movable sub-plate and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to separate when piston entering power stroke reaches a position 8°20′ or 1 inch (on flywheel) before top dead center with manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark lever. Continue to crank engine until piston reaches a position 1 inch before top dead center when the punch marks on the flywheel (which are 1 inch before the top dead center mark 'UDC1-8') will be opposite the indicator on the flywheel case. Then loosen advance arm clamp screw and rotate distributor counterclockwise until one set of contacts begin to open. Tighten the clamp screw and connect the terminal directly over the carbon brush of the rotor to the

DELCO-REMY IGNITION

spark plug in cylinder No. 1. Connect the remaining plugs in order 3-2-4-8-6-7-5 clockwise around the distributor head (see diagram).

The engine can be timed with No. 1 piston on top dead center and flywheel mark 'UDC 1-8' directly opposite indicator if the manual spark control is fully advanced and then retarded one third. This setting is recommended if contacts are synchronized as part of the timing process. After the first set of contacts are set to open with piston on top dead center the engine should be cranked over 90 degrees until the flywheel mark 'UDC 3-6' is opposite the indicator. The second set of contacts should open at this point.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4. Spark plug cables are not connected in this order (see diagram).

Spark Plugs:—Spark plugs are Champion No. 4. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 21/32 inches. Stem diameter, 3/8 inch. Stem length, 5 5/8 inches (over all). Valve lift, 11/32 inch. Tappet clearance, .004 inch (hot). Spring pressure, 98-108 pounds. Inlet valves open 5 degrees after top dead center and close 45 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 9/16 inches. Stem diameter, 3/8 inch. Stem length, 5 5/8 inches (over all). Valve lift, 11/32 inch. Tappet clearance .006 inch (hot). Spring pressure, 98-108 pounds. Exhaust valves open 40 degrees before lower dead center and close 12 degrees after top dead center. The flywheel is marked 'IN.OP1-8' at a point 5 degrees after the top dead center mark for cylinders 1 and 8. Valve stem guides are removable. Oversize valves are not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open with piston on top dead center when flywheel mark 'IN.OP/1-8' lines up with indicator on housing. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Gears are marked. Mesh marked tooth on crankshaft gear between the two marked teeth on the camshaft gear.

STARTER:—Model 728-C. Starter is connected to the engine through reduction gears and a manual pinion shift interconnected with the starting switch. The direction of rotation is clockwise (armature shaft), viewed from the commutator end. Starter draws 175 amperes cranking engine. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3	600

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal rod and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at each end of the armature shaft every six weeks or each 2500 miles. Once each year remove the grease plug in the reduction gear case and repack the gear compartment with medium grease.

GENERATOR:—Model 955-C. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 160°F. cutting the resistance across the thermostat contacts in series with the field and reducing the output approximately 40%. To adjust the charging rate, remove the commutator cover band and loosen the small round headed screw on the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw. With standard car setting maximum charging rate is 19.5 amperes (cold) reached at 1550 R.P.M. or 22 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.35-8.7	1550	9-12	7.35-7.65	1800-2000

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is cradle mounted at left of engine and is driven by the fan belt. The water pump is driven by an extension of the generator shaft. To remove generator, disconnect pump coupling and relay lead and loosen mounting strap. Then slip off drive belt and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator oilers every six weeks or each 2500 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 650 R.P.M. or 10 M.P.H. when the voltage of the generator reaches 6.4 volts and open with a discharge current of 1-2.5 amperes. Contacts separate .015-.025 inch. Air gap is .014 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-E. Lighting switch is mounted at base of steering column. Double filament headlights are used instead of dimming. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome and corner lights are each 6-8 volt, 6 cp. S.C. Mazda 81.

Stop light switch is Delco-Remy Model 466-D.

CURRENT LIMIT RELAY:—Model 410-C & F. This device is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits. The circuit breaker begins to vibrate when the current reaches 29-35 amperes and continues limiting the current flow to approximately 15 amperes. Contact opening is .012-.030 inch. Air gap is .019-.025 inch.

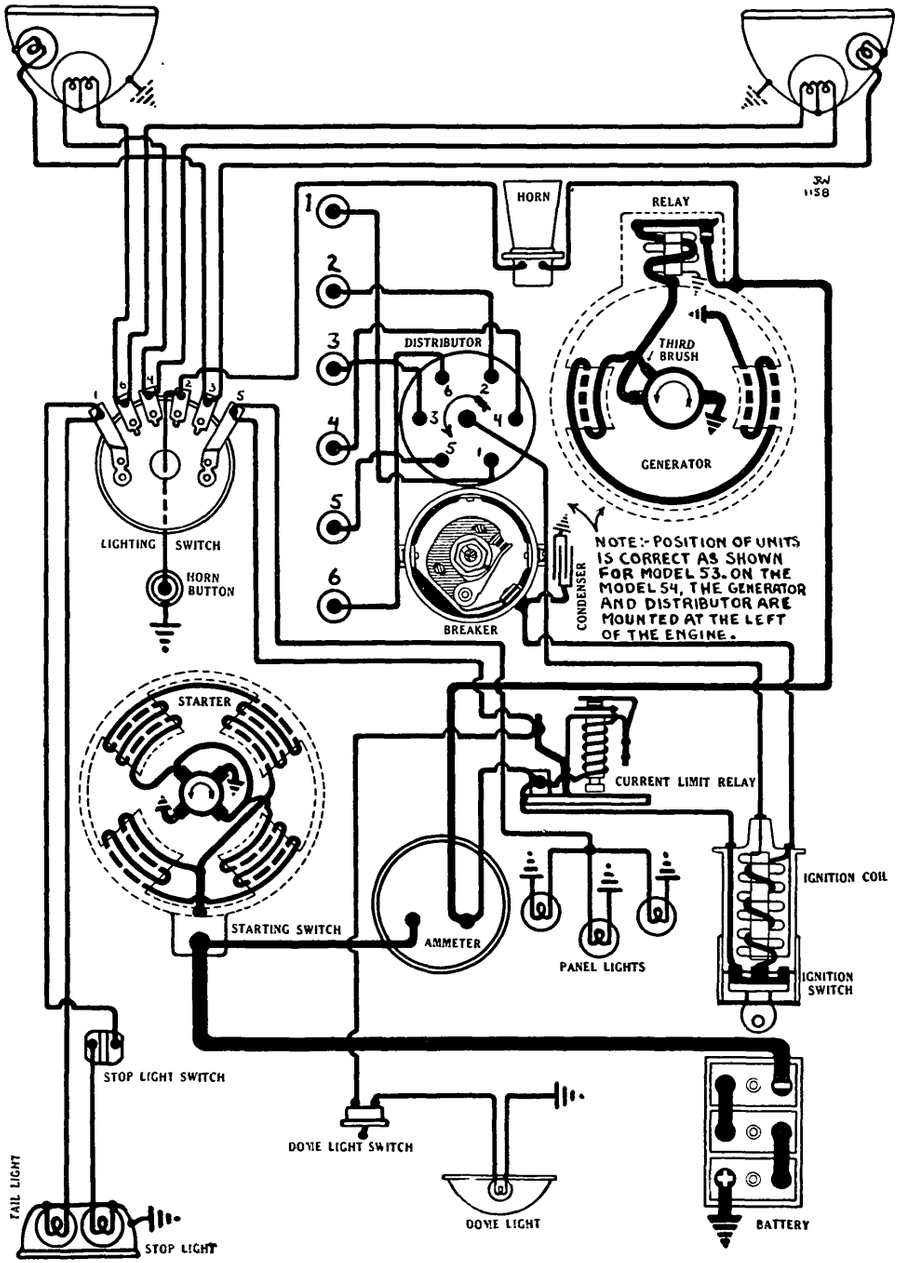
STUDEBAKER SIX

MODEL 53 (1930) NEW MODEL 54 (1931)
DELCO-REMY GENERATING STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WJ-1-11, 6 volt, 90 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16 hours. Battery is mounted on the right frame member under the right front seat.

IGNITION:—Coil Model 533-Y. The ignition switch is built in the base of the coil. Coil is mounted on the dash with the ignition switch extending through to the face of the instrument panel. Ignition current is .5-2.5 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.

Distributor Model 639-J. Breaker contacts separate .018-.024 inch. Set contact gap by loosening lock screw on crescent shaped stationary contact mounting plate and turning eccentric adjusting screw until gap is .020 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 30 degrees reached at 2400 R.P.M. of engine.



Mounting:—(Model 53). Distributor is mounted on accessory bracket at right of engine. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with cables intact. Then take out stop screw on advance arm and lift distributor from place.

(Model 54). Distributor is mounted at the left of the engine and is driven by an inclined shaft from the camshaft. To remove distributor, disconnect primary lead and manual spark control and remove distributor cap with cables intact. Then take out hold-down screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every six weeks or each 2500 miles. At the same time remove the distributor head and rotor and put 4 or 5 drops of light engine oil in the wickoiler in the center of the shaft and put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position 7½ degrees or ½ inch (on the flywheel) before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark control lever and see that distributor is rotated clockwise to the full extent of the advance arm slot. Remove cover over inspection hole in the flywheel housing and turn engine over until the punch marks on the flywheel (which are ½ inch or 7½ degrees before the top dead center mark 'U-D-C-1-6') are directly in line with the indicator on the flywheel housing. Then loosen advance arm clamp screw and rotate distributor until the contacts begin to open. Tighten the clamp screw and see that the rotor is directly opposite the segment connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 4-2-6-3-5 counter-clockwise around the distributor head.

The engine can be timed on top dead center with the flywheel mark 'U-D-C-1-6' opposite the indicator if the spark control lever is advanced exactly one half. Place the spark lever midway between the fully retarded and fully advanced positions and crank engine over until the dead center mark is opposite the indicator. Piston No. 1 will be on top dead center entering power stroke and the breaker contacts should open at this point.

STUDEBAKER SIX

MODEL 53 (1930) NEW MODEL 54 (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard Champion No. 4. Gaps are .020 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1⅝ inches. Stem diameter, 5/16 inch. Stem length, 5⅜ inches. Valve lift, 5/16 inch. Spring pressure, 63-68 pounds (valve closed). Tappet clearance, .004 inch. Inlet valves open 5 degrees after top dead center and close 53 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1½ inches. Stem diameter, 5/16 inch. Stem length, 5⅜ inches. Valve lift, 5/16 inch. Spring pressure, 63-68 pounds (valve closed). Tappet clearance, .006 inch. Exhaust valves open 38 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open with piston slightly past top dead center when flywheel mark 'IN.OP/1-6' lines up with indicator on housing. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with straightedge across the shaft centers. Timing chain is not adjustable on 1931 model.

Timing Chain Adjustment (1930):—Loosen accessory sprocket mounting bracket support screws, turn up adjusting screw until play on rim of fan pulley is ⅛", tighten mounting screws.

STARTER:—**Model 718-L.** Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 1050 R.P.M. (armature speed) drawing 275 amperes. Brush spring tension is 24-28 ounces. The starting switch is mounted on the starter field frame and is operated through a flexible control by a button on the dash.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.2	575

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting switch control and take out the flange mounting bolts and cap screw. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every six weeks or each 2500 miles. The drive end bearing is oilless.

GENERATOR:—**Model 955-U (53), 943-J (54).** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the small round headed screw on the end plate and remove the commutator cover band. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 10-12 amperes (hot) reached at 1650 R.P.M. or 20.7 miles per hour.

Generator Data—Model 955-U

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
15-17	8.0	1400	11-14	7.55-7.85	1700-1800

Generator Data—Model 943-J

16-18	8.0-8.3	1700	11-13	7.5-7.8	1800

Brush Spring Tension—14-18 ounces on each brush.
Field Current—4-6.1 amperes (955-U), 3.5-4.5 amperes (943-J) at 6 volts.

Mounting:—**(Model 53).** Generator is flange mounted at right of engine at rear of accessory bracket. To remove generator, disconnect lead and take out three flange mounting cap screws. Then pull generator to rear to disengage drive coupling and lift from place.

(Model 54). Generator is mounted at the left of the engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then take out bolts under generator forming bracket hinge and lift generator from place. The fan belt tension is adjusted by loosening the adjustment and hinge bolts and swinging the generator away from the engine. Tighten the adjustment bolt after making this adjustment. The belt tension should be just sufficient to drive the generator and fan without slipping.

Oiling:—Put 8 or 10 drope of light engine oil in the oiler at each end of the generator every six weeks or each 25000 miles.

RELAY:—**Model 265-B.** Relay is mounted on the generator. Relay contacts close at 600 R.P.M. or 7.5 miles per hour when th egenerator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—**Clum Switch Model 9115.** Lighting switch is mounted at lower end of steering column. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights (in headlights) are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

Stop light switch is Delco-Remy Model 466-L and H.

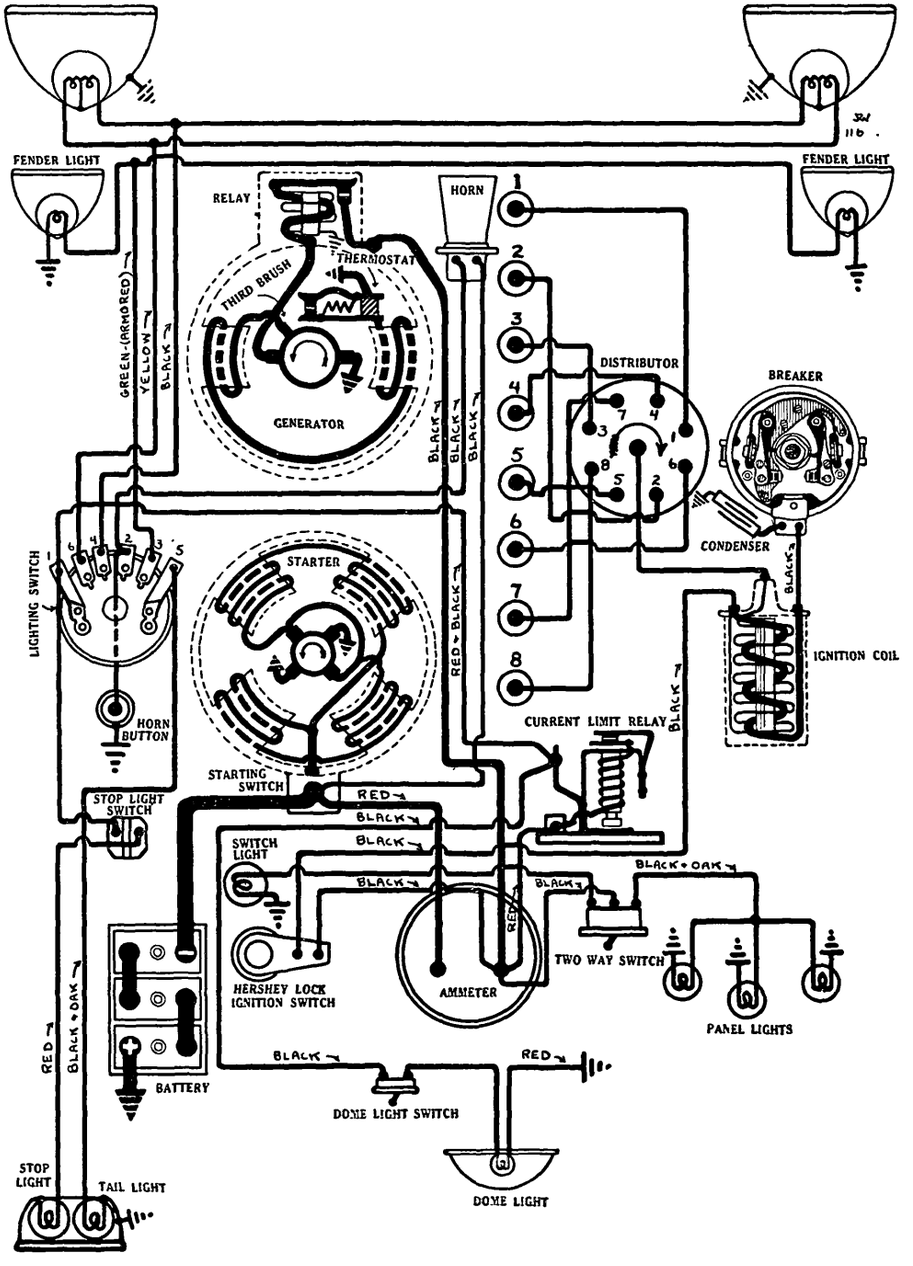
CURRENT LIMIT RELAY:—**Model 410-F.** This device is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits to protect them against overload and short-circuits. The circuit breaker begins to vibrate when the current reaches 30-35 amperes and continues to vibrate limiting the current to 5-22 amperes. Contact gap is .012-.030 inch. Air gap is .015-.030 inch with contacts closed.

STUDEBAKER

DICTATOR EIGHT MODEL 61 (1931)
COMMANDER EIGHT MODEL 70 (1931)
DELCO-REMY SYSTEM

BATTERY:—Willard, Type WJ-4-15. 6 volt, 128 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 145 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 25.6 hours. Battery is mounted on the left frame member under the front compartment floor boards.

IGNITION:—Coil Model 533-Y (61), 528-E (70). Mounted on instrument board (533-Y—lock coil type), or on dash (528-E).
Ignition Current—½-2½ amperes (idling), 4-5 amperes (stopped).
Ignition Switch—Coillock (61), Oakes Hershey co-incidental ignition switch and steering post lock (70). See Model 54 (preceding page) for wiring of 533-Y coil.



Distributor Model 658-Z. Breaker contacts separate .018-.024". Set contact gap by loosening lock screw on stationary contact mounting plate and turning up eccentric adjusting screw until gap is .022 inch with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 22 degrees (engine) reached at 2800 R.P.M. Breaker has two sets of contacts operating on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. This firing interval must be accurately set by synchronizing contacts for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect manual advance rod and primary lead and remove distributor head with cables intact. Then loosen clamp screw on advance plate and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every six weeks or each 2500 miles of operation. At the same time remove the distributor head and rotor and put a drop of light engine oil on the breaker arm pivot pins and oil the wick oiler in the center of the shaft. Put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 820738, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after the distributor has been timed to the engine by cranking the engine over 90 degrees when piston No. 6 will reach firing position 1" (61), ¾" (70) on flywheel before top dead center when punch mark on flywheel (1"—61 or ¾"—70) before the top dead center mark 'UDC.3-6' will be opposite the indicator. The manual spark control must be fully advanced). If the second set of contacts (mounted on the movable sub-plate) do not open at this point, loosen the two lock screws and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches position 1" (61), ¾" (70) on flywheel before top dead center with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance manual spark control and remove the timing inspection hole cover on the top of the flywheel housing at the right of the engine. Then crank engine over until punch mark 1" (61), ¾" (70) before the top dead center mark 'UDC. 1-6'

STUDEBAKER

DICTATOR EIGHT MODEL 61 (1931)
COMMANDER EIGHT MODEL 70 (1931)
DELCO-REMY SYSTEM

is directly opposite the pointer on the housing. Then loosen the advance arm clamp screw and rotate the distributor until the first set of contacts (mounted directly on the breaker plate) begin to open. Tighten the clamp screw and see that the segment in the distributor head directly opposite the rotor is connected to the spark plug in cylinder No. 1. The second set of contacts should open exactly 45 degrees after this point with piston No. 6 at firing position when punch mark 1" or ¾" before the top dead center mark 'UDC.3-6' will be directly opposite the indicator.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Std. Champion No. 4. Gaps are .025 inch.

VALVE TIMING (61):—INLET VALVES. Head Diameter 1 13/32". Stem Diameter, 5/16 inch. Stem length, 5 7/32 inches. Valve lift, 9/32 inch. Spring pressure, 63-68 pounds (valve closed). Tappet clearance, .004 inch (hot). Inlet valves open at top dead center and close 40 degrees after lower dead center. The flywheel is marked 'UDC.1-8' at point of inlet opening of cylinder No. 1.

EXHAUST VALVES. Head diameter, 1 9/32 inches. Stem diameter, 5/16 inch. Stem length, 5 7/32 inches. Valve lift, 9/32 inch. Spring pressure, 63-68 pounds (valve closed). Tappet clearance, .006 inch (hot). Exhaust valves open 45 degrees before lower dead center and close 11 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open with piston on top dead center when flywheel mark 'UDC/1-8' lines up with indicator on housing. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Gears are marked. Mesh marked tooth on crankshaft gear between the two marked teeth on the camshaft gear.

VALVE TIMING (70):—INLET VALVES. Head Diameter 1 13/32". Stem Diameter, 5/16 inch. Stem length, 5 7/32 inches. Valve lift, 11/32 inch. Spring pressure, 63-68 pounds (valve closed). Tappet clearance, .004 inch (hot). Inlet valves open 15 degrees before top dead center and close 43 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 9/32 inches. Stem diameter, 5/16 inch. Stem length, 5 7/32 inches. Valve lift, 11/32 inch. Spring pressure, 63-68 pounds (valve closed). Tappet clearance, .006 inch (hot). Exhaust valves open 48 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open with piston 15° or .0914" before top dead center when flywheel mark 'IN.OP./1-8' line up with indicator on housing. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Gears are marked. Mesh marked tooth on crankshaft gear between the two marked teeth on the camshaft gear.

STARTER:—Model 718-Q. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 25-28 ounces. Starter switch is mounted on the starter field frame and is operated through a flexible control by a button on the dash.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at the left of the engine on the forward side of the flywheel housing. To remove starter, disconnect cable and starter switch control and take out three flange mounting cap screws. Then pull starter forward to clear the Bendix drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every six weeks or each 2500 miles of operation. The drive end bearing is oilless.

GENERATOR:—Model 955-C. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the round headed lock screw on the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. With standard car setting the maximum charging rate is 19 amperes (cold) reached at 1550 R.P.M. or 22-25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-22	8.3-8.7	1550	9-12	7.35-7.65	2000

Shunt field current is 4-6.1 amperes at 6 volts. Brush spring tension is 14-18 ounces. Generator draws 5.5 amperes at 6 volts operating as a motor.

Mounting:—Generator is cradle mounted on special mounting bracket at the left of the engine and is driven by the fan belt. The water pump is driven by an extension of the water pump shaft. To remove generator, disconnect water pump drive coupling and relay lead and loosen mounting clamp band. Then slip off drive belt and lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every six weeks or each 2500 miles of operation.

RELAY:—Model 265-B. Relay is mounted on the generator field frame. Relay contacts close at 550 R.P.M or 7-10 M.P.H. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 1-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—Clum Switch Model 9115. Lighting switch is mounted at the lower end of the steering column. Double filament headlight bulbs are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights (for parking) are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 6 cp. S.C. Mazda 81.

CURRENT LIMIT RELAY:—Model 410-F. This is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits to protect them from overload or short circuits. Circuit breaker begins to vibrate when the current reaches 30-35 amperes and continues limiting the current to 5-18 amperes. Circuit breaker contact gap is .012-.030 inch. Air gap is .015-.025 inch with contacts closed. Spring tension is 5 ounces minimum.

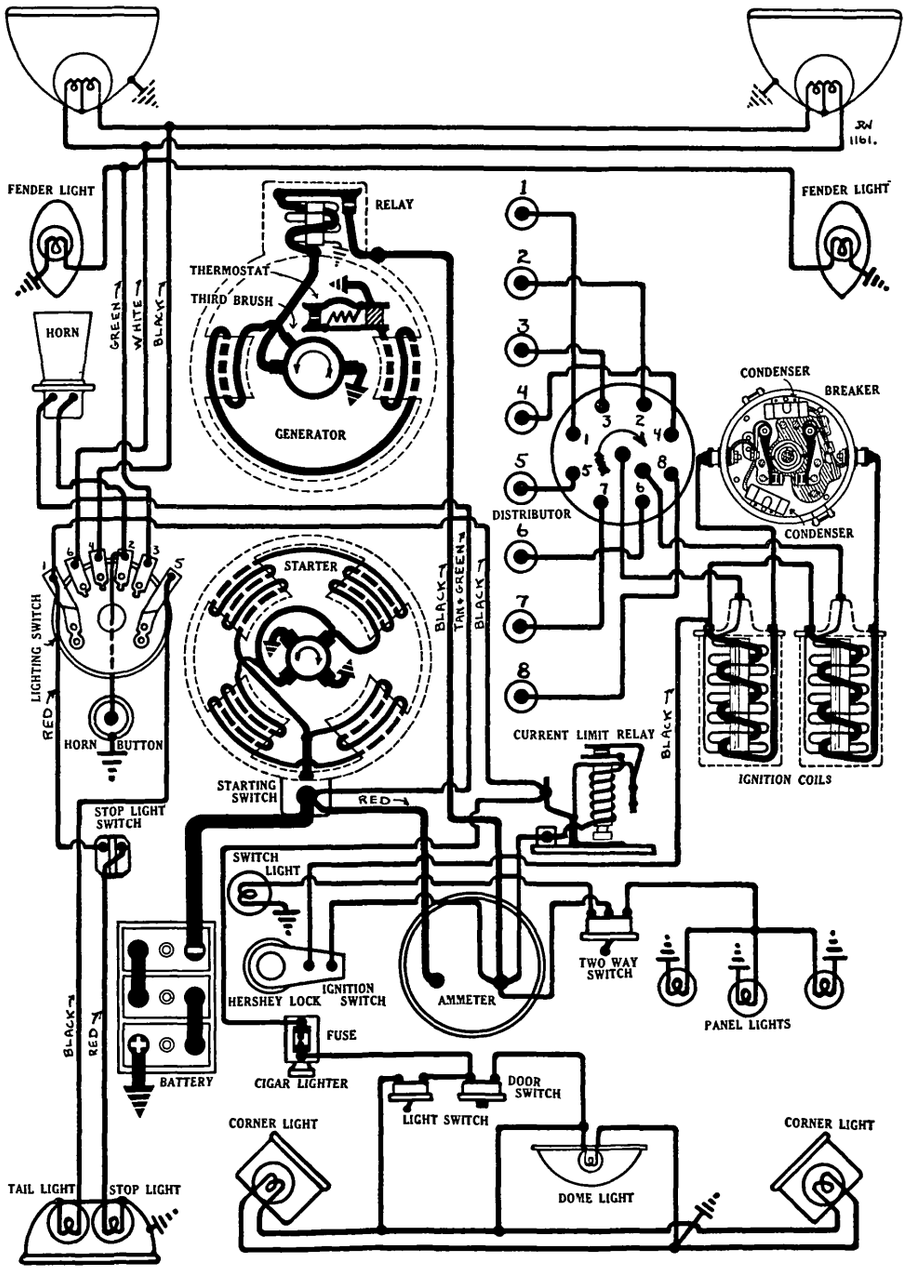
PRESIDENT EIGHT MODELS 80 AND 90 (1931)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WJ-4-15, 6 volt, 128 ampere hour. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 145 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 25.6 hours. Battery is mounted on the right frame member under the floor boards of the front compartment.

IGNITION:—Coil Model 528-E. (2 used). Coils are mounted on the dash. Ignition current (each coil) is ½-2½ amperes at 6 volts with engine running and 4-5 amperes at 6 volts with engine stopped. The ignition switch is an Oakes 'Hershey' type co-incidental steering post and ignition switch lock.



Distributor Model 668-C. Breaker contacts separate .018-.022 inch. Set contact gap by loosening lock screw on stationary contact mounting plate and turning up eccentric adjusting screw until gap is .022 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 19 degrees (engine) reached at 3200 R.P.M. Breaker has two sets of contacts operating on a single four sided cam. Each set of contacts controls one ignition coil and fires the spark plugs in four cylinders. Contacts separate alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. This firing interval must be accurately set by synchronizing contacts for satisfactory engine performance. See Timing.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect manual advance control rod and primary leads and remove distributor head with cables intact. Then loosen arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every six weeks or each 2500 miles of operation. At the same time remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil. Put one drop of oil on the breaker arm pivot pins and put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Delco-Remy tool, Part No. 1835009, and follow complete directions in Equipment Section. Contacts can be synchronized without special equipment after distributor has been timed to the engine by cranking engine over 90 degrees when piston No. 6 will reach firing position (one inch on the flywheel before top dead center with the punch mark on the flywheel which is one inch before top dead center mark 'UDC.1-8' directly opposite the indicator. The manual spark control must be fully advanced). If the second set of contacts (mounted on the movable sub-plate) do not open at this point, loosen the two lock screws and turn the eccentric adjusting screw until the contacts begin to open. Tighten the lock screws and check the contact gap. If outside limits of .018-.024 inch reset at .022 inch and repeat synchronization.

Timing Distributor to Engine. Breaker contacts begin to open when the piston entering power stroke reaches a position one inch before top dead center (measured on the flywheel) with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance manual spark control and remove the timing inspection hole cover plate

STUDEBAKER

DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

on the flywheel housing at the right of the engine. Crank engine over until the punch mark on the flywheel which is one inch before top dead center mark 'UDC.1-8' is directly opposite the indicator on the housing. Then loosen the advance arm clamp screw and rotate the distributor until the first set of contacts (mounted directly on the breaker plate) begin to open. Tighten the clamp screw and see that the segment in the distributor head directly opposite the rotor is connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs in accordance with the diagram. Note that connections do not follow the firing order of the engine.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4. Spark plugs are connected 1-3-2-4-8-6-7-5 clockwise around the distributor head.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Std. Champion No. 4. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 21/32 inches. Stem diameter, ⅜ inch. Stem length, 5 19/32 inches. Valve lift, 11/32 inch. Spring pressure 98-108 pounds (valve open). Tappet clearance, .004 inch (hot). Inlet valves open 5 degrees after top dead center and close 45 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 9/16 inch. Stem diameter, ⅜ inch. Stem length, 5 19/32 inches. Valve lift, 11/32 inch. Spring pressure, 98-108 pounds (valve open). Tappet clearance, .006 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 12 degrees after top dead center. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open with piston slightly past top dead center when flywheel mark 'IN.OP/1-8' lines up with indicator on housing. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Gears are marked. Mesh marked tooth on crankshaft gear between the two marked teeth on the camshaft gear.

STARTER:—**Model 728-C.** Starter is connected to the engine through a set of reduction gears and a manually operated pinion shift interconnected with the starting switch. The direction of rotation is clockwise (armature shaft), viewed from the commutator end. Brush spring tension is 24-28 ounces. Starter switch is mounted on the starter field frame.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3	600

Mounting:—Starter is flange mounted at the left of the engine on the forward side of the flywheel housing. To remove starter, disconnect cable and starting switch pedal linkage and take out three flange mounting cap screws. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the starter armature shaft every six weeks or each 2500 miles of operation. Every six months remove the plug in the reduction gear case and repack gears with graphite grease.

GENERATOR:—**Model 927-J.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance connected across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the round headed lock screw on the commutator end plate. Then shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. With standard car setting the maximum charging rate is 19.5 amperes (cold) reached at 1600 R.P.M. or 22-25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
20-22	8.5-8.7	1600	12-14	7.6-7.9	1800

Shunt field current is 1.8-2.3 amperes at 6 volts. Brush spring tension is 20-28 ounces. Generator draws 3.5 amperes at 6 volts operating as a motor.

Mounting:—Generator is cradle mounted at the left of the engine and is driven by the fan belt. The water pump is driven by an extension of the generator shaft. To remove generator, disconnect water pump drive coupling and relay lead and loosen mounting clamp band. Slip off drive belt and lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every six weeks or each 2500 miles of operation.

RELAY:—**Model 265-B.** Relay is mounted on the generator field frame. Relay contacts close at 7-10 M.P.H. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 1-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.020 inch with contacts closed.

LIGHTING:—**Clum Lighting Switch Model 9115.** Lighting switch is mounted at the lower end of the steering column. Double filament headlight bulbs are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights (for parking) are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash, tail and instrument lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome and corner lights are each 6-8 volt, 6 cp. S.C. Mazda 81.

Stop light switch is Delco-Remy Model 466-D.

CURRENT LIMIT RELAY:—**Model 410-F.** This device is a vibrating circuit breaker connected in the lighting circuits to protect them from overload and short circuits. Circuit breaker begins to vibrate when the current reaches 30-35 amperes and continues limiting the current to 5-18 amperes. Circuit breaker contact gap is .012-.030 inch. Air gap is .015-.025 inch. Plunger spring tension is 5 ounces minimum.

STUDEBAKER

SIX MODEL 55 (1932), SERIAL NUMBERS 5,120,001 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On plate riveted to frame under left front fender.

ENGINE NUMBER:—Stamped on front center of engine block back of water pump.

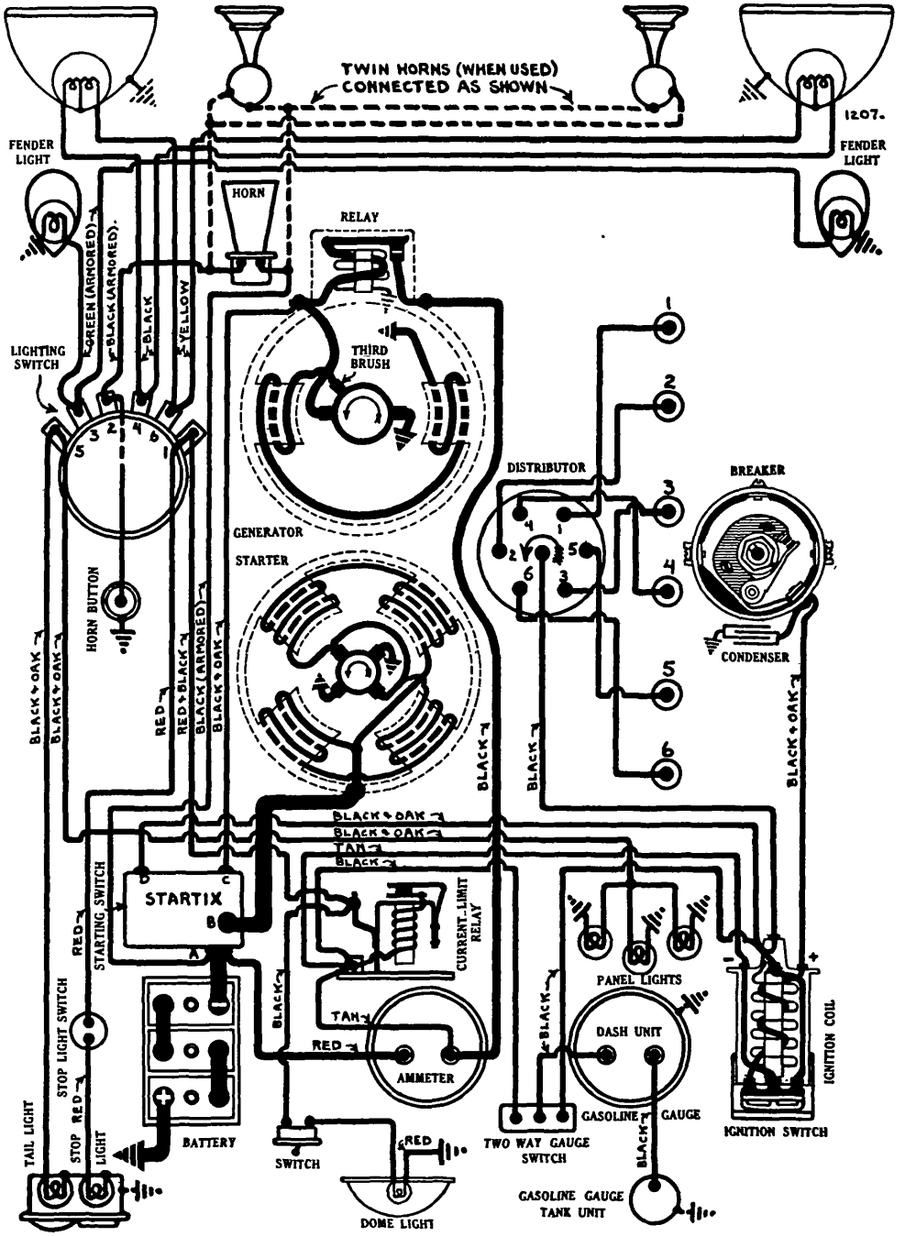
BATTERY:—**Willard, Type WH-1-13,** 6 volt, 13 plate, 102 ampere hour (5 ampere rate). Positive (+) terminal is grounded. Battery mounted on left frame member under driver's seat. Battery size, 7 1/16 inches wide, 9 1/16 inches long, 8⅞ inches high.

IGNITION:—**Coil Model 534-X, 536-Z.** Lock coil type with switch in base. Coil mounted on back of instrument board at right of instrument panel. Ignition current .5-1.5 amperes (engine running), 4-5 amperes (engine stopped).

Distributor Model 632-M. Single breaker arm, 6-lobe cam type with semi-automatic advance and 'Spark Modifier' (see Note). Manual advance controlled by button on dash. Ordinary driving position with button pushed in toward dash (spark advanced), pull out button to retard spark. Breaker contact gap set at .020 inch. Hold within limits of .018-.024 inch. To set gap, loosen lock screw on stationary contact mounting plate, turn eccentric adjusting screw (mounting plate moves concentrically and does not change parallel relation between contact surfaces), tighten locking screw. Breaker arm spring tension, 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). Maximum manual advance, 15 degrees (engine).

Cam Angles—Closed 36°. Open 24° (distributor degrees).

Automatic Advance



Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	4.5		800
12.75		1500	25.5		3000

Spark Modifier:—Model 680-D. The 'Vacuum Spark Advance Modifier' consists of a spring-loaded vacuum-operated piston mounted on the spark advance plate and connected to a secondary plate directly underneath. It is designed to momentarily retard the spark (up to 6°) whenever the engine is quickly accelerated to eliminate spark knock. Spark Modifier requires no attention in service but must be locked out when setting ignition timing. See Timing.

Mounting:—Distributor mounted at left center of engine, driven by inclined shaft from the camshaft. To remove, disconnect primary lead, take off distributor cap, loosen clamp bolt in advance arm, lift distributor out.

Oiling:—1000 Miles. Turn down grease cup under distributor head two turns. Keep cup filled with medium cup grease. Take off distributor cap and rotor. Put 2-4 drops S.A.E. No. 20 oil in wick oiler in center of shaft. Apply thin film vaseline to face of breaker cam.

Timing:—Standard setting, 5° or ½" (on flywheel) before top dead center with full manual advance. To set timing, first remove inspection cover plate over inspection hole in top of flywheel housing, fully advance manual spark control (push button in toward dash), check distributor to see that it is rotated clockwise to full extent of advance arm slot, disconnect and tape wire marked 'IGN' on Startix to prevent automatic cranking of engine with ignition turned on, lock out Vacuum Spark Advance Modifier by inserting ⅛" diameter pin through hole in advance arm and slot in secondary arm. With No. 1 piston on compression turn engine over until the punch marks on the flywheel (which are 5° or ½" before top dead center mark 'UDC.1-6') are directly opposite the pointer on the housing. Loosen advance arm clamp bolt, rotate distributor cup until contacts begin to open (use test lamp),

DELCO-REMY SYSTEM

tighten clamp bolt. Connect spark plugs as indicated on diagram.

Firing Order:—1-4-2-6-3-5. No. 1 cylinder nearest radiator.

Spark Plugs:—⅞-18 S.A.E. Champion #2. Set gap at .025 inch.

VALVE TIMING:—Valves at right of engine. Camshaft driven by two-sprocket non-adjustable chain drive.

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1⅝"	.341/.342"	5⅜"	45°	5/16"
Exhaust	1½"	.341/.342"	5⅜"	45°	5/16"

Tappet Clearance		Spring Pressure
Operating	Timing	
Intake .....004" (hot)	.....010" (cold)	Closed.....63-68 pounds (1 23/32")
Exhaust .....006" (hot)		

Intake valves open 5 degrees after top dead center. Intake valves close 53 degrees after lower dead centr.

Exhaust valvs open 38 degrees before lower dead center. Exhaust valves close 10 degrees after top dead center.

To Check Valve Timing. Set tappet clearance No. 1 intake valve at .010 inch (cold). With No. 6 piston on compression crank engine over until flywheel mark 'IN-OP/1-6' (which is 5 degrees or ½ inch past top dead center mark 'UDC/1-6') is directly opposite pointer on housing in inspection hole in flywheel housing at right of engine. No. 1 intake valve should begin to open at this point. Reset tappet clearance at .004 inch with engine hot.

To Set Valve Timing. Camshaft sprocket has one tooth marked. Crankshaft sprocket has two teeth marked. Turn crankshaft and camshaft so that mark on camshaft sprocket is directly opposite and between the marks on the crankshaft sprocket (use straightedge across shaft centers to center marks). Assemble chain.

STARTER:—Model 718-Z. Starter drives through outboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension, 24-28 ounces. Starter cranks engine at 100 R.P.M. drawing 180 amperes.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	6000	5	65
15 "	Lock	3.15	570

Startix:—This model equipped with Startix automatic starting switch. See complete article on Startix in Equipment Section.

Mounting:—Starter flange mounted on forward face of flywheel housing at left of engine. To remove, disconnect cable, take out 3 flange mounting screws, pull starter straight forward to clear Bendix housing, lift from place.

Oiling:—1000 Miles. Put 2-4 drops S.A.E. No. 20 engine oil in commutator end oiler. Drive end bearing (outer end of Bendix housing) is oilless.

GENERATOR:—Model 943-V. Third brush regulation. To adjust charging rate, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush (by hand) counter-clockwise to increase or clockwise to decrease charging rate, tighten locking screw. Rotation counter-clockwise at commutator end. With standard setting, maximum charging rate is 12½ amperes at 7.8 volts (hot) reached at 1800 R.P.M. (generator) or 23.13 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
16-18	8.0-8.3	1700	11-13	7.5-7.8	1800

Brush spring tension, 14-18 ounces. Shunt field current, 3.5-4.5 amperes at 6 volts. Generator motoring draws 5.5 amperes at 6 volts.

Mounting:—Generator mounted on swinging bracket at left front of engine, driven by fan belt. To remove, loosen adjustment clamp bolt, swing generator toward engine, slip off drive belt, take out adjustment bolt and two bolts forming bracket hinge, lift generator out.

Belt Adjustment:—Loosen bracket hinge bolts and adjustment clamp bolt, pull generator away from engine until fan can just be rotated with belt held stationary, tighten adjustment bolt and mounting bolts.

Oiling:—1000 Miles. Put 2-4 drops S.A.E. No. 20 engine oil in oiler at each end of generator.

RELAY:—Model 265-G. Mounted on generator. Relay contacts close at 8.2 M.P.H. or 780 R.P.M. (generator) when generator voltage reaches 6.4 volts with charging current of approximately 1 ampere and open with discharge current of 0-2.5 amperes. Relay contact gap limits, .015-.025 inch. Air gap limits, .012-.017 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9115. Lighting switch mounted at lower end of steering column, controlled by lower lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome Light	6-8	6	S.C.	81

CURRENT LIMIT RELAY:—Model 410-L. Vibrating circuit breaker mounted on dash. Starts with current load of 30-35 amperes, limits current to 5-22 amperes with direct short-circuit. Contacts gap limits, .012-.030 inch. Air gap limits, .015-.025 inch (contacts closed). Spring tension, 5 ounces minimum (measured at brass button on contact arm with spring scale at right angles to contact arm).

GASOLINE GAUGE:—A.C. electric type (see Carburetion Section). Selector switch in gauge circuit so that reading may be obtained with ignition 'off' by pressing switch button (gauge always 'on' with ignition turned 'on').

FUEL PUMP:—Stewart-Warner mechanical fuel pump at right of engine driven from camshaft (see Carburetion Section).

HORN:—Sparton motor-driven type mounted under engine hood. Twin horns optional equipment. Current draw, 6 amperes at 6 volts.

Intake	1 13/32"	.341/.342"	5 7/32"	45°	11/32"
Exhaust	1 9/32"	.341/.342"	5 7/32"	45°	11/32"

Tappet Clearance		Spring Pressure
Operating	Timing	
Intake .004" (hot)	.010" cold)	Closed 48-53 pounds (2 1/32")
Exhaust .006" (hot)		Open 63-68 pounds (1 23/32")

Timing—Dictator Model 62

Intake valves open at top dead center. Intake valves close 40 degrees after lower dead center.

Exhaust valves open 45 degrees before lower dead center. Exhaust valves close 11 degrees after top dead center.

To Check Valve Timing. Set tappet clearance No. 1 intake valve at .010 inch (cold). With No. 8 piston on compression stroke crank engine over until piston reaches top dead center with flywheel mark 'UDC/IN-OP-1-8' directly opposite pointer in inspection hole in flywheel housing. No. 1 intake valve should begin to open at this point. Reset tappet clearance at .004 inch with engine hot.

Timing—Commander Model 71

Intake valves open 15 degrees before top dead center. Intake valves close 43 degrees after lower dead center.

Exhaust valves open 48 degrees before lower dead center. Exhaust valves close 10 degrees after top dead center.

To Check Valve Timing. Set tappet clearance No. 1 intake valve at .010 inch (cold). With No. 8 piston on compression, crank engine over until flywheel mark 'IN-OP/1-8' (which is 15 degrees or approximately 1¼ inches before the top dead center mark 'UDC/1-8') is directly opposite pointer in inspection hole in flywheel housing. No. 1 intake valve should begin to open at this point. Reset tappet clearance at .004 inch with engine hot.

To Set Valve Timing. One tooth on crankshaft gear marked. Two adjacent teeth on camshaft gear similarly marked. Mesh gears so that marked tooth on crankshaft gear is between two marked teeth on camshaft gear.

STARTER:—Model 718-Y. Starter drives to engine through outboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces. Starter cranks engine at 90 R.P.M. (armature speed 1050 R.P.M.) drawing 180 amperes.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5.0	65
2.2 "	1050	—	180
15 "	Lock	3.15	570

Startix:—This model equipped with Startix automatic switch—see complete article on Startix in Equipment Section.

Mounting:—Starter flange mounted on forward face of flywheel housing left of engine. To remove, disconnect cable, take out 3 flange mounting cap screws, pull starter straight forward to clear Bendix housing, lift from place.

Oiling:—1000 Miles. Put 2-4 drops S.A.E. No. 20 engine oil in commutator end oiler. Drive end bearing (outer end of Bendix housing) is oilless.

GENERATOR:—Model 955-C. Third brush regulation, thermostat control. Thermostat operates at 200°F. (contacts open—cuts in resistance) reducing the output approximately 40%. To adjust charging rate, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush (by hand) counter-clockwise to increase or clockwise to decrease the charging rate, tighten locking screw. With standard car setting maximum charging rate is 11 amperes (hot) at 7.4 volts, reached at 2100 R.P.M. or 23.5 M.P.H. (62), 23 M.P.H. (71).

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

Startix:—This model equipped with Startix automatic starting switch—see complete article on Startix in Equipment Section.

Mounting:—Starter flange mounted on forward face flywheel housing at left of engine. To remove, disconnect cable, take out 3 flange mounting cap screws, pull starter straight forward to clear housing, lift from place.

Oiling:—Starter bearings are oilless.

GENERATOR:—Model 927-J. Third brush regulation, thermostat control. Thermostat operates at 165°F. (contacts open—cuts in resistance) reducing output approximately 40%. To adjust charging rate, loosen small round headed lock screw on commutator end plate, take off cover band, shift third brush (by hand) counter-clockwise to increase or clockwise to decrease charging rate, tighten lock screw. With standard car setting maximum charging rate is 13 amperes (hot) at 7.7 volts reached at 1800 R.P.M. or 22 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
20-22	8.5-8.7	1600	12-14	7.6-7.9	1800

Brush spring tension, 20-28 ounces. Shunt field current, 1.8-2.3 amperes at 6 volts. Generator motoring draws 3.5 amperes at 6 volts.

Mounting:—Generator cradle mounted at left front of engine, driven by fan belt. Drives water pump through shaft extension and flexible coupling. To remove, disconnect lead, disconnect water pump drive coupling, slack off belt adjustment, loosen mounting clamp band, lift generator out.

Belt Adjustment. Loosen nut on back of fan bracket, lift up fan assembly until fan can just be turned with belt held stationary, tighten nut.

Oiling:—1000 Miles. Put 2-4 drops S.A.E. No. 20 engine oil in oiler at each end of generator.

RELAY:—Model 265-B. Mounted on generator. Relay contacts close at 10 M.P.H. or 650 R.P.M. (generator) when generator voltage reaches 6.4 volts. Contacts open with discharge current of 1-2.5 amperes. Charging current at closing of contacts approximately 1 ampere. Relay contact gap limits, .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9115. Lighting switch mounted at lower end of steering column controlled by lower lever on steering wheel. Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking (Fender) Lights	6-8	3	S.C.	63
Dash and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome and Corner Lights	6-8	6	S.C.	81

NOTE:—Stop light switch is Delco-Remy, Model 466-Q.

CURRENT LIMIT RELAY:—Model 410-L. Vibrating circuit breaker mounted on dash. Starts to operate with current load of 30-35 amperes, limits current to 5-22 amperes with direct short-circut. Contact gap limits .012-.030 inch. Air gap limits, .015-.025 inch. Spring tension, 5 ounces minimum (measured at brass button with spring scale hooked under contact arm and at right angles to arm).

CLOCK:—Borg electric type. Equipped with 5 ampere fuse on back of clock.

GASOLINE GAUGE:—A.C. electric type (see Carburetion Section). Selector switch in gauge circuit permits readings to be obtained with ignition turned 'off' by pressing switch button (gauge always registers with ignition turned 'on').

FUEL PUMP:—Stewart-Warner mechanical type (see Carburetion Section). Fuel pump mounted at right of engine, driven from camshaft.

HORNS:—Sparton horn mounted under engine hood (standard) or twin horns mounted under headlights (optional). Current draw approximately 6 amperes each.

STUDEBAKER

SIX MODEL 56 (1933) SERIAL NUMBERS 5,133,401 UP
DELCO-REMY SYSTEM

CAR SERIAL NUMBER:—On plate on frame side rail under left hand front fender. First number this series 5,133,401.

ENGINE NUMBER:—Stamped on front center of engine block directly behind water pump.

ENGINE:—Six cylinder, 'L' head type, 3¼x4⅝" bore and stroke, 230 cubic inch displacement, rated at 25.4 horsepower, develops 85 hp. at 3200-3600 R.P.M. Standard compression ratio—5.5-1. Optional high compression head (6.0-1) available but not recommended by factory. Standard compression pressure, 105 pounds at 1200 R.P.M.

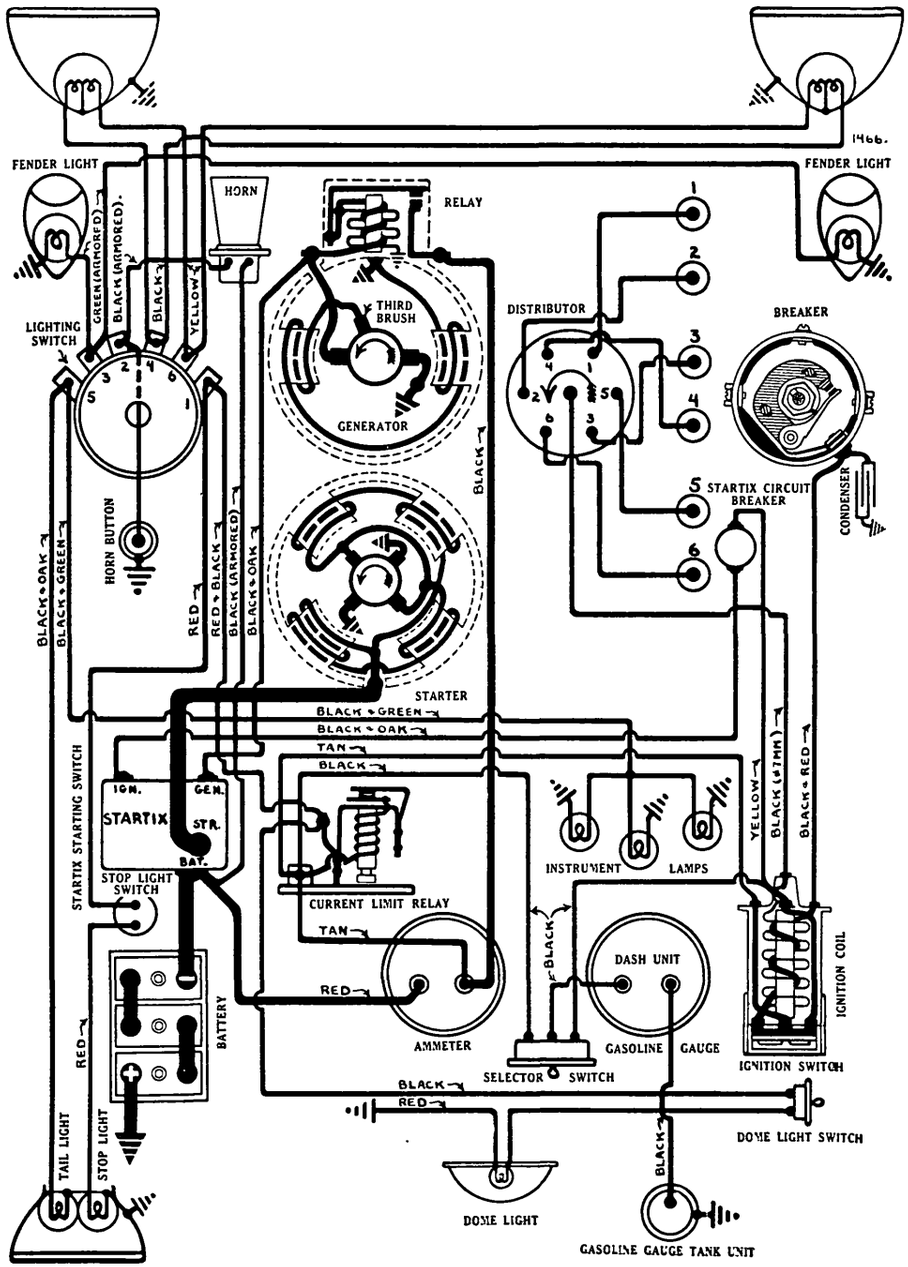
BATTERY:—Willard, Type WH-1-13, 6 volt, 13 plate, 102 ampere hour (20 hour rate). Starting capacity, 120 amperes for 20 minutes.
Ground Terminal:—Positive (+) terminal grounded to frame side rail.
Mounting:—Battery mounted in cradle under driver's seat.
Dimensions:—Width, 7 1/16". Length, 9 1/16". Height, 9 5/16".

IGNITION:—Coil Model 537-X. Lock coil type mounted on back of instrument board.
Ignition Current:—½-1½ amperes at 6 volts (engine running), 4-5 amperes at 6 volts (engine stopped).

Distributor Model 622-A. Single breaker arm, six lobe cam, semi-automatic advance type with manual retard and vacuum 'Spark Modifier'. Spark control button at left of instrument panel retards distributor 15° (engine) when pulled out for hand cranking or heavy pulling.
Breaker Gap:—Set contact gap at .020". Hold within limits of .018-.024".
Breaker Arm Spring Tension:—17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface).
Cam Angles—Closed 36°. Open 24° (distributor degrees).

Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		400	4.5		800
12.75		1500	25.5		3000



Spark Modifier Model 680-D:—Consists of spring-loaded vacuum operated diaphragm mounted on spark advance plate and connected to secondary plate directly underneath. It is designed to momentarily retard spark (up to 6°) whenever engine is quickly accelerated to eliminate spark knock. It requires no attention.

Mounting:—Distributor mounted at left center of crankcase and driven by inclined shaft from camshaft. To remove, disconnect breaker lead, take off distributor cap, loosen clamp bolt in distributor arm, lift out.

Oiling:—5000 Miles. Turn down grease cup two or three turns. Keep cup filled with pressure lubricant. Take off distributor cap and rotor, put 2-4 drops S.A.E. #20 oil in oiler in center of shaft, apply thin film vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting—top dead center with manual control advanced.

To Set Ignition Timing:—Remove cover plate over inspection hole in top of flywheel housing, advance manual spark control (push button in toward dash), see that distributor is rotated clockwise to end of advance arm slot, latch out 'Spark Modifier' by inserting ⅛" pin through hole in advance arm and slot in secondary arm, turn engine over until No. 1 piston reaches top dead center on compression with flywheel mark 'U.D.C.1-6' opposite pointer on housing, loosen advance arm clamp bolt, rotate distributor cup until contacts begin to open (if ignition is turned on to check contact opening, use left hand position of switch to avoid automatic cranking), tighten clamp bolt, see that rotor is opposite No. 1 terminal in distributor cap (see diagram), connect spark plugs as indicated.

STUDEBAKER

SIX MODEL 56 (1933) SERIAL NUMBERS 5,133,401 UP
DELCO-REMY SYSTEM

Firing Order:—1-4-2-6-3-5. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion #8. Set spark plug gaps at .025".

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is gear driven from crankshaft. Crankshaft gear (cast iron) has one marked tooth. Camshaft gear (Celeron-fabric) has two adjacent teeth marked. Mesh marked tooth of crankshaft gear between marked teeth of camshaft gear. Use a gear puller to remove and install gears.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010" (cold). With No. 6 piston on compression turn engine over until flywheel mark 'IN.OP./1-6' (which is 5° after top dead center mark 'U.D.C1-6') registers with pointer on flywheel housing. No. 1 intake valve should open at this point. Reset tappet clearance at .004" with engine warm.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1⅝" (overall)	11/32"	5⅜"	45°	5/16"
Exhaust	1½" "	11/32"	5⅜"	45°	5/16"

Tappet Clearance (Operating Timing)		Spring Pressure	
Intake	.004" (hot) .010" (cold)	Closed	48-53 pounds (2 1/32")
Exhaust	.006" (hot) .010" (cold)	Open	71-76 pounds (1 23/32")

NOTE:—Install valves with stem clearance in guide of .001-.003" (intake and exhaust).

Timing

Intake Valves	Exhaust Valves
Open 5° after top dead center.	Open 38° before lower dead center.
Close 53° after lower dead center.	Close 10° after top dead center.

CARBURETION:—Stromberg Downdraft Carburetor, Model EX-22 (see Carburetor Section for complete data). Automatic manifold heat control and Stromberg Automatic choke standard equipment.

Air Cleaner:—Oil-wetted wire mesh type. Remove every month or six weeks, disassemble and remove cover and felt silencer pad, clean wire mesh unit by dipping in gasoline, dry, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—Stewart-Warner Mechanical Fuel Pump mounted on right side of crankcase (see Carburetion Section for complete data). Remove sediment bowl on pump, clean filter screen (directly above bowl), empty water and sediment from bowl, at 3-month intervals.

Gasoline Gauge:—A.C. electric type (see Carburetion Section). Selector switch in gauge circuit permits gauge reading with ignition 'off' by pressing selector switch button.

STARTER:—Model 718-Z. Starter drive—Outboard Bendix drive and Startix switch. See Equipment Section for complete data on Startix and special Startix circuit breaker (Anti-backfire unit). Starter rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces. Starter cranks engine at 100 R.P.M. (1050 armature R.P.M.) drawing 180 amperes.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5.0	65
15 "	Lock	3.15	570

Mounting:—Three-capscrew flange mounting on front face of flywheel housing, left hand side. To remove, disconnect cable, take out flange mounting screws, pull starter forward to clear Bendix housing, lift out.

Oiling:—5000 Miles. Put 2-4 drops SAE. #20 engine oil in oiler on commutator end. Drive end bearing at outer end of Bendix housing is oilless.

GENERATOR:—Model 943-V. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate (standard setting), 12.5 amperes (hot) at 7.8 volts reached at 1800 R.P.M. or 20.4 M.P.H.

Charging Rate Adjustment. Take off commutator cover band, loosen small round headed lock screw on endplate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
16-18	8.0-8.3	1700	11-13	7.5-7.8	1800

Brush Spring Tension:—14-18 ounces on each brush.

Field Current:—3.5-4.5 amperes at 6 volts across field terminals.

Motoring:—Approximately 5.5 amperes at 6 volts.

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, slip off drive belt, take out 2 bolts forming bracket hinge, lift out.

Belt Adjustment:—Loosen bracket hinge bolts and adjustment clamp bolt, pull generator away from engine until fan can just be rotated with belt held stationary, tighten adjustment bolt before slacking off on generator, tighten hinge bolts.

Oiling:—5000 Miles. Put 2-4 drops SAE. #20 engine oil in oiler at each end.

RELAY:—Model 265-G. Mounted on generator field frame. Contacts close at 7.3 M.P.H. or 780 R.P.M. with generator voltage of 6.4 volts and open with discharge current of 0-2.5 amperes.

Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9115. Lighting switch mounted at lower end of steering column controlled by lower lever on steering wheel. Lighting system 'depressed beam' with double filament headlight bulbs.

Lamp Sizes

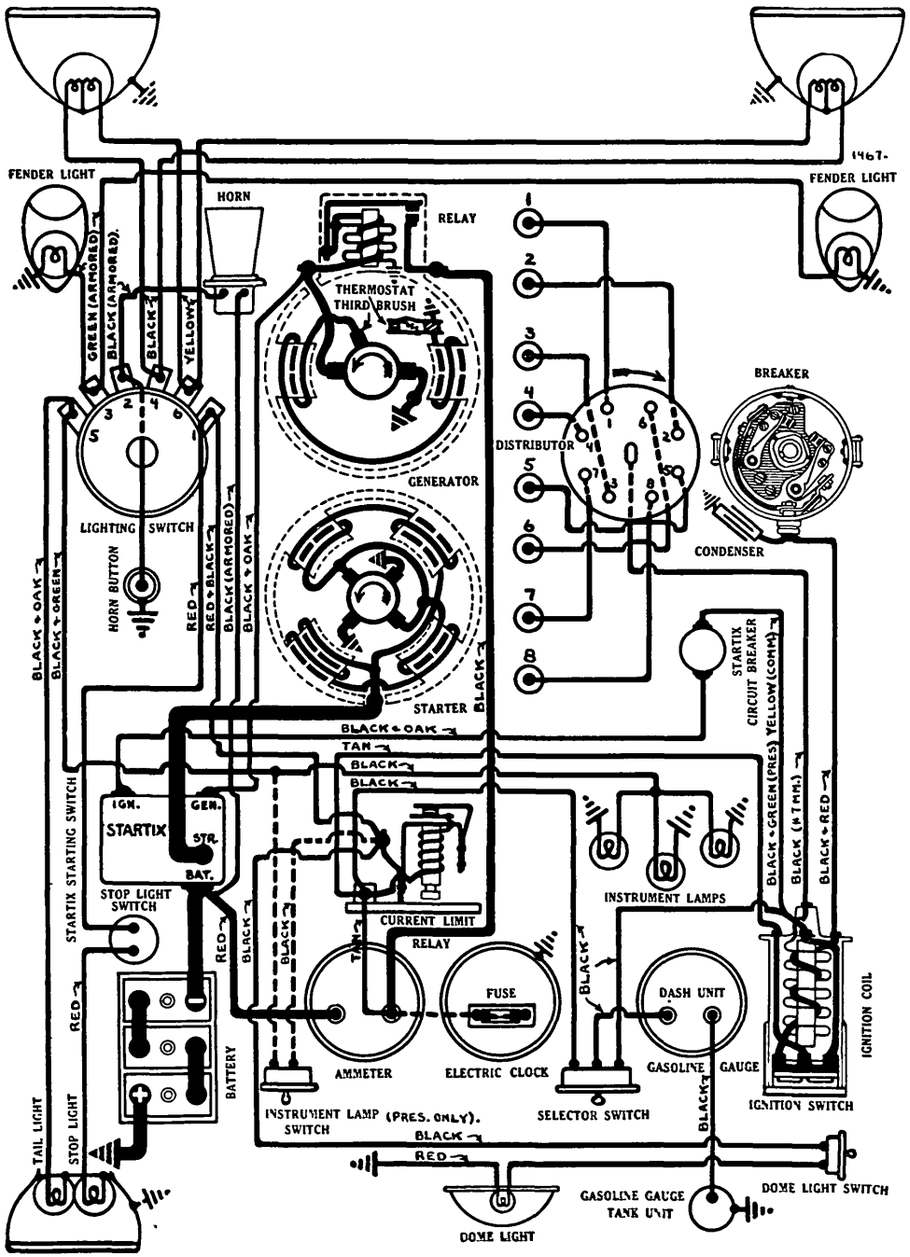
14½	1800	29	3600



Spark Modifier Model 680-C:—Consists of spring-loaded vacuum operated diaphragm mounted on spark advance plate and connected to secondary plate directly underneath. Designed to momentarily retard spark (up to 6°) whenever engine is quickly accelerated to eliminate spark knock. It requires no attention.

Mounting:—Distributor mounted on cylinder head. Remove from right side of car. To remove, disconnect primary lead, take off distributor cap, loosen advance arm clamp bolt, lift out.

Oiling:—5000 Miles. Turn down grease cup two or three turns. Keep cup filled with pressure gun lubricant. Take off distributor cap and rotor, put 2-4 drops SAE. #20 engine oil in oiler in center of shaft, apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting—4° (flywheel) or .006"—Commander, .0066"—President (piston travel) before top dead center with manual control advanced.

To Set Ignition Timing:—Remove cover plate over inspection hole in flywheel housing, advance manual spark control (push button in toward dash),

STUDEBAKER

COMMANDER EIGHT, MODEL 73 (1933) SERIAL NUMBERS 8,040,001 UP
PRESIDENT EIGHT, MODEL 82 (1933) SERIAL NUMBERS 7,040,001 UP
DELCO-REMY SYSTEM

latch out 'Spark Modifier' by inserting ⅛" pin through hole in advance arm and slot in secondary arm, turn engine over until No. 1 piston on compression stroke reaches firing position with punch marks on flywheel (located 4° or approximately ½" before top dead center mark 'U.D.C.1-8') directly opposite pointer on flywheel housing. Loosen advance arm clamp bolt, rotate distributor cup until first set of contacts (mounted directly on breaker plate) begin to open (if ignition is turned on to check contact opening, use left hand position of switch to avoid automatic cranking). Tighten clamp bolt, see that rotor is opposite No. 1 terminal in distributor cap (see diagram), connect spark plugs as indicated. Then synchronize contacts.

Synchronization of Contacts—First Method: Turn engine over 90° to firing position of No. 6 cylinder with punch marks on flywheel which are 4° or approximately ½" before top dead center mark 'U.D.C./3-6' directly opposite pointer on flywheel housing. Loosen lock screws on movable sub-plate (on which second set of contacts are mounted), turn eccentric adjusting screw until contacts begin to open, tighten lock screws.

Synchronization of Contacts—Second Methohd: Use special Delco-Remy tool, Part No. 1838182, and follow complete directions given in Equipment Section.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion #8. Set spark plug gaps at .025".

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is gear driven from crankshaft. Crankshaft gear (cast iron) has one marked tooth. Camshaft gear (Celeron-fabric) has two adjacent teeth marked. Mesh marked tooth of crankshaft gear between marked teeth on camshaft gear. Use a gear puller to remove and install gears.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010" cold. With No. 8 piston on compression stroke turn engine over until flywheel mark 'IN.OP./1-8' (which is 15° before top dead center mark 'U.D.C. 1-8') is directly opposite pointer on housing. No. 1 intake valve should begin to open at this point. Reset tappet clearance at .004" with engine warm.

Valve Specifications

Valve	Head Dimeter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 13/32" (overall)	11/32"	5 7/32"	45°	11/32"
Exhaust	1 9/32" "	11/32"	5 7/32"	45°	11/32"

bolt, see that rotor is opposite No. 1 terminal in distributor cap (see diagram), connect spark plugs as indicated. Then synchronize contacts.

Synchronization of Contacts—First Method:—Turn engine over 90° to firing position for No. 6 cylinder with flywheel mark 'U.D.C./3-6' directly opposite pointer on flywheel housing, loosen lock screws on movable sub-plate (carrying second set of breaker contacts), turn eccentric adjusting screw until contacts begin to open, tighten lock screws.

Synchronization of Contacts—Second Method:—Use special Delco-Remy tool, Part No. 1838182, and follow complete directions in Equipment Section.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion No. 8. Set gaps at .025 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine is gear driven from crankshaft. Crankshaft gear (castiron) has one marked tooth. Camshaft gear (Celeron-fabric) has two adjacent teeth marked. Mesh marked tooth of crankshaft gear between marked teeth on camshaft gear. Use a gear puller to remove and install gears.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010" cold. With No. 8 piston on compression turn engine over until flywheel mark 'IN.OP./1-8' (which is 5° past top dead center mark 'U.D.C./1-8') is directly opposite pointer on housing. No. 1 intake valve should begin to open at this point. Reset tapppet clearance at .004" with engine warm.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake	1 21/32" (overall)	3/8"	5 19/32"	45°	11/32"
Exhaust	1 9/16" "	3/8"	5 19/32"	45°	11/32"

Tappet Clearance	Operating Timing	Spring Pressure
Intake	.004" (hot) .010" (cold	Closed .59-64 pounds—2 3/32"
Exhaust	.006" (hot) .010" (cold	Open .98-108 pounds—1¾"

NOTE:—Install all valves with .001-.003" steam clearance in guides.

Intake Valves	Timing	Exhaust Valves
Open 5° after top dead center.	Open 40° before lower dead center	
Close 45° after lower dead center.	Close 12° after top dead center.	

CARBURETION:—Stromberg Downdraft Carburetor, Model EE-22 (see Carburetor Section for complete data). Automatic manifold heat control and Stromberg Automatic Choke standard equipment.

Air Cleaner:—Oil-wetted wire mesh type. Remove every month or six weeks, clean wire mesh by dipping in gasoline, thoroughly dry, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. combination fuel and vacuum pump (see Carburetion Section for complete data). At 3 month intervals, remove sediment bowl on pump, clean filter screen (mounted directly above bowl), empty water and sediment from bowl before replacing.

Gasoline Gauge:—A.C. electric type (see Carburetion Section). Selector switch in gauge circuit permits gauge readings with ignition turned 'off' by pressing selector switch button.

STARTER:—Model 497. Six pole type. Starter drive—Outboard Bendix drive and Startix switch. See Equipment Section for complete data on Startix and special Startix circuit breaker (Anti-backfire unit). Rotation counter-clockwise at commutator end. Brush spring tension 36-40 ounces each. Starter cranks engine at 90 R.P.M. (1050 armature R.P.M.) drawing 180 amperes.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5.0	70
3.6 "	1050	....	180
19 "	Lock	3.0	500

Mounting:—Three capscrew flange mounting on left hand side of front face of flywheel housing. To remove, disconnect cable, take out flange mounting screws, pull starter straight forward to clear Bendix housing, lift out.

Oiling:—Starter bearings are oilless.

GENERATOR:—Model 927-J. Third brush regulation with thermostat control. Thermostat contacts open at 160-170°F. reducing charging rate approximately 40%. Rotation counter-clockwise at commutator end. Maximum charging rate (standard setting), 11 amperes (hot) at 7.7 volts reached at 1800 R.P.M. or 23.4 M.P.H.

Charging Rate Adjustment:—Take off commutator cover band, loosen small round lock screw on end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
20-22	8.5-8.7	1600	12-14	7.6-7.9	1800

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—1.8-2.3 amperes at 6 volts across field terminals.

Motoring:—3.5 amperes at 6 volts approximately.

Mounting:—Cradle mounted at left front of engine with fan belt drive. Generator drives water pump through extension shaft and flexible coupling. To remove, disconnect lead, disconnect water pump drive coupling, slack off drive belt, loosen mounting clamp band, lift generator out.

Belt Adjustment. Loosen nut on back of fan bracket, lift up fan assembly until belt can just be turned with fan held stationary, tighten nut.

Oiling:—5000 Miles. Put 2-4 drops S.A.E. #20 engine oil in oiler at each end.

RELAY:—Model 265-B. Mounted on generator field frame. Contacts close at 650 R.P.M. of generator or 8.6 M.P.H. with generator voltage of 6.4 volts and open with discharge current of 0-2.5 amperes.

Contact Gap:—.015-.025 inch. **Air Gap:**—.012-.017 inch (contacts closed).

LIGHTING:—Clum Switch, Model 9115. Lighting switch mounted at lower end of steering column and controlled by lower lever on steering wheel. Lighting system 'depressed beam' with double filament headlight bulbs.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Fender Lights	6-8	3	S.C.	63
Instrument and Tail Lights	6-8	3	S.C.	63
Stop Light	6-8	15	S.C.	87
Dome and Corner Lights	6-8	6	S.C.	81

CURRENT LIMIT RELAY:—Model 410-L. Vibrating circuit breaker mounted on the dash. Starts with current load of 30-35 amperes limiting load to 5-22 amperes.

Contact Gap:—.012-.030 inch. **Air Gap:**—.015-.025 inch (contacts closed).

Spring Tension:—5 ounces minimum (measured at brass button with spring scale at right angles to contact arm).

HORN:—Sparton vibrator type mounted under engine hood. Current draw, 6 amperes at 6 volts.

FUSES:—5 ampere capacity mounted on back of electric clock.

SERIAL NUMBER:—First number 5,145,001 (first Model A), 5,200,001 (Year Ahead Model A). On plate on left frame member under front fender.

COMPRESSION:—Ratio—Std 6 3-1 head.
Pressure—137 lbs at 1200 R P M. or 109 5-116 lbs at 150 R P M (cranking speed)

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model IG-4607. Lock coil type on back of instrument panel.
Ignition Current—½-1½ amperes (idling), 4 5 amperes (stopped)
Ignition Switch:—Two 'on' positions provided Turn key to right for regular operation Turn key to left for timing or operation with Startix inoperative.

Distributor Model IGB-4393. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control
Breaker Gap—Set at 020". Limits, 020- 024" new), 018-.020" (after 1000 miles)
Breaker Arm Spring Tension—16-20 ozs (at tip of arm)
Cam Angles—Closed 34°. Open 26° (distributor).

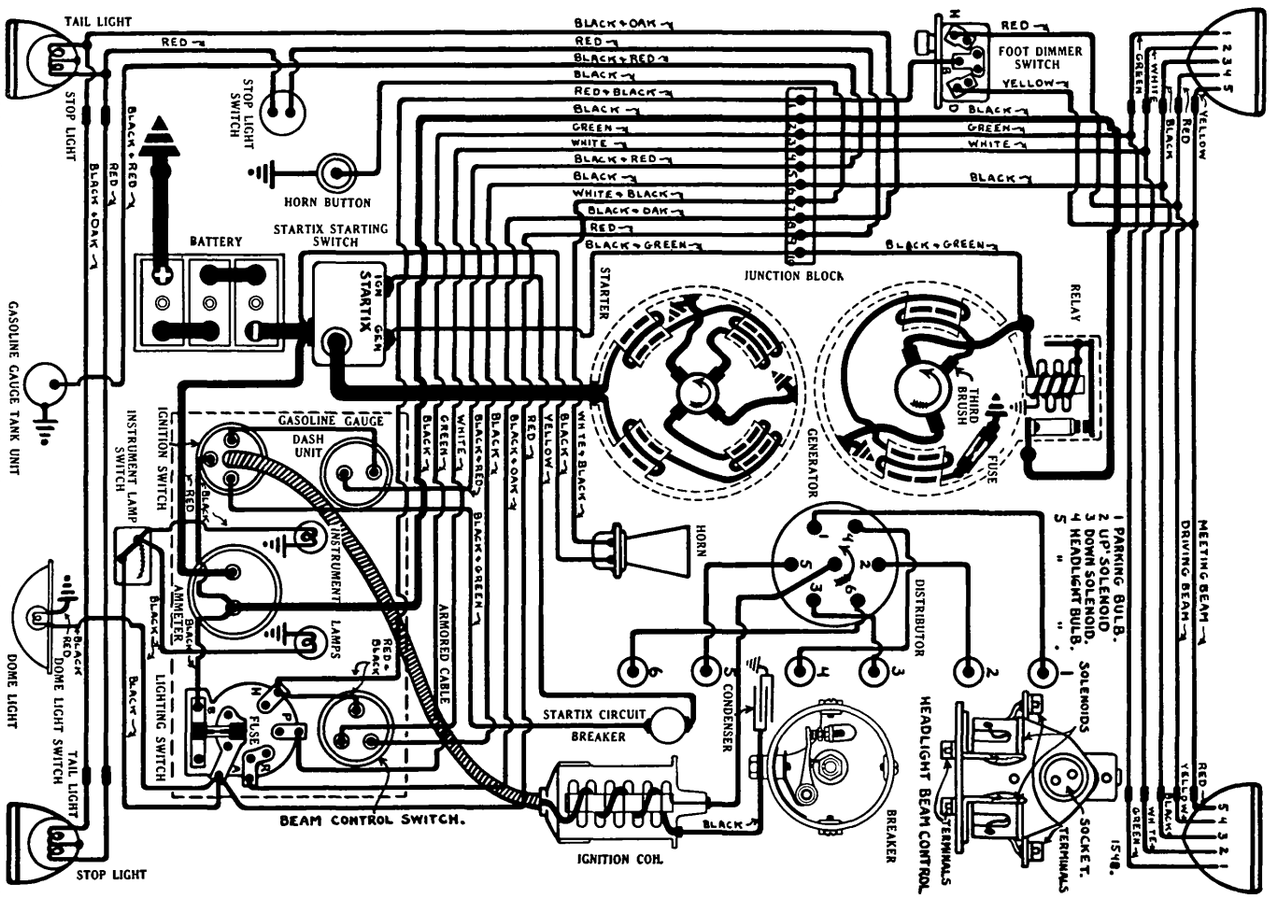
Automatic Advance

Distributor		Engine	
Degrees	R P M	Degrees	R P M
0	400	0	800
4	600	8	1200
8	1000	16	2000
10 5	1400	21	2800

Vacuum Spark Control, Model VC-4001. Vacuum unit provides additional spark advance except when engine is accelerated, pulling heavily, or operated with wide open throttle when spark will be retarded by return spring in unit Vacuum advance, 6° (engine—maximum)

Mounting:—On left hand side of crankcase Driven by inclined accessory shaft To remove, loosen advance arm clamp bolt (not necessary to take off vacuum connections).

IGNITION TIMING:— Flywheel Degs Piston Position
All engines At TDC 0000 ' TDC
Timing:—Use left hand 'on' position of ignition switch to avoid automatic cranking when turning on ignition to check contact opening With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'UDC /1-6' registers with indicator on housing (inspection hole in left hand front face of housing below starter), loosen hold-down screw in advance arm, shift arm until center line of graduations lines up with reference line on engine, tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram)



Car can be road-tested and setting changed slightly for best performance by loosening hold-down screw and rotating advance arm toward 'A' (to advance) or 'R' (to retard) end of scale
Motor Gauge—Weidenhoff Adapter #104, Rod #2

Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—Champion #7 18 MM Metric type
Spark Plug Gaps— 025". Limits, .0225- 027".

CARBURETION:—(Fuel System) See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge
Carburetor:—Stromberg, Model UR-2, UR-23, 1¼' plain tube, updraft type.
Automatic Choke—Stromberg (UR-23 only).
Fuel Pump:—A.C., Type R.
Gasoline Gauge:—A C , Electric type

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at 010". This valve should open with piston #1 (0876") or 15° before top dead center when flywheel mark 'IN OP./1-6' registers

with indicator on housing (inspection hole in left front face of flywheel housing below starter). Reset tappet clearance at .004" with engine hot.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Tappet Clearance:—.004" Int., .006" Exh., engine hot.
Valve Spring Pressure:—59-64 lbs. at 2 3/32" (valve closed). 98-108 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts.
Normal Oil Pressure—40 lbs. at 26.8 M.P.H.

BATTERY:—Willard, Type WH-1-13 (RH-1-13 Export), 6 volt, 13 plate, 102 A.H. capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under front floor.

STARTER:—Model MAN-4002, MAN-4005 (without Startix). Armature No. MAD-2083. Drive—Bendix Type RCD10FXD-9.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).
Cranking Performance—90 R.P.M. (1050 armature), 240 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4000	5.5	65
.4 "	2400	5.5	100
3.0 "	1280	5.0	200
6.1 "	790	4.5	300
9.4 "	470	4.0	400
15.0 "	Lock	3.0	580
23.0 "	Lock	4.0	820

Starting Switch:—(MAN-4002) Startix Automatic Starting controlled by ignition switch. See Equipmen Section for complete data. (MAN-4005) Type SW-3737S switch.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out two cap screws.

GENERATOR: — Model GAM-4601. Armature No. GAM-2055. Third brush control type.

Charging Rate Adjustment—Take off commutator cover band. Shift third brush by prying on brush mounting stud, counter-clockwise to increase, or clockwise to decrease charging rate. Brush held in position by friction.

Maximum Charging Rate—16½ amperes (cold), 2000 R.P.M. or 18 M.P.H.

Performance Data

Amperes	Volts	R.P.M.
0	6.4	700
4	6.9	880
7	7.0	1000
10	7.2	1180
14	7.8	1520
16-18	8.0	2400

Rotation—Counter-clockwise at commutator end.
Field Current—4.08-4.52 amperes at 6.0 volts.
Motoring—4.94-5.46 amperes at 6.0 volts.
Brush Spring Tension—18-22 ozs. each.
Field Fuse—7½ ampere capacity on field frame.

SPECIAL GENERATORS:—Model GAR-4605. Used on cars equipped with radio. See Equipment Section for complete data.

Mounting:—Pivot mounted at left front of engine. Driven by fan belt. To remove, take out two pivot bolts, one clamp bolt.
Belt Adjustment—Loosen pivot bolts and clamp bolt, swing generator away from engine until fan can just be turned with belt held stationary, tighten mounting bolts.

CUT-OUT RELAY:—Model CB-4021. Mounted on generator field frame.
Cuts in—6.4 volts, 700 R.P.M. (generator), 6.3 M.P.H. Cut-in limits, 6.75-7.5 volts.
Cuts out—.5-2.5 ampere discharge.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" (contacts closed).

LIGHTING:—Clum Switches. Light Switch Model 9236. Foot Control Switch 9505. R.B.M. Beam Control Switch. Lights are turned on and off by lighting switch. Headlight system provides six beam patterns. Three driving beams (primary or clear road beam, secondary or lower beam, city or low beam) are controlled by Beam Control switch on instrument panel. A passing or deflected beam for each of the driving beams is provided by operation of the foot control switch.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-32	1000
Parking, Instrument	3	63
Stop and Tail	21-2	1158
Dome	6	C81

FUSES:—Lighting—20 ampere capacity (on lighting switch).
Generator Field—7½ ampere capacity (on generator).

HORNS:—Sparton, Type RA. Vibrator type. Horn current, 6 amperes.

SERIAL NUMBER:—First number (Dictator) 5,145,001, (Year Ahead Model) 5,200,001. On plate on left frame side member under left front fender.

COMPRESSION:—**Ratio**—Std. 6.3-1 head.
Pressure—137 lbs. at 1200 R.P.M. or 109.5-116 lbs. at 150 R.P.M. (cranking speed).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—**Coil Model 538-A.** Ignition switch and coil assembled as single unit.
Ignition Current—½ to 1½ amperes (idling), 4-5 amperes (stopped).
Ignition Switch—Two 'on' positions provided. Turn key to right for regular operation (Startix operative). Turn key to left to check timing or for operation without Startix.

Distributor Model 622-X. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set gap at .020". Limits, .018-024".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles (Distributor Degrees) — Closed 36°. Open 24°.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	400	2	800
6	700	12	1400
12½	1500	25	3000

Vacuum Spark Control Model 680S. Vacuum unit. Provides additional advance except when engine is accelerated, is pulling heavily, or operated with wide open throttle when spark will be retarded by return spring in unit.
Vacuum Advance—6° (engine—maximum).

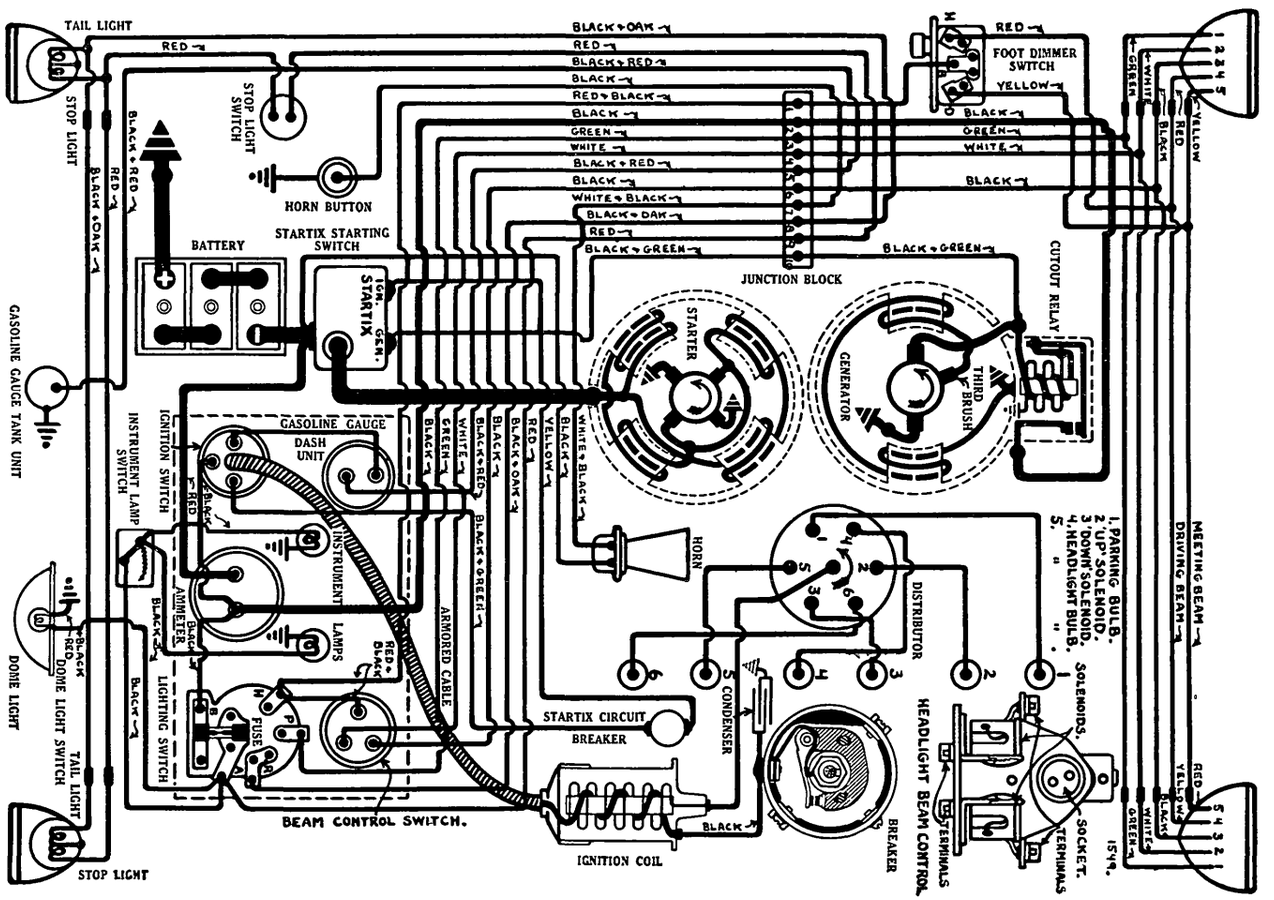
Mounting:—On left hand side of crankcase. To remove, loosen advance arm camp bolt (not necessary to take off vacuum connections).

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines .....At TDC..... .0000" TDC.

Timing:—Use left hand 'on' position of ignition switch to avoid automatic cranking when turning on ignition to check timing. With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'UDC/1-6' registers with indicator on housing (inspection hole in left hand front face of housing below starter), loosen hold-down screw in advance arm, shift arm until center line of graduation lines up with reference line on engine, tighten hold-down screw, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram).
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion #7 (first cars), #8 (Year Ahead Model). 18 MM. Metric type.
Spark Plug Gaps—.025". Limits, .0225-.0275".



CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model UR-23, 1¼" plain tube, updraft type.
Automatic Choke—Stromberg.

Fuel Pump:—A.C., Type R.

Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—**To Check**—Set tappet clearance #1 intake valve at .010". This valve should open with piston #1 15° or .0876" before top dead center when flywheel mark 'IN.OP./1-6' registers with indicator on housing (inspection hole on left hand front face of flywheel housing below starter). Reset tappet clearance at .004".

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Valve Springs—Taper type with flat coil type damper installed on all springs at top. Thread damper down over spring from top to provide minimum clearance of 7/32" between top of damper and top of spring (spring not compressed). Install springs with small end up.

	Spring Pressure	Spring Length
Valve Closed	59-64 lbs.	2 3/32"
Valve Open	98-108 lbs.	1 ¾"

LUBRICATION:—Pressure type. Gear type oil pump located on lower end of inclined accessory shaft at right of crankcase.

Oil Pressure—40 lbs. at 26.8 M.P.H.

Oil Pressure Relief Valve—Operates at 40 lbs. Adjustable.

Capacity and Oil—5 qts. Use SAE. #30 (summer 45° and up—use #40 for high speed driving above 90°F), #20 (45° to 10°F), #10 (winter below 10°F).

BATTERY:—Williard, Type WH-1-13 (RH-1-13 Export). 6 volt, 13 plate, 102 A.H. cpacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left hand side under front floor.

STARTER:—Model 736-R. Armature No. 1357578.

Starter Drive—Outboard Bendix.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—32-36 ounces each.

Cranking Engine—90 R.P.M., 250 amps., 4.75 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	65
15 "	Lock	3.15	570

Starting Switch:—Startix automatic starting controlled by ignition switch. Startix circuit breaker or 'back-fire' unit used. See Equipment Section.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out two flange mounting capscrews.

GENERATOR:—Model 937-U. Armature No. 1841027. Third brush control type.

Charging Rate Adjustment:—Take off commutator cover band, loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw.

Performance Data

	Amperes	Volts	R.P.M.
Cold	16-18	8.05-8.25	2000
Hot	11-13	7.5-7.8	2000-2100

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—14-18 ounces each.

Field Current—3.5-4.5 amperes at 6.0 volts.

Mounting:—Pivot mounted at left front of engine. Driven by fan belt. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, swing generator away from engine until fan can just be turned with belt held stationery, tighten clamp bolt before slacking off on generator, tighten pivot bolts.

SPECIAL GENERATORS:—Model 935-R. Used on cars equipped with radio or heaters. See Equipment Section for complete data.

CUT OUT RELAY:—Model 265-G (937-U). Mounted on generator field frame.

Cuts in—6.75-7.5 volts.

Cuts out—0-2.5 amperes discharge.

Relay Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

LIGHTING: — Clum Switches. Light Switch Model 9236. Foot Control Switch Model 9505. R.B.M. Beam Control Switch. Lights are turned on and off by lighting switch. Headlight system provides six beam patterns. Three driving beams (primary or clear road beam, secondary or lower beam, city or low beam) are controlled by Beam Control switch on instrument panel. A passing or deflected beam for each of the driving beams is provided by operation of the foot control switch.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-32	1000
Parking, Instrument	3	63
Stop and Tail	21-2	1158
Dome	6	C81

FUSES:—Lighting—20 ampere (on lighting switch).

Generator Field—6 ampere (in regulator case).

HORNS:—Sparton Type RA. Vibrator type. Horn current 6 amperes.

SERIAL NUMBER:—First number (first Model B) 8,045,001, (Year Ahead Model B) 8,100,001. On plate on left frame side member under left front fender.

COMPRESSION:—Ratio—Std. 6.3-1 head.
Pressure—128 lbs. at 1200 R.P.M. or 101.5-106 lbs. at 150 R.P.M. (cranking speed).

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling.

IGNITION:—Coil Model 538-A. Ignition switch and coil assembled as single unit.
Ignition Current—½-1½ amperes (idling), 4-5 amperes (stopped).
Ignition Switch, Type 430-A. Two 'on' positions provided. Turn key to right for regular operation (Startix operative). Turn key to left to check timing or for operation without Startix.

Distributor Model 662-M, H. Double breaker, 4 lobe cam, full automatic advance type with auxiliary vacuum spark control. Contacts open alternately at regular 45° intervals, corresponding to 90° firing interval of engine. Contacts must be synchronized (see Timing).
Breaker Gap—Set gap at .020". Limits, .018-.024".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles (Distributor Degrees) — Closed 34°. Open 11°. Both sets together when properly synchronized.
Manual Advance—25° engine (adjustment only).

Automatic Advance

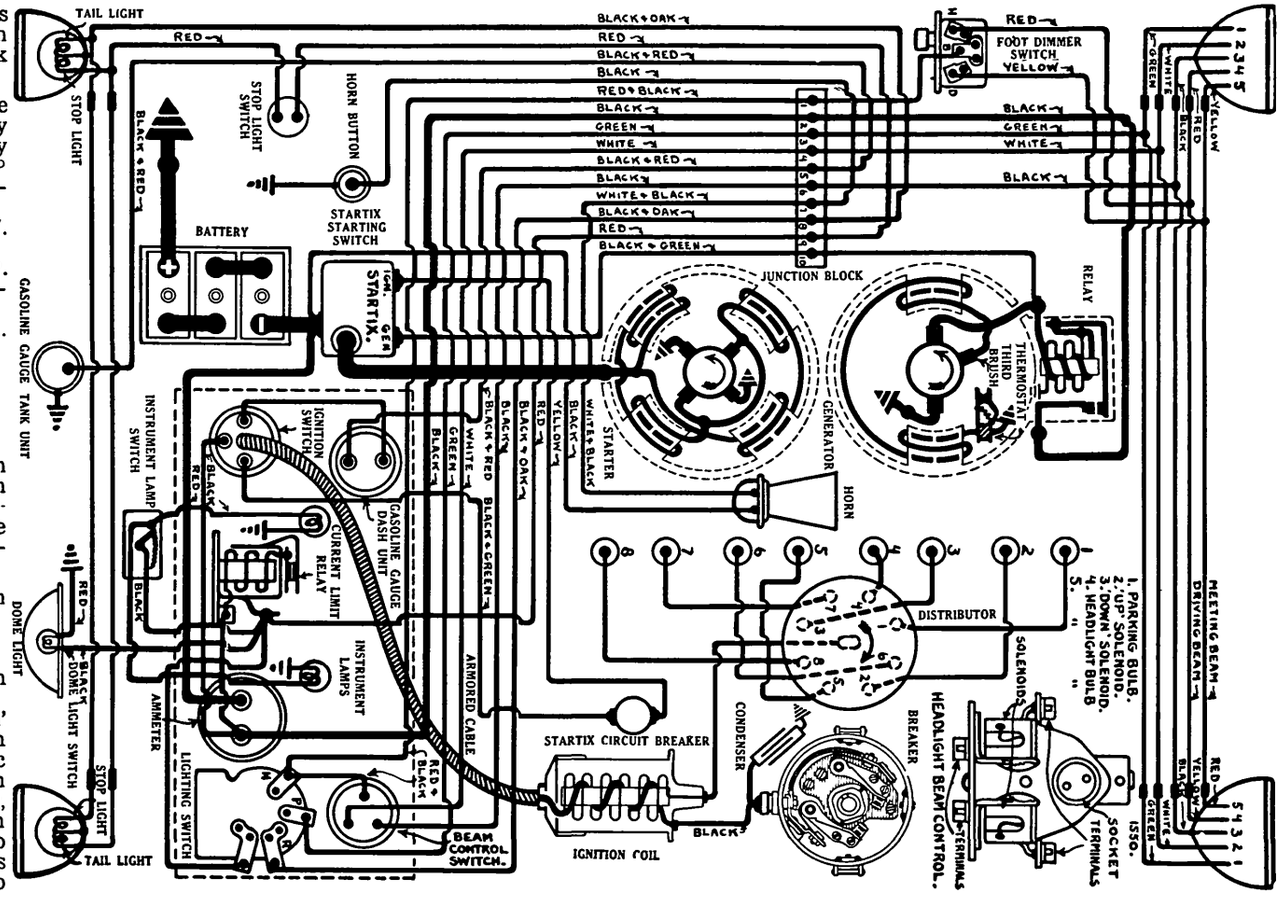
Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	2.5	600
14½	1800	29	3600

Vacuum Spark Control, Model 680-J:—Vacuum unit provides additional advance except when engine is accelerated, pulling heavily, or operated with wide open throttle when spark will be retarded by return spring in unit. Vacuum Advance—6° (engine—maximum).

Mounting:—On cylinder head. To remove, loosen advance arm clamp bolt (not necessary to remov vacuum connections).

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines ..... At TDC ..... .0000" TDC.
Timing (Stationary Contacts):—Use left hand 'on' position of ignition switch if ignition turned on to check contact opening to avoid automatic cranking. With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'UDC./1-8' lines up with indicator on housing, loosen advance arm clamp bolt, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram). Then synchronize second or movable contacts.

Synchronization (Movable Contacts)—First Method:—Turn engine over 90° to firing position for piston #6, stop when flywheel mark 'UDC./3-6' lines up with indicator on housing. Loosen lock screws on movable sub-plate carrying second set of contacts, turn eccentric adjusting screw until contacts open, tighten lock screws, check contact gap.



Synchronization—Second Method: — Use special synchronizing tool, Delco-Remy Part #1838182, follow complete directions in Equipment Section, or synchronize distributor on rotary spark gap. Contact opening interval is regular 45-45-45 (distributor degrees).

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—Champion #7 (Model B), #8 (Year Ahead Model), 18 MM. Metric type.

Spark Plug Gaps—.025". Limits, .0225-.0275".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model E-33, 1½" plain tube, downdraft type.

Automatic Choke—Stromberg.

Fuel Pump:—A.C., Type T (right side of crankcase).

Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Timing (Model B)—Set tappet clearance #1 intake valve at .010". This valve should open with piston #1 (.0876") or 15° before top dead center when flywheel mark 'IN.OP. /.1-8' lines up with indicator on housing. Reset tappet clearance at .004" (hot or cold).

To Check Timing (Year Ahead Model)—Set tappet clearance #1 intake valve at .010". This valve should open with piston #1 on top dead center when flywheel mark 'UDC/1-8' lines up with indicator. Reset tappet clearance at .004".

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.004" Int., .006" Exh., engine hot.

Valve Spring Pressure—59-64 lbs. at 2 3/32" (valve closed). 98-108 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—6½ quarts.

Normal Oil Pressure—40 lbs. at 26 M.P.H.

BATTERY:—Willard, Type WH-1-13 (RH-1-13 Export), 6 volt, 13 plate, 102 A.H. capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left hand side under front floor boards.

STARTER: — Model 736-H. Armature No. 1838663. Starter drive—Outboard Bendix.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—32-36 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	65
15 "	Lock	3.15	570

Cranking Performance—90 R.P.M. (1050 armature), 180 amperes.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out flange mounting cap screws.

Starting Switch:—Startix automatic starting switch and Startix circuit breaker (Anti-backfire unit) used. Controlled by ignition switch. See Equipment Section for complete data.

GENERATOR:—Model 955-C. Armature No. 820370. Third brush regulation, thermostat control. Thermostat contacts open at 200°F., reducing generator output approximately 40%.

Charging Rate Adjustment—Take off commutator cover band, loosen small round lock screws on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screws.

Maximum Charging Rate—20 amperes (cold), 8.4 volts, 1550 R.P.M. or 18.5 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	19-22	8.35-8.7	1550
Hot	9-12	7.35-7.65	1800-2000

Rotation—Counter-clockwise at commutator end.

Shunt Field Current—4.0-6.1 amperes at 6.0 volts.

Brush Spring Tension—14-18 ounces each.

SPECIAL GENERATORS:—Model 935-H. Used on cars equipped with radio. See Equipment Section for complete data.

Mounting:—Cradle mounted at left front of engine. Fan Belt drive. To remove, slack off belt, disconnect water pump drive coupling, loosen mounting clamp band.

Belt Adjustment:—Loosen nut back of fan bracket, lift up fan assembly until fan can just be turned with belt held stationary, tighten nut.

CUT-OUT RELAY:—Model 265-B. Mounted on generator.

Cuts in—6.4 volts, 700 R.P.M. (generator), 7.6 M.P.H. Cut-in limits, 6.75-7.5 volts.

Cuts out—0-2.5 amperes discharge.

Relay Contact Gap—.015-.025".

Air Gap—.012-.017" (contacts closed).

LIGHTING:—Clum Switches. Light Switch Model 9498. Foot Control Switch 9492. R.B.M. Beam Control Switch. Lights are turned off and on by lighting switch. Headlight system provides six beam patterns. Three driving beams (Primary or Clear Road Beam, Secondary or Lower Beam, City or Low Beam) are controlled by Beam Control Switch on instrument panel. A passing or deflected beam for each of the driving beams is provided by operation of the foot control switch.

Bulb Specifications

Lamp	Candlepower	Mazda No.

Stop and Tail	21-2	1158
Dome	6	C81

CURRENT LIMIT RELAY:—Model 410-L. Vibrating circuit breaker in lighting circuits. Starts to operate with load of 30-35 amperes, limiting load to 5-22 amperes.

Contact Gap—.012-.030".

Air Gap—.015-.025" (contacts closed).

Spring Tension—5 ozs. min. (at brass button).

HORNS:—Sparton, Type RA. Vibrator type. Horn current, 6 amperes.

SERIAL NUMBER:—First number (first Model C) 7,045,001 (Year Ahead Model C) 7,100,001. On plate on left frame side member under left front fender.

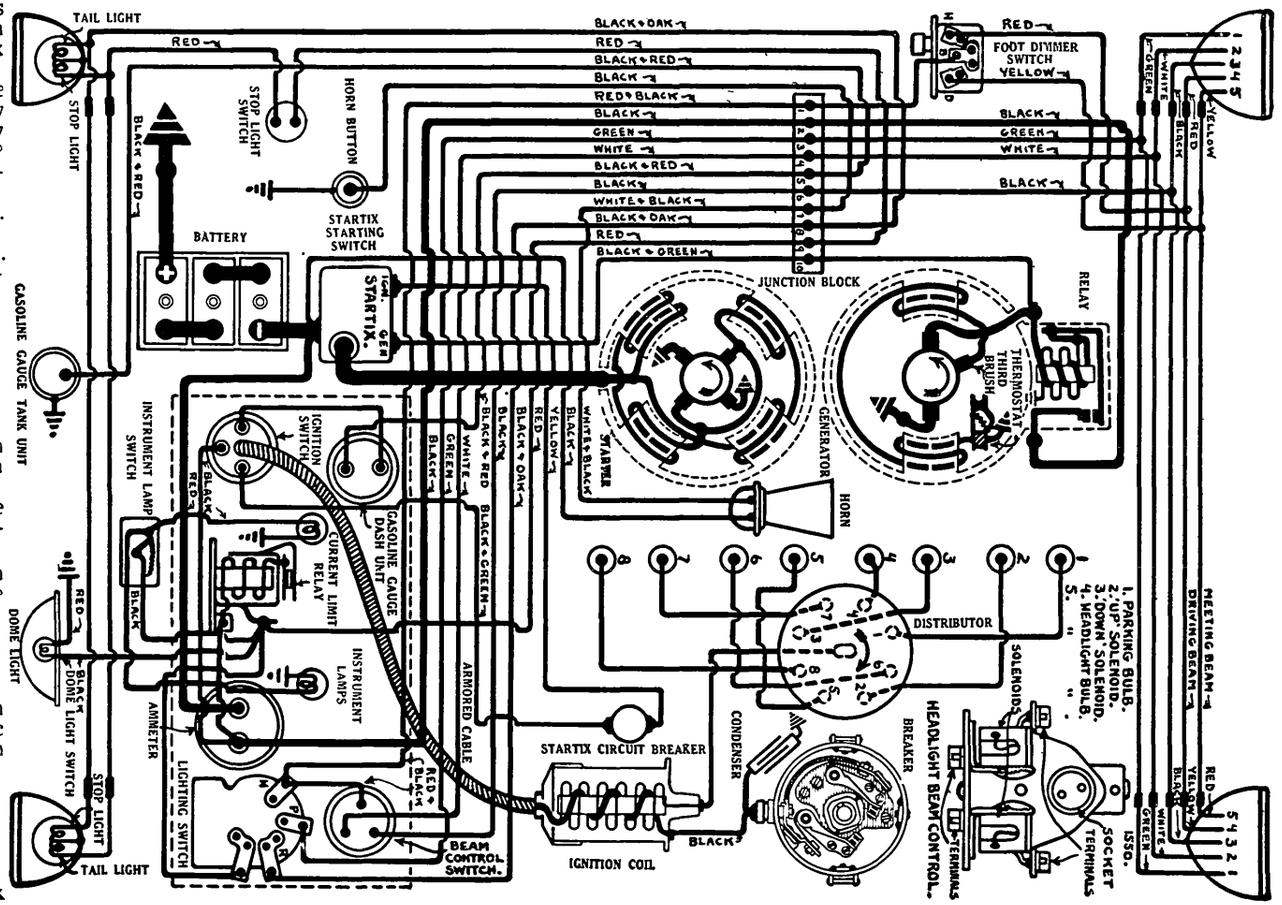
COMPRESSION:—Ratio—Std. 6.3-1 head.
Pressure—137 lbs. at 1200 R.P.M. or 114-117 lbs. at 150 R.P.M. (cranking speed).

VACUUM READING:—Gauge should show steady read-reading of 18-20" with engine idling.

IGNITION:—Coil Model 538-A. Ignition switch and coil assembled as single unit.
Ignition Current—½-1½ amperes (idling), 4-5 amperes (stopped).
Ignition Switch, Type 430-A. Two 'on' positions provided. Turn key to right for regular operation (Startix operative). Turn key to left to check timing or for operation without Startix.
Distributor Model 662-M, H. Double breaker, 4 lobe cam, full automatic advance type with auxiliary vacuum spark control. Contacts open alternately at regular 45° intervals, corresponding to 90° firing interval of engine. Contacts must be synchronized (see Timing).
Breaker Gap—Set gap at .020". Limits, .018-.024".
Breaker Arm Spring Tension—19-23 ounces.
Cam Angles (Distributor Degrees) — Closed 34°. Open 11°. Both sets together when properly synchronized.
Manual Advance—25° engine (adjustment only)

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	2.5	600
14½	1800	29	3600



Vacuum Spark Control, Model 680-J:—Vacuum unit provides additional advance except when engine is accelerated, pulling heavily, or operated with wide open throttle when spark will be retarded by return spring in unit. Vacuum Advance—6° (engine—maximum).
Mounting:—On cylinder head. To remove, loosen advance arm clamp bolt (not necessary to remove vacuum connections).

IGNITION TIMING:— Flywheel Degs. Piston Position
All engines ..... At TDC. ..... .0000" TDC.
Timing (Stationary Contacts):—Use left hand 'on position of ignition switch if ignition turned on to check contact opening to avoid automatic cranking. With #1 piston on compression, turn engine over until piston reaches top dead center stop when flywheel mark 'UDC./1-8' lines up with indicator on housing, loosen advance arm clamp bolt, rotate distributor until stationary contact (mounted directly on breaker plate) begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram). Then synchronize second or movable contacts.

Synchronization (Movable Contacts)—First Method:—Turn engine over 90° to firing position for piston #6, stop when flywheel mark 'UDC./3-6' lines up with indicator on housing. Loosen lock screws on movable sub-plate carrying second set of contacts, turn eccentric adjusting screw until contacts open, tighten lock screws, check contact gap.

Synchronization—Second Method: — Use special synchronizing tool, Delco-Remy Part #1838182, follow complete directions in Equipment Section, or synchronize distributor on rotary spark gap. Contact opening interval is regular 45-45-45 (distributor degrees).
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Firing Order:—1-6-2-5-8-3-7-4 (see diagram).
Spark Plugs:—Champion #7 (Model B), #8 (Year Ahead Model), 18 MM. Metric type.
Spark Plug Gaps—.025". Limits, .0225-.0275".

CARBURETION:—(Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.

Carburetor:—Stromberg, Model EE-22, 1¼" dual, plain tube, downdraft type.
Automatic Choke—Stromberg.
Fuel Pump:—A.C., Type J Combination fuel and vacuum pump.
Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston #1 (.0915") or 15° before top dead center when flywheel mark 'IN.OP./1-8' lines up with indicator on housing. Reset tappet clearance at .004" with engine hot or cold.
Motor Gauge—Weidenhoff Adapter #104. Rod #2.
Tappet Clearance:—.004" Int., .006" Exh., engine hot.
Valve Spring Pressure:—59-64 lbs. at 2 3/32" (valve closed). 98-108 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—6½ quarts.
Normal Oil Pressure—40 lbs. at 27.4 M.P.H.

BATTERY:—Willard, Type WH-4-17 (RH-4-17 Export), 6 volt, 17 plate, 136 A.H. capacity (20 hour rate).
Starting Capacity—160 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under front floor boards.

STARTER: — Model 736-H. Armature No. 1838663. Starter drive—Outboard Bendix.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—32-36 ounces each.
Cranking Performance—90 R.P.M. (1050 armature), 180 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	65
15 "	Lock	3.15	570

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out flange mounting cap screws.
Starting Switch:—Startix automatic starting switch and Startix circuit breaker (Anti-backfire unit) used. Controlled by ignition switch. See Equipment Section for complete data.

GENERATOR:—Model 955-C. Armature No. 820370. Third brush regulation, thermostat control. Thermostat contacts open at 200°F., reducing generator output approximately 40%.
Charging Rate Adjustment—Take off commutator cover band, loosen small round lock screws on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screws.
Maximum Charging Rate—20 amperes (cold), 8.4 volts, 1550 R.P.M. or 18.5 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	19-22	8.35-8.7	1550
Hot	9-12	7.35-7.65	1800-2000

Rotation—Counter-clockwise at commutator end.
Shunt Field Current—4.0-6.1 amperes at 6.0 volts.
Brush Spring Tension—14-18 ounces each.

SPECIAL GENERATORS:—Model 935-H. Used on cars equipped with radio. See Equipment Section for complete data.
Mounting:—Cradle mounted at left front of engine. Fan Belt drive. To remove, slack off belt, disconnect water pump drive coupling, loosen mounting clamp band.
Belt Adjustment:—Loosen nut back of fan bracket, lift up fan assembly until fan can just be turned with belt held stationary, tighten nut.

CUT-OUT RELAY:—Model 265-B. Mounted on generator.
Cuts in—6.4 volts, 700 R.P.M. (generator), 7.6 M.P.H. Cut-in limits, 6.75-7.5 volts.
Cuts out—0-2.5 amperes discharge.
Relay Contact Gap—.015-.025".
Air Gap—.012-.017" (contacts closed).

LIGHTING:—Clum Switches. Light Switch Model 9498. Foot Control Switch 9492. R.B.M. Beam Control Switch. Lights are turned off and on by lighting switch. Headlight system provides six beam patterns. Three driving beams (Primary or Clear Road Beam, Secondary or Lower Beam, City or Low Beam) are controlled by Beam Control Switch on instrument panel. A passing or deflected beam for each of the driving beams is provided by operation of the foot control switch.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-32	1000
Parking, Instrument	2	63
Stop and Tail	21-2	1158
Dome	6	C81

CURRENT LIMIT RELAY:—Model 410-L. Vibrating circuit breaker in lighting circuits. Starts to operate with load of 30-35 amperes, limiting load to 5-22 amperes.
Contact Gap—.012-.030".
Air Gap—.015-.025" (contacts closed).
Spring Tension—5 ozs. min. (at brass button).

HORNS:—Sparton SOS, Type A2. Vibrator type. Horn current, 6 amperes.

NOTE—Models designated as '1-A' have conventional front axle, '2-A' types have independently sprung front wheels. All other data is the same for all cars.

SERIAL NUMBER:—First number (1A) 5,500,001. (2-A) 5,212,001. On plate on left frame side member under front fender.

COMPRESSION:—Ratio—6.3-1 Std., 6.9-1 Optional.
Pressure—109.5-116 lbs. (Std. 6.3-1 head), 110-120 lbs. (Optl. 6.9-1 head) at cranking speed (150 R.P.M.).

VACUUM READING:—Gauge should show steady reading of 18" with engine idling at 450 R.P.M. or 8 M.P.H.

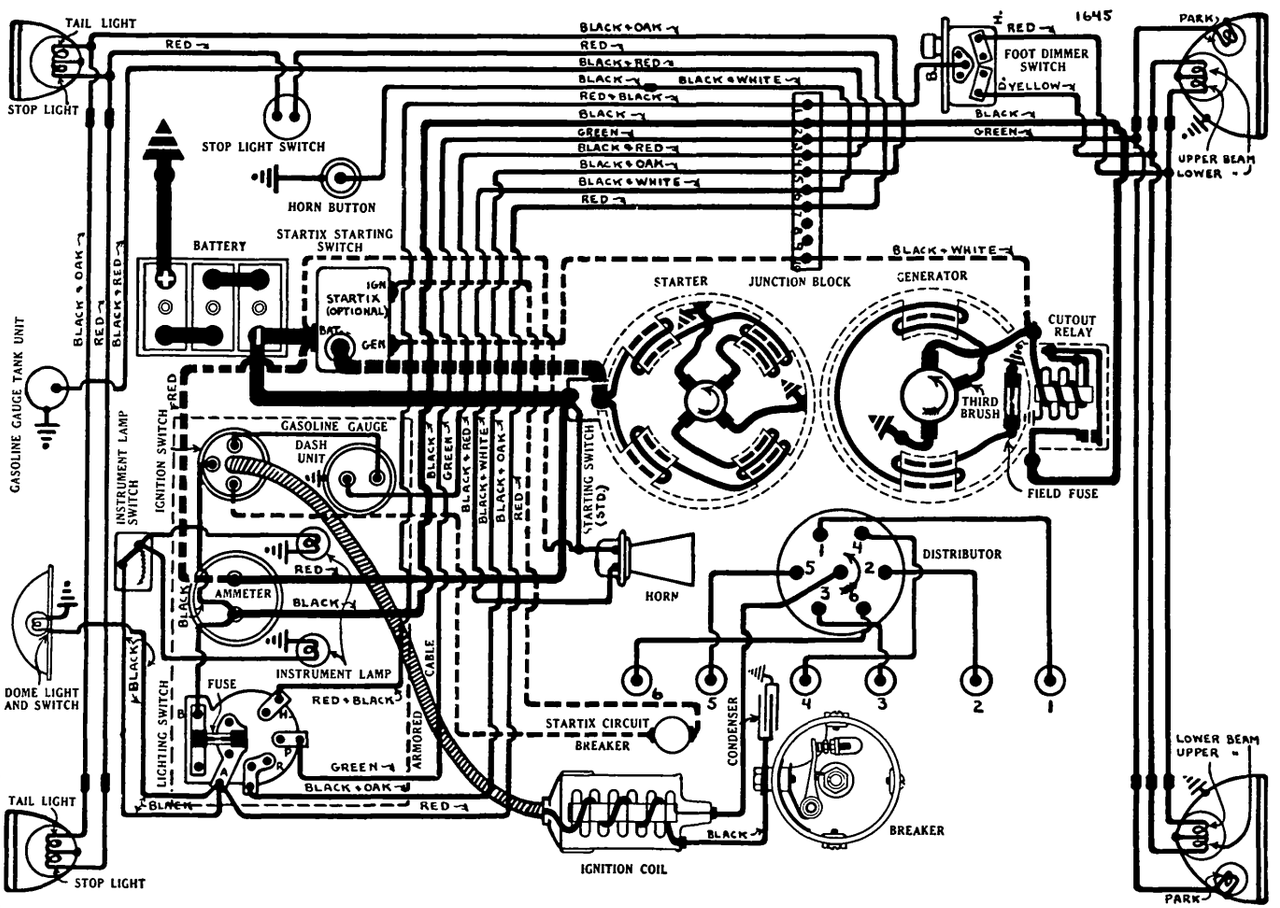
IGNITION: — Coil Model IG-4607. Mounted under cowl.
Ignition Current—½-1½ amperes idling, 4-5 amperes stopped.
Ignition Switch—Connected to coil by armored cable. On models with Startix, switch has two 'on' positions. On position with key turned to right is regular running position with Startix operative. Key should be turned to left to check ignition timing or whenever automatic cranking is not desired.

Distributor Model IGB-4393. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set at .020". Limits .018-.020".
Breaker Arm Spring Tension—16-20 ounces
Cam Angles—Closed 34°. Open 26° (distributor).

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	0	800
2	500	4	1000
4	600	8	1200
6	700	12	1400
8	1000	16	2000
10.5	1400	21	2800

Vacuum Spark Control Model VC-4001:—Provides additional advance except when engine is suddenly accelerated, or is operated with wide open throttle when spark will be retarded by return spring in unit. Maximum vacuum advance, 6° (engine).



Removal:—Distributor mounted on left side of crankcase. To remove, loosen clamp bolt in advance arm (not necessary to disconnect vacuum line).

IGNITION TIMING:— Flwheel Degs. Piston Position
All engines ..... At TDC. ..... .0000" TDC.

Timing—Use left hand 'on' position of ignition switch if ignition turned on to check timing. Crank engine by placing transmission gears in 'high', jack up one rear wheel, turn wheel by hand, stop with piston #1 on top dead center entering power stroke when flywheel mark 'UDC.1-6' lines up with indicator in inspection hole in left front face of flywheel housing under starter. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap.

Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Firing Order:—1-5-3-6-2-4 (see diagram).
Spark Plugs:—Champion No. 8. 18 MM. Metric.
Spark Plug Gaps—Set at .025". Limits .0225-.0275".

CARBURETION:—See Carburetion Section for complete data on Carburetor, Automatic Choke, Fuel Pump, and Gasoline Gauge.
Carburetor:—Stromberg, Model EX-23, 1¼" downdraft type with built-in Automatic Choke and integral Fast-idle.
Fuel Pump:—A.C., Type R-1521795 diaphragm type.
Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 5° or .0098" BTDC. when flywheel mark 'IN.OP.1-6' lines up with indicator (inspection hole in left front face of flywheel housing below starter). Reset tappet clearance at .004" with engine hot.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.004" Int., .006" Exh., engine hot.

Valve Spring Pressure:—63-68 lbs. at 2 1/16" (valve closed). 98-108 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts.
Normal Oil Pressure—40 lbs. at 26.8 M.P.H.

BATTERY:—Willard, Type WH-1-13, RH-1-13 (Export). 6 volt, 13 plate, 102 A.H. capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under front floor boards.

STARTER:—Model MAN-4005, MAN-4002 (with Startix). Armature No. MAD-2083.
Starter Drive—Outboard Bendix Type RCD10FXD-9.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).
Cranking Performance—90 R.P.M., 240 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4000	5.5	65
.4 "	2400	5.5	100
3.0 "	1280	5.0	200
6.1 "	790	4.5	300
9.4 "	470	4.0	400
12.5 "	190	3.5	500
15.0 "	Lock	3.0	580
23.0 "	Lock	4.0	820

Starting Switch: — (MAN-4005), Type SW-3737S. Mounted on starter and operated through flexible cable by button on instrument panel. Pull required to close switch should be 2.3 lbs. minimum at end of switch lever.
(MAN-4002). Startix automatic starting with Startix circuit breaker. Controlled by ignition switch. See Equipment Section for complete data.
Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out two flange capscrews.

GENERATOR:—Model GBM-4604 (first), GBM-4604-A-2 (later cars). Armature No. GBM-2006B. Air cooled Third brush control type. See Special Generator Section for generators equipped with Current Regulator.

Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.

Maximum Charging Rate—20 amperes (cold), 17 amperes (hot), 8.5 volts, 2100 R.P.M., 17.9 M.P.H.

Performance Data—GBM-4604

Cold			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	760	0	6.4	800
4	6.8	920	¼	6.9	960
8	7.25	1050	8	7.35	1150
12	7.65	1240	12	7.8	1360
16	8.1	1450	16	8.3	1750
20	8.5	2150	18	8.5	2450

Performance Data—GBM-4604-A-2

0	6.4	760	0	6.4	820
4	6.8	920	4	6.8	1000
8	7.3	1080	8	7.3	1200
12	7.75	1300	12	7.75	1500
16	8.2	1640	14.6	8.05	2300
17.2	8.3	2050			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24 ozs. minimum (old brushes), 36 ozs. maximum (new brushes).
Field Current—3.80-4.20 amperes at 6.0 volts.
Field Fuse—5 ampere under cover on generator field frame.
Motoring Current—5.22-5.78 amperes at 6.0 volts
Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.
Belt Adjustment:—Loosen pivot bolts and clamp bolt, pull generator out or away from engine until fan can just be turned with belt held stationary.

SPECIAL GENERATORS:—Model GAR-4609-4 (first), GAR-4609-A-4 (later cars). Optional equipment on cars with radio or other accessories. Used with Relay-Regulator Model TC-4302. See Equipment Section for complete data.

CUTOUT RELAY:—Model CB-4021 (GBM-4604), CB-4014 (GBM-4604-A-2). Model CB-4021 has special terminal connected to main brush lead for Startix connection. See Equipment Section for complete data on these units.
Cuts In—6.4 volts, 6 M.P.H.
Cuts Out—1 ampere (.5-2.5) discharge current.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

LIGHTING:—Clum Switch Model 9582. Foot Control Switch Model 9584. Foot operated control switch on toeboard controls headlamp upper and lower beams. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Parking	1.5	55
Instrument	3	63
Stop and Tail	21-2	1158
Dome	6	C81

FUSES:—Lighting—30 ampere on back of lighting switch.
Generator Field—5 ampere under cover on generator field frame.

HORNS:—Sparton. Vibrator type. Horn current (amperes.

SERIAL NUMBER:—First number (Comm.) 8,103,001, (Pres) 7,101,001. On plate on left frame side member under front fender.

COMPRESSION:—Ratio—(Comm.) 6.0-1 cast-iron head, (Pres) 6 5-1 aluminum head 6 5-1 aluminum head optional on Commander Models.
Pressure—94-104 lbs (6 0-1 head), 105-115 lbs (6 5-1 head), at cranking speed (150 R P M.).

VACUUM READING:—Gauge should show steady reading of 18" with engine idling at 450 R P.M. or 8 M P.H. (President).

IGNITION:—Coil Model 538-A (Comm.), 538-H (Pres). On cowl connected to switch by armored cable
Ignition Current—½-1½ amp idling, 4 5 stopped
Ignition Switch:—Type 430-A Two 'on' positions Regular running position is with key turned to right (ignition on, Startix operative). Turn key to left whenever automatic cranking not wanted

Distributor Model 662-M. Double breaker, 4 lobe cam, full automatic advance type with auxiliary vacuum spark control Contacts open alternately at 45° intervals corresponding to 90° firing interval of engine Must be synchronized (see Timing)
Breaker Gap—Set at 020" Limits 018- 024".
Breaker Arm Spring Tension—19-23 ounces
Cam Angles—Closed—34° Open 11° (distributor). Both sets together when properly synchronized

Automatic Advance

Distributor		Engine	
Degrees	R P M	Degrees	R P M
Start	300	2 5	600
14 5	1800	29	3600

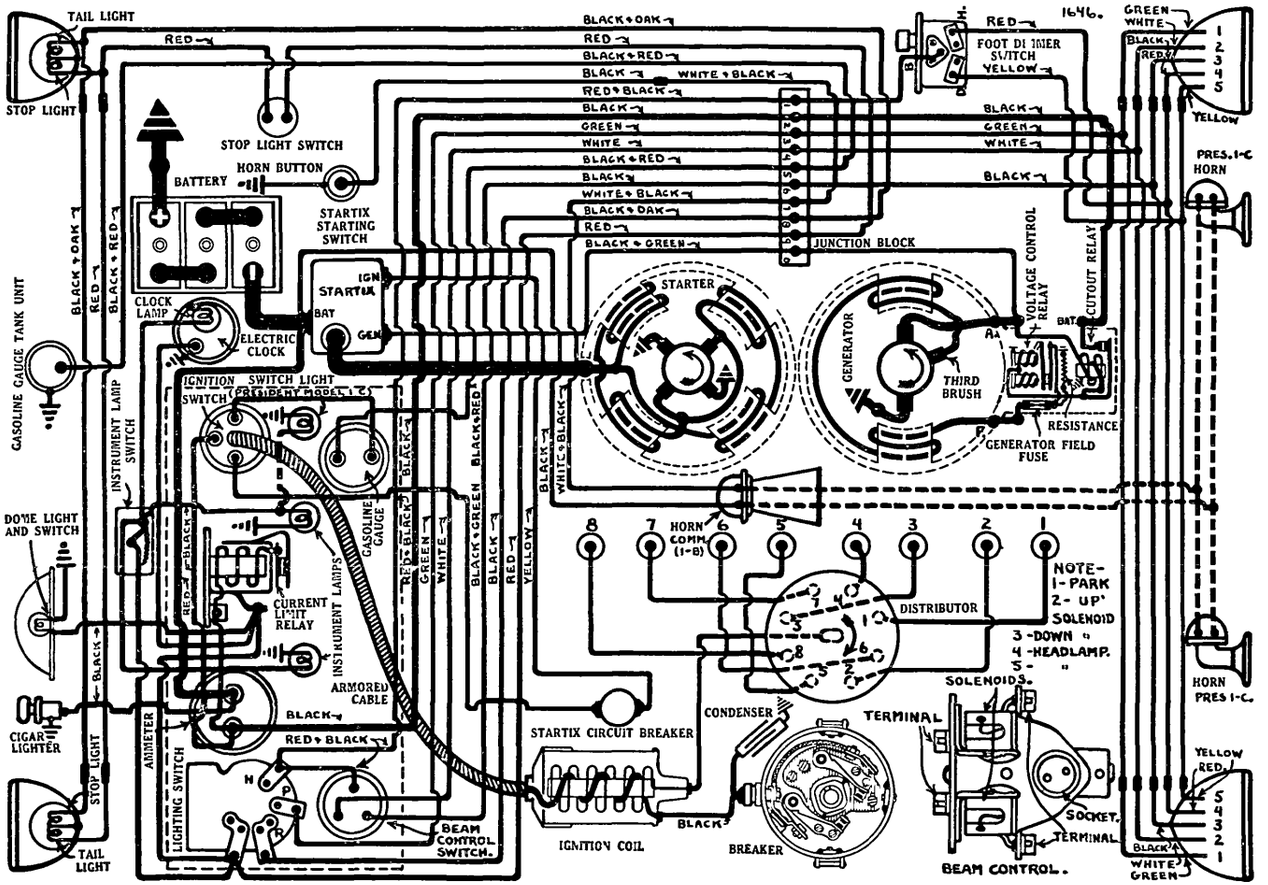
Vacuum Spark Control Model 680-J. Vacuum unit provides additional advance except when engine is being accelerated, pulling heavily, or operated with wide open throttle when spark will be retarded by return spring within unit

Vacuum Unit

Advance—Engine °	Vacuum—Inches of Hg
Start	3" min
5-7°	6" max

Removal:—Mounted on cylinder head To remove, loosen advance arm clamp bolt, lift distributor out

IGNITION TIMING:— Flywheel Degs Piston Position
All engines At TDC .0000" TDC
Timing (Stationary Contacts)—Use left hand 'on' position of ignition switch if ignition turned on to check contact opening (to avoid automatic cranking). Crank engine by placing transmission in high and rolling car forward on floor. With #1 piston on top dead center of compression stroke and flywheel mark 'UDC/1-8' lined up with indicator in inspection hole in flywheel housing, loosen advance arm clamp bolt, rotate distributor until stationary contacts open, tighten clamp bolt



Synchronization (Movable Contacts)—Turn engine over 90° to top dead center position for piston #6 with flywheel mark 'UDC/3-6' lined up with indicator. Loosen lock screws on movable sub-plate carrying second set of contacts, turn eccentric adjusting screw until contacts open, tighten lock-screws

Synchronization (using Tool)—Use special Delco-Remy tool, Part #1838182,. See Equipment Section for complete directions Firing intervals should be regular 45-45-45 distributor degrees
Motor Gauge—Weidenhoff Adapter #104, Rod #2

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—Champion, Type #8 18 MM Metric
Spark Plug Gaps— 025". Limits 0225- 0275".

CARBURETION:—See Carburetion Section for data
Carburetor:—Stromberg, Model EE-1, 1" dual, downdraft type with lever type Fast idle.
Automatic Choke—Stromberg Type

Fuel Pump:—A.C. (Comm.) Type T-1521796, (Pres.) Type J-1521797 fuel and vacuum pump.

Gasoline Gauge:—A.C., Electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 15° or .0915" before top dead center when flywheel mark 'IN.OP./1-8' lines up with indicator. Reset tappet clearance at .004" with engine hot.

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.004" Int., .006" Exh., with engine hot.

Valve Spring Pressure:—59-64 lbs. at 2 3/32" (valve closed). 98-108 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—8 quarts.

Normal Oil Pressure—40 lbs. at 27.4 M.P.H.

BATTERY:—Comm., Willard, Type WH-1-13, RH-1-13 (export), 6 volt, 13 plate, 102 A.H. capacity (20 hour rate). Starting capacity 120 amperes for 20 minutes.

Pres., Willard, Type WH-4-17, RH-4-17 (export), 6 volt, 17 plate, 136 A.H. capacity (20 hour rate). Starting capacity 160 amperes for 20 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Left hand side under front floor boards.

STARTER:—Model 736-H. Armature No. 1838663.

Starter Drive—Outboard Bendix Type RCD10FXD-9.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—32-36 ounces.

Cranking Performance—90 R.P.M., 180 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.0	65
15 "	Lock	3.15	570

Starting Switch:—Startix automatic starting switch and Startix circuit breaker (anti-backfire unit). See Equipment Section for complete data.

Removal:—Flange mounted on left hand front face of flywheel housing. Take out two capscrews.

GENERATOR:—Model 935-Y. Armature No. 1856072. Air-cooled. Third brush control with external voltage control (Voltage control Relay) providing two step charging rate. See Equipment Section.

Charging Rate Adjustment—Connect test ammeter in charging line at 'Bat' terminal of control unit, short out Voltage Control Relay by connecting jumper wire between 'F' terminal and ground. Loosen lock screw on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten locking screw, remove jumper wire.

Maximum Charging Rate—20 amperes (cold), 17 (hot), 8.5 volts, 2800 R.P.M. or 33.3 M.P.H. (Comm.), 32.3 M.P.H. (Pres.).

Performance Data

	Amperes	Volts	R.P.M.
Cold	20-23	8.5-8.8	2800
Hot	16-20	8.1-8.5	3100

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third brush).

Field Current—2.3-2-6 amperes at 6.0 volts.

Field Fuse—6 ampere capacity in control unit.

Removal:—Cradle mounted at left front of engine. To remove, slack off belt, disconnect water pump drive coupling, loosen mounting clamp band.

Belt Adjustment:—To take up slack in generator drive belt, loosen nut back of fan bracket, lift up fan assembly until fan can just be turned with belt held stationary, tighten bracket nut.

CONTROL UNIT:—Model 5546. Mounted on generator. Consists of Cutout Relay and Voltage Control Relay. See complete articles in Equipment Section.

Cutout Relay

Cuts In—6.4-6.8 volts, 8.3 M.P.H. (Comm.), 8.1 M.P.H. (Pres.).

Cuts Out—3 amperes maximum discharge.

Relay Contact Gap—.015-.025".

Air Gap—.012-.017" contacts closed.

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70°F.

Contacts Close—7.3-7.7 volts at 70°F.

Contact Gap—.008-.013".

Contact Spring Tension—.7-.9 ounces.

Air Gap—.028-.040" between armature and core (armature down against lower stop), .028-.040" armature travel (between armature and lower stop).

LIGHTING:—Clum Switch, Model 9583. Foot Control Switch Model 9584. R.B.M. Beam Control Switch Model 1100. Lights are turned off and on by lighting switch. Headlight system provides six beam patterns. Three driving beams (Primary or Clear Road Beam, Secondary or Lower Beam, City or Low Beam) are controlled by Beam Control Switch on instrument panel. A passing or deflected beam for each of the driving beams is provided by operation of the Foot Control Switch.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights	32-32	1000
Parking	1.5	55
Clock & Ig. Switch (Pres.)	1.5	55
Instrument	3	63
Stop and Tail	21-2	1158
Dome	6	C-81

CURRENT LIMIT RELAY:—Model 410-L. Vibrating circuit breaker in lighting circuits. Starts to operate with load of 30-35 amperes limiting load to 5-22 amperes.

Contact Gap—.012-.030".

Air Gap—.015-.030" with contacts closed.

Spring Tension—5 ozs. min. at brass button.

FUSES:—Generator Field—6 ampere in Control Unit.

HORNS:—Sparton Vibrator type (Twin horns on Pres. model). Horn current 6 amperes each.

NOTE:—These models are similar except that Model 3A fitted with conventional front axle, Model 4A with Planar type independent springing. All other data below applies to both models. Startix optional on all models.

SERIAL NUMBER:—On plate on left frame side member under front fender. First numbers as follows:

Factory	Model 3A	Model 4A
South Bend	5,512,001	5,235,001
Pacific Coast	5,850,001	5,800,001
Canada	5,960,801	5,965,801

COMPRESSION:—Ratio—6.3-1. **Pressure**—105 lbs. at cranking speed of 150 R.P.M.

VACUUM READING—Gauge should show steady reading of 18-20" of HG. with engine idling at 450 R.P.M. or 8 M.P.H.

IGNITION:—Coil Model IG-4634. Mounted on dash.

Coil Draw—½-1½ amperes idling, 4-5 stopped.

Ignition Switch:—Delco-Remy Model 430-R (switch & cable assembly). Connected to coil by armored cable. See article in Equipment Section for complete data.

Distributor Model IGW-4001. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—Set at .020". Limits .018-.020".

Cam Angle or Dwell—40.0° closed, 20.0° open.

Breaker Arm Spring Tension—16-20 ounces.

Condenser—Part No. IGB-1025. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	400	0	800
2	600	4	1200
4	800	8	1600
6	1000	12	2000
8	1200	16	2400
10.5	1400	21	2800

Vacuum Spark Control Model VC-4001:—Mounted below distributor and linked to advance arm. Provides additional advance except when engine is operated at wide open throttle when spark is retarded by return spring within unit. Maximum vacuum advance—6° (engine).

Distributor Removal:—Mounted on left side of crankcase. To remove, loosen advance arm clamp bolt (not necessary to disconnect vacuum connection).

IGNITION TIMING:—Setting for all engines as follows:

Degrees	Piston Position
9/64" BTDC	0016" BTDC

To Set Timing—Crank engine by engaging gears and rolling car on floor. On cars with Startix use left hand 'on' position of key to avoid automatic cranking if ignition turned on to check timing. With #1 piston on compression, turn engine over until straight line 'IGN' mark on vibration dampener at front of engine lines up with pointer on timing gear cover. This line is 9/64" before top dead center mark 'UDC/1-6.' Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt.

Timing (Motor Gauge)—Weidenhoff #104 Adapter, #2 Rod.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion #8-S. 18 MM. Metric.

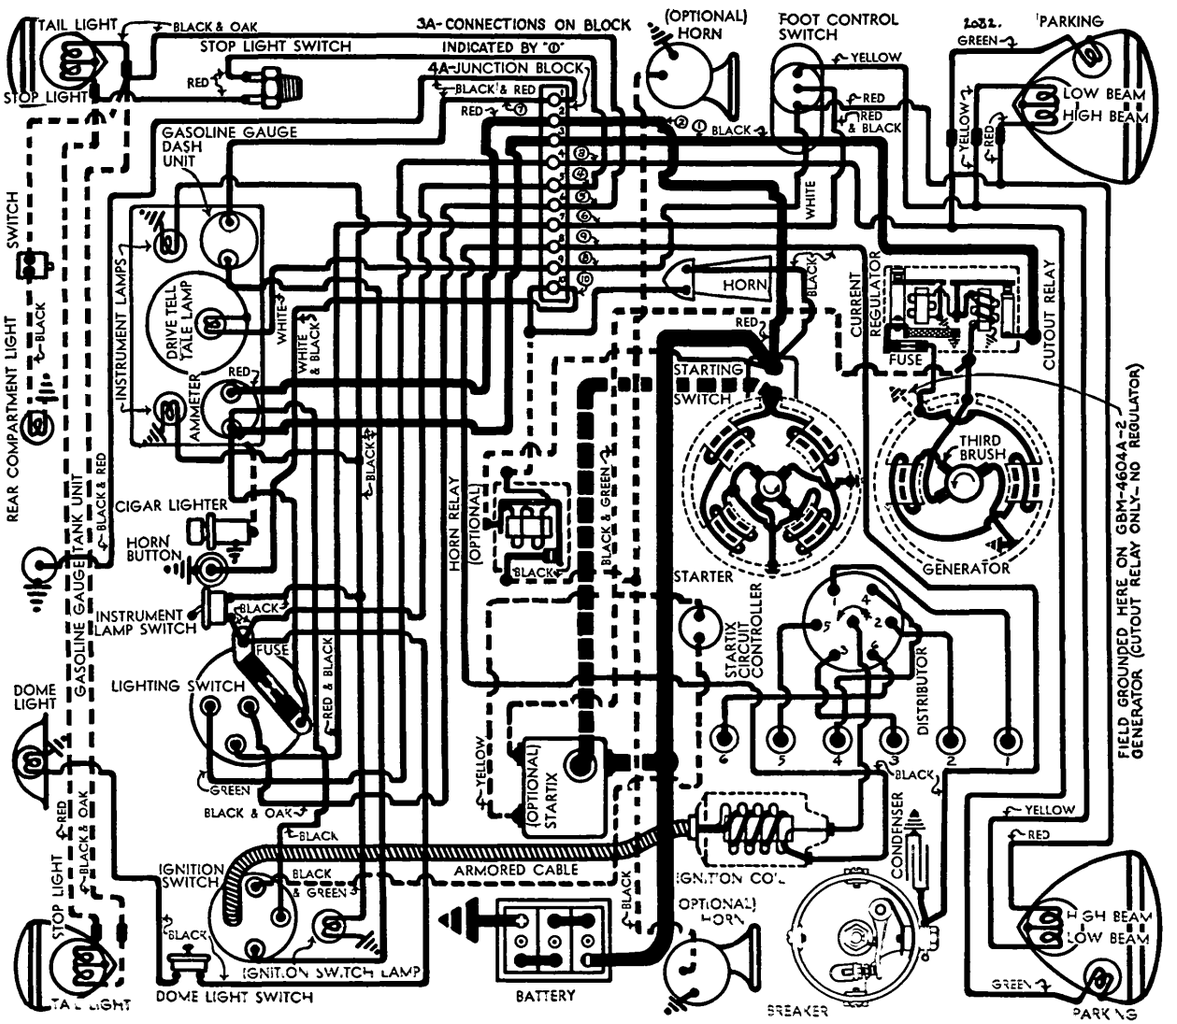
Spark Plug Gap—.025".

NOTE—For extremely hard service such as fast driving in hot weather, cooler plug such as Champion #7, or #13 may be installed.

CARBURETION:—Carburetor—Stromberg Model EX-23, 1¼" downdraft type. See Carburetion Section for complete adjustment, overhaul, and jet specifications.

NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at slow or hot idling speed.

Idle Adjustment—Adjust throttle stopscrew so that engine idles at 450 R.P.M. or 8 M.P.H. Turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.



Accelerating Pump Setting—Three holes provided in throttle lever for pump link engagement. Change setting for seasonal requirements as follows:
Center Hole—Normal operating conditions.
Inner Hole (Min. stroke)—Extreme warm weather.
Outer Hole (Max. stroke)—Extreme cold weather.
NOTE—A .056" or one size smaller main metering jet may be installed to secure greater fuel economy with a slight loss in performance. The .054" two size smaller jet should only be used for high altitudes. See Jet Specification table in Carburetion Section.

Fast Idle Control & Automatic Choke—Integral with Carburetor. No adjustment required. See special article in Carburetion Section.

Air Cleaner:—Burgess oil-wetted type standard. AC. #1526824 oil-bath type optional.

Fuel Pump:—AC. Type W #1522227. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—Motometer Electric. No. EG-7732-D (dash unit), EG-7679-T (tank unit). See article in Carburetion Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .020". This valve should open when piston #1 is 15° or .0942" before top dead center when mark 'IN.OP/1-6' on vibration dampener at front of engine lines up with pointer on gear case cover. Reset tappet clearance at .016".

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.016" for all valves, cold.

Valve Spring Pressure:—125-135 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts.

Normal Oil Pressure—40 lbs. minimum at 40 M.P.H.

BATTERY:—Willard, Type WH-1-13, RH-1-13 (Export). 6 volt, 13 plate, 102 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.1 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left side under front floor boards.

STARTER:—Model MAX-4019, MAX-4018 (with Startix). Armature No. MAW-2091.

Drive—Outboard Bendix (barrel) Type A-1729.

Cranking Engine—110 R.P.M., 205 amps., at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
.65 "	3300	5.5	100
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out two flange capscrews.

Starting Switch (MAX-4019):—Type SW-3737A. Mounted on starter and operated through flexible cable by button on instrument panel. Pull required to close switch should be 2.3 lbs. minimum at end of switch lever.

Startix (MAX-4018)—Type 'D' automatic starting switch with Startix circuit controller (anti-backfire unit), controlled by ignition switch. See Equipment Section for complete data.

GENERATOR:—Standard—Model GBM-4604A-2. Armature No. GBM-2006-B. Air cooled, third brush control.

Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.

Maximum Charging Rate—17.2 amperes at 8.3 volts (cold), 14.6 amperes at 8.05 volts (hot). Do not exceed.

Performance Data

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	820
4	6.8	920	4	6.8	1000
8	7.3	1080	8	7.3	1200
12	7.75	1300	12	7.75	1500
16	8.2	1640	14.6	8.05	2300
17.2	8.3	2050			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24 ozs. minimum (old brushes), 36 ozs. maximum (new brushes).

Field Current—3.80-4.20 amperes at 6.0 volts.

Motoring Current—5.51-6.09 amperes at 6.0 volts.

Field Fuse—5 ampere under cover on generator field frame.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, swing generator away from engine until fan can just be turned with belt held stationary.

GENERATOR:—Radio—Model GAR-4609A-4. Armature No. GAR-2116-B. Third brush control in conjunction with Current Regulator (two-rate charging control). Ventilated by fan on drive pulley.

Charging Rate Adjustment—Use test meters. Connect jumper between fuse cup on regulator and ground. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate. Third brush held in position by friction. Remove jumper.

Maximum Charging Rate—24.8 amperes (cold), 21 amperes (hot), at 8.5 volts. Do not exceed.

Performance Data

Cold — Regulator Inoperative — Hot

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	750	0	6.5	840
4	6.75	900	4	6.85	980
8	7.1	1025	8	7.25	1160
12	7.4	1200	12	7.6	1400
16	7.7	1380	16	8.0	1720
20	8.1	1675	21	8.5	2680
24.8	8.5	2400			

Field Current—3.75-4.15 amperes at 6.0 volts.

Motoring Current—4.75-5.25 amperes at 6.0 volts.

Field Fuse—5 ampere in knurled cup on regulator case. All other data same as for standard generator. See above.

CUTOUT RELAY:—Model CB-4021 (GBM-4604A-2). Mounted on generator. Special terminal connected to main brush lead for Startix connection.

Cuts In—6.75-7.5 volts.

Cuts Out—.5-2.5 amperes discharge current.

Contact Gap—.025-.035".

Air Gap—.010-.030" with contacts closed.

RELAY-REGULATOR:—Model TC-4302A (GAR-4609A-4). Mounted on generator. Consists of Cutout Relay and Current-Regulator (two-rate charging control). See article in Equipment Section for complete data.

Cutout Relay—See above. Data same except for Contact Gap which is .015-.045".

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.

Contacts Close—1.2-1.4 volts below opening point.

Contact Gap—.005" minimum.

Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Corcoran-Brown, Pre-focused type. Headlamps aimed straight ahead (upper beam with lenses in place). Upper and lower beams controlled by foot selector switch (lower beam deflected slightly to right).

Headlamp Beam Indicator—Green dot on speedometer face. Lighted when headlamp upper beams in use.

Switches

Lighting—Douglas.

Foot Selector—R.B.M. Model 1085.

Trunk Light—R.B.M. Model 2350.

Stop Light—Hydraulic type mounted on brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Ign. Key	1½	55
Stop and Tail	21-3	1158
Instruments	1	51
Dome and Trunk	6	81

FUSES:—Lighting—30 amperes on back of lighting switch.

Generator Field—5 amperes. Located on generator field frame under cover (standard gen.), on Current Regulator case under knurled cup (radio gen.).

HORNS:—Klaxon Model K-26L-1622. Vibrator type. Current draw 6.5-8.5 amperes at 6 volts. Air Gap .025-.029". See 1936 President Model (next page) for twin horns and horn relay.

NOTE:—Startix optional on all models.

SERIAL NUMBERS:—On plate on left frame side member under front fender. First numbers as follows:

Factory	Serial Number
South Bend	7,104,001
Pacific Coast	7,800,001
Canada	7,951,001

COMPRESSION:—Ratio—6.5-1. **Pressure**—105-115 lbs. at cranking speed of 150 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 450 R.P.M. or 8 M.P.H.

IGNITION:—Coil Model 537-B. Mounted on dash.

Coil Draw—½-1½ amperes idling, 4.5 amp. stopped.

Ignition Switch:—Delco-Remy Model 430-R (switch and cable). Connected to coil by armored cable. Key has two 'on' positions (cars with Startix). Turned right Startix operative, turned left if Startix (automatic cranking) not wanted.

Ignition Lock—Yale and Towne.

Distributor Model 662-M. Double breaker, 4 lobe cam, full automatic advance type with auxiliary vacuum spark control. Distributor contacts open alternately at 45° intervals corresponding to 90° firing interval of engine and must be synchronized. See Timing.

Breaker Gap—Set at .020". **Limits** .018-.024".

Cam Angle or Dwell—34° closed. 11° open for both contacts operating together when properly synchronized.

Breaker Arm Spring Tension—19-23 ozs.

Condenser—Part No. 1838163. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
14.5	1800	29	3600

Vacuum Spark Control Model 680-J:—Mounted under distributor and linked to advance arm. Provides additional advance except when engine is operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	3" Min.
5-7°	6" Max.

Distributor Removal:—Mounted on cylinder head. To remove, loosen advance arm clamp bolt (not necessary to disconnect vacuum connection).

IGNITION TIMING:—Setting for all engines as follows:

Flywheel Degrees	Piston Position
0° or TDC	.000" TDC

Timing (Stationary Contacts)—Crank engine by engaging gears and rolling car on floor. On cars with Startix use left hand 'on' position of key to avoid automatic cranking if ignition turned on to check timing. With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'UDC/1-8' lines up with pointer in inspection hole in right top edge of housing. Loosen advance arm clamp bolt, rotate distributor until stationary contacts begin to open, tighten clamp bolt, then synchronize movable contacts.

Synchronization (On Engine)—Turn engine over 90° to #6 firing position, stop when flywheel mark 'UDC/3-6' lines up with indicator. Loosen lockscrews on movable sub-plate carrying second set of contacts, turn eccentric adjusting screw until contacts begin to open, tighten lockscrews.

Synchronization (Using Tool)—Use Delco-Remy tool #1838182 and follow complete directions in Equipment Section. Distributor intervals regular 45-45-45°.

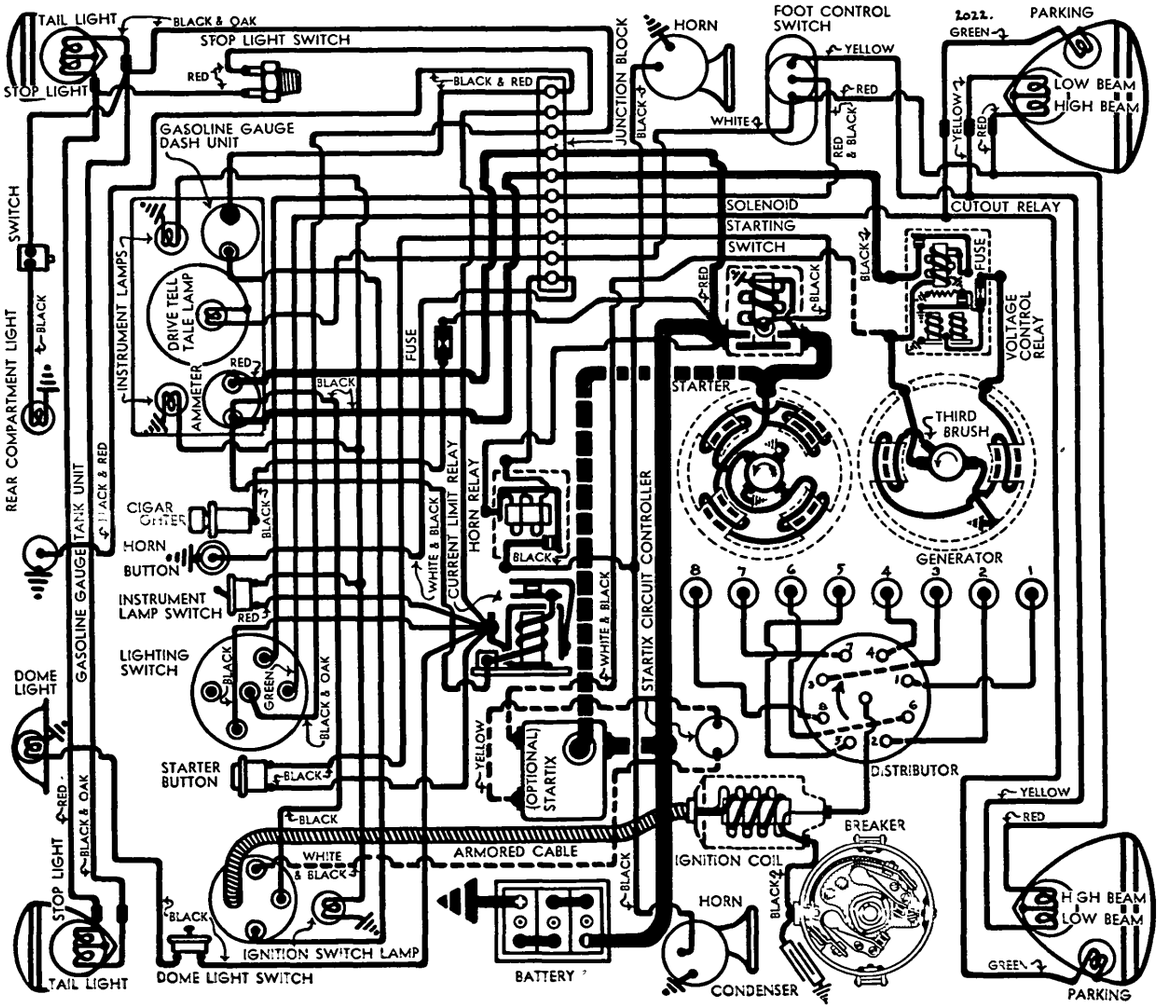
Motor Gauge—Weidenhoff #104 Adapter, #2 Rod.

Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—Champion #8-S. 18 MM. Metric.

Spark Plug Gaps—.025".

NOTE—For very hard service such as fast driving in hot weather, cooler plug such as Champion #7, or #13 may be used.



CARBURETION:—Carburetor—Stromberg Model EE-1, 1" dual, downdraft type. See Carburetion Section for complete adjustment, overhaul, and jet specifications.

NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at slow or hot idling speed.

Idle Adjustment—Set throttle stopscrew so that engine idles at 450 R.P.M. or 8 M.P.H. Turn inner idling adjusting screw in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Repeat with outer idling adjusting screw. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump—Not adjustable.

NOTE—A .045" or one size smaller main metering jet may be installed to secure greater fuel economy with slight loss in performance. The .043" two size smaller jet should be used only for high altitudes. See Jet Specification table in Carburetion Section.

Fast Idle:—Stromberg type. No adjustment required.

Automatic Choke:—Stromberg Type C. See article in Carburetion Section.

Air Cleaner:—Burgess oil-wetted type standard, AC. #1526864 oil-bath type optional.

Fuel Pump:—AC. Type P #1521829 standard. Combination fuel-and-vacuum pumps Type J #1521797 or Type AD #1522228 optional. See articles in Carburetion Section.

Gasoline Gauge:—Motometer Electric No. EG-7815-D (dash unit), No. EG-7679-T (tank unit). See article in Carburetion Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .020". This valve should open with #1 piston 15° or .0915" before top dead center when flywheel mark 'IN.OP/1-8' lines up with indicator in inspection hole on right top surface of flywheel housing. Reset tappet clearance at .016".

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Tappet Clearance:—.016" all valves, cold.

Valve Spring Pressure:—125-135 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—8 quarts.
Normal Oil Pressure—40 lbs. minimum at 40 M.P.H.

BATTERY:—Willard, Type WH-1-13, RH-1-13 (Export). 6 volt, 13 plate, 102 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.1 minutes.

Grounded Terminal—Positive (+) terminal.

Location—Left hand side under front floor boards.

STARTER:—Model 737-J, 737-K (with Startix). Armature No. 1863128.

Drive—Outboard Bendix (barrel) Type A-1729.

Cranking Engine—110 R.P.M., 200 amperes at 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—32-36 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5	65
15 "	Lock	3.15	570

Removal:—Flange mounted on left hand front face of flywheel housing. Take out two capscrews.

Starting Switch (737-J):—Magnetic switch mounted on starter controlled by push button (R.B.M. Model 1865), on left side of instrument panel.
Startix (737-K)—Type 'D' automatic starting switch and Startix circuit controller (anti-backfire unit), controlled by ignition switch. See Equipment Section for complete data.

GENERATOR:—Model 936-X. Armature No. 1856072. Third brush control with Voltage Control Relay (step voltage control). Ventilated by fan on drive pulley.

Charging Rate Adjustment—Connect test ammeter in charging line at 'BAT' terminal, ground generator field 'F' terminal to frame. Loosen lockscrew on commutator end plate, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate, tighten lockscrew, remove generator field ground.

Maximum Charging Rate—21 amperes (cold), 17 amperes (hot), 8.5 volts, 2800 R.P.M., 37 M.P.H.

Performance Data

	Amperes	Volts	R.P.M.
Cold	22-25	8.7-9.1	3000
Hot	17-20	8.1-8.5	3200

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ozs. (main), 16-20 ozs. (third).
Field Current—2.3-2.6 amperes at 6 volts.
Field Fuse—6 ampere capacity in control unit.

Removal:—Cradle mounted at left front of engine. To remove, slack off belt, disconnect water pump drive coupling, loosen mounting clamp band.

Belt Adjustment:—To take up slack in generator drive belt, loosen nut back of fan bracket, lift up fan assembly until fan can just be turned with belt held stationary, tighten bracket nut.

CONTROL UNIT (STEP-VOLTAGE TYPE):—Model 5546. Mounted on generator. Consists of Cutout Relay and Voltage Control Relay. See article in Equipment Section.

Cutout Relay

Cuts In—6.4-6.8 volts, 8.1 M.P.H.
Cuts Out—3 amperes maximum discharge current.
Contact Gap—.015-.025".
Air Gap—.012-.017" contacts closed.

Voltage Control Relay

Contacts Open—8.35-8.65 volts at 70° F.
Contacts Close—7.3-7.7 volts at 70° F.
Contact Gap—.008-.013".
Contact Spring Tension—.7-.9 ounces.
Air Gap—.028-.040" between armature and core (armature down against lower stop), .028-.040" armature travel (between armature and lower stop).

LIGHTING:—Headlamps—Corcoran-Brown, Prefocused type. Headlamps aimed straight ahead (upper beam with lenses in place. Upper and lower beams controlled by foot selector switch (lower beam deflected slightly to right).
Headlamp Beam Indicator—Green dot on speedometer face. Lighted when upper driving beam in use.

Switches

Lighting—Douglas. Studebaker Part No. 188006.

Foot Selector—R.B.M. Model 1085.

Stop Lamp—Hydraulic type mounted on brake master cylinder.

Trunk Lamp—R.B.M. Model 2350.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Ign. Key	1½	55
Stop and Tail	21-3	1158
Instruments	1	51
Dome and Trunk	6	81

CURRENT LIMIT RELAY:—Model 410-R. Vibrating circuit breaker in lighting circuits. Starts to operate with load of 30-35 amperes limiting load to 5-18 amperes.

Contact Gap—.012-.030".

Air Gap—.015-.030" with contacts closed.

Spring Tension—5 ozs. min. at brass button.

FUSES:—Cigar Lighter—7½ amperes. In connector in lead from starter.

Generator Field—6 ampere in Control Unit.

HORNS:—Klaxon Model K-33-S, Types 2059, 2060. Vibrator type, blended tone, twin horns operated by horn relay.

Horn Type	Current at 6 volts	Air Gap
2059 Low Note	11-13	.042-.046"
2060 High Note	10-12	.032-.036"

Horn Relay:—Model 269-E. Requires .25 amperes at 2 volts minimum to close contacts. Current draw .8 amperes.

Contact Gap—.015-.025". **Spring Tension**—6-8 ozs.

Air Gap—.012-.017" with contacts closed.

NOTE:—These models are similar except that Model 5-A fitted with conventional front axle. Model 6-A with Planar type independent springing. All other data below applies to both models.

SERIAL NUMBER:—On plate on left frame side member under front fender. First numbers as follows:

Factory	Model 5A	Model 6-A
South Bend	5,536,001	5,255,001
Pacific Coast	5,852,001	5,802,001

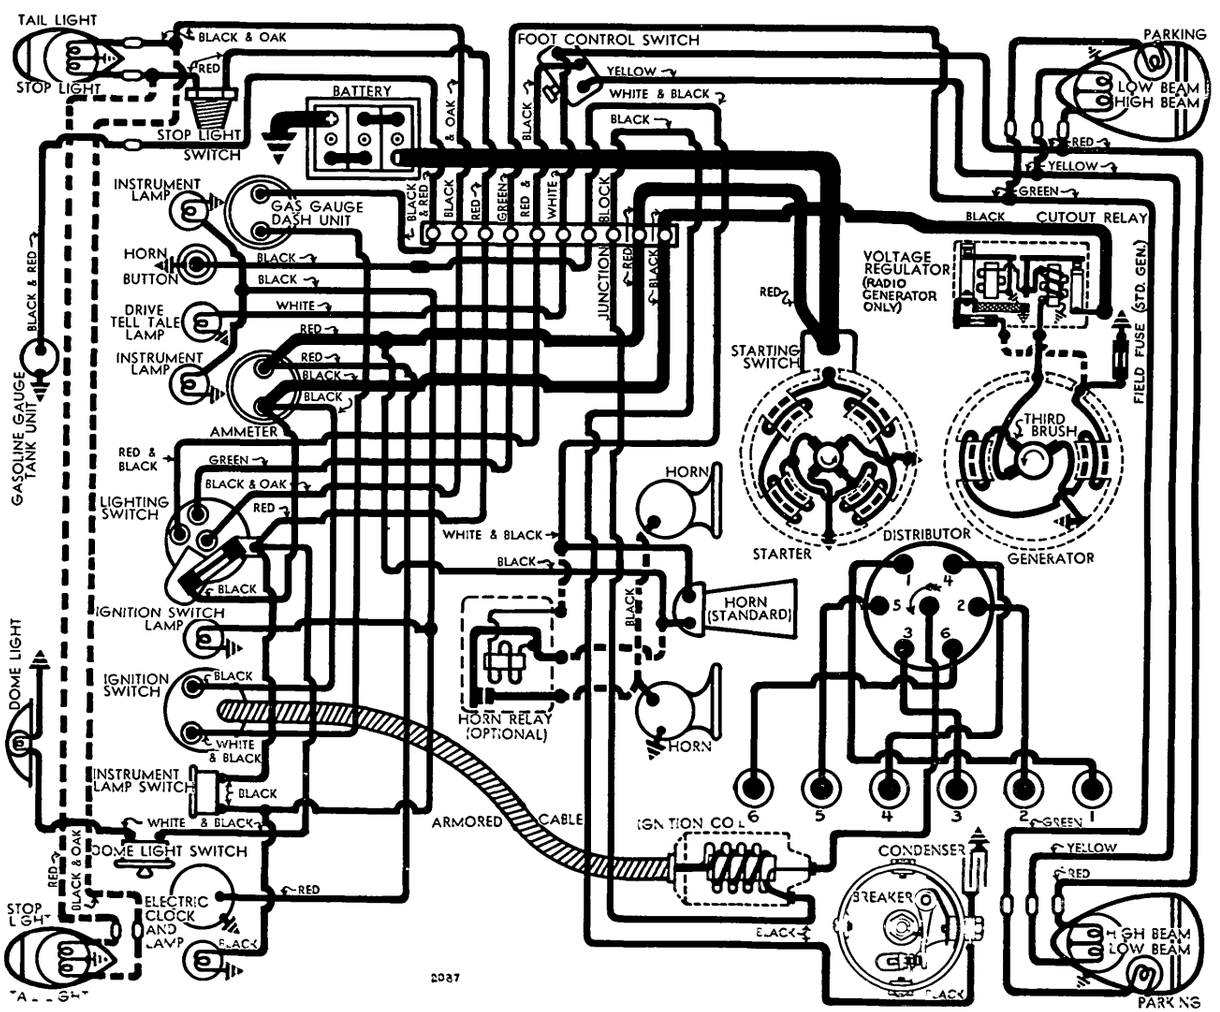
COMPRESSION:—Ratio—6.0-1. **Pressure**—105 lbs. at 150 R.P.M. (cranking speed).

VACUUM READING:—Gauge should show steady reading of 18" with engine idling at 450 R.P.M. or 8 M.P.H.

IGNITION:—Coil Model IG-4643. Mounted on dash.
Coil Draw—½-1½ amperes idling, 4-5 stopped.
Ignition Switch:—Mitchellock Model 24-R, Type 7071. Connected to coil by armored cable.
Ignition Lock—Yale & Towne.
Distributor Models IGW-4001, 4026 (spec. tachometer drive). Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—Set at .020".
Cam Angle or Dwell—40.0° closed, 20.0° open.
Breaker Arm Spring Tension—16-20 ounces.
Condenser—Part No. IGB-1025. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	400	0	800
2	600	4	1200
4	800	8	1600
6	1000	12	2000
8	1200	16	2400
10.5	1400	21	2800



Vacuum Spark Control Model VC-4004—Mounted below distributor and linked to advance arm. Provides additional advance at speeds above idling (vacuum port in carburetor above throttle) except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit. Maximum vacuum advance 12° (engine).
Distributor Removal:—Mounted on left side of crankcase. To remove, loosen advance arm clamp bolt (not necessary to disconnect vacuum connection). NOTE—When installing distributor place .016" feeler between hold-down plate (with hold-down screw tight) and advance plate, tighten clamp bolt (on advance plate), then remove gauge. This insures free movement of advance plate.

IGNITION TIMING:—Setting for all engines as follows:

Degrees	Piston Position
2° BTDC	.0016" BTDC

To Set Timing—Crank engine by engaging gears and rolling car on floor. With #1 piston on compression, turn engine over until straight line 'IGN' mark on vibration dampener at front of engine lines up with pointer on timing gear cover. This line is 9/64" before top dead center mark 'UDC/1-6.' Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, insert .016" feeler between advance arm plate and hold-down plate(insuring free movement of advance plate), tighten clamp bolt, remove feeler gauge.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Firing Order:—1-5-3-6-2-4. See diagram.
Spark Plugs:—Champion #8-A. 18 MM. Metric standard. Champion #7-A or #13 (cooler plugs) may be used for fast driving in hot weather.
Spark Plug Gap—Set at .025".

CARBURETION:—Carburetors—Stromberg Model EX-23, Carter Model 371-S (Motor #D-143675 and up), 1¼" downdraft types with automatic choke.
See Articles in Carburetion Section.
Idle Adjustment—With engine warm, choke valve wide open and idling at hot or slow idling speed, adjust throttle stopscrew so that engine idles at 450 R.P.M. or 8 M.P.H. Turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Readjust throttle stopscrew for correct idling speed.
Accelerating Pump Setting—Three holes provided in throttle lever for pump link engagement. Change setting for seasonal requirements as follows:
Center Hole—Normal operating conditions.
Inner Hole (Min. stroke)—Extreme warm weather.
Outer Hole (Max. stroke)—Extreme cold weather.
NOTE—On Stromberg models a .056" (std. Air Cl.) .054" (Oil Bath Air Cl.) or one size smaller main metering jet may be installed to secure greater fuel economy with a slight loss in performance. The .054" (std. cl.), .052" (Oil Bath Air Cl.) or two size smaller jet should only be used for high altitudes. For similar adjustments on Carter models see Carter Jet Specifications in Carb. Section for metering rod changes.
Fast Idle Control & Automatic Choke:—Integral with carburetor. No adjustment required. See separate article for Stromberg and Carter Climatic Control.
Air Cleaner:—AC. #1528097 oil-wetted type standard, #1526923 oil-bath type optional.
Fuel Pump:—AC. Type W #1522227. Diaphragm type.
See Article in Carburetion Equipment Section.
Gasoline Gauge:—Motometer Electric. No. NG-8199D (dash unit). No. NG-8165T (tank unit).
See Article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .020". This valve should open when piston #1 is 15° or .0942" before top dead center when mark 'IN.OP/1-6' on vibration dampener at front of engine lines up with pointer on gear case cover. Reset tappet clearance at .016".
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Tappet Clearance:—.016" for all valves, cold.
Valve Spring Pressure:—125-135 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—5½ qts. (dry).
Normal Oil Pressure—40 lbs. minimum at 40 M.P.H.

BATTERY:—Willard, Type WHT-2-105. 105 ampere hour capacity (20 hour rate).
Starting Capacity—133 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.9 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under front seat.

STARTER:—Model MAX-4028 (1st 15,000 cars), Armature No. MAW-2030. Model MAX-4019 (after 5A-5,542,738; 6A-5,260,534), Armature No. MAW-2091.
Drive—**(MAX-4028)** Positive shift with overrunning clutch. **(MAX-4019)** Outboard Bendix (barrel) Type A-1729.
Cranking Engine—110 R.P.M., 150-200 amps., at 5.0-5.5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
.65 "	3300	5.5	100
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out two flange capscrews.
Starting Switch:—(MAX-4028) SW-2677-B. Mounted on starter field frame and operated by pinion shift (starting pedal). **(MAX-4019)** SW-3737-A. Mounted on starter and operated through flexible cable by button on instrument panel. Pull required to close switch should be 2.3 lbs. minimum at end of switch lever.

GENERATOR—STANDARD:—Model GBM-4607A-2. Armature No. GBM-2065-B. Air cooled, third brush control.
Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction.
Maximum Charging Rate—17.2 amperes at 8.3 volts (cold), 14.6 amperes at 8.05 volts (hot). Do not exceed.

Performance Data

Cold Amperes	Volts	R.P.M.	Hot Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	820
4	6.8	920	4	6.8	1000
8	7.3	1080	8	7.3	1200
12	7.75	1300	12	7.75	1500
16	8.2	1640	14.6	8.05	2300
17.2	8.3	2050			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24 ozs. minimum (old brushes), 36 ozs. maximum (new brushes).
Field Current—3.80-4.20 amperes at 6.0 volts.
Motoring Current—5.51-6.09 amperes at 6.0 volts.
Field Fuse—5 ampere under cover on generator field frame.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.
Belt Adjustment:—Loosen pivot bolts and clamp bolt, swing generator away from engine until fan can just be turned with belt held stationary.

GENERATOR—RADIO:—GCM-4802A-4. Armature No. GCJ-2006B. Third brush control in conjunction with Current Regulator (two-rate charging control). Ventilated by fan on drive pulley.
Charging Rate Adjustment—Use test meters. Connect jumper between fuse cap on regulator and ground. Shift third brush by hand counter-clockwise to increase or clockwise to decrease charging rate. Third brush held in position by friction. Remove jumper.
Maximum Charging Rate—22 amperes (cold), 18 amperes (hot), at 8.0 volts. Do not exceed.

Performance Data

Cold — Regulator Inoperative — Amperes	Volts	R.P.M.	Hot Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	830
4	6.7	920	4	6.75	980
8	7.0	1040	8	7.1	1040
12	7.3	1200	14	7.65	1660
16	7.6	1450	18	8.0	2600
20	7.85	1920			
22	8.0	2680			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—23-27 ozs. (new brushes).
Field Current—3.50-3.89 amperes at 6.0 volts.
Motoring Current—5.75-6.25 amperes at 6.0 volts.
Field Fuse—5 ampere in knurled cup on regulator case.
Removal and Belt Adjustment same as for standard generator.

CUTOUT RELAY:—Model CB-4021. (GBM-4607A-2). Mounted on generator.
NOTE—Special terminal for Startix connection on relay.
Cuts In—6.75-7.5 volts.
Cuts Out—.5-2.5 amperes discharge current.
Contact Gap—.025-.035".
Air Gap—.010-.030" with contacts closed.

RELAY REGULATOR:—Model TC-4302A (GCM-4802A-4). Mounted on generator. Consists of Cutout Relay and Current Regulator (two rate charging control).
See Article in Electrical Equipment Section.
Cutout Relay—See above. Data same except for Contact Gap which is .015-.045".

Current Regulator

Contacts Open—8.25-8.75 volts at 70° F.
Contacts Close—1.2-1.4 below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Corcoran-Brown. Pre-focused type. Headlamps aimed straight ahead (upper beam with lenses in place). Upper and lower beams controlled by foot selector switch (lower beam deflected slightly to right).
Headlamp Beam Indicator—Green dot on speedometer face. Lighted when headlamp upper beams in use.

Switches

Lighting—Douglas. Studebaker Part No. 188036.
Foot Selector—R.B.M. Model 1085.
Stop Light—Hydraulic type mounted on brake master cylinder.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Ign. Key	1½	55
Stop and Tail	21-3	1158
Instruments	½	51
Dome	6	81

FUSES:—Lighting—30 amperes on back of lighting switch.
Generator Field—5 amperes. Located on generator field frame under cover (standard gen.), on Current Regulator case under knurled cup (radio gen.).

HORNS:—Klaxon Model K-26-L Type 1638 Std. Model K-33-S Types 2059, 2060 twin horns with relay optl.

Horn Type	Current at 6 volts	Air Gap
1638 Single (Low)	6.5-8.5	.025-.029"
2059 Low Note	11-13	.042-.046"
2060 High Note	10-12	.032-.036"

Horn Relay:—Mod. 271-A. Points close at 2.7-4.0 volts.
Contact Gap—.015-.030". **Air Gap**—.010-.025".

SERIAL NUMBER:—On plate on left frame side member under front fender. First number as follows:

Factory	Serial Number
South Bend	7,111,001
Pacific Coast	7,800,801

COMPRESSION:—Ratio—6.5-1 **Pressure**—105-115 lbs. at cranking speed at 150 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" with engine idling at 450 R.P.M. or 8 M.P.H.

IGNITION:—Coil Model 537-B. Mounted on dash.
Coil Draw—1-1½ amperes idling, 4.5 amp. stopped.
Ignition Switch:—Mitchellock Model 24-R, Type 7073. Connected to coil by armored cable.
Ignition Lock—Yale and Towne.
Distributor Model 662-M. Double breaker, 4 lobe cam, full automatic advance type with auxiliary vacuum spark control. Distributor contacts open alternately at 45° intervals corresponding to 90° firing interval of engine and must be synchronized. See Timing.
Breaker Gap—Set at .020". **Limits**—.018-.024".
Cam Angle or Dwell—34° closed. 11° open for both contacts operating together when properly synchronized.
Breaker Arm Spring Tension—19-23 ozs.
Condenser—Part No. 1838163. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	2.5	600
14.5	1800	29.0	3600

Vacuum Spark Control Model 681-S. Mounted under distributor and linked to advance arm. Provides additional advance except when engine is operated with wide open throttle when spark is retarded by return spring within unit.

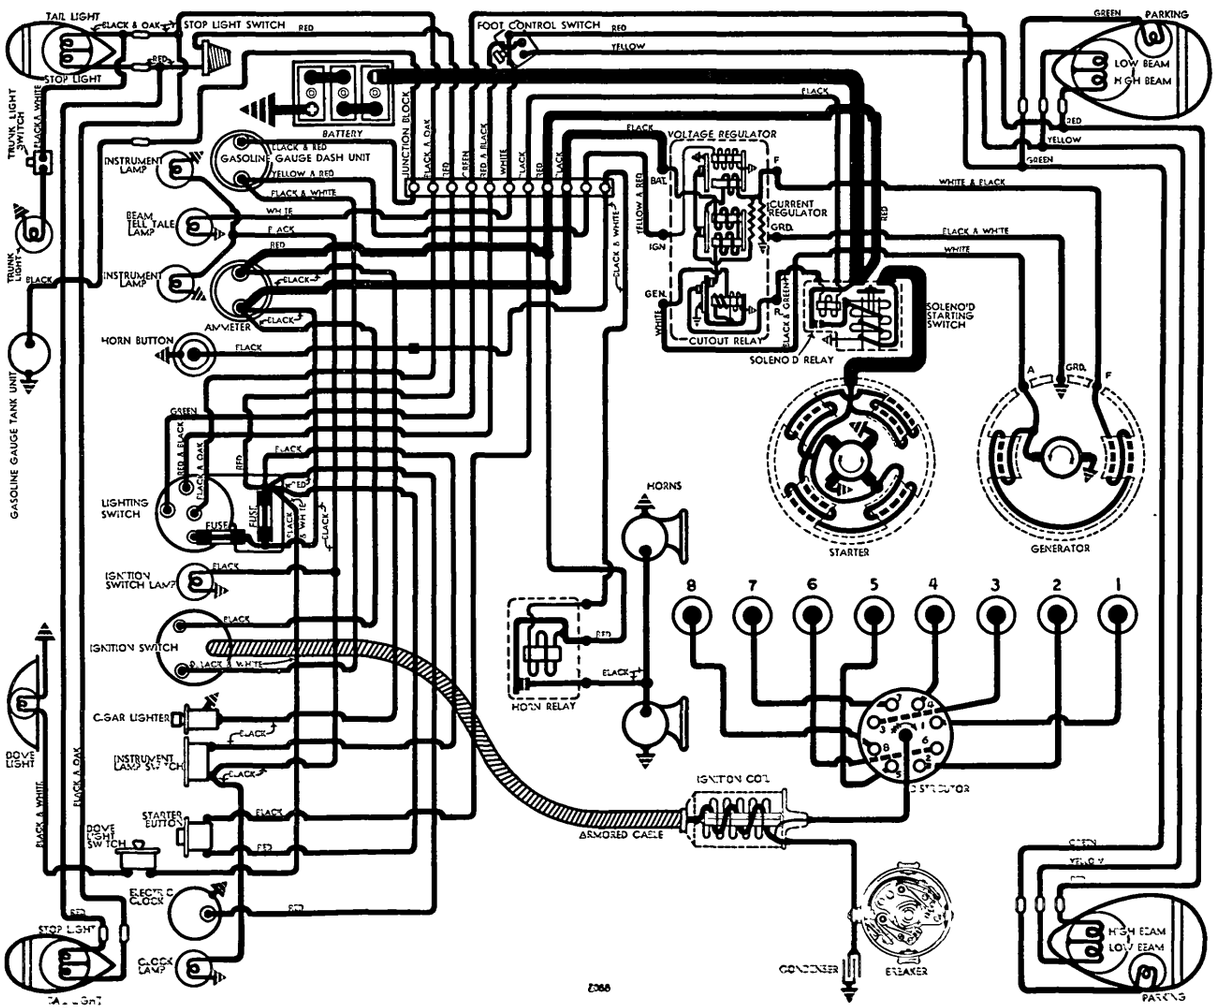
Vacuum Advance

Engine Degrees	Vacuum (" of HG.)
Start	5-7"
12°	13-16"

Distributor Removal:—Mounted on cylinder head. To remove, loosen advance arm clamp bolt (not necessary to disconnect vacuum connection).

IGNITION TIMING:—Setting for all engines as follows:

Flywheel Degrees	Piston Position
0° or TDC.	.000" TDC



Timing (Stationary Contacts)—Crank engine by engaging gears and rolling car on floor. With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'UDC/1-8' lines up with pointer in inspection hole in right top edge of housing. Loosen advance arm clamp bolt, rotate distributor until stationary contacts begin to open, tighten clamp bolt, then synchronize movable contacts.
Synchronization (On Engine)—Turn engine over 90° to #6 firing position, stop when flywheel mark 'UDC/3-6' lines up with indicator. Loosen lockscrews on movable sub-plate carrying second set of contacts, turn eccentric adjusting screw until contacts begin to open, tighten lockscrews.
Synchronization (Using Tool)—Use Delco-Remy tool #1838182 and follow complete directions in Electrical Equipment Section. Distributor intervals regular 45-45-45°.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Firing Order:—1-6-2-5-8-3-7-4. See diagram.

Spark Plugs:—Champion #8-A. 18 MM. Metric. std. Champion #7-A or #13 (cooler plugs) may be used for fast driving in hot weather.
Spark Plug Gap—Set at .025".

CARBURETION:—Carburetor—Stromberg Model EE-1, 1" dual downdraft type.
See Article in Carburetion Sec. for complete data.
NOTE—A .045" or one size smaller main metering jet may be installed to secure greater fuel economy with slight loss in performance. The .043" two size smaller jet should be used only for high altitudes.
See Jet Specification Table in Carburetion Section.
Idling Adjustment—Adjust throttle stopscrew so that engine idles (hot or slow idling speed) at 450 R.P.M. or 8 M.P.H. Turn inner idling adjusting screw in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Repeat with outer idling adjusting screw. Readjust throttle stopscrew for correct idling speed.
Accelerating Pump—Not adjustable.

Fast Idle:—Stromberg type. See article in Carburetion Section for complete data.
Automatic Choke:—Stromberg Type C.
See Article in Carburetion Sec. for complete data.
Air Cleaner:—Burgess oil-wetted type standard, AC. #1528256 oil-bath optional.
Fuel Pump:—AC. Type P #1521829 standard. Combination fuel-and-vacuum Type J #1521797 or Type AD #1522228 optional.
See Article in Carburetion Sec. for complete data.
Gasoline Gauge:—Motometer Electric.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .020". This valve should open with #1 piston 15° or .0915" before top dead center when flywheel mark 'IN.OP/1-8' lines up with indicator in inspection hole on right top surface of flywheel housing. Reset tappet clearance at .016".
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Tappet Clearance:—.016" all valves, cold.

Valve Spring Pressure:—125-135 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—8 quarts (dry).
Normal Oil Pressure—40 lbs. minimum at 40 M.P.H.

BATTERY:—Willard, Type WHT-2-105. 6 volt, 15 plate, 105 ampere hour capacity (20 hour rate).
Starting Capacity—133 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.9 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left side under drivers seat.

STARTER:—Model 729-G. Armature No. 820158.
Drive—Solenoid pinion shift and overunning clutch.
Cranking Engine—110 R.P.M., 150-200 amperes at 5.0-5.5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
16 ft. lbs.	Lock	3.0	600

Removal:—Flange mounted on left front face of flywheel housing. Take out capscrews to remove.

Starting Switch:—Solenoid Switch Type 1516. R.B.M. push button switch #1875. Solenoid switch controlled through relay by push button on instrument board.
See Article in Electrical Equipment Section.

Solenoid Switch

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.2 volts max. **Open**—1.6-2.0 volts.
Contact Gap—.030-.045". **Air Gap**—.010-.014" (closed)

GENERATOR:—Model 961-H. Armature No. 1866171.
Straight shunt (two brush) type with external voltage and current regulation. Ventilated by fan on drive pulley.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output controlled by Current Regulator. See Control Unit Section below.
Maximum Charging Rate—25 amperes (cold) with discharged battery as indicated on test ammeter connected in charging line at 'BAT' terminal on control unit. Decreases as battery comes up on charge. Generator output constant at all speeds above 1650 R.P.M. or 25 M.P.H.

Performance Data—Generator Cold

Amperes	Volts	R.P.M.
25	8.0	1650

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces.
Field Current—2.0-2.2 amperes at 6 volts.

Removal:—Cradle mounted at left front of engine. To remove, slack off belt, disconnect water pump drive coupling, loosen mounting clamp band.

Belt Adjustment:—To take up slack in generator drive belt, loosen nut back of fan bracket, lift up fan assembly until fan can just be turned with belt held stationary, tighten bracket nut.

CONTROL UNIT:—Model 5818. Mounted on dash. Consists of Cutout Relay, Voltage Regulator and Current Regulator in a single case.
NOTE—Cover of case sealed and units are serviced on an exchange basis if seals are unbroken. Unit can be checked without breaking seal, but cannot be adjusted.
See Article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.5-7.0 volts at 9¼ M.P.H.
Cuts Out—3 amperes maximum discharge.
Contact Gap—.018-.025".
Air Gap—.018-.022" with contacts closed.

Voltage Regulator

Setting—7.55-7.85 at 70° F., 7.45-7.55 volts at 150° F. Regulator is over-compensated for temperature and must be checked at these points.
Checking—To check without breaking seal, disconnect lead at 'IGN' terminal on regulator case, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2000-3000 R.P.M. Check with setting as given above (with 8-10 amps. charging rate).
To Adjust—This requires breaking seal in order to remove cover. Proceed as outlined under 'Checking' (above) and set regulator by bending spring hanger at lower end of armature spring until performance is as shown above. Remove jumper and restore original connections.
NOTE—Voltage Regulator readings must be taken with cover on unit and setting should be checked by decreasing speed until Cutout Relay contacts open, and then increasing speed to original point.
Contact Gap—.015-.025".
Contact Spring Tension—3.5 ozs. minimum.
Air Gap—.060-.070" between armature and core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.

Current Regulator

Setting—24-26 amperes.
Checking—To check without breaking seal, disconnect 'IGN' and 'BAT' leads, connect ammeter with one lead to 'BAT' terminal and other to 'BAT' lead. Operate generator and check with setting given above.
To Adjust—This requires breaking of seal in order to remove cover. Proceed as outlined under 'Checking' (above) and set regulator by bending spring hanger at lower end of armature spring until maximum output is as given.
NOTE—Generator voltage must not be allowed to exceed 8.5 volts with Voltage Regulator shorted out.
Contact Gap—.015-.025".
Contact Spring Tension—3.5 ozs. minimum.
Air Gap—.070-.080" between armature and core with armature down so that fibre bumper just touches stop, .008-.013" between fibre bumper and stop with armature up.
NOTE—To repolarize generator whenever Control Unit is disconnected or removed, connect jumper between 'GEN' and 'BAT' terminals (after all leads connected) momentarily. Do not run engine.

LIGHTING:—Headlamps—Corcoran-Brown, Prefocused type. Headlamps aimed straight ahead (upper beam) with lenses in place. Upper and lower beams controlled by foot selector switch (lower beam deflected slightly to right).
Headlamp Beam Indicator—Green dot on speedmeter face. Lighted when upper driving beam in use.

Switches

Lighting—Douglas. Studebaker Part No. 190015.
Foot Selector—R.B.M. Model 1085.
Stop Lamp—Hydraulic type mounted on brake master cylinder.
Trunk Lamp—R.B.M. Model 2350.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Ign. Key	1½	55
Stop and Tail	21-3	1158
Instruments	½	51
Dome and Trunk	6	81

FUSES:—Lighting—30 ampere on lighting switch.
Auxiliary—30 ampere on lighting switch carries stop light and accessories.

HORNS:—Klaxon Model K-26-L Type 1638 std. Model K-33-S Types 2059, 2060 twin horns with horn relay optional.

Horn Type	Current at 6 volts	Air Gap
1638 Single (low)	6.5-8.5	.025-.029"
2059 Low Note	11-13	.042-.046"
2060 High Note	10-12	.032-.036"

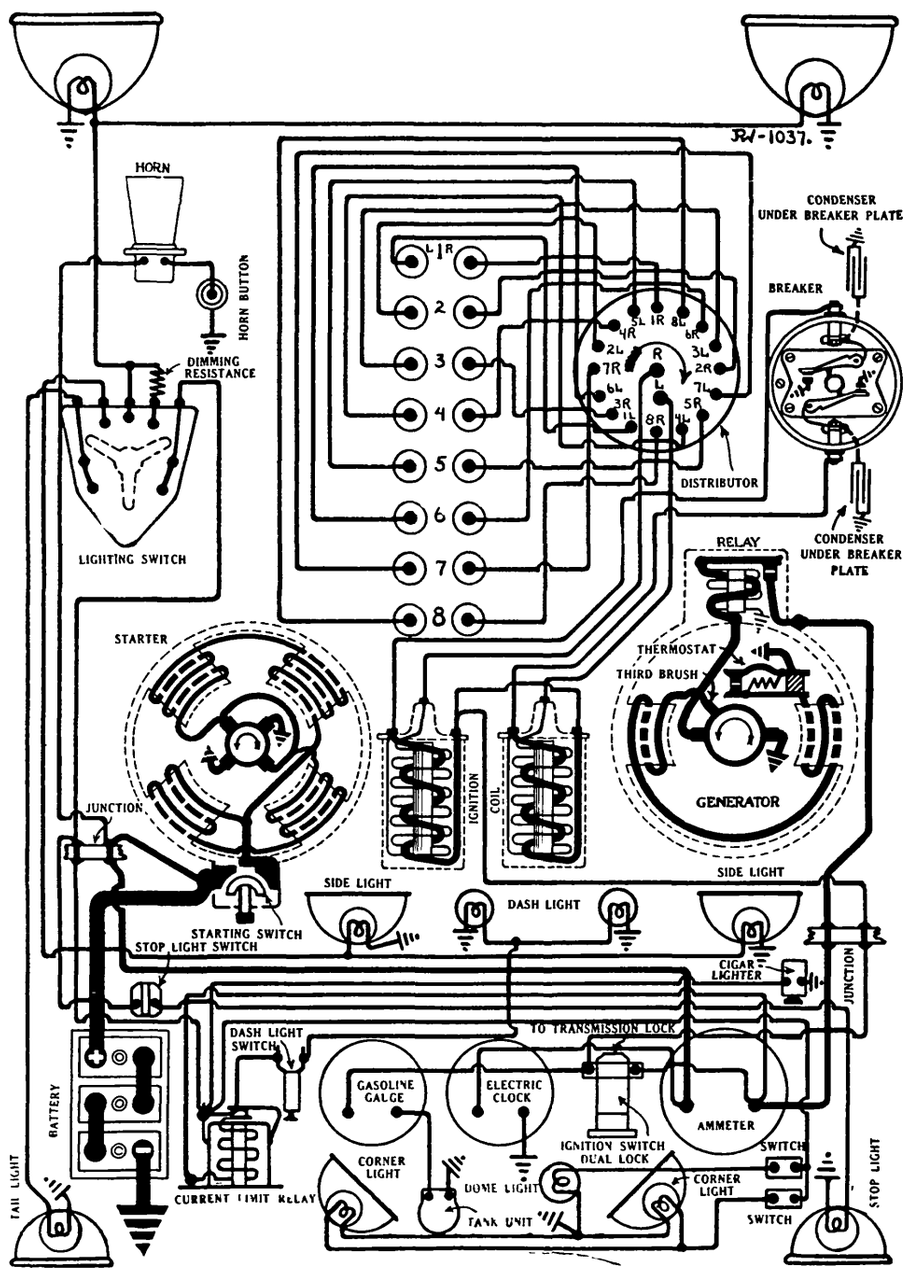
Horn Relay:—Mod. 271-A. Points close at 2.7-4.0 volts.
Contact Gap—.015-.030". **Air Gap**—.010-.025".

STUTZ

SERIES MA, MB (1929-30), AFTER DECEMBER 4, 1928
(134½" WHEELBASE) SERIAL NUMBERS 30,001 UP
(145" WHEELBASE) SERIAL NUMBERS 40,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type A-617-SH, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 170 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 32 hours. Battery is mounted under the left front seat.

IGNITION:—Coil Model 531-C. (2 used). Coils are mounted under the hood on the right of the engine. Ignition current is 6 amperes at 6 volts with engine running and 10 amperes at 6 volts with engine stopped. The ignition switch is a Delco-Remy Dual-lock Model 426-K and 426-C.



Distributor Model 4028. Breaker contacts separate .017 inch. Set breaker gap by loosening lock nut on stationary contact stud and turning up stud until proper gap is obtained with breaker arm on lobe of cam. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 40 degrees (engine). Automatic advance begins at 400 R.P.M. (engine). Maximum automatic advance is 22 degrees reached at 2600 R.P.M. There are two sets of contacts on an eight sided cam. Contacts open simultaneously and each set of contacts controls one coil and fires one set of spark plugs. The electrical circuit of each coil is entirely separate except that one distributor is used. Contacts must be synchronized for correct performance. See Timing.

Mounting:—Distributor is mounted on accessory bracket at right front of engine. To remove distributor, disconnect primary leads and manual advance rod and remove distributor head with cables intact. Then remove manual advance stop screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor every 750 miles. Every 1000 miles remove the distributor head and rotor and put a small bit of vaseline on the face of the breaker cam and oil the breaker arm pivot pins with light engine oil.

Timing:—Synchronization of Contacts:—Contacts must be synchronized so that they open at the same instant to fire both spark plugs in each cylinder simultaneously. Connect a six volt lamp in each primary circuit. Turn ignition on and crank engine slowly. The lamps will go out as the contacts open. If both lamps go out at the same instant the contacts are properly synchronized. If one lamp remains lighted loosen the four lock screws on the breaker mounting plate and shift the plate until the proper adjustment is reached. Tighten the lock screws and check the contact gap. It must be within limits of .015-.020 inch. This is important for correct high speed performance.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 15 degrees before top dead center with the manual spark control lever in the fully advanced position. To set timing, crank engine over until piston No. 1 reaches top dead center on compression stroke (the upstroke with both valves closed) when the flywheel mark 'Top C 1 & 8' will be opposite the indicator on the flywheel case. Then fully retard spark lever and carefully advance it 6/10 of the total range with the ignition turned on. The ammeter reading should drop from an indicated discharge of 12 amperes to '0' at this point. If it drops to 6 amperes and then to '0' the contacts are not properly synchronized. If the ammeter reading does not change, remove the distributor head and rotor and loosen the screw in the center of the breaker cam. Then carefully rotate the cam until the contacts begin to open and the ammeter pointer drops to '6'. Tighten the lock screw and connect the segment oppo-

STUTZ

SERIES MA, MB (1929-30), AFTER DECEMBER 4, 1928
(134½" WHEELBASE) SERIAL NUMBERS 30,001 UP
(145" WHEELBASE) SERIAL NUMBERS 40,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

site the rotor segment connected to the center terminal in the distributor head to the spark plug in cylinder No. 1 on the right side. Connect the remaining spark plugs as shown on the diagram.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4. Spark plugs are connected 1R-8L-6R-3L-2R-7L-5R-4L-8R-1L-3R-6L-7R-2L-4R-5L clockwise around the distributor head. Spark plugs are right (R) and left (L) in the cylinder head and No. 1 cylinder is nearest the radiator.

Spark Plugs:—Spark plugs are 18 MM. Metric Standard. Gaps are .022 inch.

VALVE TIMING:—Specifications:—Head diameter, 1 21/32 inches. Stem diameter, ⅜ inch. Stem length, 6 11/32 inches (top of seat to end of stem). Valve lift, 11/32 inch. Spring pressure, 56 pounds—valve closed (spring length 2 27/64 inches) and 102 pounds—valve open (compressed to 2 5/64 inches). Tappet clearance or lash between valve cap and cam, .028 inch. Valve stem guides are removable. Oversize valves are not made.

Timing:—Inlet valves open 7 degrees after top dead center and close 47 degrees after lower dead center. Exhaust valves open 49 degrees before lower dead center and close 7 degrees after top dead center.

To Set Valve Timing:—Cam shaft sprocket should be removed from camshaft and automatic adjusting or idling sprocket in upper chain must be off the engine. Crank engine over until piston No. 1 reaches a position 7 degrees after top dead center when the flywheel mark 'EX.CL.1&8 IN.OP.1&8' will be in the exact center of the inspection hole in the upper flywheel housing. Then turn camshaft until the heel of the first cam is directly above No. 1 valve (exhaust valve in cylinder No. 1). Set lash or clearance at .028 inch. This is very important. Then turn camshaft in clockwise direction (direction of rotation) until valve has just closed. This may be determined by inserting pin in hole in valve cap and oscillating valve. The added drag when the valve seats is perceptible. Then mesh camshaft sprocket in chain and rotate sprocket counter-clockwise to take up all slack in driving side of chain. Line up holes in camshaft sprocket and camshaft by slipping the upper chain one tooth at a time on the transfer sprocket. Install four cap screws mounting sprocket on camshaft. Mesh automatic adjusting sprocket in chain and insert eccentric adjusting hub. Wind up spiral spring 1½ turns to provide proper tension and insert spring tongue in nearest slot in stud. Assemble plain washer on sprocket shaft and insert cotter.

STARTER:—Model 726-C. Starter is connected to the engine through a clutch and manual pinion shift connected to the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 200 R.P.M. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted on the forward side of the flywheel housing at the left of the engine. To remove starter, disconnect cable and starting pedal linkage and remove three cap screws in flange mounting. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every 750 miles. The drive end bearing is oilless.

GENERATOR:—Model 391. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 50%. To adjust generator output, remove the commutator cover band and shift the third brush by hand in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in position by friction. With standard car setting, the maximum charging rate is 22-24 amperes (cold) reached at 1400 R.P.M. or approximately 32 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
22-24	8.2-8.62	1400	10-12	7.3-7.7	1600

Shunt field current is 1.8-2.3 amperes at 6 volts. Brush spring tension is 20-28 ounces.

Mounting:—Generator is mounted by special flange at right of engine on rear of accessory bracket. The water pump is driven by an extension of the generator shaft. To remove generator, disconnect water pump drive coupling and generator lead. Then remove three flange mounting cap screws and pull generator to the rear.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at each end of the generator every 750 miles.

RELAY:—Model 266-N. Relay is mounted on the generator. Relay contacts close at 600 R.P.M. or 7 M.P.H. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contacts open .015-.020 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-G. Lighting switch is mounted at lower end of steering column. Headlight dimming is by resistance on switch. Headlights are 6-8 volt, 32 cp. S.C. Mazda 1133. Cowl lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda 87. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

CURRENT LIMIT RELAY:—Model 410-C. This device is a vibrating circuit breaker mounted on the dash. It is connected in the lighting circuits and begins to vibrate when the current reaches 20-30 amperes limiting the current to 2-15 amperes. Contact opening is .012-.030 inch. Air gap is .019-.025 inch.

STUTZ

SIX CYLINDER, SERIES LA (1931), LAA (1932-33)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

CAR SERIAL NUMBER:—Stamped on plate on right front side of dash and on right top side of front frame cross member (forward engine support).

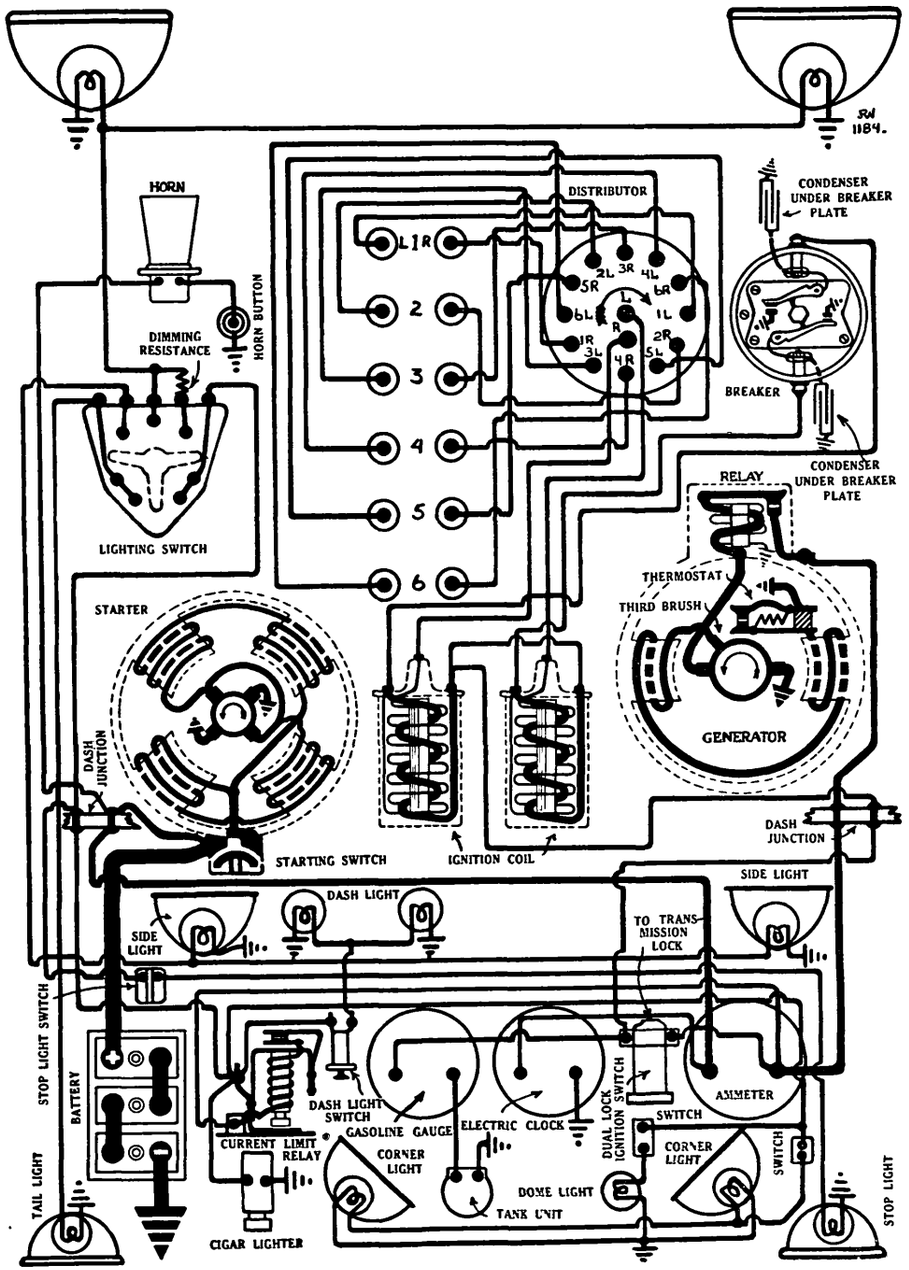
ENGINE NUMBER:—Stamped on plate on right side of cylinder cover and on right crankcase wall back of distributor.

BATTERY:—**Prest-O-Lite, Type A-617-SP,** 6 volt, 17 plate, 160 ampere hour capacity (5 ampere rate). Starting capacity 170 amperes for 20 minutes. Negative (—) terminal grounded. Battery mounted under driver's seat. Battery size 7 inches wide, 13 inches long, 9⅝ inches high.

IGNITION:—**Coil Model 528-C** (two used). Coils are mounted under the hood on the right side. Ignition current is 10 amperes at 6 volts with engine stopped and 6 amperes at 6 volts with engine running. The ignition switch is a Delco-Remy Dual-lock Model 426-K.

**Distributor Model 4043. Breaker contact gap exactly .017". Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is obtained with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension 17-21 ounces (measured at tip of breaker arm with spring scale at right angles to contact surface). There are two sets of contacts operating on a six lobe cam. Contacts open simultaneously to fire both spark plugs in each cylinder. Contacts must be synchronized (see Timing). Distributor is semi-automatic. Maximum manual advance is 38° (engine).

Cam Angles—Closed 36°. Open 24° (distributor) each set independently.



Automatic Advance					
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start		300	2		600
6		700	12		1400
11		1275	22		2550

Mounting:—Distributor is mounted on accessory bracket at right of engine. To remove distributor, disconnect manual advance rod and primary leads and remove distributor head with cables intact. Then remove manual advance stop screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor every 750 miles. Every 1000 miles remove the distributor head and rotor and put a small amount of vaseline on the face of the breaker cam and oil the breaker arm pivot pins with light engine oil.

Timing:—**Synchronization of Contacts.** Contacts must be synchronized so that they open at the same instant firing both spark plugs in each cylinder simultaneously. Connect a six volt lamp in each primary circuit. Turn ignition on and crank engine over slowly. The lamps will go out as each set of contacts open. If both lamps go out at the same instant the contacts are synchronized. If they do not, loosen the four lock screws on the breaker plate and shift the plate causing one set of contacts to open earlier or later until synchronization is effected. Then tighten lock screws and check contact gap with breaker arm on lobe of cam. If outside limits of .015-.020 inch, reset at .017 inch and repeat synchronization.

Timing Distributor to Engine. Standard setting 15 degrees (on flywheel) before top dead center with manual spark control fully advanced. To set timing, fully advance manual spark control, see that distributor is rotated counter-clockwise as far as possible, take off cover over inspection hole in flywheel housing. With No. 1 piston on compression stroke turn engine over until flywheel mark 'AD.SPK.1 & 8' is directly opposite indicator in inspection hole in housing. Loosen lock screw in center of breaker cam, carefully locate cam so that contacts are beginning to open, tighten locking screw. Connect spark plugs as indicated on diagram.

STUTZ

SIX CYLINDER, SERIES LA (1931), LAA (1932-33)
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

NOTE:—The flywheel mark 'AD.SPK.1&8' is not provided on Model LA cars and ignition should be set with piston on top dead center with spark control advanced 6/10.

Firing Order:—The firing order is 1-5-3-6-2-4. Spark plugs are connected 1R-6L-5R-2L-3R-4L-6R-1L-2R-5L-4R-3L clockwise around the distributor head. Spark plugs are right (R) and left (L) in the cylinder head as viewed from the driver's seat and No. 1 cylinder is nearest the radiator.

Spark Plugs:—18 MM. Metric Champion No. 7. Set gaps at .022 inch.

VALVE TIMING:—Valves in cylinder head operated directly by overhead camshaft. Camshaft driven from transfer sprocket on front of engine block by silent timing chain. Transfer sprocket driven from crankshaft by silent timing chain. Automatic idler take-up sprockets are used on both chains.

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake and Exhaust	1 21/32"	3/8"	6 11/32"	45°	11/32"

Tappet Clearance	Spring Pressure
Intake .028" (see Note)	56 pounds (length 2 27/64")
Exhaust .028" (see Note)	102 pounds (length 2 5/64")

Timing—LA 1931

Intake Valves	Exhaust Valves
Open—7° before top dead center.	Open—49° before lower dead center.
Close —47° after lower dead center.	Close—7° after top dead center.

Timing—LAA 1932

Open—1° before top dead center.	Open—49° before lower dead center.
Close—55° after lower dead center.	Close—7° after top dead center.

Note on Tappet Clearance or Lash. Valves equipped with conventional removable valve stem guide (inner guide) and piston guide (outer guide) screwed on end of valve stem. Valve cap (which bears against cam face) screwed on end of valve stem against valve piston. To set tappet clearance or lash, turn camshaft until nose of cam points up at 45° angle with heel of cam at one side of metering pin directly over valve cap. Insert bar in hole in valve piston (piston guide cut away on left side) to hold valve piston from turning and turn valve cap by bar inserted in hole. Adjust lash to .028 inch by screwing valve cap and piston up or down on valve stem.

To Set Valve Timing. Cam shaft sprocket should be taken off cam shaft and automatic adjusting sprocket must be off engine. Crank engine over until piston No. 1 reaches a position 7 degrees past top dead center when the flywheel mark 'EX.CL.1 & 6' should be in the exact center of the inspection hole in the upper flywheel housing. Then turn cam shaft until the heel of the first cam at the front of the engine is directly above No. 1 valve (exhaust valve in cylinder No. 1). Set lash or clearance between valve cap and cam at .028 inch (this is very important). Then turn cam shaft in direction of rotation (clockwise) until the valve has opened and just closed. This may be determined by inserting pin in hole in valve cap and oscillating valve. The added drag when the valve seats will be perceptible. Then mesh cam shaft sprocket in upper chain and rotate sprocket counter-clockwise to take up all the slack in the driving side of the chain. Line up holes in sprocket and cam shaft flange by slipping chain one tooth at a time on the transfer sprocket. Insert four cap screws mounting sprocket on cam shaft. Mesh automatic adjusting sprocket in chain and insert eccentric adjusting hub. Wind up spiral spring one and one half turns to provide proper chain tension and insert spring tongue in nearest slot. Assemble plain washer on sprocket shaft and insert cotter.

STARTER:—Model 726-C. Starter is connected to the engine through a clutch and manual pinion shift connected to the starting switch. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting pedal linkage and remove three flange mounting cap screws. Then pull starter forward and lift from place.

GENERATOR:—Model 391. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165 F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, take off commutator cover band and shift third brush using a screwdriver inserted in the notch in the third brush plate to shift the plate. Shift third brush counter-clockwise to increase or clockwise to decrease the charging rate. Third brush mounting plate held in position by friction. With standard car setting maximum charging rate is 12 amperes (hot) at 7.6 volts reached at 1600 R.P.M. or 32 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
22-24	8.2-8.62	1400	10-12	7.35-7.65	1600

Shunt field current is 1.8-2.3 amperes at 6 volts. Brush spring tension is 20-28 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of accessory bracket. To remove generator, disconnect water pump drive coupling and generator lead and remove three flange mounting cap screws. Then pull generator to rear and lift from place.

RELAY:—Model 266-N. Relay is mounted on the generator. Relay contacts close at 575 R.P.M. or 8 M.P.H. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .015-.020 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-G. Lighting switch is mounted at lower end of steering column. Headlights are dimmed by resistance on lighting switch. Lighting switch positions:

1. Lever vertical—All lights off.
2. No. 1 right—Headlights dimmed through resistance, tail light on.
3. No. 2 right—Headlights on bright, tail light on.
4. No. 1 left—Cowl lights on, tail light on.

Lamp Sizes

Stop Light	6-8	15	S.C.	87
Dome and Corner Lights	6-8	15	S.C.	87

CURRENT LIMIT RELAY:—Model 410-C. This device is a vibrating circuit breaker mounted on the dash and connected in the lighting circuits. It begins to vibrate when the current flow reaches 20-30 amperes and continues limiting the current to 2-15 amperes. Contacts separate .012-.030 inch. Air gap is .019-.025 inch with contacts closed.

STUTZ

MODEL SV-16 (1931-32-33-34)
DELCO-REMY ELECTRICAL SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on right front side of engine dash and on right top side of front frame cross member (forward engine support).

ENGINE NUMBER:—Stamped on plate on right side cylinder cover and on right crankcase wall back of distributor.

ENGINE:—Eight cylinder, 'I' or overhead valve type, 3⅜x4½" bore and stroke, 322 cubic inch displacement, rated at 46.4 H.P., develops 113 H.P. at 3300 R.P.M. Standard compression ratio 5.5-1. Optional low compression ratio 5.0-1.

BATTERY:—**Prest-O-Lite, Type A-619-ST,** 6 volt, 19 plate, 145 ampere hour capacity (5 ampere rate). Starting capacity 173 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—On left hand side of frame under driver's seat.
Dimensions:—Width, 7". Length, 13". Height, 9 3/16".

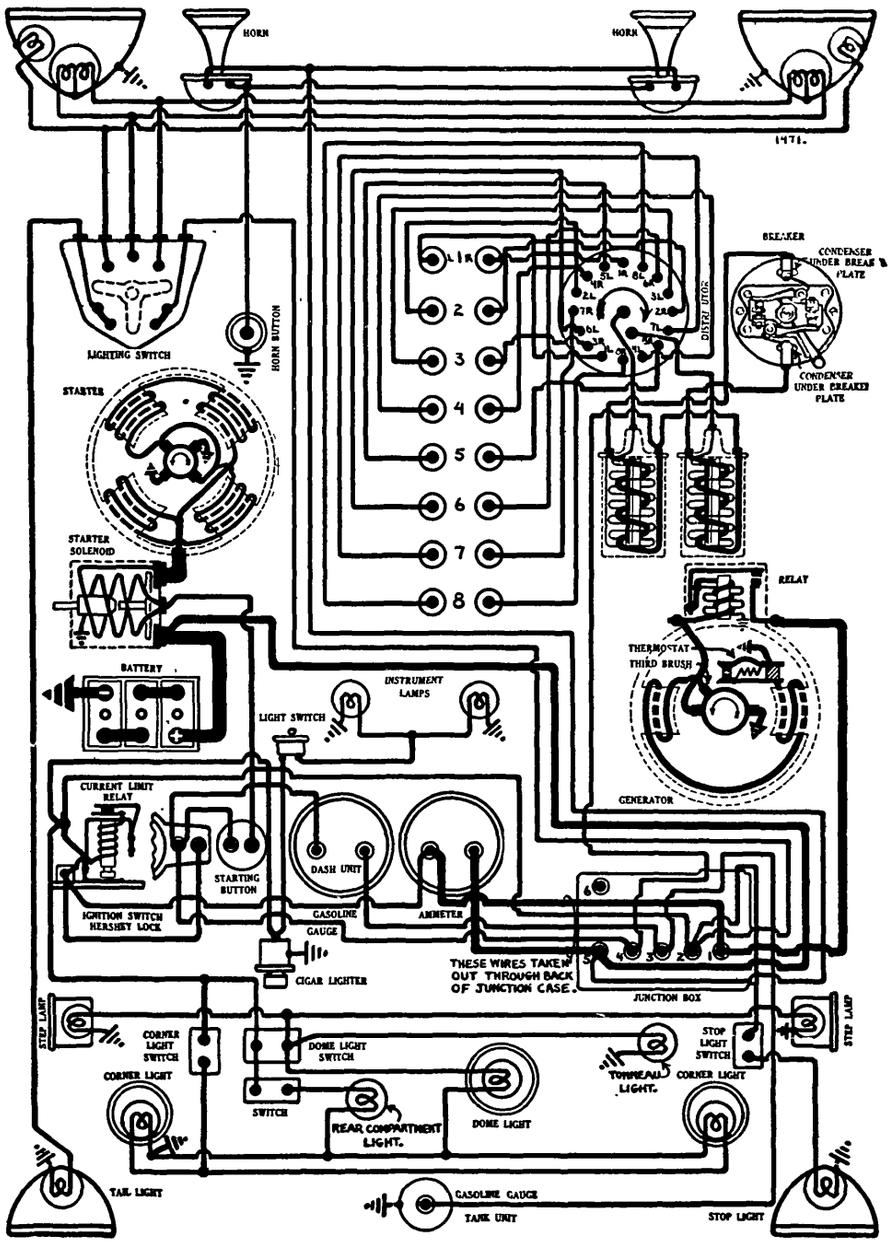
IGNITION:—**Coil Model 531-C (2 used).** Coils are mounted at right of engine.
Ignition Current:—6 amperes at 6 volts (engine running), 10 amperes at 6 volts (engine stopped) total for both coils.
Ignition Switch:—**Oakes** 'Hershey' type co-incidental ignition switch and steering post lock.

Distributor Model 4028. Two breaker arm, 8-lobe cam type with semi-automatic advance. Breaker contacts open simultaneously to fire both spark plugs in each cylinder. Contacts must be synchronized—(see Timing). Manual advance is controlled by left hand lever on steering wheel. Maximum manual advance is 38° (engine).
Breaker Gap:—Set contact gap at .017". Hold within limits of .015-.020".
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm with spring scale at right angles to contact surface.

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start	.....	300	2	.....	600
6	.....	700	12	.....	1400
11	.....	1275	22	.....	2550

Mounting:—Distributor mounted on accessory bracket at right front of engine. To remove, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—**750 Miles.** Put 8-10 drops light engine oil in oiler on side of distributor cup.



1000 Miles. Take off distributor cap and rotor. Put one drop oil on breaker arm pivot pins, apply thin film vaseline to face of breaker cam.

Timing:—Standard setting 15° (on flywheel) before top dead center with manual spark control fully advanced. To set timing, first advance manual spark control (pull lever down), see that distributor is rotated counter-clockwise to end of advance arm slot, take off cover over inspection hole in top of flywheel housing. With No. 1 piston on compression turn engine over until piston is slightly before top dead center with flywheel mark AD.SPK. 1 & 8' directly opposite indicator on housing, loosen taper lock screw in center of breaker cam, carefully locate cam so that contacts are beginning to open (use test lamp), tighten locking screw, connect spark plugs as indicated on diagram.

Synchronization of Contacts. To synchronize contacts, connect test lamp in each primary circuit, loosen four lock screws on movable breaker sub-plate, shift plate until both sets of contacts open at the same instant. Synchronization should be checked whenever contacts are adjusted or ignition is set.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator. See diagram for order in which spark plug cables are connected around distributor head.

Spark Plugs:—18 MM. Metric. Champion No. 7. **Set gaps at .022 inch.**

STUTZ

MODEL SV-16 (1931-32-33-34)
DELCO-REMY ELECTRICAL SYSTEM

VALVE TIMING:—Valves in cylinder head operated directly from overhead camshaft. Camshaft driven from transfer sprocket on front of engine by silent timing chain. Transfer sprocket driven from crankshaft in tandem with accessory sprocket by silent timing chain. Automatic idler sprockets on both chains.

Valve Specifications

	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake and Exhaust	1 21/32"	⅜"	6 11/32"	45°	11/32"

Tappet Clearance		Spring Pressure	
Intake	.028" (see note)	Closed	56 pounds (2 27/64")
Exhaust	.028" (see note)	Open	102 pounds (2 5/64")

Intake Valves	Timing	Exhaust Valves
Open—1° before top dead center.		Open—49° before lower dead center.
Close—55° after lower dead center.		Close—7° after top dead center.

Note on Tappet Clearance or Lash:—Valves equipped with conventional removable valve stem guide (inner guide) and piston guide (outer guide) screwed on end of valve stem. Valve caps (which bears against cam face) are screwed on valve stem against valve piston. To set tappet clearance or lash, turn camshaft until nose of cam points up at 45° angle with heel of cam at one side of metering pin directly over valve cap. Insert bar in hole of valve piston (piston guide cut away on left side), hold valve piston from turning, turn valve cap with bar inserted in hole to loosen. Adjust lash to .028" by screwing valve cap and piston up or down on valve stem.

To Check Valve Timing. Set tappet clearance or lash of No. 1 exhaust valve at .028" (see above). With No. 8 piston on compression turn engine over until No. 1 exhaust valve begins to close (insert valve adjusting rod in hole in valve cap and oscillate valve until added drag indicates that valve has begun to seat). Flywheel mark 'EX.CL.1 & 8' should be directly opposite indicator on housing (inspection hole at top or side of flywheel housing).

To Set Valve Timing—with upper chain and idler sprocket off engine and camshaft sprocket off camshaft. Turn crankshaft until flywheel mark 'EX. CL.1 & 8' is directly opposite indicator on housing. Turn camshaft in direction of rotation until No. 1 exhaust valve has begun to close (see paragraph above). Mesh camshaft sprocket in chain, turn sprocket counter-clockwise to take up all slack in driving side of chain, slip chain on transfer sprocket one tooth at a time until cap screws can be inserted without disturbing position of camshaft (a closer adjustment can be obtained by rotating camshaft sprocket one quarter turn which changes the timing ¼ tooth). After mounting camshaft sprocket, mesh automatic sprocket, turn eccentric hub clockwise to take up all slack in chain, wind up spring 1½ turns to secure proper spring tension, insert end of spring in nearest slot in stud, assemble plain washer and cotter pin. Wire camshaft sprocket cap screws. Check setting and set tappet clearance or lash of all valves at .028 inch.

CARBURETION:—Zenith Updraft Dual Carburetor (see Carburetor Section for complete data).

Fuel System:—Kingston Vacuum tank mounted on dash.

Gasoline Gauge:—Stewart-Warner electric type.

STARTER:—**Model 726-C ('31-32), 727-C ('33-34).** Starter drive—manual pinion shift operated by pedal on toeboard (1931-32), or by solenoid starting switch Type 1501 (1933-34). See article in Electrical Equipment Section for complete data on this solenoid switch. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.0	65
16 "	Lock	3.0	600

Mounting:—Starter flange mounted left front face flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take out 3 flange mounting screws, pull starter forward to clear pinion housing, lift out.

Oiling:—**750 Miles.** Put 8-10 drops light engine oil in commutator end oiler. Intermediate bearing and drive end bearing are graphite bronze oilless.

GENERATOR:—**Model 391.** Third brush regulation, thermostat control. Thermostat operates at 160°F. (contacts open, cuts in resistance) reducing output approximately 40%. Rotation is counter-clockwise at commutator end. Maximum charging rate is 12 amperes (hot) at 7.3 volts reached at 1600 R.P.M. or 32 M.P.H.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting plate by means of a scrwdriver inserted in the slot in the plate. Shift third brush counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
22-24	8.2-8.6	1400	10-12	7.3-7.6	1600

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—1.8-2.3 amperes at 6 volts across field terminals.

Mounting:—Generator flange mounted on rear face of accessory bracket at right of engine. To remove, disconnect water pump drive coupling, disconnect lead, take out 3 flange mounting screws, pull generator to rear to disengage drive coupling, lift out.

Oiling:—**750 Miles.** Put 8-10 drops light engine oil in oiler at each end.

RELAY:—**Model 266-N.** Relay mounted on generator. Contacts close at 600 R.P.M. of generator or 7 M.P.H. with generator voltage of 7-7.5 volts and open with discharge current of 0-2.5 amperes. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—**Delco-Remy Switch, Model 486-G.** Lighting switch mounted at lower end of steering column controlled by lower lever on steering wheel. Headlamps dimmed by resistance on switch (1931-32). On 1933-34 models, double filament bulbs used for 'depressed beam' dimming and are controlled by lighting switch.

Lamp Sizes

NOTE—Headlamp bulbs for 1931-32 models 32 cp. SC., Mazda No. 1133.

CURRENT LIMIT RELAY:—**Model 410-C, N, F.** Vibrating circuit breaker mounted on back of instrument panel at extreme left. Circuit breaker begins to vibrate with current load of 35-40 amperes (410-N), 30-35 amperes (410-F) limiting load to 5-22 amperes with direct short-circuit.

Contact Gap:—.012-.030". **Air Gap:**—.015-.025" with contacts closed.

Spring Tension:—5 ounces minimum measured at brass button with spring scale at right angles to contact arm.

HORNS:—Klaxon Model K-26, Type 1509 (low note), Type 1510 (high note) matched tone twin horns. Current draw 6.0-8.5 amperes at 6.0 volts (Type 1509), 5.0-6.5 amperes at 6.0 volts (Type 1510).

STUTZ

MODEL DV-32 (1931-32-33-34)
DELCO-REMY ELECTRICAL SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on right front side of engine dash and on right top side of frame front cross member (front engine support).

ENGINE NUMBER:—Stamped on plate on right side cylinder head cover and on right crankcase wall back of distributor.

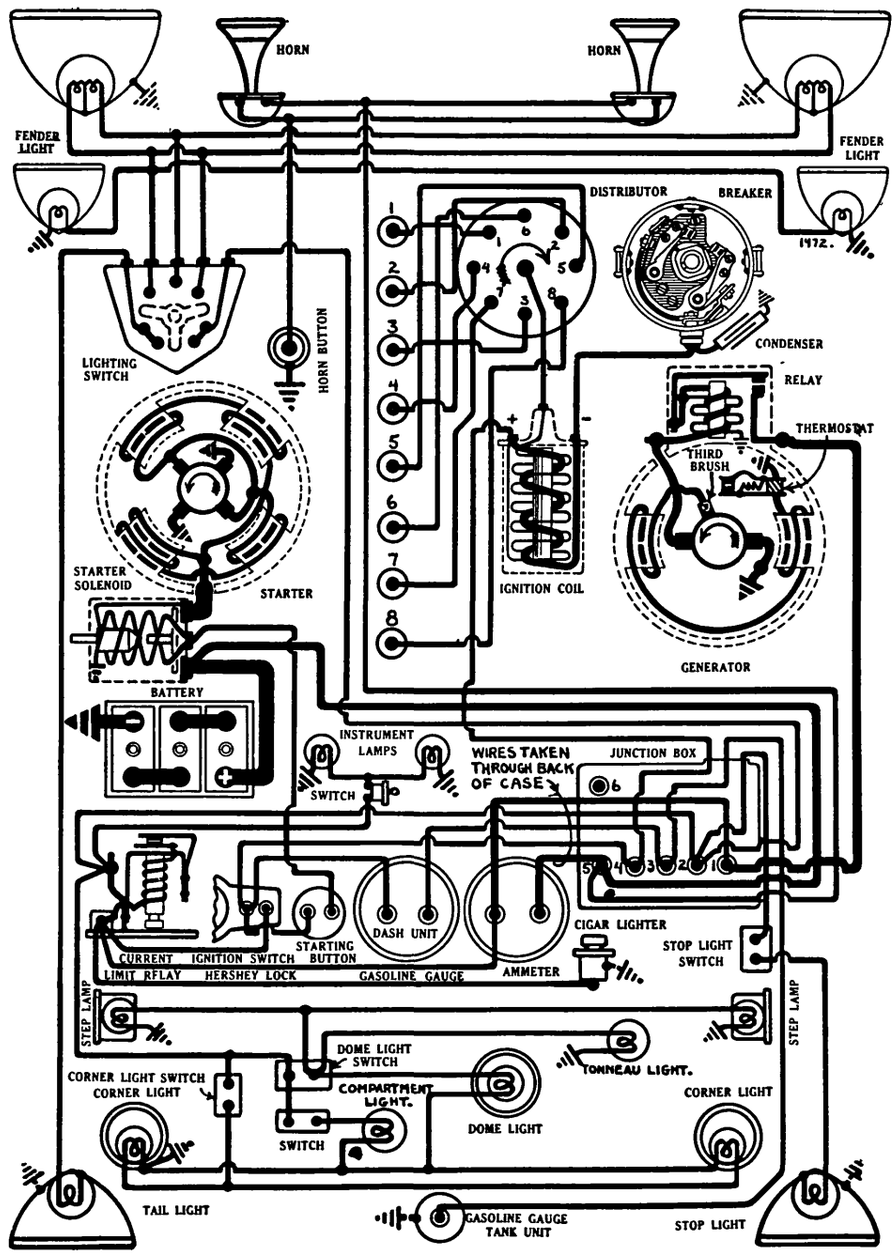
ENGINE:—Eight cylinder, 'I' or overhead valve type with separate intake and exhaust camshafts mounted on cylinder head and two intake and exhaust valves per cylinder. Bore and stroke 3⅜x4½", 322 cubic inch displacement, rated at 46.4 H.P., develops 156 H.P. at 3900 R.P.M. Standard compression ratio 5.0-1. Optional high compression ratio 5.5-1.

BATTERY:—**Prest-O-Lite, Type A-619-ST,** 6 volt, 19 plate, 145 ampere hour capacity (5 ampere rate). Starting capacity 173 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded.
Mounting:—On left hand side of frame under driver's seat.
Dimensions:—Width, 7". Length, 13". Height, 9 3/16".

IGNITION:—**Coil Model 531-C.** Coil mounted on bracket at right front of engine beside generator. Ignition current 3 amperes at 6 volts (engine running) 5 amperes at 6 volts (engine stopped). Ignition switch is Oakes 'Hershey' type co-incidental ignition switch and steering post lock.

Distributor Model 660-W. Two breaker arm, 4 lobe cam type with semi-automatic advance. Breaker contacts open alternately at 45° intervals corresponding to 90-degree firing interval of engine. Contacts must be synchronized (see Timing).
Manual Advance:—40 degrees (engine) maximum.
Breaker Gap:—Set contact gap at .020". Hold within limits of .018-.024".
Breaker Arm Spring Tension:—17-21 ounces measured at tip of breaker arm
Cam Angles—Closed 34°. Open 11° (distributor) when synchronized.

Automatic Advance



Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	2		600
6		700	12		1400
18.5		2100	37		4200

Mounting:—Distributor mounted on accessory bracket at right front of engine. To remove, disconnect lead, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.
Timing:—Standard setting 20° (on flywheel) before top dead center with manual spark control fully advanced. To set timing, first advance manual spark control (pull lever down), see that distributor is rotated counter-clockwise to end of advance arm slot, take off cover plate over inspection hole in top of flywheel housing. With No. 1 piston on compression stroke, turn engine over until flywheel mark 'AD.SPK.1&8' (which is 20° before top dead center mark 'TOP C.1 & 8') is directly opposite indicator in inspection hole, loosen advance arm clampscrew, rotate distributor until first set of contacts mounted directly on breaker plate begin to open (use test lamp), tighten clamp screw, connect spark plugs as indicated on diagram.
Synchronization of Contacts. Use special Delco-Remy tool, Part No. 1838182 and follow complete directions in Equipment Section. No flywheel marks provided to check synchronization by timing distributor using second set of contacts.
Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.
Spark Plugs:—18 MM. Metric. Champion No. 7. Set gaps at .022 inch.

VALVE TIMING:—Exhaust valves (two per cylinder) in cylinder head at right of engine operated by overhead exhaust camshaft. Intake valves (two per cylinder) in cylinder head at left of engine operated by overhead intake camshaft. Both camshafts driven in tandem by silent timing chain from transfer sprocket on front of engine block. Transfer sprocket driven in tandem with accessory sprocket by silent timing chain from crankshaft. Both chains equipped with automatic take-up idler sprockets, no adjustment necessary in service.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Length	Seat Angle	Lift
Intake and Exhaust	1 9/32"	⅜"	5 21/32"	45	11/32"

STUTZ

MODEL DV-32 (1931-32-33-34)

DELCO-REMY ELECTRICAL SYSTEM

Tappet Clearance		Valve Springs	
Intake	.028" or .046" see note	Open	115 pounds (1 15/16")
Exhaust	.028" or .046" see note	Closed	53 pounds (2 9/32")

Intake Valves	Timing	Exhaust Valves
Open—5° before top dead center.		Open—46° before lower dead center.
Close—41° after lower dead center.		Close—10° after top dead center.

Note on Tappet Clearance or Lash:—Tappet clearance on various engines set at either .028" or .046". Correct tappet clearance for each engine is stamped on name plate on engine and should be consulted when tappet clearance is being set. Valves are fitted with conventional removable valve stem guide (inner guide) and piston guide screwed on end of valve stem (outer guide). Valve cap (which bears on cam face) is screwed on valve stem against valve piston. To set tappet clearance or lash, turn camshaft until nose of cam is perpendicular (at right angles to face of valve cap), with metering pin turned off valve cap. Insert adjusting bar in hole in valve piston (piston guide cut away on inside), hold valve piston from turning, insert second bar in hole in valve cap and turn cap to loosen. Adjust lash to .028" or .046" by screwing valve cap and piston up or down on valve stem. All turning must be done on valve cap to avoid formation of burs on valve piston.

To Check Valve Timing Intake Camshaft:— Set tappet clearance No. 1 intake and exhaust valves at .028" or .046" (see name plate on engine), take off cover plate over inspection hole in top or side of flywheel housing. Turn engine over until No. 1 intake cam is about to touch valve cap (tappet clearance taken up—valve about to open), insert adjusting bar in valve cap hole so that bar is pointed across engine and loop rubber band over bar fastening other end of band to engine so that band tension is slightly less than amount necessary to rotate valve. Turn engine over slightly until band begins to rotate valve indicating that valve has left its seat. Flywheel mark 'IN.OP.1 & 8' (which is 5° before top dead center mark "TOP. C. 1 & 8') should be directly opposite indicator on housing. If setting is not exact, turn crankshaft over two revolutions and stop with flywheel mark at indicator. Then loosen camshaft sprocket mounting capscrews slightly, rotate camshaft until intake valve begins to open, tighten capscrews (capscrew holes are slotted). Check setting.

To Check Exhaust Camshaft:—After checking intake camshaft setting (above) insert adjusting rod in hole of No. 1 exhaust valve cap, turn engine over slowly until added drag on rod when valve is oscillated indicates that valve is beginning to seat. Flywheel mark 'EX.CL.1 & 8' (which is 10° after top dead center mark 'TOP.C. 1 & 8') should be directly opposite indicator on housing. If setting is not correct, turn crankshaft two revolutions and stop with flywheel mark at indicator. Then loosen camshaft sprocket mounting capscrews slightly, turn camshaft until valve closes, tighten mounting screws (capscrew holes are slotted). Check setting.

To Set Valve Timing:—With intake and exhaust camshaft sprockets and automatic idler take-up sprocket off engine. Turn crankshaft until flywheel mark '0' (which is 2½° after top dead center mark 'TOP.C.1 8') is directly opposite indicator on housing with distributor rotor pointed toward rear of car (if rotor points toward front of car turn engine over one complete revolution). Turn intake camshaft until No. 1 intake valve is about to open and turn exhaust camshaft until No. 1 exhaust valve is about to close. Mesh intake camshaft sprocket in chain, turn sprocket counter-clockwise to take up all slack in driving side of chain (between sprocket and transfer sprocket), see if lines indicating center of slotted holes in sprocket line up with lines on camshaft flange indicating center of capscrew holes without disturbing position of camshaft. If they do not, slip sprocket on chain one tooth at a time to left until sprocket can be mounted on flange with marks in line without disturbing camshaft. This is necessary to provide for later adjustment. Insert capscrews mounting sprocket on flange. Mesh exhaust camshaft sprocket in chain, turn to left to take up slack in driving side of chain between camshaft sprockets, slip sprocket on chain one tooth at a time until sprocket can be mounted on camshaft flange with marks indicating center of slots in sprocket and center of holes in flange in line without disturbing position of camshaft. Mesh automatic take-up idler sprocket in chain, turn eccentric hub to left to take up all slack in chain, wind up eccentric spring one and one half turns, insert end of spring in nearest slot, assemble washer and cotter. Check valve timing as directed above for both camshafts and make any adjustment necessary by shifting sprockets on camshafts until exact settings are secured.

CARBURETION:—Stromberg Downdraft Carburetor, Model EE-3 (see Carburetor Section for complete data). Stromberg Automatic Choke is standard equipment.

Fuel Pump:—Stewart-Warner mechanical type fuel pump is mounted on valve cover at left rear of engine (see Carburetion Section).

Gasoline Gauge:—Stewart-Warner electric type.

STARTER:—**Model 726-C ('31-32), 727-C ('33-34).** Starter drive—manual pinion shift operated by pedal on toeboard (1931-32), or by solenoid starting switch Type 1501 (1933-34). See article in Electrical Equipment Section for complete data on this solenoid switch. Rotation counter-clockwise at commutator end. Brush spring tension 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.0	65
15 "	Lock	3.0	600

Mounting:—Starter flange mounted left front face flywheel housing. To remove, disconnect cable, disconnect starting pedal linkage, take out 3 flange mounting screws, pull starter forward to clear pinion housing, lift out.

GENERATOR:—**Model 391.** Third brush regulation, thermostat control. Thermostat operates at 160° F. (contacts open, cuts in resistance) reducing output approximately 40%. Rotation is counter-clockwise at commutator end. Maximum charging rate is 12 amperes at 7.3 volts (hot) reached at 1600 R.P.M. or 32 M.P.H.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by means of a screwdriver inserted in slot in brush mounting plate, counter-clockwise to increase, or clockwise to decrease charging rate. Brush mounting plate is held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
22-24	8.2-8.6	1400	10-12	7.3-7.6	1600

Brush Spring Tension:—20-28 ounces on each brush.

Field Current:—1.8-2.3 amperes at 6 volts across field terminals.

Mounting:—Generator flange mounted on rear face of accessory bracket at right of engine. To remove, disconnect water pump drive coupling, disconnect lead, take out 3 flange screws, pull generator to rear to disengage drive coupling, lift out.

RELAY:—**Model 266-N.** Relay mounted on generator. Contacts close at 600 R.P.M. of generator or 7 M.P.H. with generator voltage of 7-7.5 volts and open with discharge current of 0-2.5 amperes. Relay contact gap limits .015-.025 inch. Air gap limits .012-.017 inch (contacts closed).

LIGHTING:—**Delco-Remy Switch, Model 486-G.** Lighting switch mounted at the lower end of steering column controlled by lower lever on steering wheel. Headlamps dimmed by resistance on switch (1931-32). On 1933-34 models, double filament bulbs used for 'depressed beam' dimming and are controlled by lighting switch.

Stop Lights	6-8	15	S.C.	87
Dome, Corner Lights	6-8	15	S.C.	87

NOTE—Headlamp bulbs for 1931-32 models 32 cp. SC., Mazda No. 1133.

CURRENT LIMIT RELAY:—**Model 410-C, N, F.** Vibrating circuit breaker mounted on back of instrument panel at extreme left. Circuit breaker begins to vibrate with current load of 35-40 amperes (410-N), 30-35 amperes (410-F) limiting load to 5-22 amperes with direct short-circuit.

Contact Gap:—.012-.030". **Air Gap:**—.015-.025" with contacts closed.

Spring Tension:—5 ounces minimum measured at brass button with spring scale at right angles to contact arm.

HORNS:—Klaxon Model K-26, Type 1509 (low note), Type 1510 (high note), matched tone twin horns. Current draw 6.0-8.5 amperes at 6.0 volts (Type 1509), 5.0-6.5 amperes at 6.0 volts (Type 1510).

SERIAL NUMBER:—First number (K) 373,000, (KU) 21,500, (KS) 396,727. On plate on engine side of dash under hood

COMPRESSION:—Ratio—Std 5 75-1 hd. Optl 6 25-1 hd. **Pressure**—(Std. head) 80 lbs. at 125 R P.M.

VACUUM READING:—Gauge should show steady reading of 18-19" with engine idling

IGNITION:—Coil Model IG-4311. Lock coil type. Resistor mounted on distributor.
Ignition Current—2 5 amperes (idling), 4 5 amperes (stopped).
Distributor Model IGB-4301-A. Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set gap at 020 . Limits, .018- 020'.
Breaker Arm Spring Tension—16-22 ounces
Cam Angles—Closed 40°. Open 20° (distributor).

Automatic Advance

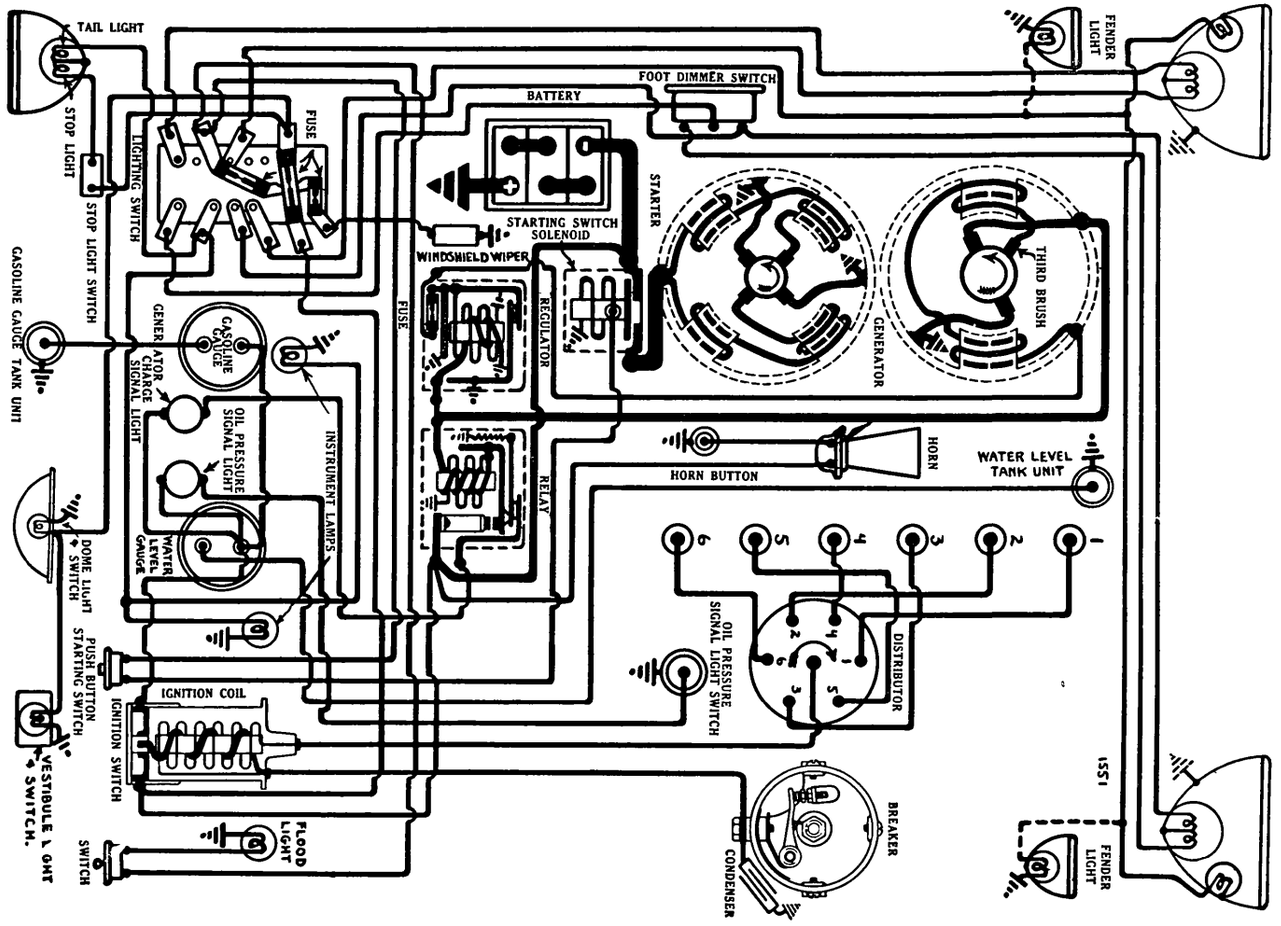
Distributor		Engine	
Degrees	R P M	Degrees	R P M.
Start	400	0	800
3	.. 720	6	1440
6	1040	12	2080
9	1360	18	2720
12	1680	24	3360
15	2000	30	4000

IGNITION TIMING:— Flywheel Degs. Piston Position Initial Setting (all engines) at TDC. .0000' TDC
Timing (Initial Setting):—With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'UDC.1-6/' registers with pointer in inspection hole (left hand front face of flywheel housing above starter), loosen hold-down screw in advance arm, rotate distributor clockwise to limit of advance arm slot, then rotate distributor slowly counter-clockwise until contacts begin to open, tighten hold-down screw, check rotor position and spark plug connections (see diagram) This top dead center setting should be checked by road-testing car and spark advanced as much as operating conditions and fuel rating will allow (see below)
Timing (Final Setting:—With engine at normal operating temperature and running at 8 M P H in high gear on level road, accelerate engine rapidly and note performance from 10 to 15 M P H With correct setting a slight spark knock should be noted under these conditions. If no knock is heard, loosen hold-down screw in advance arm and rotate distributor one graduation counter-clockwise (advance). If knock is too severe, rotate distributor one graduation colckwise (retard). Repeat test until satisfactory setting is secured Final setting must not be beyond maximum advance mark on flywheel (¾" before top dead center mark 'UDC 1-6/').
Motor Gauge—Weidenhoff Adapter #114, Rod #43.

Firing Order:—1-5-3-6-2-4 (see diagram).

Spark Plugs:—Champion, Type J-7. 14 MM Metric
Spark Plug Gaps—.022".

CARBURETION: — (Fuel System). See Carburetion Section for complete data on Carburetor, Automatic Choke (Climatic Control), Fuel Pump, and Gasoline and Oil Level Gauge
Carburetor:—Carter, Model 281-S (K, KU), 295-S (KS), 1¼" plain tube, downdraft type
Automatic Choke—Carter Climatic Control (281-only)
Fuel Pump:—A C , Type R
Gasoline Gauge:—Motometer, electric type



VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at 010" This valve should open with piston 10°40' or 0562" before top dead center when a point on the flywheel approximately 3 17 teeth before top dead center mark 'UDC 1-6' lines up with indicator Reset tappet clearance at .006" with engine warm and running

Motor Gauge—Weidenhoff Adapter #114, Rod #43.

Tappet Clearance:— 006" Int , 008" Exh , engine hot and running.

Valve Spring Pressure:—44 lbs at 2" (valve closed). 102 lbs at 1 21/32" (valve open)

LUBRICATION:—Duo-flow (splash) system with positive pump feed to oil troughs and timing gears by oscillating plunger type pump. Pump mounted on right hand side of crankcase.
Normal Oil Pressure—3 pounds
Oil Pressure Relief Valve—Operates at 3 lbs Located on right hand side of crankcase at rear (combined with oil pressure signal light switch) See Signal Lights article in Equipment Section.
Capacity and Oil—7 qts (dry), 6 qts (refill) Use SAE #30 (above 40°F), #20-W (40° to 0°F)

BATTERY:—National, Type ST-3-17X, 6 volt, 17 plate, 100 ampere hour capacity.
Starting Capacity—122 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—Left hand side under front floor boards.

STARTER:—Model MAB-4060. Armature No. MAB-2114. Starter drive—Inboard Bendix.
Rotation—Counter-Clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).
Cranking Engine—125-150 amperes at 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE:—Lock torque figures correct without switch.

Starting Switch: — Type SS-4001. Solenoid type switch mounted on starter field frame and controlled by pushbutton switch on instrument panel.

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, take out two flange mounting bolts.

GENERATOR: — Model GBK-4602. Armature No. GBK-2055. Ventilated, third brush control type with external voltage regulator. See Equipment Section for complete data on Voltage Regulator.

Charging Rate Adjustment:—Use test meters to check generator output. Short out voltage regulator by connecting short jumper wire from 'F' terminal on generator to ground. Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Remove jumper wire.

Maximum Charging Rate—22 amperes (cold), 8.0 volts, 2400 R.P.M. or 28 M.P.H.

Performance Data
Cold—Regulator Inoperative—Hot

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	800	0	6.4	840
4	6.7	980	4	6.8	1025
8	7.0	1110	8	7.15	1200
12	7.3	1300	12	7.5	1450
16	7.55	1500	16	7.85	1760
22	8.0	2200	18	8.0	2400

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ounces.
Field Current—3.75-4.15 amperes at 6.0 volts.
Motoring—4.46-4.94 amperes at 6.0 volts.
Field Fuse—7½ ampere capacity in knurled cup under regulator case.

Mounting:—Pivot mounted at left front of engine. Driven by fan belt. To remove, take out two pivot bolts and one clamp bolt.
Belt Adjustment—Loosen pivot bolts and clamp bolt, swing generator out or away from engine until slight pull is felt on belt, tighten clamp bolt before slacking off on generator, tighten pivot bolts.

CUT-OUT RELAY: — Model CBA-4002. Mounted on dash. Relay has extra set of contacts above armature for charge tell-tale light control.
Cuts in—6.4 volts, 750 R.P.M. or 8 M.P.H.
Cuts out—.5-2.5 ampere discharge.

VOLTAGE REGULATOR:—Model TC-4102A. Two Charge Regulator mounted on engine side of dash. See article in Electrical Equipment Section for complete data.
Contacts Open—7.86-8.27 volts at 70° F.
Contacts Close—6.46-6.86 volts at 70° F.
Contact Gap—.005" minimum.
Core Gap—.030" plus or minus .001" with contacts closed.

LIGHTING:—Soreng-Manegold Switch, Model 5640-A, C-5640-A (without windshield wiper fuse). Soreng-Manegold Foot Control Switch. Foot control switch provides assymetric 'meeting' beam (lower beam right hand headlight, upper beam left hand headlight). Headlight beams are crossed (left hand headlight lights right side of road). Operative only with lighting switch in 'Country Driving' position. Headlight bulbs are pre-focused type.

Bulb Specifications

Lamp	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking, Instrument, Flood	3	63
Dome, Vestibule	15	87
Stop and Tail	21-2	1158
Signal	3	64 (DC.)

SIGNAL LIGHTS:—Battery charge tell-tale and oil pressure tell-tale light mounted on instrument panel. Light bulbs are standard 3 cp. DC. bulbs.

Battery Charge Tell-tale. At left of instrument cluster. Tell-tale should light with ignition turned on and should go out when gentrator begins to charge battery (relay contacts closed). If tell-tale does not burn when ignition turned on, check bulb by grounding tell-tale terminal on relay to generator field frame. If tell-tale does not light, replace bulb. If lamp lights, check auxiliary contact spring, contacts and ground resistor. See that auxiliary contacts are closed with main contacts open. If tell-tale lights at speeds above idling (8 M.P.H.), generator or relay is defective.

Oil Pressure Tell-tale. At right of instrument cluster. Tell-tale should light with ignition turned on but should go out when engine is operated (light should flash at idling speeds). Tell-tale should not light or flash at speeds above idling. If tell-tale does not light when ignition is turned on, check bulb by grounding terminal on oil pressure check valve (right side of crankcase) to engine. If tell-tale does not light, replace bulb. See special article on Hudson Signal Lights in Equipment Section for complete data.

FUSES:—Lighting—Two 20 ampere capacity fuses on back of lighting switch.
Windshield Wiper—7½ ampere capacity fuse on lighting switch (not used on all cars).
Generator Field—7½ ampere capacity.

SERIAL NUMBERS:—First number — 51-101 On plate on engine side of dash. All cars have this prefix '51'.

COMPRESSION:—Ratio—6 0-1 std. (cast-iron) head, 7 0-1 optl. (composite aluminum-iron) head.
Pressure—111 lbs at 215 R P M. (6 0-1 head), 127 lbs (7 0-1 head) with all spark plugs removed and throttle wide open

VACUUM READING:—Gauge should show steady reading of 18-19" with engine idling at 350 R P M. or 7 M P H

AUTOMATIC SHIFT (ELECTRIC HAND):—Bendix electro-pneumatic type optional on this car See article in Electrical Equipment Section for complete description, wiring diagram, and trouble shooting

IGNITION:—Coil Model IG-4616. Resistance unit mounted on distributor connected in primary
Ignition Current—2 5 amperes idling, 4 5 stopped
Ignition Switch—Mitchellock Mod 24-B, Type 6509.
Distributor Model IGB-4301-A (first 25076 cars), IGB-4301-B (after Eng. No. 128077). Single breaker, 6 lobe cam, full automatic advance type
Breaker Gap—Set at 020' Limits 018-020'
Breaker Arm Spring Tension—16-22 ounces
Cam Angles—Closed 40°. Open 20° (distributor).

Automatic Advance—IGB-4301-A

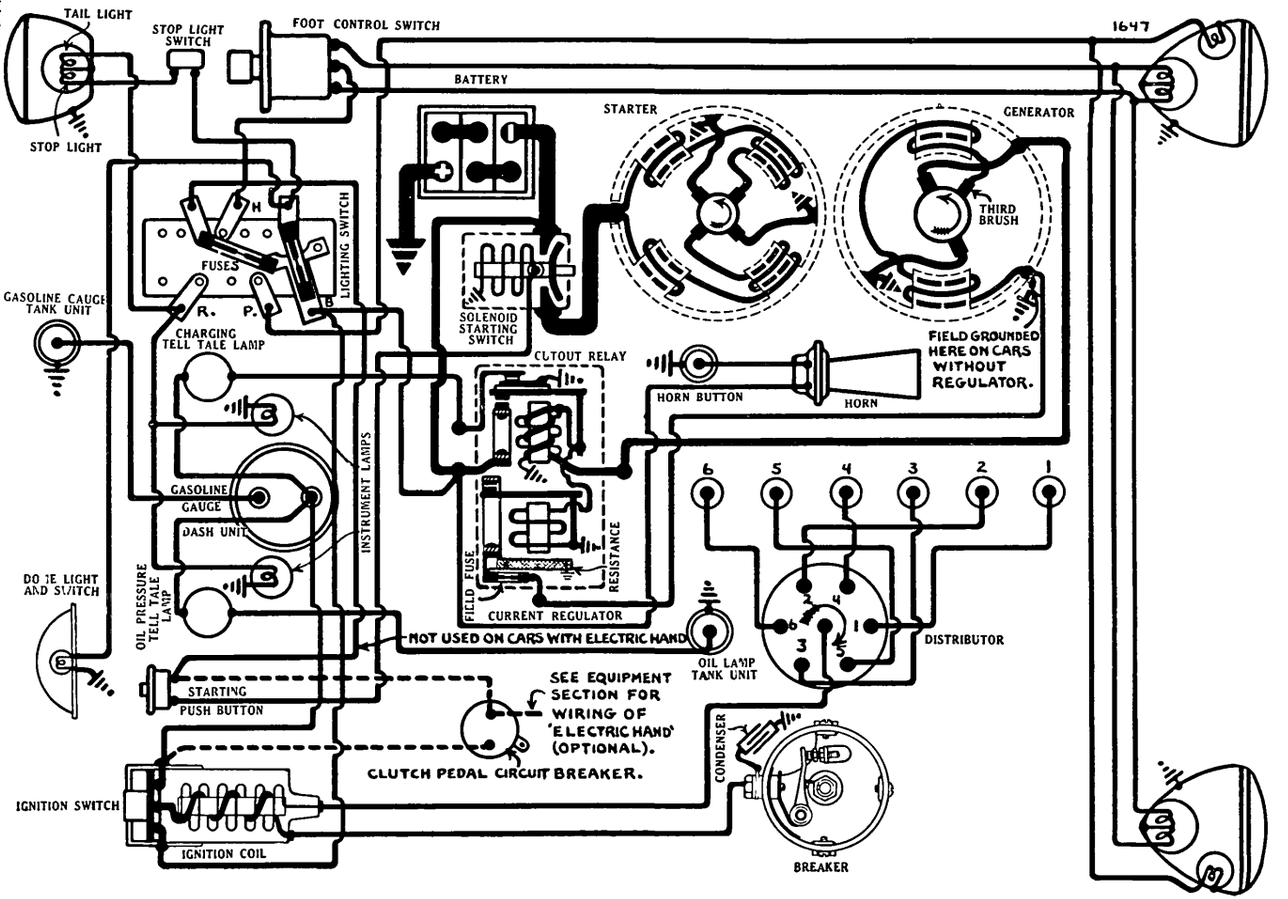
5	615	10	1230
10	1150	20	2300
14	1580	28	3160



Removal:—Mounted on right side of crankcase To remove, take out hold-down screw in advance arm

IGNITION TIMING:— Flywheel Degs Piston Posi
First 25076 cars 4½° or ½" BTDC 0101 BTDC
Eng No 128077 up At TDC 0000" TDC
Timing (Initial Setting)—With #1 piston on compression, turn engine over until piston reaches top dead center, stop when flywheel mark 'UDC 1-6' lines up with pointer on edge of inspection hole in left front face of flywheel housing above starter (after 25076 cars or ½" before this point on first cars) Loosen hold-down screw in advance arm, turn distributor clockwise to limit of advance arm slot, then turn distributor slowly counter-clockwise until contacts just open, tighten hold-down screw, see that rotor is opposite #1 segment in distributor cap Car should then be road-tested and spark advanced as much as operating conditions and fuel will allow.

Timing (Final Setting)—With engine at normal operating temperature, and running at 8 M P H in high gear on level road, accelerate engine rapidly and note performance from 10-15 M P H A slight spark knock should be noticed If no knock is heard, loosen hold-down screw and advance distributor one graduation on scale (turn distributor counter-clockwise) If knock is too severe, retard distributor one graduation (clockwise) Repeat test until satisfactory setting is secured Final setting must not be beyond maximum advance mark on flywheel (¾" before mark 'UDC 1-6')
Motor Gauge—Weidenhoff Adapter #114, Rod #43.

Firing Order:—1-5-3-6-2-4 See diagram

Spark Plugs—Champion Type J-7-S 14 MM Metric
Spark Plug Gaps—Set at 022'.

CARBURETION:—See Carburetion Section for data.
Carburetor: — Carter Model 311-S, 1¼" downdraft type.
Fuel Pump:—AC. Type R-1521540 diaphragm type.
Gasoline Gauge:—King-Seeley electric type.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when a point on the flywheel approximately 3.17 teeth before top dead center mark 'UDC.1-6' lines up with indicator. Reset tappet clearance at .006" with engine warm and running.
Motor Gauge—Weidenhoff Adapter #114, Rod #43.
Tappet Clearance:—.006" Int., .008" Exh., engine hot and running.
Valve Spring Pressure:—44 lbs. at 2" (valve closed). 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—3 pounds.

BATTERY:—National, Type ST-3-17X. 6 volt 17 plate, 96 A.H. capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Grounded Terminal—Positive (+) terminal.
Location—On left hand side under front floor.

STARTER:—Model MAB-4060. Armature MAB-2114.
Starter Drive—Inboard Bendix, Type A-1588.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).
Cranking Engine—150 R.P.M., 125 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

Lock torque figures correct without switch.

Starting Switch:—Type SS-4001. Solenoid type switch mounted on starter field frame controlled by pushbutton switch. See Equipment Section.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting bolts.

GENERATOR:—Model GBK-4601-2. Armature No. GBK-2055. Air-cooled. Third brush control type. Current Regulator (two-rate charging control) used on some models. See Equipment Section for complete data on Regulator.

Charging Rate Adjustment—Use test meters to check generator output. On cars with Current Regulator, short out regulator by connecting jumper wire from 'F' terminal on generator to ground on generator frame. Take off commutator cover band, shift third brush by hand counter-clockwise to increase charging rate, or clockwise to decrease charging rate. Third brush held in position by friction. Remove jumper wire.

Maximum Charging Rate—17 amperes (cold) or 13 amperes (hot) cars without regulator or 22 amperes (cold), 17 amperes (hot) cars with regulator, 8.0 volts, 2200 R.P.M., 28 M.P.H.

NOTE—On generators used without the regulator, the field terminal on the generator frame is grounded by a grounding cup assembled on the terminal. This ground cup must be removed when a regulator is installed.

Performance Data—No Regulator

Cold			Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	800	0	6.4	840
4	6.8	1000	4	6.85	1050
8	7.2	1200	8	7.3	1260
12	7.6	1400	12	7.7	1560
16.5	8.0	2200	14.8	8.0	2250

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ozs. (new brushes).
Field Current—4.08-4.52 amperes at 6.0 volts.
Field Fuse—5 ampere in knurled cup on side of regulator case (no fuse when regulator not used).
Motoring Current—4.18-4.62 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, pull generator out from engine until slack on belt midway between crankshaft and generator pulleys is 1¼" (measure from straightedge across pulleys), tighten mounting bolts.

CUTOUT RELAY:—Model CBA-4002. Used on cars without regulator. Mounted on dash. See Equipment Section for complete data.
Cuts In—6.4 volts, 8 M.P.H.
Cuts Out—.5-2.5 amperes discharge current.
Contact Gap—.025-.035". With upper or ground contacts closed.
Air Gap—.010-.030" with contacts closed.

RELAY-REGULATOR:—Model TC-4304-A. Used on some cars. Mounted on dash. Consists of Cutout Relay and Current Regulator in a single case. See Equipment Section for data on these units.

Cutout Relay
Cuts In—6.5-7.25 volts.
All other data same as for CBA-4002 above.

Current Regulator
Contacts Open—8.0-8.50 volts at 70°F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Soreng-Manegold Switch Model F-5640-A. R.B.M. Foot Control Switch Model 1076, A. Foot switch used to control Country Driving (high) and City (low) beams with lighting switch in second or driving position. Headlamp bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320-C
Parking, Instrument	3	63

22	8.0	2200	18	8.0	2400

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ozs. (new brushes).
Motoring—4.46-4.94 amperes at 6.0 volts.
Field Current—3.75-4.15 amperes at 6.0 volts.
Field Fuse—5 amperes in knurled cup on side of regulator case.
Removal:—Pivot mounted at left front of engine with fan belt drive. To remove, take out two pivot bolts, one clamp bolt.
Belt Adjustment—Loosen pivot bolts and clamp bolt, pull generator out from engine until slack on belt midway between crankshaft and generator pulleys is 1¼" (measure from straightedge across pulleys), tighten mounting bolts.

REGULATOR:—Model TC-4304-A. Consists of Cutout Relay and Current Regulator (two-rate relay) in a single case on the dash. See Equipment Section for complete article on these units. Cutout relay has extra set of ground contacts for generator charging tell-tale signal light control.

Cutout Relay

Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current.
Relay Contact Gap—.015-.045" (with upper or ground contacts closed—ground contacts must be open with main contacts closed).
Air Gap—.010-.030" with contacts closed.

Current Regulator

Contacts Open—8.0-8.50 volts at 70° F.
Contacts Close—1.2-1.4 volts below opening point.
Contact Gap—.005" minimum.
Air Gap—.045" with contacts closed.

LIGHTING:—Soreng-Manegold Switch Model 5770-A. R.B.M. Foot Control Switch Model 1076, A. Foot switch used to control Country Driving (high) and City (low) beams with lighting switch in driving or second position. Headlight bulbs are pre-focused type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights	32-21	2320-C
Parking, Instrument	3	63
Signal Lights	3	64(DC)
Stop & Tail	21-2	1158
Dome	15	87

SIGNAL LIGHTS:—Battery Charge Tell-tale and Oil Pressure Tell-tale lights mounted on instrument panel. See Equipment Section for complete data.

HORNS:—Auto-Lite HA-4003, 4004 (Std), Klaxon Model K-26-M, Type 1716 (high note), 1717 (low note) matched tone, twin horns (optl.).

FUSES:—Lighting—Two 20 ampere on switch.
Generator Field—5 ampere in regulator.

NOTE:—'Electric Hand' Bendix electro-pneumatic type gear shift optional on all models. See article in Electrical Equipment Section for specifications, trouble shooting and repair.

SERIAL NUMBER:—First number—(61) 61101 (U.S.), 61C101 (Canada); (62) 62101 (U.S.), 62C101 (Canada). Stamped on plate on dash under hood.

COMPRESSION:—Ratio 6.0-1 Std. cast-iron head, 7.0-1 Optl. high compression aluminum head. Check compression pressure by removing all spark plugs and cranking engine with throttle wide open.

Cylinder Head	Compression Pressure
Std. 6.0-1	111 lbs. at 215 R.P.M.
Optl. 7.0-1	127 lbs. at 207 R.P.M.

VACUUM READING:—Gauge should show steady reading of 18-20" of HG. with engine idling at 350 R.P.M.

IGNITION:—Coil Model IG-4633. Resistor unit mounted on distributor terminal is connected in series with coil primary.
Resistance Unit—Part No. SP-4008.
Coil Draw—2.5 amperes idling, 4.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 6696. Connected to coil by armored cable.
Ignition Lock—Briggs & Stratton No. 50184, Mitchell No. 6095.

Distributor Model IGB-4301B. Single breaker, 6 lobe cam, full automatic advance type.
Breaker Gap—Set at .020". Limits .018-.020".
Cam Angle or Dwell—40° (closed), 20° (open).
Breaker Arm Spring Tension—16-20 ounces.
Condenser—Part No. IGB-1025J. Capacity .20-.25 mfds.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	0	600
3	400	6	800
5	615	10	1230
10	1150	20	2300
14	1580	28	3160

Distributor Removal:—Mounted on right side of crank case. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Initial setting for all engines as shown. See Final Setting Section for adjustment in accordance with octane rating of fuel used.

Flywheel Degrees	Piston Position
At TDC.	.000" TDC.

NOTE—High octane type fuel must be used in engines with high compresion 7.0-1 aluminum head.

To Set Timing (Initial Setting)—With #1 piston on compression, turn engine over until flywheel mark 'UDC.1-6/' lines up with pointer in inspection hole in left front face of flywheel housing above starter. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of advance arm slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw.

Final Setting—Check ignition setting by road testing car. With engine warm and running in high gear on level road, a slight spark knock should be evident when car is accelerated from 10-15 M.P.H. with wide open throttle. Adjust by loosening hold-down screw in advance arm and rotating distributor one graduation on scale counter-clockwise (if no knock evident) or clockwise (if knock too severe). Repeat test until slight knock is evident. Final setting must not be more than ¾" on flywheel before 'UDC.1-6/' mark.

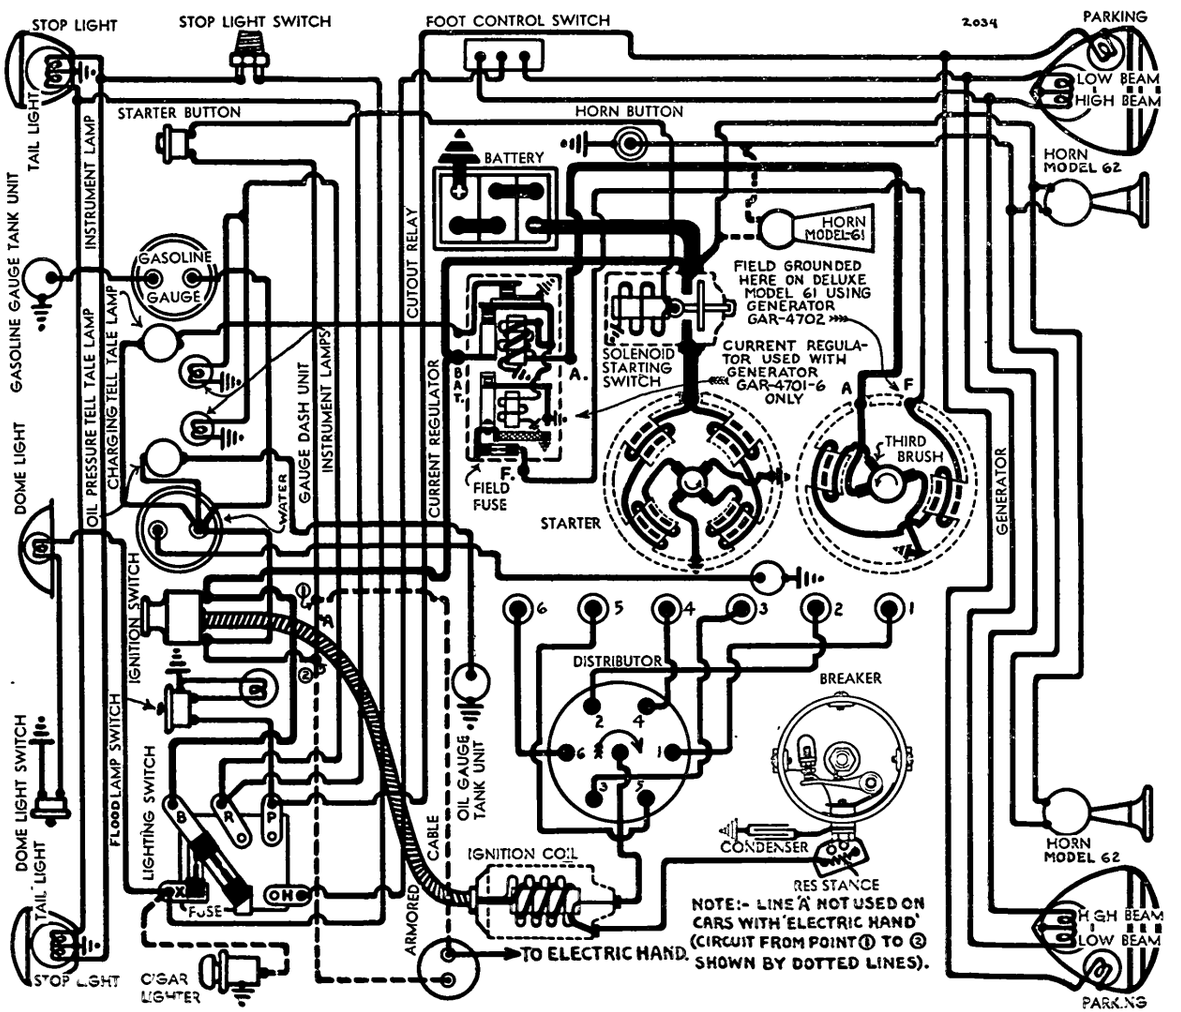
Timing (Motor Gauge)—Weidenhoff #114 Adapter, #44 Rod.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-8 (Std. 6.25-1 engines), J-9 (Optl. 7.0-1 engines). 14 MM. Metric type.

Spark Plug Gaps—.025" (Std. engine), .022" (Optl. H. C. engine).

CARBURETION:—Carburetor—(61) Carter Mod. 331-S, (62) Carter Model 329-S. 1¼" downdraft types. See Carburetion Section for complete adjustment, overhaul and Jet Specifications.



NOTE—Do not adjust carburetor until engine is warmed up so that choke valve is wide open and engine idling at slow or hot idling speed.

Idle Adjustment—Adjust throttle stopscrew so that speed is 350 R.P.M. or 7 M.P.H. Turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be ¼-1 (331-S), ½-1 (329-S) turn open from seated position. Readjust throttle stopscrew for correct idling speed.

Accelerating Pump Setting—Pump lever (under dust cover at top of carburetor) has three holes for pump link engagement. Change for seasonal requirements as follows:
Center Hole—Normal summer temperatures.
Inner Hole (Min. stroke)—Extreme hot weather.
Upper Hole (Max. stroke)—Extreme cold weather.

Throttle Cracking (331-S only):—Opens throttle valve .036-.040" with choke fully closed. No adjustment.

Fast Idle (329-S only):—Integral with carburetor. No adjustment required. See article on Carter Fast Idle in Carburetion Section.

Automatic Choke (329-S only):—Carter Climatic Control. See article in Carburetion Section.

Air Cleaner:—AC. #1526650 Std., #1526651 on cars with Electric Hand. Heavy duty oil-bath type optl.

Fuel Pump:—AC. Type R #1521450. Diaphragm type. See article in Carburetion Section.

Gasoline Gauge:—King-Seeley Electric. See article in Carburetion Section.

VALVE TIMING:—Tappet Clearance—.006" Int., .008" Exh., with engine hot.

Valve Spring Pressure—44 lbs. at 2" (valve closed), 102 lbs. at 1 21/32" (valve open).

To Check Valve Timing—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when point on flywheel approximately 3.94 teeth before dead center mark 'UDC.1-6/' lines up with pointer in inspection hole in left front face of housing. Reset tappet clearance at .006" with engine hot.

Motor Gauge—Weidenhoff #114 Adapter, #44 Rod.

LUBRICATION:—Crankcase Capacity—5 qts. refill.

Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Signal Light—Used instead of pressure gauge. Controlled by oil pressure regulator valve. See complete article in Equipment Section.

BATTERY:—National, Type ST-317X. 6 volt, 17 plate, 96 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.2 minutes.

Grounded Terminal—Positive (+) terminal.

Location—On left hand side under front floor.

STARTER:—Model MAB-4075. Armature MAB-2113.

Drive—Inboard Bendix (barrel), Type A-1673.

Cranking Engine—150 R.P.M., 120-125 amps. at 5 vs.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.	582
22.5 "	Lock	4.	775

NOTE—Lock Torque figures correct without switch.

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting bolts.

Starting Switch:—Solenoid Type SS-4001. Controlled by pushbutton switch (R.B.M. Model 1800) on dash. Operative with switch turned on. On cars with Electric Hand clutch must be disengaged to operate switch.

Solenoid Switch

Closes with terminal voltage of 4 volts or less and will remain closed until voltage drops to .75-2.0 volts. Current draw 3 amperes at 6 volts.

GENERATOR:—(61) Model GAR-4702, (62) GAR-4701-6 Armature No. GAR-2077. Ventilated, third brush control type. Current Regulator (two-rate charging control) on GAR-4701-6.

Charging Rate Adjustment—Use test meters to check generator output. On Mod. GAR-4701-6, short out regulator by connecting jumper wire from 'F' terminal on generator to ground. Take off commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Third brush held in position by friction. Remove jumper wire.

NOTE—Model GAR-4702 generator field terminal on generator frame is grounded by a grounding cup assembled on the terminal. If regulator is installed, this ground cup must be removed.

Performance Data—GAR-4701-6

Cold—Regulator Inoperative—Hot

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	780	0	6.4	820
4	6.7	930	4	6.8	1000
8	6.95	1060	8	7.1	1180
12	7.25	1210	12	7.35	1400
16	7.6	1440	16	7.8	1790
22.8	8.0	2400	18.4	8.0	2700

Model GAR-4702

Cold — No Regulator — Hot

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	860	0	6.4	830
4	6.8	1000	4	6.85	1040
8	7.2	1200	8	7.3	1300
12	7.6	1460	12	7.75	1550
16	8.0	2150	14.5	8.0	2200

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—18-22 ozs. (new brushes).

Field Current—3.70-4.10 amperes (GAR-4702), 3.51-3.89 amperes (GAR-4701-6) at 6.0 volts.

Motoring Current—4.56-5.04 amperes (GAR-4702), 5.32-5.88 amperes (GAR-4701-6) at 6.0 volts.

Field Fuse—5 ampere in knurled cup on side of regulator case (GAR-4701-6 only).

Removal:—Pivot mounted at left front of engine, with fan belt drive. To remove, take out two pivot bolts and one clamp bolt.

Belt Adjustment:—Swing generator away from engine until slack in belt midway between fan pulley and generator pulley is 1¼" (measure from straight edge across pulleys).

CUTOUT RELAY:—Model CBA-4003 (GAR-4702). Mounted on dash. Extra set of ground contacts provided for generator charging tell-tale signal light control. See article in Equipment Section for complete data.

Cuts In—6.75-7.5 volts.

Cuts Out—.5-2.5 amperes discharge current.

Contact Gap—.025-.035" (with upper or ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.010-.030" with contacts closed.

RELAY-REGULATOR:—Mod. TC-4304A (GAR-4701-6). Mounted on engine side of dash. Consists of Cutout Relay and Current Regulator (two-rate charging control). See Equipment Section for complete data. Cutout Relay has extra set of ground contacts for generator charging tell-tale signal light control.

Cutout Relay

Cuts In—6.5-7.25 volts. All other data same as for Model CBA-4003 (see above).

Current Regulator

Contacts Open—8.0-8.50 volts at 70° F.

Contacts Close—1.2-1.4 volts below opening point.

Contact Gap—.005" minimum.

Air Gap—.045" with contacts closed.

LIGHTING:—Headlamps—Hall, Pre-focused type. Head lamps aimed straight ahead (upper beams with lenses in place). Upper and lower beams controlled by foot selector switch.

Switches

Lighting—R.B.M. Model 1650.

Foot Selector—R.B.M. Model 1082.

Instrument Lights—Soreng-Manegold Mod K2060A.

Stop Light—Motometer Model 58012-C. Hydraulic type mounted in brake line at left frame side rail in channel at rear.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Parking, Instrument	1	55
Signal Lights	1	51
Stop and Tail	21-3	1158
Dome	15	87

SIGNAL LIGHTS:—Battery Charge Tell-tale and Oil Pressure Tell-tale lights mounted on instrument panel. See Equipment Section for complete data.

FUSES:—Lighting—Two 20 ampere capacity on switch.
Generator Field—5 ampere in regulator (on GAR-4701-6 only).

HORNS:—E. A. Vibrator type. Twin horns on Model 62

NOTE:—Electric Hand (Bendix type Electro-pneumatic gear shift) optional equipment. See article in Electrical Equipment Section for complete data.

SERIAL NUMBER:—First number 70-101 (Commercial Model 70), 71-101 (Deluxe Model 71). Stamped on plate on right front door hinge pillar above top hinge.

COMPRESSION:—Ratio—6.25-1 Std. cast-iron head. 7.0-1 Optl. 'Super Power Dome' aluminum alloy hd. NOTE—High octane fuel must be used with this hd.

Pressure—Check pressure by removing all spark plugs and cranking engine with throttle wide open.

Cylinder Head	Compression Pressure
6.25-1	103 lbs., 170 R.P.M.
7.0-1	119 lbs., 170 R.P.M.

VACUUM READING:—18-20" steady reading with engine idling at 350 R.P.M. or 6 M.P.H.

IGNITION:—Coil Model IG-4644. Service winding (coil less switch and cable) IG-3224S. Resistor unit mounted on distributor terminal connected in primary circuit.

Ignition Current—2.5 amperes idling, 4.5 stopped.

Ignition Switch:—Michellock Model 24-B, Type 7063. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton, Mitchell No. 6095.

Distributor Model IGW-4012-A. Single breaker, 6 lobe cam, full automatic advance type.

Breaker Gap—Set at .020".

Cam Angle or Dwell—35° (closed), 25° (open).

Breaker Arm Spring Tension—16-20 ounces.

Condenser—No. IGB-1025J. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
3	400	6	800
5	520	10	1040
10	1150	20	2300
14	1575	28	3150

Distributor Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Initial setting for all engines as shown. See Final Setting for adjustment dependent on Octane rating of fuel used.

Flywheel Degrees	Piston Position
At TDC.	.0000" TDC.

NOTE—High Octane fuel must be used in engines with 7.0-1 high compression aluminum head.

To Set Timing (Initial Setting)—With #1 piston on compression, crank engine over until flywheel mark 'UDC.1-6/' lines up with pointer in left front face of flywheel housing. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw.

Final Ignition Setting—Road test car and note performance when accelerating from 10-15 M.P.H. with wide open throttle on level road (engine must be warm), slight spark knock should be evident. Adjust by loosening hold-down screw and rotating distributor one graduation on scale counter-clockwise (if no knock), clockwise (if knock too severe). Repeat test. Final setting must not be advanced more than ¾" before 'UDC.1-6/' mark on flywheel.

Timing (Motor Gauge)—Weidenhoff Adapter #114, Rod #43.

Firing Order:—1-5-3-6-2-4. See diagram.

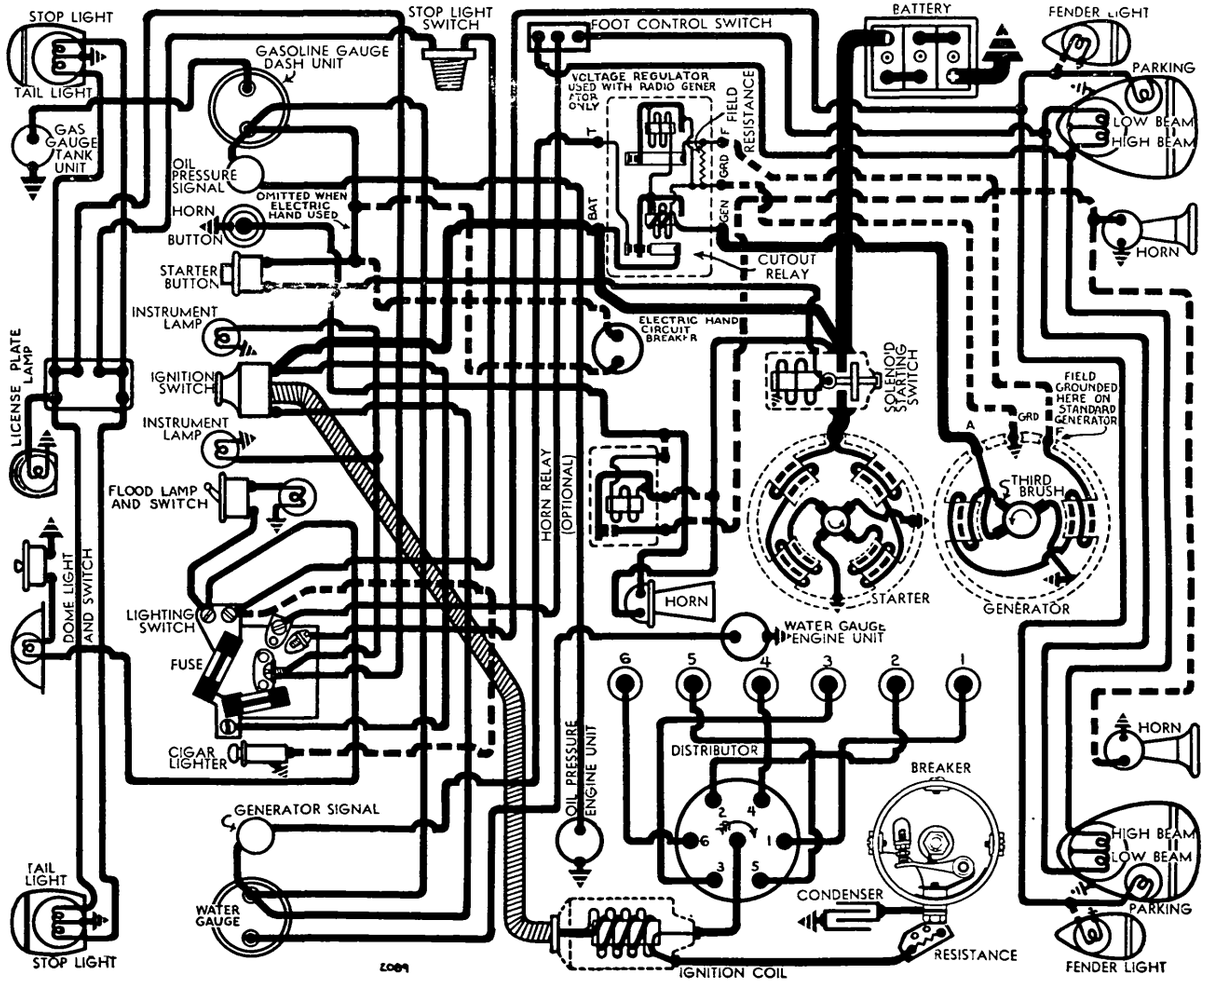
Spark Plugs:—Champion Type J-8 (Std. 6.25-1 hd.), H-10 (Optl. 7.0-1 hd.). 14 MM. Metric type.

Spark Plug Gaps—.025".

CARBURETION:—Carburetor—Carter Model W1 Type 348-S. Single barrel, downdraft type.

See Article in Carburetion Section for data.

Idle Adjustment—Engine must be warm so that choke valve wide open and throttle cracker inoperative. Set throttle lever stopscrew so that idling speed is 6 M.P.H. Turn idle adjusting screw in until engine begins to miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be ¼-1 turn open from inner seated position. Readjust throttle stopscrew for correct idling speed.



Accelerating Pump Setting—Pump lever (under dust cover at top of carburetor) has three holes for pump link connection. Change for seasonal requirements as follows:
Center Hole—Normal summer temperatures.
Inner (Min. stroke)—Extreme hot weather.
Upper (Max. stroke)—Extreme cold weather.

Throttle Cracker:—Open throttle valve .036-.040" with choke valve fully closed. No adjustment.

Air Cleaner:—AC. #1528159 (Std.), #1528158 (cars with Electric Hand), oil-wetted type. Heavy duty oil-bath type optional.

Fuel Pump:—AC. Type AK #1523289. Diaphragm type std., Type AB #1523290 combination fuel-and-vacuum type optl.

Gasoline Gauge:—King-Seeley Electric Type. K-S No. 6190 (dash unit), 5835 (tank unit).

VALVE TIMING:—To Check—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when a point on the flywheel approximately 3.94 teeth before top dead center mark 'UDC.1-6/' lines up with indicator on left front face on flywheel housing. Reset tappet clearance at .006" hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #43.

Tappet Clearance:—.006" Int., .008" Exh. engine hot.

Valve Spring Pressure:—44 lbs. at 2" (valve closed), 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).

Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Signal—Used instead of press. gauge. Controlled by oil pressure regulator valve.

See Article in Mechanical Equipment Section.

BATTERY:—National, Type ST-317X. 6 volt, 17 plate, 96 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.2 minutes.

Grounded Terminal—Positive (+) terminal.

Location—In left front fender. Accessible from engine compartment by taking out 3 slotted screws in cover flange (2 top, 1 rear) and removing cover.

STARTER:—Model MAB-4075. Armature MAB-2113.

Drive—Inboard Barrel type Bendix No. A-1673.

Rotation—Counter-clokwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—150 RPM., 120-125 amps., 6 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.0	582
22.5 "	Lock	4.0	775

NOTE—Lock torque figures correct without switch.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Type SS-4001. Magnetic solenoid type mounted on starter field frame. Controlled by pushbutton (R.B.M. Model 1815) on instrument panel. Operative only with ignition on (and clutch disengaged on cars with Electric Hand).

GENERATOR:—Mod GCJ-4804A-1. Armature GCJ-2006. Third brush control type. Ventilated by fan on drive pulley. Vibrating voltage regulator used on cars with radio only.

NOTE—On standard cars (without Voltage Regulator) field terminal on generator frame is grounded by ground cup assembled on terminal stud. This ground cap must be removed if regulator installed.

Maximum Charging Rate—16 amperes (cold), 12.4 amperes (hot) without regulator, 25 amperes (cold) 22 amperes (hot) with regulator.

Charging Rate Adjustment—Remove commutator cover band, shift third brush by hand, counter-clockwise to increase or clockwise to decrease charging rate. Third brush held in position by friction. Do not exceed maximum rate as given above. Actual charging rate, on cars with regulator, determined by regulator setting and dependent upon battery condition (see Regulator Section below).

Performance Data

Cold		Without Regulator	Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	835	0	6.4	920
4	6.6	1025	4	6.9	1100
8	7.2	1225	8	7.4	1325
12	7.6	1460	12.4	8.0	2400
16	8.0	2250			

Performance Data

Cold		Cars with Regulator	Hot		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	760	0	6.4	850
4	6.65	920	4	6.7	1020
8	6.9	1080	8	7.0	1240
12	7.2	1240	12	7.3	1400
16	7.45	1400	16	7.6	1650
20	7.7	1580	20	7.9	2100
25	8.0	2500	22	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—23-27 ozs. (new brushes).

Field Current—1.9-2.1 amperes at 6.0 volts.

Motoring Current—4.0-4.4 amperes at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine. To remove, take out clamp bolt and pivot bolts.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, swing generator out until total sideplay or deflection midway between generator and fan pulleys is ¾-1¼".

CUTOUT RELAY:—Model CBA-4003 (Std.). Mounted on the dash. Has extra set of ground contacts for Generator Charge Signal control. See Electrical Equipment Section for complete data.

Cuts In—6.75-7.5 volts.

Cuts Out—.5-2.5 ampere discharge current.

Contact Gap—.025-.035" with upper ground contacts closed (upper contacts must open when main contacts close).

Air Gap—.010-.030" with contacts closed.

REGULATOR:—Models VRD-4003A, B, Voltage Type. (Cars with Radio only). Consists of Cutout Relay and Vibrating Voltage Regulator in case on dash. Cutout Relay has extra set of contacts for Generator Charge Signal control.

See Article in Electrical Equipment Section.

NOTE—Regulator cover is sealed. Serviced on exchange basis if seals unbroken. Cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum (with ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting—(VRD-4003A)—7.4-7.9 volts hot.

Setting (VRD-4003B)—7.7-8.2 volts hot.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads), connect voltmeter between regulator 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 M.P.H. car speed until voltage is steady. Voltmeter reading should be within 7.4-7.9 volts (high limit cold, low limit hot). If outside these limits, regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.060" Min., .062" Max. contacts just opening.

LIGHTING:—Headlamps. Hall, pre-focused type. Lenses interchangeable. Aim headlamps straight ahead with top of beam 39" above floor level at 25' (car unloaded, upper beam lighted). Upper and lower beams controlled by foot selector switch with lighting switch in driving (right hand) position.

Switches

Lighting—R.B.M.

Foot Selector—R.B.M. No. 1076.

Dome Light—R.B.M. No. 1220.

Stop Light—R.B.M. No. 965.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Headlamps (export)	50-21	2520
Park, Instrument	1½	55
Signals, Service	1	51
Fender (Optl.) License	3	63
Stop-Tail	21-3	1158
Dome	15	87

SIGNAL LIGHTS:—Oil Pressure Indicator and Generator Charge Indicator mounted on instrument board. Similar to design used previously except that bulb lights up word 'Not' on dials. See article in Electrical Equipment Section.

FUSES:—Lighting—Two 20 ampere type on back of lighting switch.

HORNS:—Delco-Remy Klaxon, Model K16 Type 2010. Vibrator type. Current draw 6.5-8.5 amperes at 6.0 volts.

Air Gap—.025-.029".

NOTE—See Terraplane Model 72 for optional horns.

NOTE:—Electric Hand (Bendix type Electro-pneumatic gear shift) optional equipment. See article in Electrical Section for complete data.

SERIAL NUMBER:—First number 72-101. Stamped on plate on right front door hinge pillar above top hinge.

COMPRESSION:—Ratio—6.25-1 Standard cast-iron hd. 7.0-1 Optl. 'Super Power Dome' aluminum alloy head.
NOTE—High octane fuel must be used with this hd.
Pressure—Check presure by removing all spark plugs and cranking engine with throttle wide open.

Cylinder Head	Compression Pressure
6.25-1	103 lbs., 170 R.P.M.
7.0-1	119 lbs., 170 R.P.M.

VACUUM READING:—18-20" steady reading with engine idling at 350 R.P.M. or 6 M.P.H.

IGNITION:—Coil Model IG-4644. Service winding (coil less switch and cable) IG-3224S. Resistor unit mounted on distributor terminal connected in primary circuit.

Ignition Current—2.5 amperes idling, 4.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 7063. Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton, Mitchell No. 6095. B. & S. #50184. **Key Series**—H601-H1100.

Distributor Model IGW-4013-A. Single breaker, 6 lobe cam, full automatic advance type.

Breaker Gap—Set at .020".

Cam Angle or Dwell—35° (closed), 25° (open).

Breaker Arm Spring Tension—16-20 ounces.

Condenser—No. IGB-1025-J. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
3	400	6	800
5	520	10	1040
10	1150	20	2300
14	1575	28	3150

Distributor Removal:—Mounted on right side of crankcase. To remove, take out hold-down screw in advance arm.

IGNITION TIMING:—Initial setting for all engines as shown. See Final Setting for adjustment dependent on Octane rating of fuel used.

Flywheel Degrees	Piston Position
At TDC	.0000" TDC.

NOTE—High Octane fuel must be used in engines with 7.0-1 high compression aluminum head.

To Set Timing (Initial Setting)—With #1 piston on compression, crank engine over until flywheel mark 'UDC.1-6/' lines up with pointer in left front face of flywheel housing. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw.

Final Ignition Setting—Road test car and note performance when accelerating from 10-15 M.P.H. with wide open throttle on level road (engine must be warm). Slight spark knock should be evident. Adjust by loosening hold-down screw and rotating distributor one graduation on scale counter-clockwise (if no knock), clockwise (if knock too severe). Repeat test. Final setting must not be advanced beyond ¾" before 'UDC.1-6/' mark on flywheel.

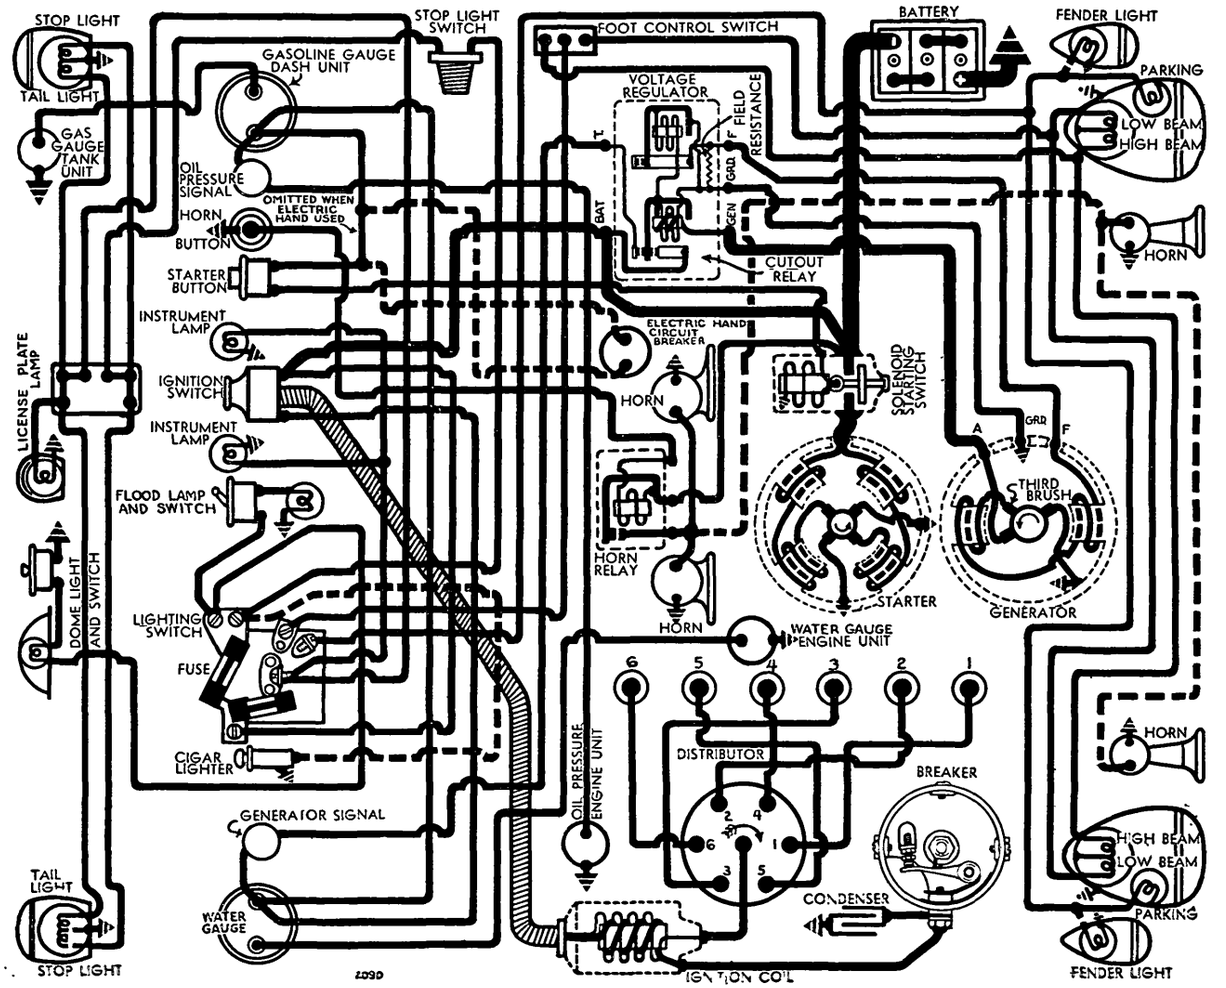
Timing (Motor Gauge)—Weidenhoff Adapter #114, Rod #43.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-8 (Std. 6.25-1 head), H-10 (Optl. 7.0-1 head), 14 MM. Metric type.
Spark Plug Gaps—.025".

CARBURETION:—Carburetor—Carter, Mod. WDO Type 344-S. Duplex or dual downdraft type.
See Article in Carburetion Section.
Idle Adjustment—Engine must be warm so that fast idle and automatic choke control inoperative. Set throttle lever stopscrew so that idling speed is 6 M.P.H. Turn each idle adjusting screw, in succession, in until engine begins to miss, then slowly out until engine fires smoothly. Final setting should be ¼-¾ turn out from inner seated position and screws must be adjusted equally so that engine fires smoothly on all cylinders. Readjust throttle stopscrew if necessary.

Accelerating Pump Setting—Adjustable for minimum and maximum stroke. Requires partial dismantling of carburetor to change setting (see article in Carburetion Section for complete directions).



Fast Idle:—Integral with carburetor. See Carburetion Section for checking and adjusting directions.

Automatic Choke:—Carter Climatic Control mounted on carburetor. See article in Carburetion Equipment Section.

Air Cleaner:—AC. #1528161 (Std.), #1528160 (Cars with Electric Hand), oil-wetted type. Oil-bath type optional.

Fuel Pump:—AC. Type AK #1523289 diaphragm type std., Type AB #1523290 combination fuel-and-vacuum type optional. See article in Carburetion Equip. Section.

Gasoline Gauge:—King-Seeley Electric type. K-S No. 6190 (dash unit), 5835 (tank unit). See article in Carburetion Equipment Section.

VALVE TIMING:—To Check—Set tappet clearance #1 intake valve at .010". This valve should open with piston 10°40' or .0562" before top dead center when a point on the flywheel approximately 3.94 teeth before top dead center mark 'UDC.1-6/' lines up with indicator on left front face of flywheel housing. Reset tappet clearance at .006" hot.

Motor Gauge—Weidenhoff Adapter #114, Rod #43.

Tappet Clearance:—.006" Int., .008" Exh., hot.

Valve Spring Pressure:—44 lbs. at 2" (valve closed), 102 lbs. at 1 21/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).

Normal Oil Pressure—3 lbs. (no gauge).

Oil Pressure Signal—Used instead of pressure gauge. Controlled by oil pressure regulator valve. See article in Electrical Equipment Section.

BATTERY:—National, Type ST-317X. 6 volt, 17 plate, 96 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.2 minutes.

Grounded Terminal—Positive (+) terminal.

Location—In left front fender. Accessible from engine compartment by taking out 3 slotted screws in cover flange (2 top, 1 rear) and removing cover.

STARTER:—Model MAB-4075. Armature MAB-2113.

Drive—Inboard Barrel Type Bendix No. A-1673.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—150 R.P.M., 120-125 amps., 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.8 "	Lock	3.	582
22.5 "	Lock	4.	775

NOTE—Lock torque figures correct without switch.

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Type SS-4001. Magnetic solenoid type mounted on starter. Controlled by pushbutton on instrument board (RBM Model 1815). Operative only with ignition on (and clutch disengaged on cars with Electric Hand).

Switch Specifications

Closes with terminal voltage of 4.0 volts or less. Remains closed until voltage drops to .75-2.0 volts. Current draw, 3 amperes at 6.0 volts.

GENERATOR:—Mod. GCJ-4803-A. Armature GCJ-2006. Third brush control type with external voltage regulation. Ventilated by fan on drive pulley.

Maximum Charging Rate—25 amperes (cold), 22 amperes (hot), 8.0 volts, 2500 R.P.M. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Charging Rate Adjustment—Maximum output controlled by third brush. Do not adjust third brush for output greater than shown in table below (with field terminal grounded to render regulator inoperative). Actual charging rate controlled by regulator setting. See Regulator Section below.

Cold Performance Data			Hot Performance Data		
Amps.	Volts	R.P.M.	Amps.	Volts	R.P.M.
0	6.4	760	0	6.4	850
4	6.65	920	4	6.7	1020
8	6.9	1080	8	7.0	1240
12	7.2	1240	12	7.3	1400
16	7.45	1400	16	7.6	1650
20	7.7	1580	20	7.9	2100
25	8.0	2500	22	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—23-27 ozs. (new brushes).

Field Current—1.9-2.1 amperes at 6.0 volts.

Motoring Current—4.0-4.4 amperes at 6 volts.

Removal:—Generator pivot mounted at left front of engine with fan belt drive. To remove, take out clamp bolt and two pivot bolts.

Belt Adjustment:—Loosen clamp bolt and pivot bolts, swing generator out until slack in belt midway between generator and fan pulleys is ¾-1¼" (measured from straightedge across pulleys).

REGULATOR:—Models VRD-4003A, B. Voltage Type. Consists of Cutout Relay and Vibrating Voltage Regulator in case on dash. Cutout Relay has extra set of contacts for generator charge signal control. **See Article in Electrical Equipment Section.**

NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken. Cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.5 volts Min., 7.25 volts Max. Cold.

Cuts Out—.5 ampere Min., 3.0 amperes Max. Cold.

Contact Gap—.015" minimum (with ground contacts closed—ground contacts must be open with main contacts closed).

Air Gap—.034" Min., .038" Max. with contacts open. Measure at hinge end of core.

Voltage Regulator

Setting (VRD-4003A)—7.4-7.9 volts hot.

Setting (VRD-4003B)—7.7-8.2 volts hot.

To Check—Connect ammeter in charging line at 'B' terminal on regulator (use short heavy leads), connect voltmeter between regulator 'B' and 'GD' terminals. Operate generator, charging fully charged battery, at speed equivalent to 30 M.P.H. car speed until voltage is steady. Voltmeter reading should be within 7.4-7.9 volts (high limit cold, low limit hot). If outside these limits regulator is defective.

To Adjust—Change regulator armature spring tension by bending lower spring hanger. See Electrical Equipment Section for complete instructions.

Contact Gap—.010" Min., .020" Max. with armature against stop pin.

Air Gap—.060" Min., .062" Max. contacts just opening.

LIGHTING:—Headlamps—Hall, Pre-focused type. Lenses interchangeable. Aim headlamps straight ahead with top of beam 39" above floor level at 25' (car unloaded, upper beams lighted). Upper and lower beams controlled by foot selector switch with lighting switch in driving (right hand) position.

Switches

Lighting—R.B.M.

Foot Selector—R.B.M. No. 1076.

Dome Light—R.B.M. No. 1220

Stop Light—R.B.M. No. 965.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2331
Headlamps (export)	50-21	2520
Park, Dash	1½	55
Dash Signal, Service	1	51
Fender (Optional)	3	63
Stop-Tail	21-3	1158
License Plate	3	63
Dome	15	87

SIGNAL LIGHTS:—Battery Charge Indicator and Oil Pressure Indicator mounted on instrument board. Similar to design used previously except that bulb lights up word 'Not' on dials. See article in Electrical Equipment Section for complete data.

FUSES:—Lighting—Two 20 ampere capacity on back of lighting switch.

HORNS:—Delco-Remy Model K-33-S Std., K-33-F Optl. Blended tone, twin horns operated by relay.

Horn	Current (6 volts)	Air Gap
K-33-S, 2051 (low note)	11-13 amps.	.042-.046"
K-33-S, 2052 (high note)	10-12 "	.032-.036"
K-33-F, 2117 (low note)	11-13 "	.040-.044"
K-33-F, 2118 (high note)	9-11 "	.032-.036"

Horn Relay Model 271-A:—Contacts close at 2.7-4.0 volts.

Contact Gap—.015-.030". **Air Gap**—.010-.025".

WILLYS SIX

MODELS 97 AND 98-D (1931) SERIAL NUMBERS 1001 UP
PRODUCTION STARTED NOVEMBER 1930
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

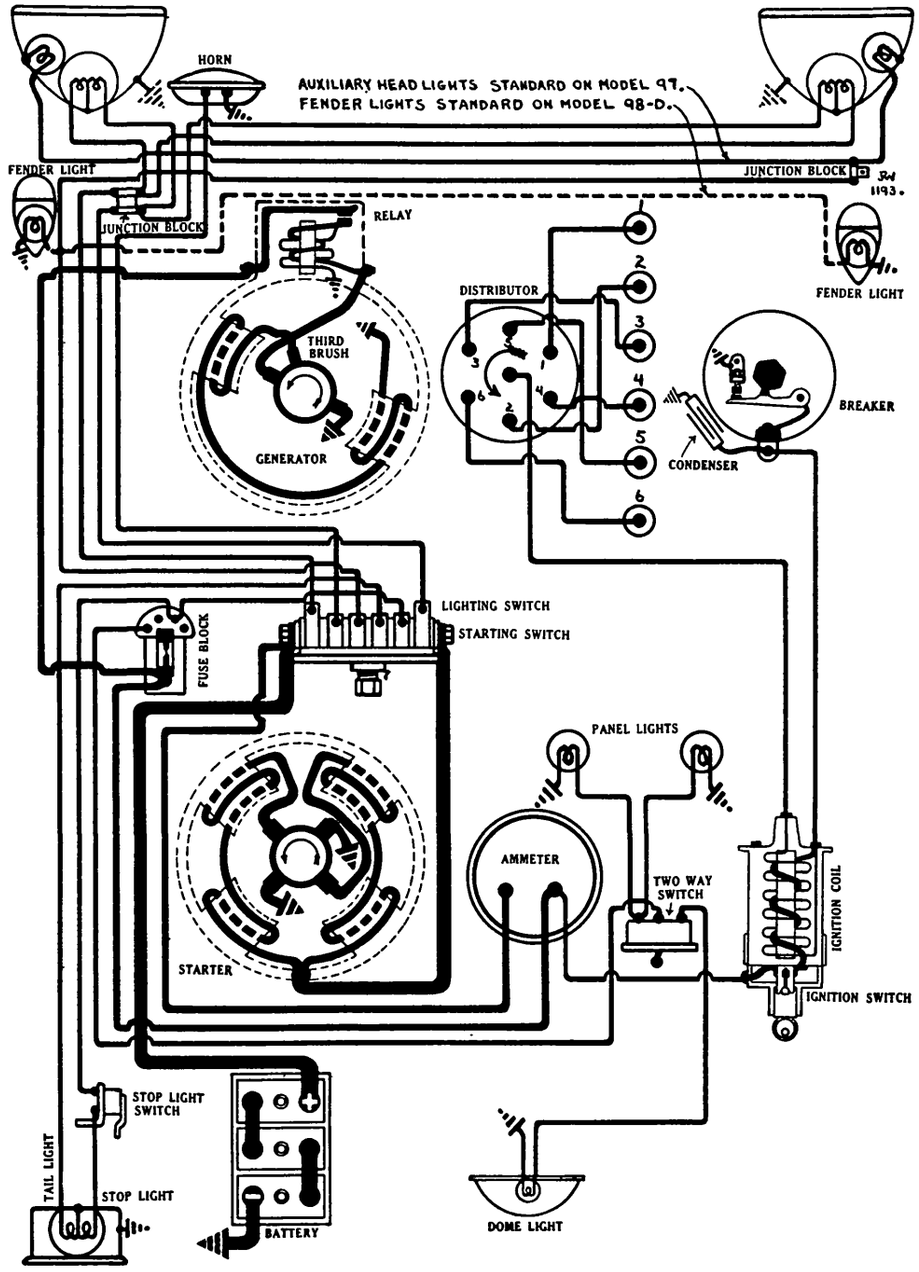
BATTERY:—U.S.L., Type XY-13X-7A, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 102 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17.6 hours. Battery is mounted under the front compartment floor boards on the left side.

IGNITION:—Coil Model IG-4303, 4203. Ignition switch is built in base of the coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1-1.5 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGB-4032. Breaker contacts separate .018-.020 inch. Set contact gap by loosening stationary contact mounting stud and turning up stud until gap is .018 inch with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic. Maximum manual advance is 10 degrees (distributor). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 22 degrees (engine) reached at 3200 R.P.M.

Mounting:—Distributor is mounted at left of engine and is driven by an inclined shaft from the camshaft. To remove distributor, disconnect primary lead and manual spark control and remove distributor cap with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.

Oiling:—Put 5 to 8 drops of light engine oil in the oiler on the side of the distributor every week or each 250 miles of operation. Every 500 miles remove the distributor cap and rotor and put 2 or 3 drops of oil in the oiler in the center of the shaft. Every 5000 miles coat the breaker cam with a light film of vaseline.



Timing:—Breaker contacts begin to open when the piston entering power stroke reaches top dead center with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark control by pushing spark control button all the way in toward the dash and see that distributor is turned clockwise as far as possible. Remove cover over inspection hole in left front face of flywheel housing. Turn engine over until piston reaches top dead center when the flywheel mark 'IGN/CYL. 1-6' will be directly opposite the indicator mark on the housing. Then loosen advance arm clamp screw and turn distributor until contacts begin to open. Tighten the clamp screw and see that the spark plugs are wired in accordance with the firing order shown on the diagram.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18 MM. Metric. Champion Type C-7. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1⅝ inches. Stem diameter, ⅜ inch. Valve lift, 5/16 inch. Spring pressure, 97-102 pounds (spring length, 1 15/16 inches). Tappet clearance, .004 inch (hot). Inlet valves open 7 degrees before top dead center and close 39 degrees after lower dead center.

EXHAUST VALVES. Head diameter, 1 15/32 inches. Stem diameter, ⅜ inch. Valve lift, 5/16 inch. Spring pressure, 97-102 pounds (spring length, 1 15/16 inches). Tappet clearance, .006 inch (hot). Exhaust valves open 49

WILLYS SIX

MODELS 97 AND 98-D (1931) SERIAL NUMBERS 1001 UP
PRODUCTION STARTED NOVEMBER 1930
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

degrees before lower dead center and close 2 degrees before top dead center. The flywheel is marked 'I.O./' for inlet opening and 'E.C./' for exhaust closing of cylinder No. 1. Valve stem guides are removable. Valves with oversize stems are not made.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .008". This valve should open with piston .018" before top dead center when flywheel mark 'I.O.' lines up with indicator on housing. Reset tappet clearance at .004" (hot).

To Set Valve Timing:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—Model MZ-4024. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 44-56 ounces. The starting switch is mounted on the lower end of the steering column and is operated by pulling up on the button on the steering wheel.

Starter Data

Torque	R.P.M.	Volts	Amperes
.65 lb. ft.	2500	5.5	100
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
12.2 "	Lock	4.0	550

Mounting:—Starter is flange mounted at left of engine on forward face of flywheel housing. To remove starter, disconnect cable and take out three flange mounting bolts. Then pull starter forward to clear drive and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at each end of the starter each 500 miles of operation.

GENERATOR:—Model GAL-4131, 4331. Direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by prying on the brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in position by friction between the brush mounting stud and the end plate. With standard car setting the maximum charging rate is 18 amperes at 8 volts reached at 1900 R.P.M. (cold).

Generator Data

Amperes	Volts	R.P.M.
2	6.4	675
6	6.9	835
10	7.3	1025
14	7.65	1275
18	8.0	1900
14	7.65	2925

Brush Spring Tension—22-25 ozs. (main), 31-34 ozs. (third brush) on GAL-4131, 8-13 ozs. (all brushes) on GAL-4331.
Field Current—4.08-4.52 amperes at 6.0 volts.
Motoring Current—4.27-4.73 amperes at 6.0 volts.

Mounting:—Generator is mounted at left of engine on a special swinging bracket and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then take out mounting bolt in swing bracket and lift generator from place.

Belt Adjustment. Fan belt tension is adjusted by shifting the generator. To take up fan belt, loosen adjustment clamp bolt and mounting bolt and swing generator to the left or away from the engine until the proper belt tension is secured. Tighten the mounting bolts. The belt should be just tight enough to drive the generator and fan without slipping.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at each end of the generator every week or each 250 miles of operation. Every 1000 miles fill the grease cup under the bearing retainer on the commutator end of the generator with pure vaseline.

RELAY:—Model CB-4014. Relay is mounted on the generator field frame. Relay contacts close at 675 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Finger Tip Control Switch Model A-805. Switch is mounted at the lower end of the steering column and is controlled by a button on the steering wheel. The starting switch, lighting switch and horn button are incorporated in a single unit. Headlights are equipped with double flament bulbs. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Parking lights in headlights (on Model 97) and side lights (on Model 98) are each 6-8 volt, 3 cp. S.C. Mazda 63. Dash light and dome light are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop light and tail light are 6-8 volt, 21-2 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 2 cp. filament.

FUSE:—Lighting fuse on fuse block on front of dash is 20 ampere capacity.

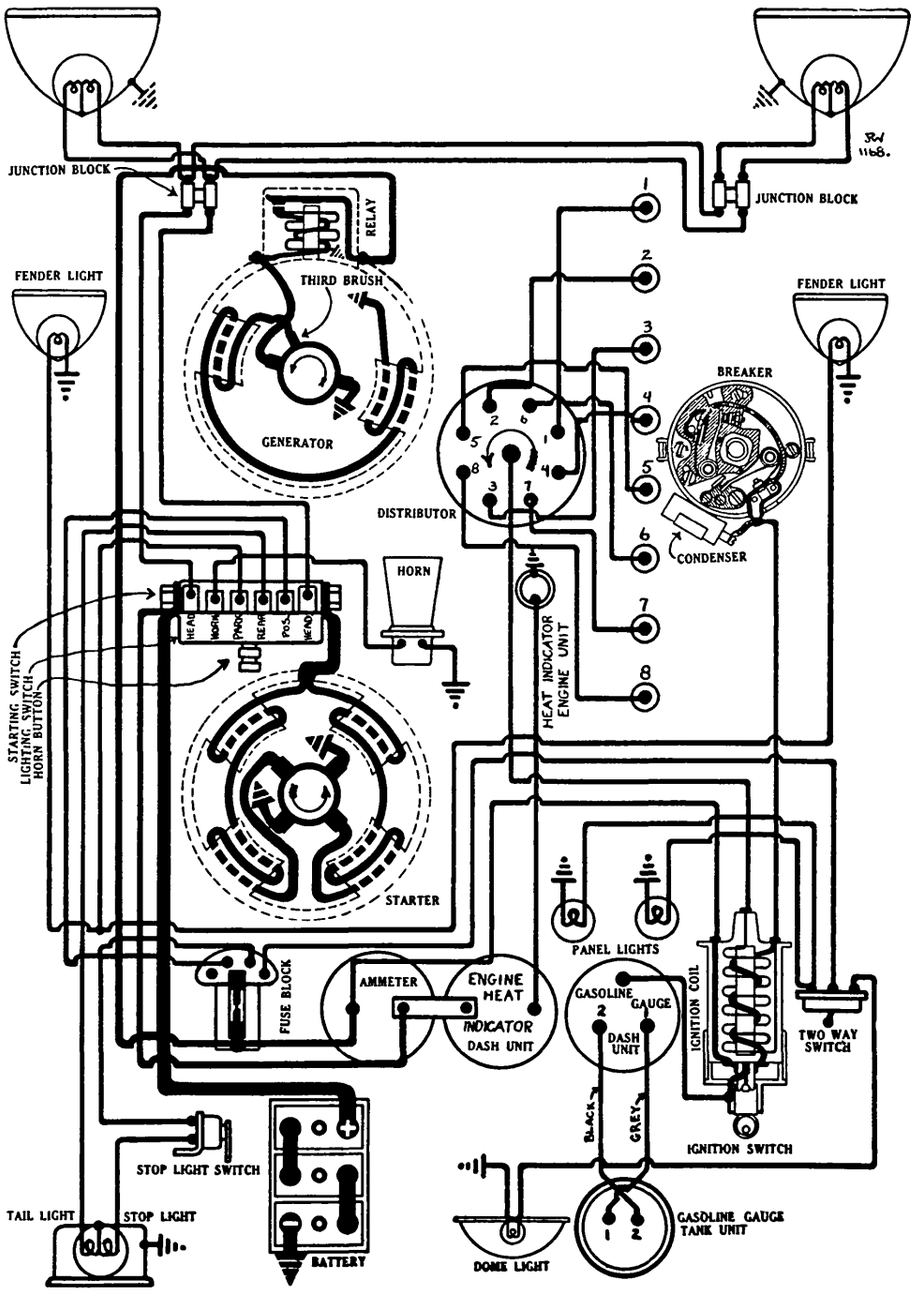
WILLYS EIGHT

MODEL 8-80 (1930) SERIAL NUMBERS 1001 UP
MODEL 8-80D (1931) SERIAL NUMBERS 1001 UP
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—U.S.L., Type 3-HVX-7X-6A, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 148.4 amperes for 20 minutes. Lighting capacity (5 ampere rate, is 5 amperes for 28 hours. Battery is mounted under the left front floor boards.

IGNITION:—Coil Model IG-4083, 4201, 4301 ('30), IG-4203, 4303 ('31). Switch is built in the base of the coil. Coil is mounted on the back of the instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1-1½ amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

NOTE:—The model IG-4303 coil used on 1931 models has both the ammeter lead terminal and gas gauge terminal at the switch end of the coil. The breaker lead terminal only at the high tension end of the coil is used.



Distributor Model IGH-4013. Breaker contacts separate .018-.020 inch. Set contact gap by loosening two lock screws on stationary contact mounting plate and turning eccentric adjusting screw (first set mounted on breaker plate). The second set mounted on the movable sub-plate are adjusted by loosening the lock nut on the stationary contact mounting stud and turning up the stud. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-21 ounces. Distributor is semi-automatic . Maximum manual advance is 20 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 22 degrees (engine) reached at 3400 R.P.M. of engine. Breaker has two sets of contacts operating on a four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to the 90 degree firing interval of the engine. Contacts must be synchronized for satisfactory performance. See Timing.

Mounting:—Distributor is mounted at left of engine and is driven by an inclined shaft. The oil pump is mounted at the right of the engine on the other end of the shaft. To remove distributor, disconnect primary lead and spark control wire and remove distributor head with cables intact. Then take out the mounting screw in the advance arm and lift the distributor from place.

Oiling:—Fill the oiler on the side of the distributor with light engine oil every 250 miles or each week of operation. Every 500 miles remove the distributor head and rotor and put 3 or 4 drops of oil in the oiler in the center of the shaft. Every 5000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Synchronization of Contacts. Synchronize contacts on a rotary spark gap or use special Auto-Lite Test Indicator and follow complete directions in Equipment Section. Synchronization should be checked whenever contacts are resurfaced or when ignition timing is checked. This is important since timing of four cylinders will be thrown off if contacts are allowed to get out of synchronization.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .0136 inch before dead center (or 6 degrees on the flywheel), with the spark control button in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). See that manual spark control button is fully advanced (pushed all the way in toward the dash). Remove cover over timing inspection hole in front face of flywheel housing at left of engine and turn engine over until the flywheel mark 'IGN' is directly opposite the pointer on the housing. This mark is 6 degrees before the top dead center mark for piston No. 1 '1&8/T.C.' Then

AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

loosen advance arm clamp screw and rotate distributor until one set of contacts begin to open. Tighten the clamp screw and see that the rotor is directly opposite the segment connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18 MM. Metric Champion No. 8. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES. Head diameter, 1 17/32 inches. Stem diameter, 3/8 inch. Valve lift, 21/64 inch. Spring pressure, 92-100 pounds (compressed to 1 15/16 inches). Tappet clearance, .006 inch (hot). Inlet valves open at top dead center and close 38 degrees after lower dead center. The flywheel is marked '1&8T.C./I.O.' at point of inlet opening for cylinder No. 1.

EXHAUST VALVES. Head diameter, 1 15/32 inches. Stem diameter, 3/8 inch. Valve lift, 21/64 inch. Spring pressure, 92-100 pounds (compressed to 1 15/16 inches). Tappet clearance, .008 inch (hot). Exhaust valves open 34 degrees before lower dead center and close 4 degrees after top dead center.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .010". This valve should open with piston on top dead center when flywheel mark '1&8T.C/I.O' lines up with indicator on housing. Reset tappet clearance at .006" (hot).

To Set Valve Timing:—Sprockets are marked. Mesh chain with sprockets turned so that marks are adjacent and in line with a straightedge across the shaft centers.

STARTER:—**Model MAB-4031 (1930), MAB-4035 (1931).** Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Brush spring tension is 44-56 ounces. The starter switch is mounted at the lower end of the steering column and is controlled by a button on the steering wheel.

Starter Data

Torque	R.P.M.	Volts	Amperes
.6 lb. ft.	1910	5.5	100
3.5 "	1100	5.0	200
6.6 "	625	4.5	300
10.2 "	420	4.0	400
24.0 "	Lock	4.0	725

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and take out three flange mounting bolts. Then pull starter forward and lift from place.

Oiling:—Put 4 to 6 drops of light engine oil in the oiler at each end of the starter every two weeks or each 500 miles of operation.

GENERATOR:—**Model GAL-4131, 4331.** Direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by prying on the brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in position by friction between the mounting stud and the end plate. With standard car setting, the maximum charging rate is 18 amperes at 8 volts reached at 1900 R.P.M.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	675
6	6.9	835
10	7.3	1025
14	7.65	1275
18	8.0	1900
14	7.65	2925

Brush Spring Tension—22-25 ozs. (main), 31-34 ozs. (third brush) on GAL-4131, 8-13 ozs. (all brushes) on GAL-4331.
Field Current—4.08-4.52 amperes at 6.0 volts.
Motoring Current—4.27-4.73 amperes at 6.0 volts.

Mounting:—Generator is mounted on special swinging bracket at left of the engine and is driven by the fan belt. To remove generator, disconnect lead and loosen adjustment clamp bolt. Swing generator toward engine and slip off drive belt. Then take out bolts in mounting lugs under generator and lift generator from place.

Belt Adjustment. To adjust belt tension, loosen adjustment clamp bolt and mounting bolts. Swing generator away from engine until correct belt tension is secured and tighten bolts. The belt should be just tight enough to drive the generator and fan shaft without slipping. Excessive belt tension will cause generator bearing wear.

Oiling:—Put 4 to 6 drops of light engine oil in the oiler at each end of the generator every 250 miles of operation. Every 1000 miles remove the grease cup directly under the bearing retainer on the commutator end of the generator and refill with pure vaseline. This is important.

RELAY:—**Model CB-4014.** Relay is mounted on the generator. Relay contacts close at 675 R.P.M. of the generator armature when the generator voltage reaches 7-7.5 volts and open with a discharge current of 2.5 amperes. Charging current at closing of contacts is 2 amperes. Relay contact gap is .035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—**Pines 'Finger Tip Control' Switch.** Switch is mounted at lower end of steering column. The starting switch, lighting switch and horn button are combined in one unit controlled by a button on the steering wheel. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. This is a double filament bulb with two 21 cp. filaments. Side and dash lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Dome light is 6-8 volt, 3 cp. S.C. Mazda 63. Tail and stop light is 6-8 volt, 3-21 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament.

Switch:—Lighting switch is No. 803.

FUSES:—Lighting fuse mounted on fuse block on left front side of dash is 20 ampere capacity.

STREAM LINE MODEL 6-90A—AFTER JUNE, 1932
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on left hand frame side rail in front of left front spring rear shackle and on plate under driver's seat cushion. First serial number of this model—14201.

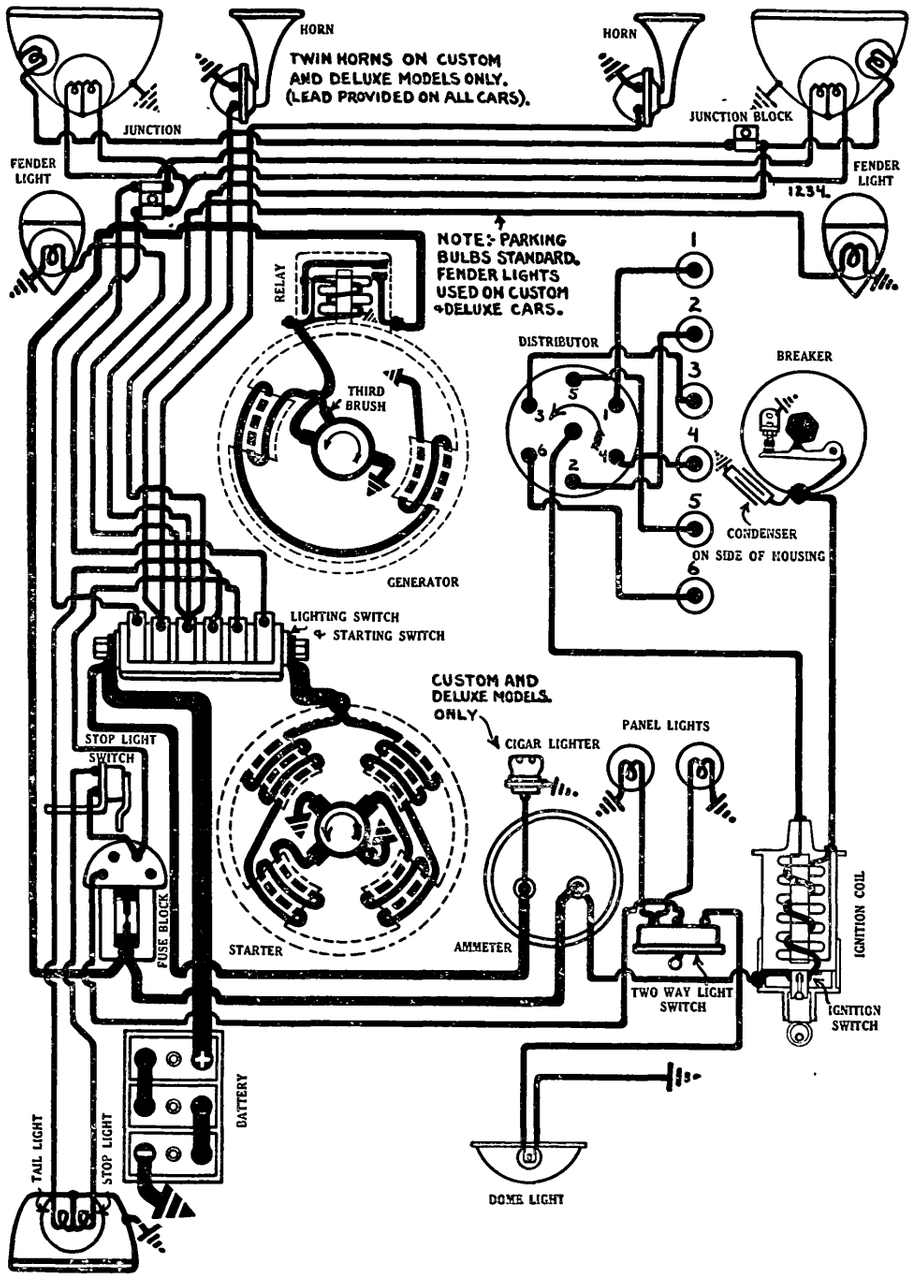
ENGINE NUMBER:—Stamped on left hand upper front of engine block.

ENGINE:—Six cylinder, 'L' head type, 3¼x3⅞" bore and stroke, 193 cubic inch displacement, rated at 25.35 H.P., develops 65 H.P. at 3400 R.P.M. Standard compression ratio—5.26-1.

BATTERY:—U.S.L., Type XY-13X-7A, 6 volt, 13 plate, 87.5 ampere hour capacity (5 ampere rate). Starting capacity 102 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—On left hand frame side rail under front floor boards.
Dimensions:—Width, 7¼". Length, 9". Height, 8⅝".

IGNITION:—Coil Model IG-4305 (Std.), IG-4602 (Clsd. Cars), IG-4502 (Sport Rdstr.), IG-4501 (Std. Rdstr.). IG-4035, 4501, 4502 are coil lock types mounted on back of instrument board (switch in base). IG-4602 mounted on dash and connected to special Mitchellock by armored cable (see Electrical Equipment Section for Mitchellock data).
Ignition Current:—1½ amperes at 6 volts (engine running), 3.4-5 amperes at 6 volts (engine stopped).

Distributor Model IGB-4032. Single breaker arm, 6 lobe cam, semi-automatic advance type. Manual advance controlled by button on dash. Distributor is retarded by pulling out button for hand cranking or heavy pulling. Pushing button in toward dash advances distributor 20° (engine).
Breaker Gap:—Set contact at .018". Hold within limits of .018-.020".
Breaker Arm Spring Tension:—16-22 ounces (measured at tip of breaker arm with spring scale centered on arm and at right angles to breaker arm.
Cam Angles—Closed 34°. Open 26° (distributor degrees).



Automatic Advance

Degrees	Distributor	R.P.M.	Degrees	Engine	R.P.M.
Start		300	0		600
3		640	6		1280
6		1010	12		2040
9		1350	18		2700
11		1600	22		3200

Mounting:—Distributor mounted at left center of engine and driven by an inclined shaft from the camshaft. To remove, disconnect primary lead, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift out.

Oiling:—250 Miles. Put 6 drops SAE. #20 engine oil in oiler on side of shaft. Take off distributor cap and rotor, put 6 drops oil in wick oiler in center of shaft.
5000 Miles. Apply thin film vaseline to face of breaker cam.

IGNITION TIMING:—Standard Setting—top dead center with manual control advanced.
To Set Ignition Timing:—Take off cover plate over inspection hole in left hand front face of flywheel housing, advance manual spark control (push button in toward dash), see that distributor is rotated clockwise to end of advance arm slot. With No. 1 piston on compression turn engine over until piston reaches top dead center with flywheel mark '1-6 CYL./IGN.TC' directly opposite indicator on housing, loosen advance arm clam bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite No. 1 terminal in distribuor cap (see diatgram), connect spark plugs as indicated.
Note on Cars with Startix:—The Electrolock ignition switch used on all cars with Startix automatic starting switch has two 'On' positions. The first 'On' position (approximately ⅛ turn from the vertical 'Off' position) turns on ignition and gasoline gauge circuit but does not connect Startix. This switch position should be used in checking ignition to avoid automatic

WILLYS OVERLAND SIX

SIX CYLINDER MODEL 6-90 (1932), SERIAL NUMBERS 1001 UP
STREAM LINE MODEL 6-90A—AFTER JUNE, 1932
AUTO-LITE SYSTEM

cranking. The second 'On' position (approximately ¼ turn of switch key) is the normal operating position of the switch with Startix operative.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion Type C-7. Set spark plug gaps at .027".

VALVE TIMING:—Camshaft Setting:—Camshaft at right of engine is driven from crankshaft by two-sprocket non-adjustable chain drive. Sprockets are marked. Mesh chain with sprockets turned so that punch marks are adjacent and in line with straightedge across shaft centers. With correct setting, mark on rim of camshaft sprocket should be in line with mark on edge of front engine support with piston No. 1 on top dead center and flywheel mark 'IGN.TC./CYL.1-6' at indicator.

To Check Valve Timing:—Set tappet clearance No. 1 intake valve at .008", No. 1 exhaust valve at .009" (cold). With No. 6 piston on compression turn engine over until flywheel mark 'IO/' is opposite pointed screw on edge of inspection hole in left front face of flywheel housing. No. 1 intake valve should begin to open at this point. Turn engine over 5° to point where flywheel mark 'EC./' registers with pointer. No. 1 exhaust valve should close at this point. Reset tappet clearance at .004" (intake), .006" (exhaust) with engine hot.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1⅝"	.372"	45°	5/16"
Exhaust	1 15/32"	.371"	45°	5/16"

Tappet Clearance		Valve Springs	
Operating	Timing		
Intake .004" (hot)	.008" (cold)	Closed .46	pounds—2¼"
Exhaust .006" (hot)	.009" (cold)	Open 85½	pounds—1 15/16"

Timing

Intake Valve	Exhaust Valves
Open—7° before top dead center.	Open—49° before lower dead center.
Close—39° after lower dead center.	Close—2° before top dead center.

CARBURETION:—Tillotson Updraft Carburetor, Model J1B. See Carburetor Section for complete data. Intake manifold heat control automatic.

Fuel Pump:—A.C. Mechanical Fuel Pump mounted on right side of crankcase (see Carburetion Section for complete data). Remove glass sediment bowl when necessary, empty water and sediment, clean filter screen (located above bowl) before reassembling.

Gasoline Gauge:—K-S Telegauge hydrostatic type gauge (see Carburetion Section).

STARTER:—Model MZ-4030 (Custom and Sport Models), (MZ-4024 Standard Models). Starter drive—inboard Bendix with Startix automatic starting switch on Custom models and Pines 'Finger Tip Control' switch on Standard models. See Equipment Section for complete data on Startix and Pines switches. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4902	5.5	47 (with Bendix)
.65 "	2500	5.5	100
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
10.1 "	Lock	3.5	470
12.25 "	Lock	4.0	545

Mounting:—Flange mounted on left hand front face of flywheel housing. To remove, disconnect cable, take out 3 flange mounting screws, pull starter forward to clear Bendix, lift out.

Oiling:—500 Miles. Put 6 drops SAE. No. 20 engine oil in oiler at each end.

GENERATOR:—Model GAL-4331. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate (standard setting) is 17.2 amperes (cold) at 8.0 volts reached at 1900 R.P.M.

Charging Rate Adjustment:—Take off commutator cover band, shift third brush by prying on brush mounting stud counter-clockwise to increase, or clockwise to decrease charging rate. Brush held in position by friction.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	600	0	6.4	700
4	6.7	740	4	6.9	900
8	7.1	900	8	7.4	1150
12	7.4	1120	10	7.7	1340
17	8.0	1900	12.4	8.0	2150
12	7.4	3200	9.5	7.7	3200

Brush Spring Tension:—8-13 ounces on each brush.

Field Current:—4.08-4.52 amperes at 6 volts across field terminals.

Motoring:—4.27-4.73 amperes at 6.0 volts.

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, loosen adjustment clamp bolt, swing generator toward engine and slip off drive belt, take out bolt forming bracket hinge, lift generator out.

Belt Adjustment:—Loosen adjustment clamp bolt and mounting bolt, pull generator away from engine until fan can just be turned with belt held stationary, tighten adjustment bolt and mounting bolt before slacking off on generator.

Oiling:—250 Miles. Put 6 drops SAE. No. 20 engine oil in oiler at each end. **1000 Miles.** Remove grease cup under bearing retainer on commutator end, clean out old grease, fill cup with vaseline, dip wick in oil and replace.

RELAY:—Model CB-4014, 4021 (With Startix terminal). Mounted on generator field frame. Relay contacts close at 675 R.P.M. with generator voltage of 7-7.5 volts and charging current of approximately 2 amperes and open with discharge current of .5-2.5 amperes.

Contact Gap:—.025-.035 inch. **Air Gap:**—.010-.030 inch (contacts closed).

LIGHTING:—Pines Switch, Model A-805 (Standard Models), 6700 (Custom and Sport Models). Lighting switch 'Finger Tip Control' type mounted at lower end of steering column and controlled by knob on steering wheel. Type A-805 on Standard models includes starting switch. Type 6700 on Custom models is used with Startix and does not include starting switch. See Equipment Section for complete data. Lighting system 'depressed beam' dimming with standard double filament headlight bulbs.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking Lights	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Stop and Tail Lights	6-8	21-2	D.C.	1158

Custom and Sport models have parking lights mounted on fenders. Standard models have parking bulbs in headlights. Stop and tail light has special double filament bulb and tail light lead must be connected to 2 cp. filament.

FUSES:—One 20-ampere capacity fuse mounted on left front of dash.

WILLYS OVERLAND EIGHT

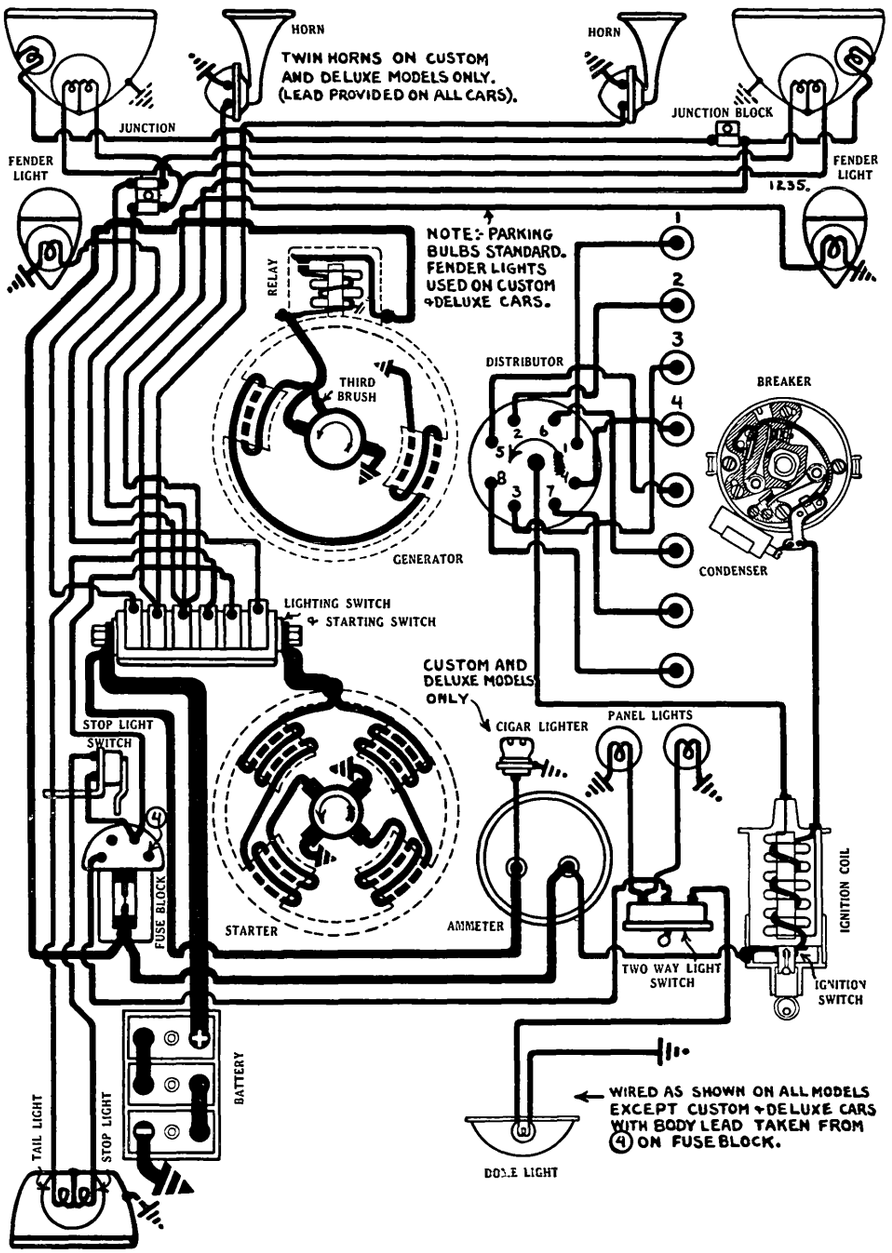
EIGHT CYLINDER MODEL 8-88 (1932), SERIAL NUMBERS 1001 UP
STREAM LINE MODEL 8-88A—AFTER JUNE, 1932
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on right hand frame side rail above right front spring rear shackle and also under driver's seat

ENGINE NUMBER:—Stamped on left side cylinder block opposite No. 1 cylinder.

BATTERY:—**U.S.L., Type 3-HVX-7X-6A,** 6 volt, 15 plate, 142 ampere hour capacity (5 ampere rate). Starting capacity 148 5 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—Mounted on left hand frame side rail under front floor boards
Dimensions:—Width, 7 7/16". Length, 11¾". Height, 9¾".

IGNITION:—**Coil Model IG-4305, 4501 (8-88), IG-4602 (8-88A).** IG-4305 and IG-4501 are coil lock types mounted on back of instrument board with switch in base of coil IG-4602 mounted on dash and connected to special Mitchellock by armored cable See Electrical Equipment Section for Mitchellock data
Ignition Current:—1-3 amperes at 6 volts (engine running), 3-4 5 amperes at 6 volts with engine stopped
Ignition Switch—Type 16-S Mitchellock integral with coil. Switch has two 'On' positions. First on position (⅛ turn from 'Off' or vertical) does not connect Startix and should be used for timing. Second 'On' position (approximately ¼ turn to right) is regular running position with Startix operative.



Distributor Model IGH-4013. Two-breaker arm, 4-lobe cam, semi-automatic advance type Distributor is retarded by pulling out spark control button for hand cranking and operation at low speeds or heavy pulling. Pushing in button advances distributor 20° (engine). Breaker contacts open alternately at 45° intervals corresponding to 90° firing interval of engine. Contacts must be synchronized (see Ignition Timing).
Breaker Gap:—Set contact gap at .018". Hold within limits of 018-020".
Breaker Arm Spring Tension:—16-22 ounces (measured at tip of breaker arm with spring scale centered and at right angles to arm).
Cam Angles—Closed 32°. Open 13° (distributor) when synchronized.

		Automatic Advance			
Degrees	Distributor	R P M	Degrees	Engine	R P M
Start		200	0		400
3		600	6		1200
6		1015	12		2030
9		1430	18		2860
11		1700	22		3400

Mounting:—Mounted at left center of crankcase and driven by inclined shaft from crankshaft To remove, disconnect primary lead, disconnect manual spark control, take off distributor cap, take out hold-down screw in advance arm, lift distributor out

Oiling:—**250 Miles.** Put 6 drops SAE No. 20 engine oil in oiler on side of shaft Take off distributor cap and rotor, oil wick oiler in center of shaft Put one drop oil on breaker arm pivot pins
5000 Miles. Apply thin film vaseline to face of breaker cam

IGNITION TIMING:—Standard Setting—6° (flywheel) or .0136" (piston travel) before top dead center with manual spark control advanced.
To Set Ignition Timing. Take off cover plate on inspection hole in right front face of flywheel housing, advance manual spark control (push button in toward dash) with No 1 piston on compression, turn engine over by hand until flywheel mark 'IGN./' (which is 6° before top dead center mark '1&8 TC/I O') registers with pointed end of inspection cover plate screw Loosen advance arm clamp bolt, rotate distributor until first set of breaker contacts (mounted directly on breaker plate) begin to open, tighten clamp bolt If ignition is turned on to check opening of contacts on Custom models equipped with Startix, use first 'On' position of switch (key turned approximately ⅛ turn to right) to avoid automatic cranking. See that rotor is directly opposite No. 1 terminal in distributor cap (see diagram) and connect spark plugs as indicated. Then synchronize contacts.
Synchronization of Contacts. No flywheel marks provided to synchronize

WILLYS OVERLAND EIGHT

EIGHT CYLINDER MODEL 8-88 (1932), SERIAL NUMBERS 1001 UP
STREAM LINE MODEL 8-88A—AFTER JUNE, 1932
AUTO-LITE SYSTEM

contacts on engine. It will be necessary to use a rotary spark gap or special Auto-Lite synchronizing tool. See Equipment Section for complete data on synchronization. If timing gause is used, shift gauge to No. 6 cylinder and repeat timing. Do not loosen clamp bolt but loosen lock screws on movable sub-plate (carrying second set of contacts), shift plate until contacts begin to open, tighten lock screws.

Firing Order:—1-6-2-5-8-3-7-4. No. 1 cylinder nearest radiator.

Spark Plugs:—18 MM. Metric. Champion Type #8. Set gaps at .027 inch.

VALVE TIMING:—Camshaft Setting. Camshaft at right of engine and driven from crankshaft by two-sprocket non-adjustable chain drive. Sprockets are marked. Mesh chain so that marks are adjacent and in line with straight-edge across shaft centers. With correct setting, mark on rim of camshaft sprocket should be in line with mark on edge of front engine support. with piston No. 1 on top dead center and flywheel mark '1&8.T.C./I.O.' registering with pointer in inspection hole.

To Check Valve Timing. Set tappet clearance No. 1 intake and exhaust valves at .010" cold. With No. 8 piston on compression turn engine over until piston reaches top dead center with flywheel mark '1&8.T.C./I.O' at indicator. No. 1 intake valve should open at this point. Turn engine over 4° until flywheel mark 'E.C/' registers with pointer. No. 1 exhaust valve should close. Reset tappet clearance at .006" (intake), .008" (exhaust) with engine warm.

Valve Specifications

Valve	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 17/32"	.372"	45°	21/64"
Exhaust	1 15/32"	.371"	45°	21/64"

Tappet Clearance (Operating Timing)	Valve Springs
Intake .006" (hot) .010" (cold)	92-100 pounds—1 15/16"
Exhaust .008" (hot) .010" (cold)	

Intake Valves	Timing	Exhaust Valves
Open—At top dead center		Open—34° before lower dead center.
Close—38° after lower dead center.		Close—4° after top dead center.

CARBURETION:—Tillotson Updraft Carburetor, Model W5D. See Carburetor Section for complete data. Intake manifold heat control automatic.

Fuel Pump:—A.C. Mechanical Fuel Pump mounted on right side of crankcase (see Carburetion Section). Remove glass sediment bowl when necessary empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasolin Gauge:—K-S Telegauge hydrostatic type (see Carburetion Section).

STARTER:—**Model MAB-4035, 4048.** Drive—Inboard Bendix with Startix automatic starting switch on Custom models and Pines 'Finger Tip Control' switch on Standard models. See Equipment Section for complete data on Startix and Pines 'Finger Tip Control' switches. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes

Brush Spring Tension:—8-13 ounces on each brush.

Field Current:—4.08-4.52 amperes at 6 volts across field terminals.

Motoring:—4.27-4.73 amperes at 6.0 volts.

Mounting:—Pivot mounting on bracket at left front of engine with fan belt drive. To remove, disconnect lead, loosen adjustment clamp bolt, swing generator toward engine and slip off drive belt, take out bolt forming bracket hinge, lift generator out.

Belt Adjustment:—Loosen adjustment clamp bolt and mounting bolt, pull generator away from engine until fan can just be turned with belt held stationary, tighten adjustment bolt and mounting bolt before slacking off on generator.

Oiling:—**250 Miles.** Put 6 drops SAE. No. 20 engine oil in oiler at each end. **1000 Miles.** Remove grease cup under bearing retainer on commutator end, clean out old grease, fill cup with vaseline, dip wick in oil and replace.

RELAY:—**Model CB-4014, 4021 (With terminal for Startix).** Mounted on generator field frame. Relay contacts close at 675 R.P.M. with generator voltage of 7-7.5 volts and charging current of approximately 2 amperes and open with discharge current of .5-2.5 amperes.

Contact Gap:—.025-.035 inch. **Air Gap:**—.010-.030 inch (contacts closed).

LIGHTING:—**Pines Switch, Model A-805 (Standard Models), 6700 (Custom and Sport Models).** Lighting switch 'Finger Tip Control' type mounted at lower end of steering column and controlled by knob on steering wheel. Type A-805 on Standard models includes starting switch. Type 6700 on Custom models is used with Startix and does not include starting switch. See Equipment Section for complete data. Lighting system 'depressed beam' dimming with standard double filament headlight bulbs.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Parking Lights	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Stop and Tail Lights	6-8	21-2	D.C.	1158

Custom and Sport models have parking lights mounted on fenders. Standard models have parking bulbs in headlights. Stop and tail light has special double filament bulb and tail light lead must be connected to 2 cp. filament.

FUSES:—One 20-ampere capacity fuse mounted on left front of dash.

WILLYS

MODEL 77 (1933-34), SERIAL NUMBERS 1001 UP
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on left hand frame side rail near rear hanger of left front spring. First serial number 1001.

ENGINE NUMBER:—Stamped on upper right hand front corner of cylinder block. First serial number 1001.

ENGINE:—Four cylinder, 'L' head type, 3⅛x4⅜" bore and stroke, 134.2 cubic inch displacement, rated at 15.6 H.P., develops 48 H.P. at 3200 R.P.M. Standard compression ratio 5.13-1. Optional compression ratios are not offered.

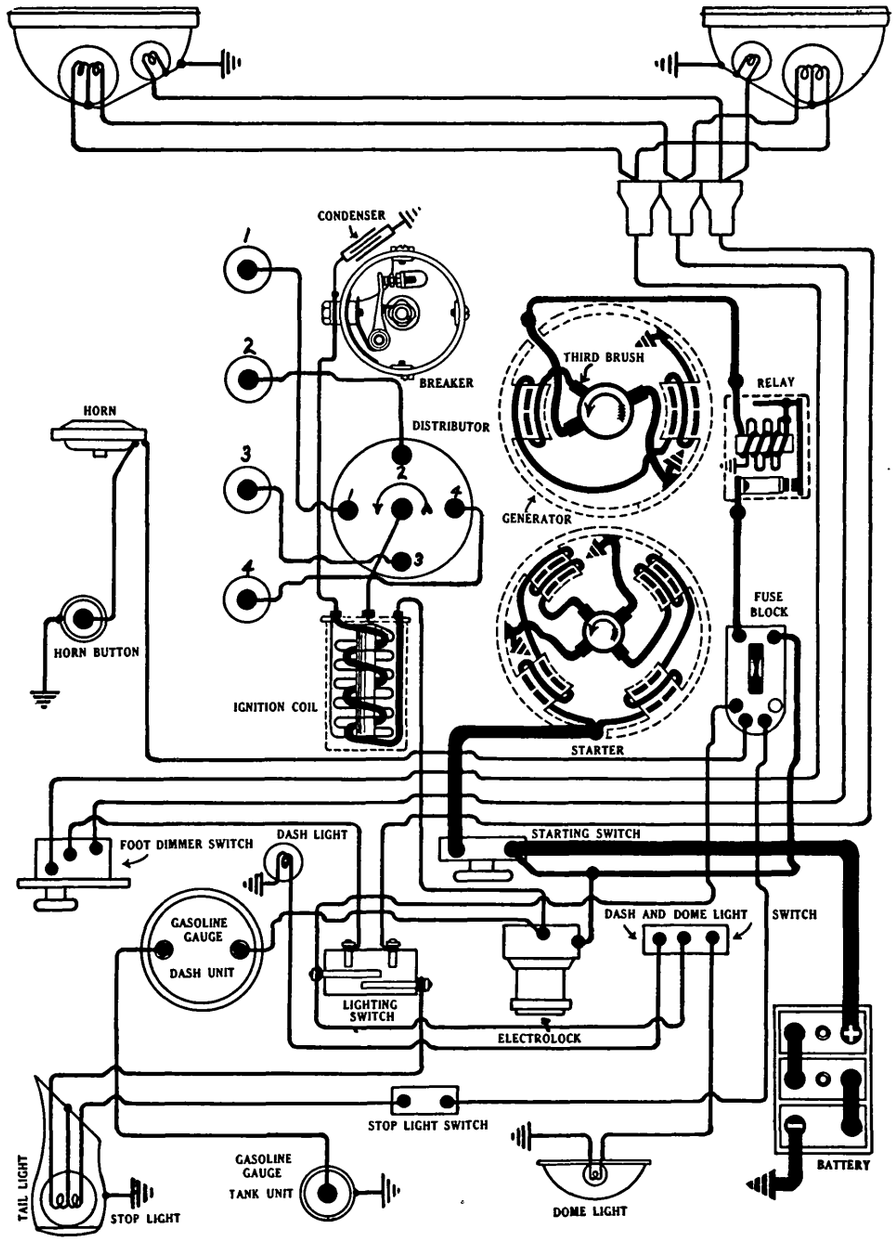
BATTERY:—**U.S.L., Type CW-11A,** 6 volt, 11 plate, 84 ampere hour capacity (5 ampere rate). Starting capacity 96 amperes for 20 minutes.
Grounded Terminal:—Negative (—) terminal grounded to frame.
Mounting:—In cradle between right hand frame side rail and 'X' member under right hand front seat.
Dimensions:—Width, 7¼". Length, 9". Height, 8⅝".

IGNITION:—**Coil Model IG-4406.** Coil is mounted on right hand side of engine block above the starter.
Ignition Current:—3.1 amperes at 6 volts (engine running), 4.98 amperes at 6 volts (engine stopped).
Ignition Switch:—Electrolock, Type 17-A (no armored cable). See Equipment Section for complete data on this type ignition switch.

Distributor Model IGB-4078. Single breaker, four-lobe cam, full automatic advance type. Contact gap is adjusted by loosening lock nut on stationary contact mounting stud and turning up stud.
Breaker Gap:—Set contact gap at .018". Hold within limits of .018-.020".
Breaker Arm Spring Tension:—16-22 ounces measured at tip of breaker arm with spring scale at right angles to back of arm.
Cam Angles—Closed 46°. Open 44° (distributor degrees).

Automatic Advance

Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	300	0	600
2	510	4	1020
4	750	8	1500
6	970	12	1940
8	1190	16	2380
10	1415	20	2830
12.5	1700	25	3400



Mounting:—Distributor mounted on right hand side of crankcase and is driven by an inclined shaft from the camshaft. To remove, disconntct primary lead, take off distributor cap, take out hold-down screw in advance arm, lift distributor out.

Oiling:—**250 Miles.** Put 6 drops S.A.E. #20 engine oil in oiler.
500 Miles. Take off distributor cap and rotor. Put 4 drops S.A.E. #20 engine oil in wick oiler in center of shaft.
5000 Miles. Apply thin film of vaseline to face of breaker cam.

IGNITION TIMING:—Standard setting 4° (flywheel) or .0066" (piston travel) before top dead center.
To Set Ignition Timing:—Take off cover plate over inspection hole in top of flywheel housing at left of engine. With No. 1 piston on compression stroke, turn engine over by hand until ignition mark 'IGN' (which is 4° before top dead center mark 'I.O./T.C.1-4') is directly in line with pointed end of inspection plate screw, then loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is directly opposite No. 1 terminal in distributor cap (see diagram), connect spark plugs as indicated.

Firing Order:—1-3-4-2. No. 1 cylinder nearest radiator.

Spark Plugs:—**18 MM. Metric. Champion Type C-7. Set gaps at .025".**

WILLYS

MODEL 77 (1933-34), SERIAL NUMBERS 1001 UP
AUTO-LITE SYSTEM

VALVE TIMING:—Camshaft Setting. Camshaft at left of engine is driven from crankshaft by two-sprocket non-adjustable chain drive. Sprokets are marked. To set timing, with crankshaft turned so that pistons Nos. 1 and 4 are on top dead center, mesh sprockets in chain so that marks on sprockets are adjacent and in line with a straightedge laid across the shaft centers.

To Check Valve Timing. With No. 1 piston on top dead center entering power stroke, set tappet clearance of No. 1 intake and exhaust valves at .010". Turn engine over one complete revolution and stop with piston on top dead center when flywheel mark 'T.C./I.O.1-4' is directly in line with pointed end of inspection plate screw in inspection hole in left hand top surface of flywheel housing. No. 1 intake valve should begin to open at this point. Turn crankshaft 5° and stop when flywheel mark 'E.C./' registers with the inspection plate screw. No. 1 exhaust valve should begin to close at this point. Reset tappet clearance at .004" (intake), .006" (exhaust) with engine warm.

Valve Specifications

	Head Diameter	Stem Diameter	Seat Angle	Lift
Intake	1 17/32"	.372"	45°	21/64"
Exhaust	1.. 15/32"	.371"	45°	21/64"

Tappet Clearance	Operating	Timing	Valve Springs
Intake	.004" (hot)	.010" (cold).	85 pounds—1 15/16 inches.
Exhaust	.006" (hot)	.010" (cold).	

Intake Valves	Timing	Exhaust Valves
Open—At top dead center.		Open—40° before lower dead center.
Close—45° after lower dead center.		Close—5° after top dead center.

NOTE:—The exhaust closing point should be used in checking valve timing and is equivalent to a piston position of .0103" past top dead center.

CARBURETION:—Tillotson Downdraft Carburetor, Model D-1A (see Carburetor Section for complete data). Manifold heat control is adjusted manually at the manifold. Three settings are provided for by depressions in which the adjusting lever set screw is designed to seat. These positions are: Heat off (summer operation), Heat On (winter operation), and Midway.

Air Cleaner:—A.C. oil-wetted wire gauze type integral with silencer. Remove complete unit at 2500 mile intervals, clean by dipping wire gauze end of unit in pan of gasoline, dry thoroughly, re-oil by dipping in pan of engine oil, drain before reassembling.

Fuel Pump:—A.C. Mechanical type mounted on left hand side of crankcase and driven by eccentric on camshaft. Remove glass sediment bowl under pump, when necessary, empty water and sediment, clean filter screen (located directly above bowl) before reassembling.

Gasoline Gauge:—National electric type (see Carburetion Section).

STARTER:—Model MZ-4033. Starter drive—Special Outboard Bendix. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces. Starter switch mounted on upper toeboard is Model SW-4001.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4900	5.5	47
.65 "	2500	5.5	100
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
12.25 "	Lock	4.0	545

Mounting:—Flange mounted on right hand forward face of flywheel housing. To remove, disconnect cable, take out two flange mounting screws, pull starter forward to clear Bendix, lift out.

Oiling:—500 Miles. Put 6 drops S.A.E. #20 engine oil in commutator end oiler.

GENERATOR:—Model GAM-4504. Third brush regulation. Rotation counter-clockwise at commutator end. Maximum charging rate is 17 amperes (cold) at 8 volts reached at 2400 R.P.M.

Charging Rate Adjustment:—Take off commutator cover band, shift third brush by prying on brush mounting stud, counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction. No ammeter is installed on the car and it will be necessary to connect a test ammeter in the generator charging circuit at the relay cut-out whenever the charging rate is being checked or adjusted.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	700	0	6.4	760
4	6.9	880	4	6.9	1040
7	7.0	1000	8	7.3	1400
10	7.2	1180	10	7.5	1600
14	7.8	1520	12.8	7.9	2550
17	8.0	2400	12.2	7.8	3200
15.2	7.9	3200			

Brush Spring Tension:—18-22 ounces on each brush.

Field Current:—4.08-4.52 amperes at 6 volts across field terminals.

Motoring:—4.94-5.46 amperes at 6 volts.

Mounting:—Pivot mounted at right hand forward end of engine with fan belt drive. To remove, disconnect lead, take out adjustment clamp bolt, swing generator toward engine and slip off drive belt, take out two bolts forming bracket pivot under generator, lift generator out.

Belt Adjustment. Loosen two mounting bolts and adjustment clamp bolt pull generator away from engine until fan can be turned with belt held stationary, tighten adjustment clamp bolt before slacking off on generator, tighten mounting bolts.

Oiling:—250 Miles. Put 6 drops S.A.E. #20 engine oil in oiler at each end.

RELAY:—Model CB-4008. Mounted on top of right hand frame side rail near generator. Contacts close at 700-800 R.P.M. of generator with generator voltage of 7.0-7.5 volts and open with discharge current of .5-2.5 amperes. **Contact Gap:**—.025-.035". **Air Gap:**—.010-.030" with contacts closed.

LIGHTING:—Lighting switch mounted at lower edge of instrument panel. Soreng-Manegold Dimmer Switch, Model D-2100-A mounted on toeboard. Double filament headlight bulbs used for 'depressed beam' dimming. A double filament bulb is used for the stop and tail light.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C	1110
Parking Bulbs	6-8	3	S.C.	63
Instrument Light	6-8	3	S.C.	63
Stop and Tail Light	6-8	21-2	D.C	1158
Dome Light	6-8	3	S.C.	63

FUSES:—20 ampere capacity lighting fuse mounted on fuse block on right hand side of the lower cowl under the engine hood.

HORN:—Schwartze Vibrator disc type horn.

SERIAL NUMBER:—First number 27,001 ('35), 42,000 ('36). On left hand frame member near front spring rear shackle and on body sill at left front door opening.

COMPRESSION:—	**Ratio**	**Pressure**
1935	5.13-1	83 lbs. at 120 R.P.M.
1936	5 7-1	87 lbs. at 216 R.P.M

NOTE—Cylinder heads are cast-iron.

VACUUM READING:—Gauge should show steady reading of 18½" with engine idling at 7 M.P.H.

IGNITION:—Coil Model IG-4090. Mounted on right hand side of engine block.
Ignition Current—2.5 amperes at 6 volts (idling at 400 R.P.M.), 4 amperes (stopped, coil at 78°F.).
Ignition Switch:—Mitchellock 17-A, Type 5159. Coil connection not armored.
Ignition Lock—Independent Lock Co. No. 4044-H, Mitchell No. 4759.
Distributor Models IGB-4078 ('35), IGS-4007 ('36). Single breaker, 4 lobe cam, full automatic advance type. Auxiliary vacuum spark control used on IGS model.
Breaker Gap—Set at .018". Limits, .018-.020"
Breaker Arm Spring Tension—16-20 ounces.
Cam Angles—(IGB)—46° (closed), 44° (open).
(IGS)—47° (closed), 43° (open).
Condenser—Part No. IGB-1025 (IGB), IG-2671 (IGS).
Capacity .20-.25 microfarads.

Automatic Advance—IGB-4078

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.

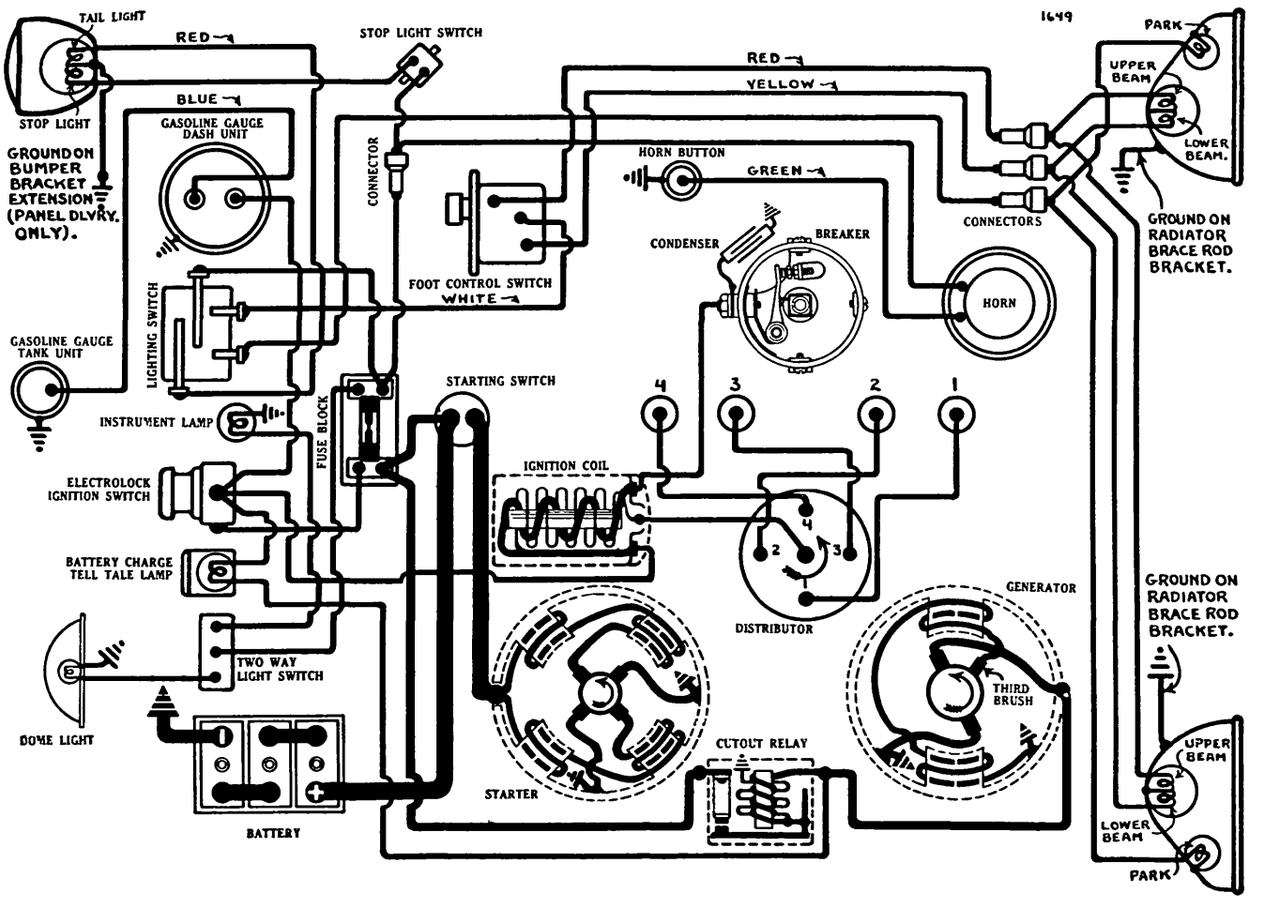
14	1700	28	3400

Vacuum Spark Control (IGS-4007)—Integral with distributor Mounted on distributor housing and linked directly to breaker plate. Provides additional advance for all speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.



IGNITION TIMING:— Flywheel Degs. Piston Position
All engines ....4° BTDC. ..... .0066" BTDC
Timing—Take off cover plate over inspection hole (top surface left hand side flywheel housing) Turn engine over with #1 piston on compression, stop with piston 4° or .0066" before top dead center when flywheel mark 'IGN' lines up with pointed end of inspection plate screw, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram). Flywheel mark 'IGN' is 4° before top dead center mark 'T.C./I.O.1-4'.

Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Firing Order:—1-3-4-2 (see diagram).
Spark Plugs:—Champion, Type C-7. 18 MM. Metric type.
Spark Plug Gaps—.025".

CARBURETION (1935):—Carburetor—Tillotson Model D-1D. 1⅛" downdraft type with manual choke control.
See article in Carburetion Section for complete data.
Air Cleaner:—Monroe oil-wetted type standard.
Fuel Pump:—A.C., Type P-1521390.
See article in Carburetion Equipment Section.
Gasoline Gauge:—National, Electric Type
See article in Carburetion Equipment Section.

CARBURETION (1936):—Carburetor—Tillotson Model D-1E. 1⅛" downdraft type with manual choke control.
See article in Carburetion Section for complete data.
Adjust as follows:
High Speed Adjustment—With engine warm set throttle for 25-30 M.P.H. speed. Turn idle adjusting screw in until it is closed. Then turn High Speed Adjusting Screw (screw with cross bar) in until engine misses, turn screw out until engine begins to roll, finally turn screw in (approximately ¾ turn) until engine fires smoothly. Then set Idle Adjustment as outlined below.
Idle Speed Adjustment—Open idle screw one full turn and close throttle. Set throttle stopscrew for idling speed of 7 M.P.H., turn idle adjusting screw out or left until engine misses, then turn screw in until engine fires smoothly. Reset throttle stop screw if necessary for correct idling speed.
Fuel Pump:—A.C. Type P-1521390.
See article in Carburetion Equipment Section.
Gasoline Gauge:—National, Electric type.
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake and exhaust valves at .010". Intake valve opens with piston on top dead center when flywheel mark 'T.C.I.O.1-4' lines up with pointed end of inspection hole cover screw (top of flywheel housing on left hand side). Exhaust valve closes with piston 5° or .0103" down on intake stroke when flywheel mark 'E.C.' lines up with indicator. Reset tappet clearance at .004" Int., .006" Exh., with engine hot.
Motor Gauge—Weidenhoff Adapter #104, Rod #2.
Tappet Clearance:—.004" Int., .006" Exh., with engine hot.
Valve Spring Pressure:—46½ lbs. at 2¼" (valve closed). 85½ lbs. at 1 15/16" (valve open).

LUBRICATION:—Crankcase Capacity—4 quarts.
Normal Oil Pressure—30 lbs. at 30 M.P.H. (warm oil).

BATTERY:—U.S.L., Type A-13-A, 6 volt, 13 plate, 78 A.H. capacity (20 hour rate).
Starting Capacity—90 amperes for 20 minutes.
Grounded Terminal—Negative (—) terminal.
Location—On 'X' member under right front seat.

STARTER:—Model MZ-4033. Armature No. MZ-2089.
Starter Drive—Special outboard Bendix.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—44-56 ozs. (new brushes).
Cranking Engine—120 R.P.M., 200 amperes, 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	47
.65 "	2500	5.5	100
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
10.1 "	Lock	3.5	470
12.25 "	Lock	4.0	545

Starting Switch:—Models SW-4191 ('35), SW-4001 ('36). Foot plunger type mounted on toeboard.

Mounting:—Flange mounted on right hand front face of flywheel housing. To remove, take out two flange cap screws and one cap screw in bracket on commutator end.

GENERATOR:—Model GAM-4504. Armature No. GAM-2055. Third brush control type.

Charging Rate Adjustment—Take off commutator cover band, shift third brush by hand by prying on brush mounting stud, counter-clockwise to increase, or clockwise to decrease charging rate. Third brush is held in position by friction.

Maximum Charging Rate—17 amperes (cold), 8.0 volts, 1950 R.P.M.

Performance Data

Cold			Hot		
Amps.	Volts	R.P.M.	Amps	Volts	R.P.M.
0	6.4	700	0	6.4	720
4	6.8	880	4	6.9	920
8	7.2	1075	8	7.35	1160
12	7.6	1280	12	7.8	1460
16.5	8.0	1950	13.8	8.0	2000

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—18-22 ozs. (new brushes).
Field Current—4.08-4.52 amperes at 6.0 volts.
Motoring Current—4.94-5.46 amperes at 6.0 volts.

Mounting:—Pivot mounted at right front of engine. Fan belt drive. To remove, take out two pivot bolts, one clamp bolt.

Belt Adjustment—Loosen two pivot bolts and adjustment clamp bolt, pull generator away from engine until fan can just be turned with belt held stationary, tighten clamp bolt and pivot bolts.

GENERATOR CHARGE INDICATOR (1935 ONLY):—Consists of signal light on instrument board connected between generator side of Cutout Relay and ignition coil terminal of Ignition Switch. Lamp should light when ignition is turned on and will go out when generator begins to charge battery (cutout relay contacts close). If lamp does not light with ignition on and engine not running, replace bulb. Signal light bulb is standard 6-8 volt, 3 cp. S.C., Mazda 63.

RELAY:—Model CB-4008. Mounted on top of right hand frame side rail near generator.
See article in Electrical Equipment Section.
Cuts in—7.0-7.5 volts, 700-800 R.P.M. of generator.
Cuts out—.5-2.5 amperes discharge.
Relay Contact Gap—.025-.035".
Air Gap—.010-.030" (contacts closed).

LIGHTING:—Headlamps—Corcoran-Brown. Fixed focus type. Headlamps aimed straight ahead (upper beam with lenses in place). Upper and lower beams controlled by foot selector switch.

Switches

Lighting—Culver-Stearns.
Foot Selector—Clum Model 9579.

Bulb Specifications

Distributor Removal:—Mounted on right side of engine. To remove, disconnect vacuum line, take out hold-down screw in plate.

IGNITION TIMING:—Flywheel Degrees Piston Position

All engines	5° ATDC	.0103" ATDC

To Check Timing—Take off inspection hole cover plate (top surface left hand side of flywheel housing). Turn engine over with #1 piston on compression, stop with piston 5° or .0103" after top dead center when flywheel mark 'IGN' lines up with pointed end of inspection plate screw, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor is opposite #1 segment in distributor cap, check spark plug connections (see diagram). NOTE—This check must be made with all back lash eliminated in distributor drive and vacuum spark control should be in a fully released position.

Motor Gauge—Weidenhoff Adapter #104, Rod #2.

Firing Order:—1-3-4-2. See diagram.

Spark Plugs:—Champion Type C-7B. 18 MM. Metric.

Spark Plug Gap—Set at .025". Limits .024-.025".

CARBURETION:—Carburetor—Tillotson Model U-1A 1⅛" downdraft type with manual choke control. **See Article in Carburetion Section.**

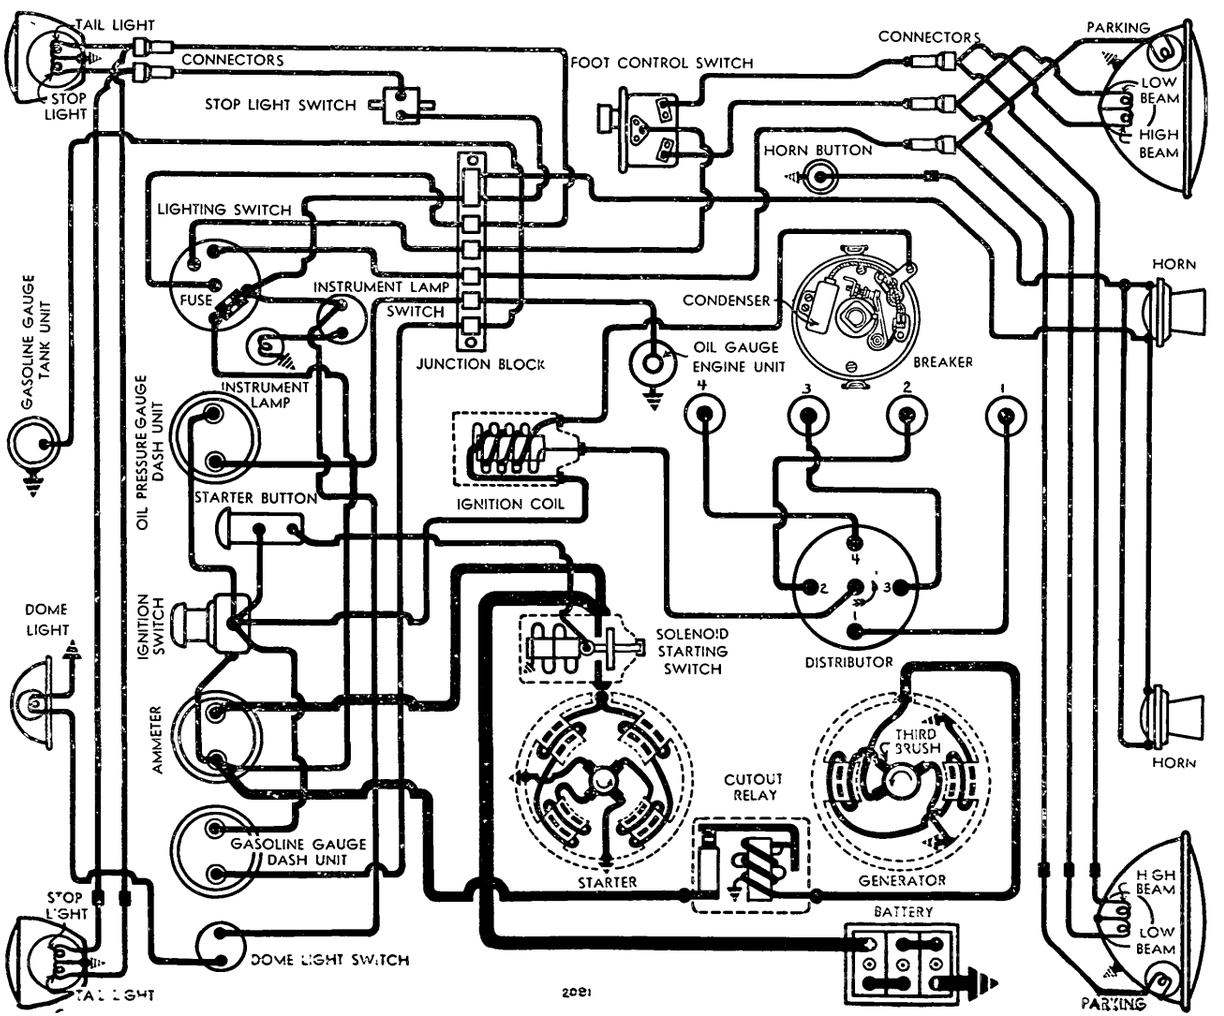
Adjust as follows:

High Speed Adjustment—Set idle adjusting screw ¾ turn open from inner seated position. With engine warm set throttle for 30-35 M.P.H. speed. Turn High Speed Adjusting Screw (screw with cross bar) in until engine misses, then turn screw out until engine begins to roll, finally screw in (approximately ⅜ turn) until engine fires smoothly. Then set Idle Adjustment as outlined below.

Idle Speed Adjustment—Close throttle, set throttle stopscrew to idle slightly faster than normal, turn idle adjusting screw out or left, until engine misses, then turn screw in until engine fires smoothly. Reset throttle stopscrew to idle engine at 7 M.P.H.

Air Cleaner:—AC. #1528326 oil-wetted type.

Fuel Pump:—AC. Type AF #1523306. Diaphragm type. **See Article in Carburetion Equipment Section.**



Gasoline Gauge:—King-Seeley Electric. Part No. 6270 (dash unit), 6280 (tank unit). See separate article in Carburetion Equipment Section for complete data.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .010". This valve should open when piston reaches top dead center and flywheel mark 'T.C.I.O.1-4' lines up with pointed end of inspection hole cover plate screw (top of flywheel housing left hand side). Reset tappet clearance at .004" with engine hot.

Motor Gauge—Weidenhoff Adapter #104 , Rod #2.

Tappet Clearance:—.004" Int., .006" Exh., hot.

Valve Spring Pressure:—46½ lbs. at 2¼" (valve closed), 85½ lbs. at 1 15/16" valve open).

LUBRICATION:—Crankcase Capacity—4 qts. (refill).
Normal Oil Pressure—30 lbs. at 30 M.P.H.

BATTERY:—U.S.L., Type A-13A. 6 volt, 13 plate, 78 ampere hour capacity (20 hour rate).
Starting Capacity—96 ampere hours for 20 minutes.
Zero Capacity—300 amperes for 1.9 minutes.
Grounded Terminal—Negative (—) terminal.
Location—In recess in right front fender skirt under hood.

STARTER:—Model MZ-4049. Armature No. MZ-2089.
Drive—Special outboard Bendix No. RC10HD.
Cranking Engine—120 R.P.M., 200 amps., at 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
.65 "	2500	5.5	100
2.55 "	1325	5.0	200

FUSES:—Lighting—Mounted on lighting switch. 20 ampere capacity.

HORNS:—Schwarze vibrator type disc horn.

WILLYS KNIGHT

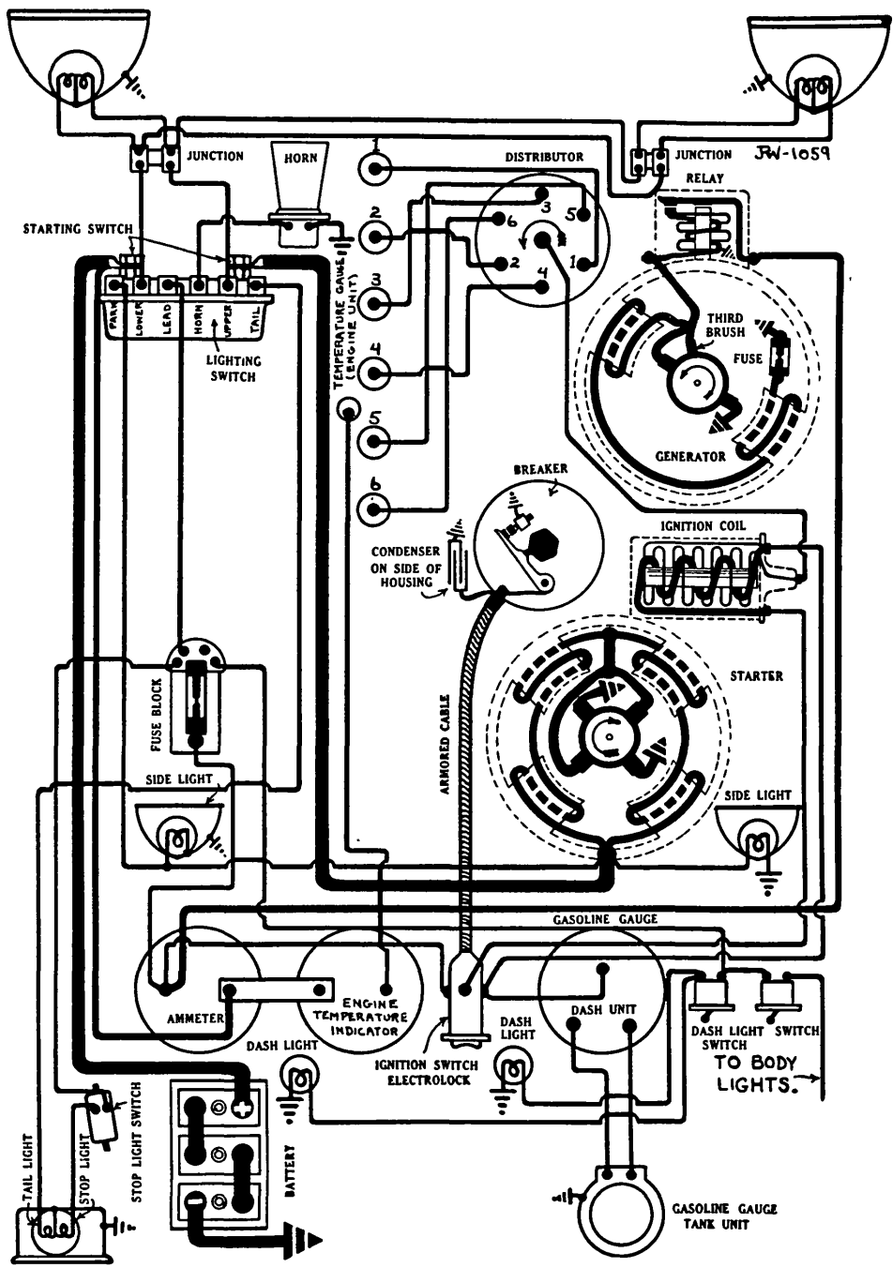
MODEL 70-B (1929-30)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—U.S.L., Type 3-HVX-6X-6A, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 127 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 23 hours. Battery is mounted on left frame member under the front floor boards.

IGNITION:—Coil Model IG-4065. Coil is mounted on right side of engine block. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGC-4004. Breaker contacts separate .020-.025 inch. Set contact gap by loosening lock nut on stationary contact stud and turning up stud until proper gap is secured with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 18 degrees reached at 2200 R.P.M.

Mounting:—Distributor is mounted on the right of the engine. To remove distributor, disconnect manual advance rod and remove Electrolock from instrument board. Then remove distributor head with cables intact and remove two mounting cap screws in distributor base. Lift distributor from place and remove Electrolock and distributor as a unit.



Oiling:—Fill the oiler on the side of the distributor housing with light engine oil every week or each 250 miles of operation. Every 500 miles remove the distributor head and rotor and oil the wick oiler in the center of the shaft with light engine oil. Put one drop of oil on the breaker arm pivot pin. Every 5000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 8 degrees or 51/64 inch (on the flywheel) before top dead center with the manual spark control in the fully advanced position. To set timing, crank engine over until piston No. 1 enters compression stroke. This may be determined by removing the spark plug in cylinder No. 1 and holding the hand over the spark plug port while the engine is being turned over until the air under compression is felt escaping. Place spark control button in the fully advanced position (pushed all the way in toward the dash) and continue to turn engine over until the ignition mark on the flywheel is directly opposite the indicator in the clutch inspection hole. This mark is 8 degrees or 51/64 inch before top dead center and piston No. 1 will be .026 inch before top dead center. Then loosen advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and see that the rotor is directly opposite the segment connected to the spark plug in cylinder No. 1 (see diagram). The allowable variation in ignition setting is 1 degree or ⅛ inch.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard Champion No. 1. Gaps are .025 inch.

VALVE TIMING:—The Willys Knight engine is of the sleeve valve type. To time sleeve valves with eccentric shaft sprocket removed, remove pipe plug in exhaust manifold opposite No. 6 cylinder and scrape carbon from edges of sleeve ports so that closing of ports can be checked. Then remove clutch inspection plate and crank engine until flywheel mark 'EC' is opposite the pointer on the flywheel case. Place electric lamp over spark plug port in cylinder No. 6 and rotate eccentric shaft in a clockwise direction until the

WILLYS KNIGHT

MODEL 70-B (1929-30)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

upper edge of the port in the outside sleeve passes the lower edge of the port in the cylinder block on the downward stroke. At this point the ray of light from the lamp will be cut off. Then assemble chain on crankshaft, idler and generator sprockets. Insert the eccentric shaft sprocket in chain and change mesh of sprocket in chain one tooth at a time until the five cap screws can be inserted without changing the position of the eccentric shaft or crankshaft. Then tighten the five cap screws holding the sprocket rigidly on the shaft. To set tension of timing chain, turn idler eccentric bushing spring until all slackness is removed from chain. Then give spring one complete turn and insert end in slot of idler stud.

Valve Timing:—Inlet valves open 10 degrees or 1 inch on the flywheel after top dead center with the piston .041 inch down on intake stroke and close 35 degrees or 3½ inches on the flywheel after lower dead center with the piston 4.066 inches from the top of the compression stroke. Exhaust valves open 50 degrees or 5 inches on the flywheel before lower dead center with the piston 3.725 inches down on power stroke and close 5 degrees or ½ inch on the flywheel after top dead center with the piston .010 inch down on intake stroke.

STARTER:—Model MAB-4014. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, viewed from the commutator end. Starter cranks the engine at 140 R.P.M. drawing 250 amperes at 5 volts. Brush spring tension is 1¾-2¼ pounds.

Starter Data

Torque	R.P.M.	Volts	Amperes
.6 lb. ft.	1900		100
3.5 "	1100		200
6.6 "	700		300
10.2 "	410		400
24 "	Lock	4	725

Mounting:—Starter is barrel mounted at the right of the transmission case on the rear of the flywheel housing. To remove, disconnect cable and remove pilot mounting screw directly above starter sleeve. Then slide starter to rear and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model GAL-4103. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush and mounting plate by tapping on the third brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting plate is held in any position by friction between the mounting stud and the end plate. The maximum charging rate is 17 amperes at 8 volts reached at 2075 R.P.M. or 23 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	675
6	6.9	835
10	7.3	1025
14	7.65	1275
17.2	8.0	2075
14	7.65	2925

Brush spring tension is 24-32 ounces. Generator motoring draws 4.7-5.7 amperes at 6 volts. Shunt field current is 4.2 amperes at 6 volts. A five ampere field fuse is mounted on the top of the generator.

Mounting:—Generator is cradle mounted on the right side of the engine. To remove generator, disconnect lead and loosen two nuts on mounting strap. Then disengage coupling and lift generator from place.

every week or each 250 miles of operation. Every 1000 miles fill the grease cup under the bearing retainer on the commutator end of the generator with pure vaseline.

RELAY:—Model CB-4014. Relay is mounted on the generator. Relay closes at 750 R.P.M. or 5.5-6 M.P.H. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts open .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch with contacts closed.

LIGHTING:—Aid Lighting Switch, Models 311 & 314. Lighting switch is mounted lower end of the steering column and is controlled by a button on the steering wheel. The lighting switch, starting switch and horn button are combined in a single unit. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail lights are 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail lamp lead must be connected to the 3 cp. filament. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63.

NOTE:—Lighting switch is of Aid Mfg. Co. design and is their Model No. 311 (1929) or 314 (1930). The Model 314 was manufactured by the Briggs & Stratton Co. as their Model No. 50160.

FUSES:—Generator field fuse is 5 ampere capacity. Lighting fuse mounted on fuse block on dash is 20 ampere capacity.

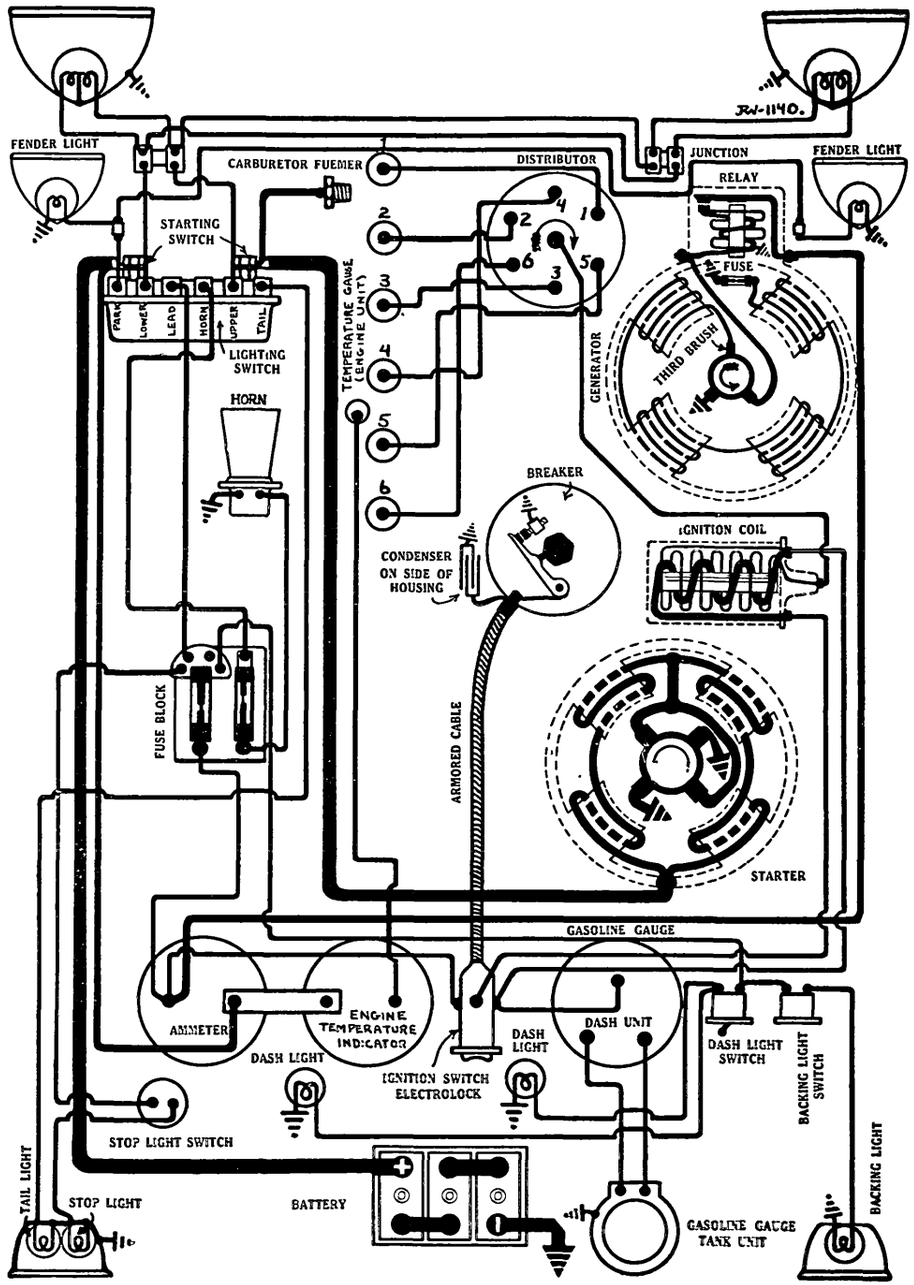
WILLYS KNIGHT

MODEL 66-B (1929-30)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—U.S.L., Type 3-HVX-8X-4A, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 170 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 33.2 hours. Battery is mounted on the frame member under the right front seat.

IGNITION:—Coil Model IG-4065. Coil is mounted on the right side of the engine. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped. The ignition switch is a Type 5-B Electrolock. The Electrolock must be removed with the distributor as a unit. A full description of the Electrolock and directions for removing it from the distributor will be found in the Equipment Section.

Distributor Model IGC-4029. Breaker contacts separate .018-.020 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until the correct gap is secured with the breaker arm on the lobe of the cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 20 degrees reached at 3400 R.P.M.



Mounting:—Distributor is mounted on top of oil pump housing at right of engine. To remove distributor, disconnect Electrolock at dash. Disconnect manual spark control and remove distributor head with cables intact. Then take out two cap screws in distributor mounting bracket and lift distributor from place.

Oiling:—Fill the oiler on the side of the distributor with light engine oil every week or each 250 miles of operation. Every 1000 miles remove the distributor head and rotor and put several drops of oil in the wick oiler in the center of the shaft and one drop of oil on the breaker arm pivot pin. Every 5000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 16 degrees or 1 29/32 inches on the flywheel before top dead center with the piston .112 inch before top dead center and the manual spark control in the fully advanced position (the spark control button pushed all the way in toward the dash). To set timing, crank engine over until piston No. 1 enters compression stroke. This may be determined by removing the spark plug in cylinder No. 1 and turning the engine over until the compressed air is felt escaping through the spark plug port. Fully advance the spark control button. Continue to turn engine over until the flywheel mark 'IGN' is directly opposite the indicator on the housing in the inspection hole in the flywheel housing. Take up all backlash in gears by turning distributor shaft in a counter-clockwise direction as far as possible. Then loosen advance arm clamp screw and rotate distributor until the contacts begin to open. Tighten the clamp screw and see that the distributor rotor is directly opposite the segment connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Champion No. 2. Gaps are .025 inch.

WILLYS KNIGHT

MODEL 66-B (1929-30)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

VALVE TIMING:—The Willys Knight engine is of the sleeve valve type. To time sleeve valves with eccentric shaft sprocket removed, remove pipe plug in exhaust manifold directly opposite No. 1 exhaust port and scrape carbon from edges of sleeve ports so that closing of ports can be checked. Remove inspection hole cover in flywheel housing and turn engine over until No. 1 piston reaches top dead center with the flywheel mark 'EC' directly opposite the indicator on the housing. Remove spark plug in No. 1 cylinder and place a test lamp in the spark plug recess so that the light from the lamp will be visible through the valve port. Then turn the eccentric shaft in direction of rotation until the upper edge of the port in the outer sleeve just passes the lower edge of the port in the cylinder block when the light will be cut off. Assemble eccentric shaft sprocket and timing chain, being careful not to disturb relative position of eccentric shaft and crankshaft.

Valve Timing:—Inlet valves open 5 degrees or 19/32 inch on the flywheel after top dead center with the piston .011 inch down on intake stroke and close 46 degrees or 4½ inches on the flywheel after lower dead center with the piston 4.161 inches from the top of the compression stroke. Exhaust valves open 50 degrees or 5 31/32 inches on the flywheel before lower dead center with the piston 4.041 inches from the top of the power stroke and close at top dead center.

STARTER:—**Model MAB-4018.** Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is clockwise, viewed from the commutator end. Brush spring tension is 28-36 ounces. The starting switch is mounted at the lower end of the steering column.

Starter Data

Torque	R.P.M.	Volts	Amperes
.6 lb. ft.	1900		100
3.5 "	1100		200
6.6 "	700		300
10.2 "	410		400
24 "	Lock	4	725

Mounting:—Starter is sleeve mounted at right of engine on rear of flywheel housing. To remove starter, disconnect cable and take out large pilot mounting screw in flywheel case directly above starter sleeve. Then pull starter to the rear to clear drive and lift from place.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler at each end of the starter every two weeks or each 500 miles of operation.

GENERATOR:—**Model GAB-4009.** The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush and mounting plate by prying on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush is held in any position by friction between the mounting stud and the end plate. With standard car setting the maximum charging rate is 17.5 amperes at 8 volts reached at 1300 R.P.M.

Generator Data

Cold Test (72°F.)			Hot Test (206 F.)		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
4	6.8	630	4	6.8	750
10	7.4	780	10	7.6	1000
14	7.8	950	13	8.0	1400
17	8.0	1300	11	7.8	2000
13	7.8	1950			

The generator running as a motor at 355-390 R.P.M. draws 4.7-5.2 amperes at 6 volts. On test shunt field current is 6.1-6.8 amperes at 6 volts. Each coil tested separately draws 24.4-27.2 amperes at 6 volts. Brush spring tension is 16-24 ounces. A five ampere field fuse is mounted on the field frame under a removable cover.

Mounting:—Generator is cradle mounted at the right of the engine and is driven through a flexible coupling from the chain case. To remove generator, disconnect lead and drive coupling. Then loosen mounting clamp band and lift generator from place.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler at each end of the generator every two weeks or each 500 miles of operation.

RELAY:—**Model CB-4014.** Relay is mounted on the generator. Relay contacts close at 545-650 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current must not exceed 5 amperes at closing of contacts. Relay contact gap is .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Lighting switch is mounted at lower end of steering column. It is of the Finger Tip Control type, incorporating the lighting switch, starting switch and horn button in a single unit controlled by a button on the steering wheel. Double filament headlight bulbs using a second 21 cp. filament instead of dimmers are standard equipment. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop and backing lights are each 6-8 volt, 15 cp. S.C. Mazda 87.

NOTE:—The lighting switch is of the Aid Manufacturing Company design and is their part No. 314. It is manufactured by the Briggs and Stratton Company as their Model 50160.

FUSES:—Generator field fuse is 5 ampere capacity. Lighting fuses mounted on fuse block on dash are 20 ampere capacity.

WILLYS KNIGHT

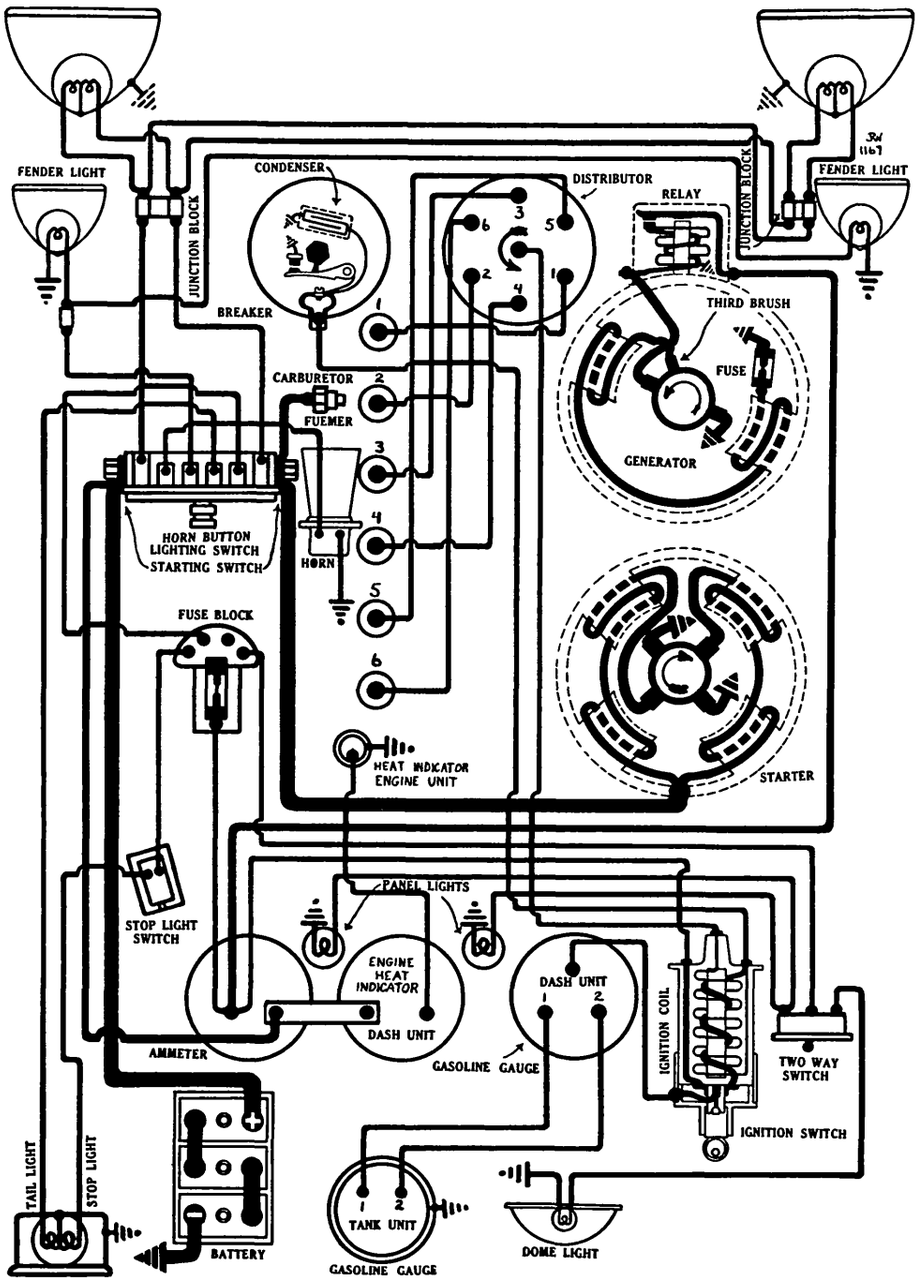
MODEL 87 SERIAL NUMBERS 1001 UP
PRODUCTION STARTED APRIL 1, 1930
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—U.S.L., Type 3-HVX-6X-6A, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 127 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 23 hours. Battery is mounted on the left frame member under the floor boards of the front compartment.

IGNITION:—Coil Model IG-4083, 4201. The ignition switch is built in the base of the coil. Coil is mounted on back of instrument board with the ignition switch extending through to the face of the instrument panel. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGC-4004 & 4045. Breaker contacts separate .018-.020 inch. Set contact gap by loosening lock nut on stationary contact mounting stud and turning up stud until correct gap is secured with breaker arm on lobe of cam. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 18 degrees reached at 2200 R.P.M. of engine.

Mounting:—Distributor is mounted on accessory drive housing at right of the engine. To remove distributor, disconnect primary lead and spark control wire and remove distributor head with cables intact. Then take out hold-down screw in advance arm and lift distributor from place.



Oiling:—Fill the oiler on the side of the distributor with light engine oil every week or each 250 miles. Every 500 miles remove the distributor head and rotor and oil the wick oiler in the center of the shaft and put one drop of oil on the breaker arm pivot pin. Every 5000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position 8 degrees before top dead center with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke. This may be determined by removing the spark plug in cylinder No. 1 and turning engine over until the air compressed in the cylinder is felt escaping when the plug port is closed by hand. Place spark control button in the fully advanced position and turn engine over until the ignition mark on the flywheel 'IGN/' is directly opposite the indicator in the clutch inspection hole. The flywheel mark is 8 degrees before the top dead center mark 'T/C'. Then loosen advance arm clamp screw and rotate distributor until the breaker contacts begin to open. Tighten the clamp screw and see that the rotor is directly opposite the segment connected to the spark plug in cylinder No. 1 (see diagram).

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark plugs:—Spark plugs are ⅞-18 S.A.E. Std. Champion No. 1. Gaps are .025 inch.

VALVE TIMING:—The Willys Knight engine is of the sleeve valve type. To time the sleeve valves after dismantling and removing the timing chain cover, remove the idler eccentric collar and sprocket after which the timing chan can be removed. Remove the pipe plug in the exhaust manifold opposite No. 6 cylinder and scrape the carbon from the edges of the sleeve port so that the closing of the port can be checked. Then remove the clutch inspection plate and crank engine over until flywheel mark 'EC' is opposite

AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

the top dead center on the flywheel case. Make sure the mark on the end of the eccentric shaft and the mark on the eccentric shaft sprocket coincide. Then remove spark plug in cylinder No. 6 and place a test lamp over the spark plug port so that the light is visible through the exhaust port. Then turn the eccentric shaft in a clockwise direction until the port closes when the rays from the light will be cut off. Assemble the chain on the crankshaft, idler and generator sprockets. Insert the eccentric shaft sprocket in the chain and set the tension of the timing chain by turning the idler eccentric bushing spring until all slackness is removed from the chain and then turning one additional turn before inserting end in slot of idler stud. With motor set in this position the distributor arm should be under the contact for No. 1 cylinder. The motor can be timed from the front end by bringing the crankshaft on top dead center for Nos. 1 and 6 cylinders. Then set the mark on the eccentric shaft and the mark on the eccentric shaft sprocket in line with the mark on the crankcase. In this position the distributor arm should be under No. 1 cylinder.

Valve specifications. Inlet opens at top dead center and closes 46 degrees or 4 19/32 inches on the flywheel after lower dead center with the piston 3.842 inches from the top of the intake stroke. Exhaust ports open 50 degrees or 5 inches on the flywheel before lower dead center with the piston 3.726 inches down on the power stroke and close 5 degrees or one-half inch on the flywheel before top dead center with the piston .010 inch before top dead center.

STARTER:—Model MAB-4014. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, viewed from the commutator end. Starter cranks the engine at 140 R.P.M. drawing 250 amperes at 6 volts. Brush spring tension is 44-56 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
.6 lb. ft.	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.2 "	420	4.0	400
24.0 "	Lock	4.0	720

Mounting:—Starter is sleeve mounted at the right of the transmission at the rear of the flywheel housing. To remove starter, take up front floor boards and disconnect cable. Then take out large pilot mounting screw in housing directly above starter sleeve. Pull starter to rear to clear Bendix drive and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at each end of the starter every two weeks or each 500 miles of operation.

GENERATOR:—Model GAL-4103. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by prying on the brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the output. The third brush and mounting plate are held in position by friction between the mounting stud and the end plate. With standard car setting, the maximum charging rate is 12 amperes (hot) at 8 volts reached at 2075 R.P.M. or 23 M.P.H.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	675
6	6.9	835
10	7.3	1025
14	7.65	1275
17.2	8.0	2075
14	7.65	2925

Brush spring tension is 22-25 ounces (main), 31-34 ounces (third brush). Field fuse is 5 ampere capacity. Shunt field current is 4.08-4.52 amperes at 6.0 volts. Motoring, generator draws 4.27-4.73 amperes at 6.0 volts.

Mounting:—Generator is cradle mounted at right of engine and is driven from the chain case. To remove generator, disconnect lead and loosen mounting clamp band. Then disengage coupling and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the generator oilers every week or each 250 miles. Every 1000 miles fill the grease cup under the bearing retainer on the commutator end of the generator with pure vaseline.

RELAY:—Model CB-4014. Relay is mounted on the generator. Relay closes at 5.5-6 M.P.H. or 750 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .020-.030 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Pines 'Finger Tip Control' Switch. Model A-805. Lighting switch, starting switch and horn button are combined in a single unit mounted at the lower end of the steering column and controlled by a button on the steering wheel. Headlights are equipped with double filament bulbs using a second 21 cp. filament instead of dimmers. Headlights are 6-8 volt, 21-21 cp. D.C. Mazda 1110. Fender lights are 6-8 volt, 3 cp. S.C. Mazda 63. Dash and dome lights are each 6-8 volt, 3 cp. S.C. Mazda 63. Stop and tail light is 6-8 volt, 21-3 cp. D.C. Mazda 1158. This is a double filament bulb and the tail light lead must be connected to the 3 cp. filament.

FUSES:—Generator field fuse is 5 ampere capacity. Lighting fuse mounted on fuse block on left front of dash is 20 ampere capacity.

MODEL 66-D (1931-32), SERIAL NUMBERS 1001 UP
STREAM-LINE MODEL 66-E (AFTER JUNE, 1932), SERIAL NOS. 7601 UP
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—On plate on right frame member above front spring rear hanger and under driver's seat cushion.

ENGINE NUMBER:—On plate on left side of crankcase.

BATTERY:—U.S.L., Type 3-HVX-8X-6A ('31), HW-17A ('32), 6 volt, 17 plate, 166 ampere hour capacity (5 ampere rate). Starting capacity 170 amperes for 20 minutes.

Grounded Terminal:—Negative (—) terminal grounded to frame.

Mounting:—On left hand side of frame under front floor boards.

Dimensions:—Width, 7⅛". Length, 13 7/16". Height, 9⅛".

IGNITION:—Coil Model IG-4202, 4303 (66-D) IG-4602 or North East No. 22636 (66-E). Lock coil type mounted on back of instrument board with switch in base (except North East coil mounted on side of engine block, and IG-4602 used with special Mitchellock Model 16-S).

Ignition Current:—2 amperes at 6 volts (engine running), 4 amperes at 6 volts (engine stopped).

Ignition Switch—Electrolock Type 5-B (N. E. distributor—see Equip. Section for complete data). Switch is assembled as unit with distributor and must be taken off the car whenever distributor is removed. No provision is made to turn ignition on with Startix being inoperative and it will be necessary to disconnect lead on 'IGN' terminal of Startix case to avoid automatic cranking when ignition is turned on to check timing.

Distributor North-East Type 10877 or Auto-Lite Model IGC-4052. Single breaker, 6 lobe cam, semi-automatic advance type.

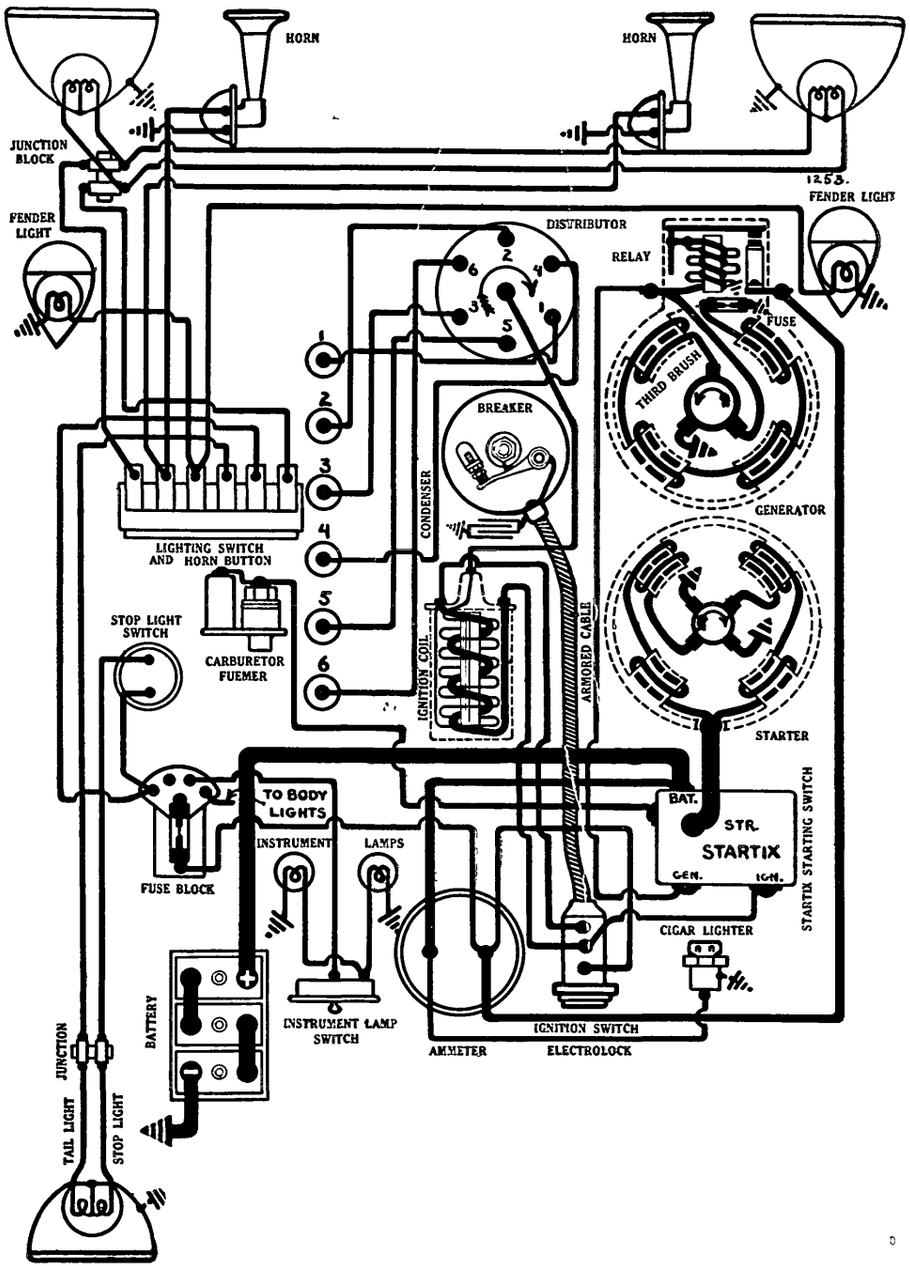
Manual Advance:—20 degrees (engine) maximum.

Breaker Gap:—Set contact gap at .020 inch.

Breaker Arm Spring Tension:—16-20 ounces.

Cam Angles—(IGC-4052). Closed 41°. Open 19° (distributor degrees).

Automatic Advance—Type 10877



Degrees	Distributor R.P.M.	Degrees	Engine R.P.M.
Start	200	2	400

6	1050	12	2100
9	1480	18	2960
10.5	1700	21	3400

Mounting:—Distributor is mounted on top of oil pump housing at right of engine. To remove distributor, take out hold-down screw in advance arm and lift distributor from place.

Timing:—Breaker contacts begin to open when the piston entering power stroke reaches a position .112 inch (actual piston travel) or 16 degrees (on the flywheel) before top dead center with the manual spark control fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke. This can be determined by taking out No. 1 spark plug and turning the engine over until the air compressed in the cylinder is felt escaping through the spark plug port. Fully advance the manual spark control (push the spark button all the way in toward the dash) and see that the distributor is turned counter-clockwise as far as possible. Turn engine over until the ignition mark on the flywheel, 'IGN', which is 16 degrees before the top dead center mark 'T.C.' is directly opposite the

AUTO-LITE SYSTEM

indicator in the inspection hole in the flywheel housing. Take up all backlash in distributor gears by turning distributor shaft counter-clockwise. Then loosen advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and connect spark plugs as shown on the diagram.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—⅞-18 S.A.E. Champion Type C-4. Gaps are .020 inch.

VALVE TIMING:—The Willys-Knight engine is of the sleeve valve type. To time sleeve valves with eccentric shaft sprocket removed, remove pipe plug in exhaust manifold directly opposite No. 1 exhaust port and scrape carbon from edges of sleeve ports so that closing of ports can be checked. Remove inspection hole cover in flywheel housing and turn engine over until piston No. 1 reaches top dead center with the flywheel mark 'T.C.' directly opposite the indicator. Remove the spark plug in cylinder No. 1 and place a test lamp in the spark plug port so that the light can be seen through the exhaust port. Then turn eccentric shaft in direction of rotation until the upper edge of the port in the outer sleeve just passes the lower edge of the port in the cylinder block when the light will be cut off. Assemble eccentric shaft sprocket and timing chain, being careful not to disturb relative positions of eccentric shaft and crankshaft.

Timing—1931

Intake Ports	Exhaust Ports
Open—5° after top dead center.	Open—50° before lower dead center.
Close—46° after lower dead center.	Close—At top dead center.

Timing—1932

Open—10° before top dead center.	Open—45° before lower dead center.
Close—36° after lower dead center.	Close—At top dead center.

STARTER:—Model MAB-4018, MAB-4036 R.H.D. Starter drives engine through a Bendix drive. The direction of rotation is clockwise, viewed from the commutator end. Brush spring tension is 44-56 ounces. The starting switch is mounted at the lower end of the steering column and is operated by pulling up on the knob on the steering wheel.

Starter Data

Torque	R.P.M.	Volts	Amperes
.6 lb. ft.	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
24 "	Lock	4.0	725

Mounting:—Starter is sleeve mounted at the right of the transmission on the rear face of the flywheel housing. To remove starter, disconnect cable and take out two dowel screws in flywheel housing directly above starter sleeve. Then pull starter to the rear to clear drive and lift from place.

GENERATOR:—Model GAG-4130, 4134. Direction of rotation is counter-clockwise at commutator end. Third brush regulation. With standard car setting, maximum charging rate is 17 amperes at 8 volts (cold) reached at 1500 R.P.M.

Charging Rate Adjustment. Take off commutator cover band, shift third brush by prying on brush mounting stud, counter-clockwise to increase, or clockwise to decrease charging rate. Third brush mounting plate is held in position by friction.

Generator Data

Cold Test			Hot Test

FUSES:—Generator field fuse is 7.5 ampere capacity. Lighting fuse mounted on fuse block on lower left front side of dash is 20 ampere capacity.

WILLYS KNIGHT

MODEL 95 (1931-32), SERIAL NUMBERS 1001 UP
PRODUCTION STARTED JUNE 6, 1931
AUTO-LITE SYSTEM

CAR SERIAL NUMBER:—Stamped on plate on right frame member in front of right front spring rear hanger and on body sill under driver's seat cushion.

ENGINE NUMBER:—Stamped on plate on right side of crankcase.

BATTERY:—**U.S.L., Type 3-HVX-6X-6A,** 6 volt, 117 ampere hour capacity (5 ampere rate). Starting capacity, 127 amperes for 20 minutes. Negative (—) terminal grounded. Battery mounted on right frame member under front compartment floor boards. Battery size, 7 7/16 inches wide, 10 7/16 inches long, 9¾ inches high.

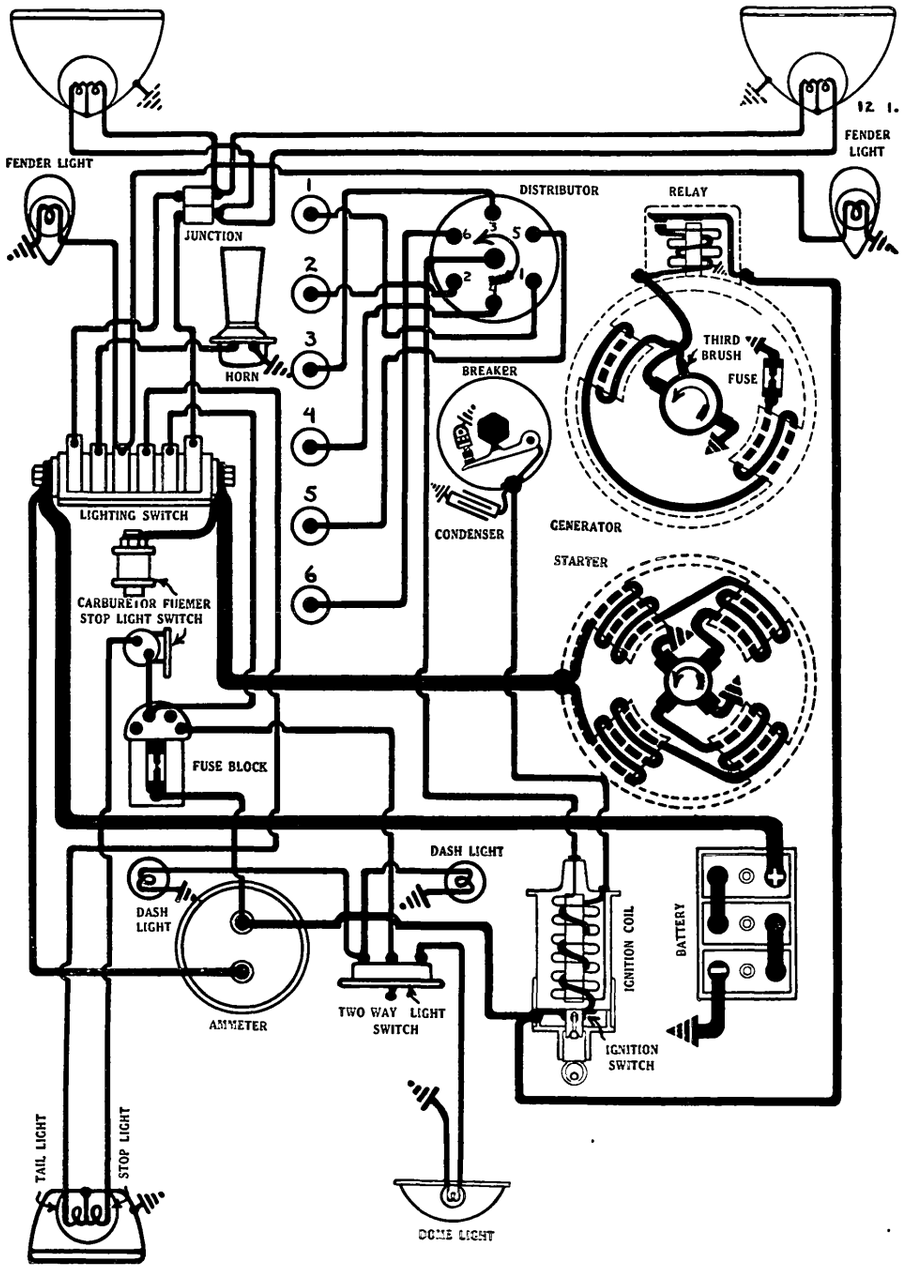
IGNITION:—**Coil Model IGC-4303.** Lock coil type with ignition switch in base. Coil mounted on back of instrument board with ignition switch at right of instrument panel. Ignition current 1-3 amperes at 6 volts (engine running), 3.4-5 amperes at 6 volts (engine stopped).

Distributor Model IGC-4045-A. Single breaker arm, 6-lobe cam type with semi-automatic advance. Manual spark controlled by button at lower right of instrument panel. Normal running position with spark advanced—button pushed in, pull out button to retard spark. Breaker contact gap set at .018 inch. Hold within limits of .018-.020 inch. To set gap, loosen lock nut on stationary contact stud, turn up stud. Breaker arm spring tension, 16-22 ounces (measured at tip of breaker arm with spring scale in line with center of contacts and at right angles to arm). Maximum manual advance, 20 degrees (engine).

Cam Angles—Closed 41°. Open 19° (distributor degrees).

		Automatic Advance			
Degrees	**Distributor**	R.P.M.	Degrees	**Engine**	R.P.M.
Start	.....	300	0	.....	600
2	.....	520	4	.....	1040
4	.....	750	8	.....	1500
6	.....	970	12	.....	1940
7.5	.....	1100	15	.....	2200

Mounting:—Mounted on accessory drive housing at right of engine. To remove, disconnect manual advance control, disconnect primary lead, take off distributor cap, take out hold-down screw in advance arm, lift unit out.



Oiling:—**250 Miles.** Fill oiler under distributor cup with light engine oil.
500 Miles. Take off distributor cap and rotor, oil wick oiler in center of shaft, put one drop of oil on breaker arm pivot pin.
5000 Miles. Take off distributor cap and rotor, apply thin film vaseline to face of breaker cam.

Timing:—Standard setting 12° (on flywheel) or .058" (piston travel) before top dead center with manual spark control fully advanced. To set timing, advance manual spark control (push button in toward dash), take off cover over inspection hole in left front of flywheel housing. With No. 1 piston on compression turn engine over until flywheel mark 'IGN/' (which is 12° before top dead center mark 'TC/EC') is directly opposite pointed indicator pin in inspection hole, loosen advance arm clamp screw, rotate distributor until contacts begin to open (use test lamp), tighten clamp screw, connect spark plugs as indicated on diagram (No. 1 terminal as designated).

NOTE:—Flywheel is stamped with two sets of marks for right hand drive cars and left hand drive cars. Inspection hole on right hand drive cars is at right of housing and no confusion should result in setting timing if care is taken that No. 1 piston is approaching top dead center on compression when flywheel mark is checked. To determine compression stroke, take out No. 1 spark plug, close opening by placing thumb in port and turn engine over until air compressed in cylinder is felt escaping.

Firing Order:—1-5-3-6-2-4. No. 1 cylinder nearest radiator.

Spark Plugs:—⅞-18 S.A.E. Champion Type C-1. Set gaps at .020 inch.

WILLYS KNIGHT

MODEL 95 (1931-32), SERIAL NUMBERS 1601 UP
PRODUCTION STARTED JUNE 6, 1931
AUTO-LITE SYSTEM

VALVE TIMING:—Sleeve valve type with double sleeves driven by eccentric shaft at left of engine. Eccentric shaft driven by chain from crankshaft. Chain adjustment by automatic idler sprocket.

Valve Timing

Inlet port opens—10° or 1 9/64" on flywheel before top dead center.
Inlet port closes—35° or 3 31/32" on flywheel after lower dead center.
Exhaust port opens—45° or 5 7/64" on flywheel before lower dead center.
Exhaust port closes—at top dead center with flywheel mark 'TC/EC' at indicator on flywheel housing.

To Check Valve Timing. Take off exhaust manifold, take off cover plate on inspection hole in left front of flywheel housing. Scrape carbon from edges of exhaust port cylinder No. 1, turn engine over until port just closes when upper edge of port in outer sleeve passes lower edge of port in cylinder block (use .0015" feeler inserted in port or take out No. 1 spark plug and insert test light in spark plug port to check closing—closing of port will be indicated by sleeve gripping feeler or ray of light from test light being cut off). Flywheel mark 'TC/EC' should be directly opposite pointed indicator screw on housing. Retime sleeves when flywheel mark is more than 3/8" from indicator when port closes.

To Set Valve Timing—with chain and automatic idler sprocket dismantled. Turn crankshaft until No. 1 piston is on top dead center with flywheel mark 'TC/EC' at indicator on housing. Turn eccentric shaft clockwise until No. 6 exhaust port just closes (see paragraph above). Assemble chain on crankshaft sprocket, eccentric shaft sprocket, accessory sprocket. Mesh idler sprocket, take up all slack by turning eccentric bushing spring, turn spring 1¼ additional turn, insert end in nearest slot of idler sprocket stud. Rotor in distributor should be opposite No. 1 terminal in distributor cap.

STARTER:—**Model MAD-4115.** Starter drives through outboard Bendix drive. Rotation counter-clockwise at commutator end. Brush spring tension 44-56 ounces. Starter switch Pines 'Finger Tip Control' mounted at lower end of steering column (see Equipment Section).

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3750	5.5	58.2
.7 "	2355	5.5	100
3.0 "	1260	5.0	200
5.7 "	770	4.5	300
8.85 "	425	4.0	400
13.0 "	Lock	3.0	505
20.2 "	Lock	4.0	730

Mounting:—Starter flange mounted on front face of flywheel housing at right of engine. To remove, disconnect cable, take out 2 flange mounting bolts, pull starter straight forward to clear Bendix housing, lift out .

Oiling:—**500 Miles.** Put 4-5 drops light engine oil in oiler at each end of armature shaft. Outboard bearing (Bendix housing) is oilless.

GENERATOR:—**Model GAL-4103** (cars without free wheeling). Third brush regulation. To adjust charging rate, take off commutator cover band, shift third brush (by prying on brush mounting stud) counter-clockwise to increase or clockwise to decrease charging rate. Brush held in position by friction. Maximum charging rate, 17-18 amperes (cold) at 8.0 volts reached at 1900 R.P.M.

Model GAL-4103—Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	600	0	6.4	700
4	6.7	740	4	6.9	900
8	7.1	900	8	7.4	1150
12	7.4	1120	10	7.7	1340
17	8.0	1900	12.4	8.0	2150
12	7.4	3200	9.5	7.7	3200

Brush spring tension, 22-25 ounces (main brushes), 31-34 ounces (third brush). Shunt field current is 4.08-4.52 amperes at 6.0 volts. Motoring, generator draws 4.27-4.73 amperes at 6.0 volts. Field fuse is 7½ ampere.

Model GAG-4134 (cars with free wheeling). Third brush regulation. Adjustment same as Model GAL-4103 (above). Maximum charging rate, 17 amperes (cold) at 8.0 volts reached at 1500 R.P.M.

Model GAG-4134—Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	550	0	6.4	640
4	6.7	660	4	6.9	800
8	7.0	760	8	7.3	980
12	7.4	900	10	7.6	1110
16	7.8	1120	12	7.8	1280
19	8.0	1540	14.2	8.0	1680
13	7.4	2400	11.5	7.7	2400

Brush spring tension is 22-27 ounces. Shunt field current is 4.08-4.52 amperes at 6.0 volts. Field fuse is 7½ ampere capacity. Motoring, generator draws 4.17-4.62 amperes at 6.0 volts.

Mounting:—Generator cradle mounted at right of engine. Driven through flexible coupling from accessory sprocket. To remove, disconnect lead, disconnect drive coupling, loosen mounting clamp band, lift generator out.

Oiling:—**250 Miles.** Put 4-6 drops light engine oil in oiler at each end.

RELAY:—**Model CB-4014, 4021.** Mounted on generator. Contacts close with generator voltage of 7-7.5 volts and open with discharge current of .5-2.5 amperes. Contact gap limits, .025-.035 inch. Air gap limits, .010-.030 inch (contacts closed).

LIGHTING:—**Pines Switch, Model A-805.** Lighting switch 'Finger Tip Control' type mounted at lower end of steering column controlled by button on steering wheel (see Equipment Section). Dimmer system 'depressed beam' double filament headlight bulbs controlled by lighting switch.

Lamp Sizes

Position	Voltage	Candlepower	Base	Mazda No.
Headlights	6-8	21-21	D.C.	1110
Fender Lights (parking)	6-8	3	S.C.	63
Instrument Lights	6-8	3	S.C.	63
Stop and Tail Light	6-8	21-2	D.C.	1158

NOTE:—Stop and tail light is a combination double filament bulb. Connect tail light lead to 2 cp. filament.

FUSES:—20 ampere capacity fuse mounted on fuse block left front of dash. Generator field fuse 7½ ampere capacity mounted on brush ring.

GASOLINE GAUGE:—K-S Telegauge hydrostatic type (see Carburetion Section).

FUEL PUMP:—A.C. Type 'B' mechanical fuel pump mounted at left of engine (see Carburetion Section).

Cam Angles for Delco-Remy distributors are correct with breaker gap set midway between limits and breaker arm fibre bumper worn in (1000 miles).

Cam Angles for Auto-Lite distributors correct with gap specified by car manufacturer except in instances where special gap specified under 'Cam Angle.'

SERIAL NUMBER:—First number 60,001. Stamped on left hand frame side member below engine oil level gauge

ENGINE NUMBER:—First number 60,001. Stamped on left hand side of crankcase above Starter Bendix.

COMPRESSION:—Ratio—7.0-1 Std. Aluminum head.
Pressure—90 lbs. at 150 R.P.M. cranking speed.

VACUUM READING:—18-20" steady reading at idling speed.

IGNITION:—Coil Model IG-4065. Service coil IG-4070.
Ignition Current—2 amperes idling, 5 stopped.

Ignition Switch:—Douglas.

Distributor Model IGW-4105-A. Single breaker, 4 lobe cam, full automatic advance type.
Breaker Gap—.018". (.022" for new set of points).
Cam Angle or Dwell—46° Clsd. 44° open (.020" gap).
Breaker Arm Spring Tension—16-20 ozs.
Rotation—Clockwise viewed from the top.
Condenser—No. IGB-1025. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
.6	500	1.2	1000
1	600	2	1200
2	900	4	1800
3	1200	6	2400
4	1500	8	3000
5	1800	10	3600

Removal:—Distributor mounted on bracket at front of engine. To remove, loosen clampscrew in mounting bracket, lift distributor out.

IGNITION TIMING:— **Flywheel Deg.** **Piston Pos.**
All Engines ..... 2° BTDC ..... .0016" BTDC.

To Set Timing—With #1 piston on compression, turn engine over until piston is 2° before top dead center when point on flywheel 3/16" before 'TDC' mark lines up with pointer on flywheel housing. Loosen distributor clampscrew, rotate distributor until contacts begin to open, tighten clampscrew.

Firing Order:—1-3-4-2.

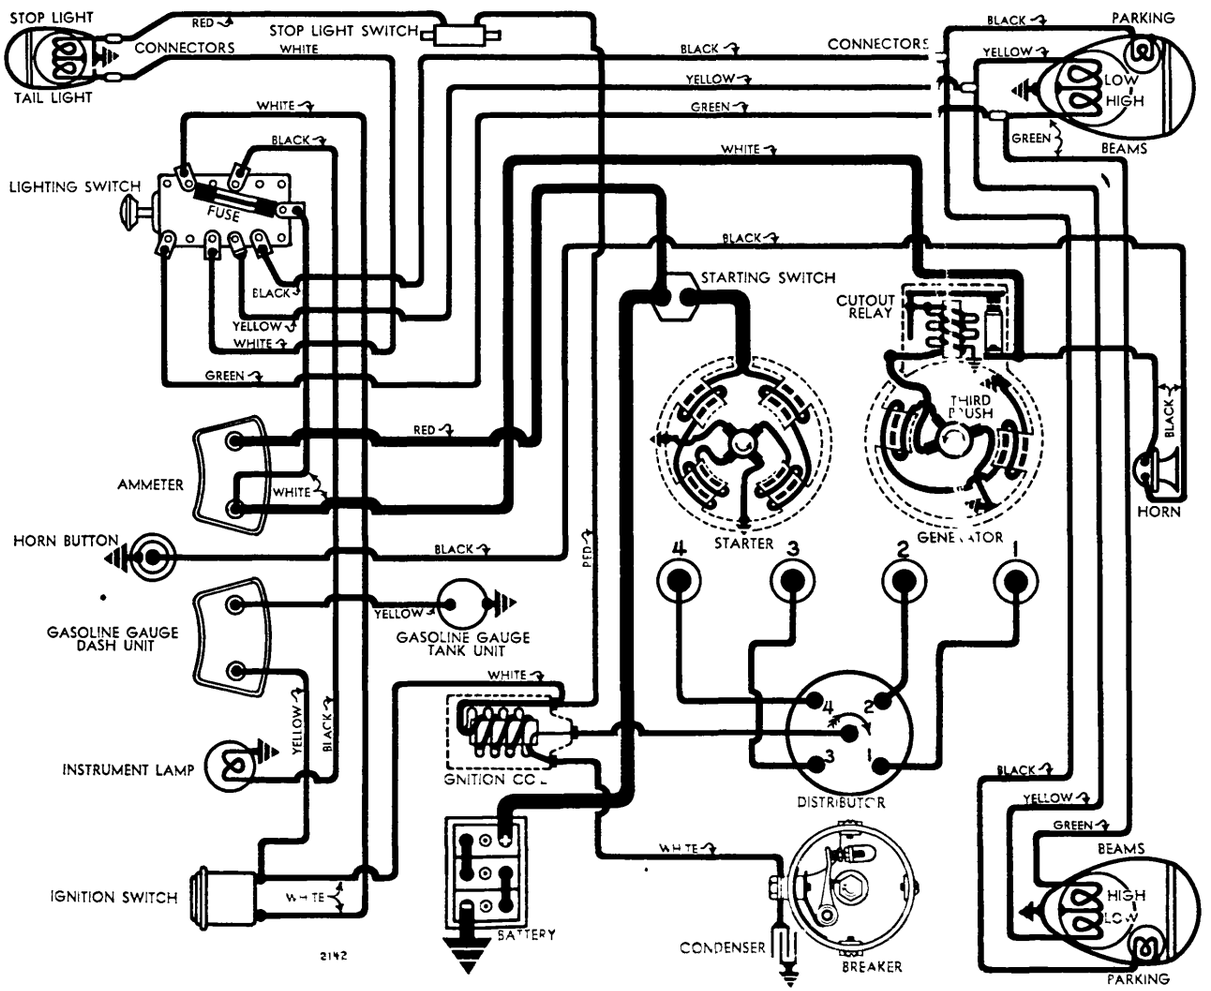
Spark Plugs:—Auto-Lite Type A9. 14 MM. Metric.
Spark Plug Gaps—.025".

CARBURETION:—Carburetor. Tillotson Model M-10B. ¾" single barrel updraft type.
See article in Carburetor Section for data.
NOTE—Carburetor has two adjustments (Idle or Low Speed, and High Speed) and adjustments must be made in correct order as given below. 'Preliminary' adjustment need not be made unless carburetor is out of adjustment and engine cannot be warmed up otherwise.

Preliminary Adjustment—Turn idling adjusting screw in lightly until seated, then back screw out 1½ turns. Turn high speed (main) adjusting needle in lightly until seated, then back needle out 1 turn. Start engine and run until it is thoroughly warmed up.

Idle Adjustment—With engine warm and running, set throttle stopscrew so that idle speed is approximately 500 R.P.M. Turn idle adjusting screw out slowly until engine begins to miss, then turn screw in ⅛ turn. Reset throttle stopscrew for correct 500 R.P.M. idling speed. Engine should idle smoothly.

High Speed Adjustment—Should be made with engine under load (can be made by jacking up rear wheels, engaging gears, and applying brakes just enough to secure temporary noticeable drag on engine or by opening throttle so that engine runs at speed equivalent to 30 M.P.H.). Turn main adjusting needle valve in until engine begins to slow down, then back needle out ⅛ turn (make adjustment slowly and determine exact point exactly).



Gasoline Gauge:—Stewart (Stewart-Warner) Electric.
See article in Carburetion Equipment Section.

VALVE TIMING:—To Check Timing—Check tappet clearance #1 intake valve. This valve should open with piston 19° or .1025" before top dead center when a point on the flywheel 1 25/32" before the 'TDC' mark lines up with the pointer on the flywheel housing.

Tappet Clearance:—.006" Intake, .009" Exhaust with engine warm (130°F.).

Valve Spring Pressure:—28 lbs. at 1¼" (valve closed).

LUBRICATION:—Crankcase Capacity—6 pints or 3 qts.
Normal Oil Pressure—8½ lbs. at 30 M.P.H.

BATTERY:—U.S.L. Type RM-11A. 6 volt, 11 plate, 66 ampere hour capacity (20 hour rate).

Starting Capacity—86 amperes for 20 minutes.

Zero Capacity—300 amperes for 1.8 minutes.

Grounded Terminal—Negative (—) terminal.

Dimensions—Width 7". Length 6 15/16". Height 8⅝".

Location—In recess in right hand side of cowl under engine hood.

STARTER:—Model MAK-4001. Armature MAK-2006.

Drive—Special Inboard Bendix Type RCE11-10.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—38-61 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.5	70
.3 " "	3240	5.5	100
1.35 " "	1880	5.0	200
3.1 " "	1000	4.5	300
4.8 " "	220	4.0	400
4.5 " "	Lock	3.0	380
7.0 " "	Lock	4.0	520

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Model SW-4001. Manually operated type. Mounted on toeboard.

GENERATOR:—Model GAS-4104-B. Armature GAS-2076. Third brush control type.

Charging Rate Adjustment—Remove commutator cover band, shift third brush by hand counter-clockwise to increase, or clockwise to decrease charging rate. Do not exceed maximum rated figure given below.

Maximum Charging Rate—14 amperes (cold), 8.0 volts, 2800 R.P.M.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	880	0	6.4	975
2	6.6	985	2	6.8	1135
4	6.9	1100	4	7.0	1310
6	7.2	1230	6	7.35	1540
8	7.3	1420	8	7.7	1860
10	7.6	1650	10.2	8.0	2800
12	7.8	2000			
14	8.0	2800			

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—15-20 ozs. (new brushes).

Field Current—3.80-4.20 amperes at 6.0 volts.

Motoring Current—4.46-4.94 amperes at 6.0 volts.

Removal:—Generator cradle mounted at left front of engine with fan belt drive. To remove, loosen drive belt, take out clamp bolt in mounting clamp band, lift generator out.

Belt Adjustment:—Loosen fan shaft clamp nut, raise fan until belt can be pulled out of vertical line (midway between pulleys) not more than 1" with single finger pull, tighten clamp nut.

CUTOUT RELAY:—Model CB-4014. Mounted on generator.

See article in Electrical Equipment Section.

Cuts In—6.75-7.5 volts, 880 R.P.M., 9.8 M.P.H.

Cuts Out .5-2.5 ampere discharge current.

Contact Gap—.025-.035".

Air Gap—.010-.030" (with contacts closed).

LIGHTING:—Headlamps—Corcoran-Brown. Upper and lower beams controlled by lighting switch. Headlamp bulbs are Pre-focused (...

Switches

Lighting—Douglas. Push-pull type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	21-21	2220
Parking	1.5	55
Instrument	3	63
Stop & Tail	21-3	1153

FUSES:—Lighting—20 ampere. Mounted on lighting switch.

HORN:—Vibrator type.

SERIAL NUMBER:—First number (All Series) 13219848 (Flint), 23238767 (South Gate, Calif.), 33245765 (Linden, N. J.). On right frame rail at dash.

ENGINE NUMBER:—Stamped on boss on right side of crankcase above starter. First number 40-, 60-, 80-, 90-3396937 (first number same for all models).

COMPRESSION:—Ratios and pressures as follows:

Model	Compression Ratio	Compression Pressure. 1000 RPM.	Cranking Spd.
38-40	6.15-1	126 lbs.	112 lbs.
38-60, 80, 90	6.35-1	130 lbs.	113.8 lbs.

VACUUM READING:—18-20" steady reading with engine idling at 7-8 MPH.

IGNITION:—Coil Model 536-H. Mounted on right side of crankcase in front of distributor.

Ignition Current—2½ amperes idling, 4½ stopped.

Ignition Switch:—Oakes-Hershey No. 301370. Co-incidental ignition switch and steering post lock.

Ignition Lock—Briggs & Stratton.

Distributor Model 1110801. Single breaker, 8 lobe cam, full automatic advance type with Vacuum Spark Control and Octane Selector adjustment.

Breaker Gap—.015". Limits .0125-.0175".

Cam Angle or Dwell—31° (closed), 14° (open).

Breaker Arm Spring Tension—22 oz.

Rotation—Counter-clockwise viewed from the top.

Condenser—Part No. 1869704. Capacity .20-.25 mfd.

Distributor Degrees	R.P.M.	Automatic Advance Degrees	Engine R.P.M.
Start	250	3.5	500
7	400	14	800
13	1500	26	3000

Vaccum Spark Control Model 681-H. Mounted on distributor and linked directly to breaker plate. Provides additional advance at speeds greater than 18 MPH. except when engine accelerated or operated with wide open throttle when spark is retarded by return spring. Plunger travel ⅛" Maximum.

Vacuum Advance.

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	5-7"
5-6½°	10-13°	10-13"

Octane Selector—Consists of manual adjustment at distributor providing 10° advance (toward 'High' on scale), 10° retard (toward 'Low' on scale) from center position. See Ignition Timing (below) for setting.

Distributor Removal:—On right side of crankcase. Disconnect vacuum line, take out two hold-down screws in mounting flange, pull distributor up.

NOTE—When installing distributor, see that cork oil seal in place in recess around shaft hole, turn distributor shaft so that rotor opposite #1 segment, position distributor so that vacuum unit connection toward rear and parallel with center-line of engine, turn oil pump shaft with screwdriver so that slot lines up with pin in end of drive gear.

IGNITION TIMING:—Standard setting below for fuel of 70 Octane Rating (Series 40), 76, (60, 80, 90). See Octane selector for final setting.

	Flywheel Degrees	Piston Position
38-40	4° BTDC	.0063" BTDC.
38-60, 80, 90	6° BTDC	.0149" BTDC.

To Set Timing (With Synchroscope)—Recommended by manufacturer. Clip one synchroscope lead to #1 spark plug cable, insert other lead in distributor cap terminal from which #1 spark plug wire removed. Direct synchroscope on flywheel through inspection hole in right front face of housing above starter. Idle engine at 400 RPM. Max. Loosen two distributor hold-down screws, rotate distributor until ADV mark lines up with line on housing, tighten hold-down screws. Loosen Octane Selector pointer lockscrew (Allen wrench) center pointer on scale. See Octane Selector setting below.

To Set Timing (without Synchroscope)—With #1 piston on compression stroke, turn the engine over until 'ADV' mark on flywheel lines with reference line on housing at inspection hole in right front face of housing above starter. Adjust distributor so contacts just opening, center Octane Selector pointer (above), adjust Octane Selector (below).

Octane Selector—Should be adjusted so that very light 'ping' secured when car accelerated between 10 and 20 MPH. in high gear with wide open throttle. To adjust, loosen the two distributor hold-down screws, rotate distributor and pointer toward 'High' end of scale for fuel of higher rating, or toward 'Low' end for fuel of lower rating.

NOTE—To correct excessive spark knock (not caused by incorrect spark plugs, inferior fuel, or incorrect timing) install special advance springs #1873745.

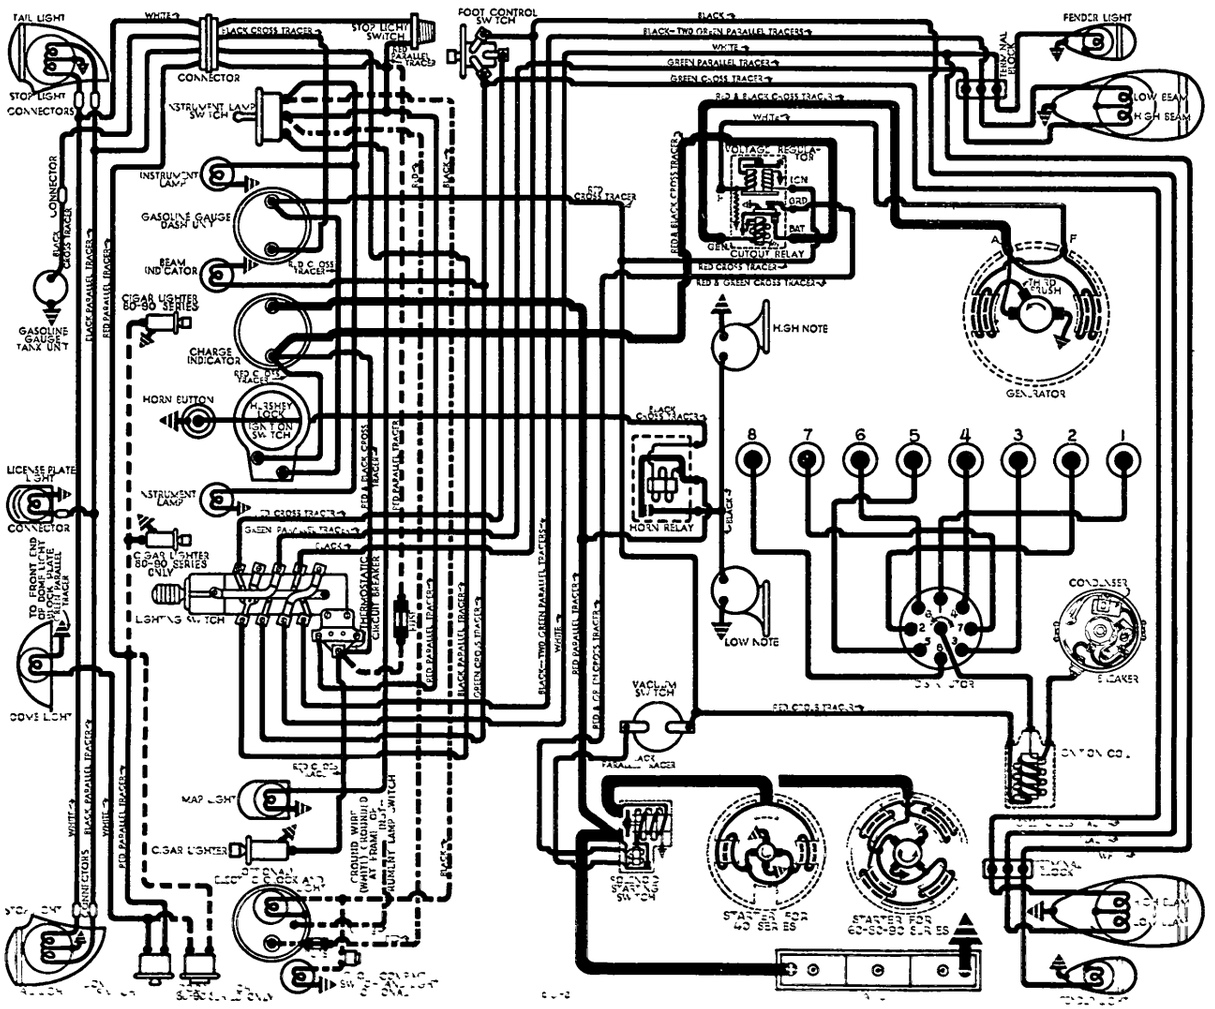
Motor Gauge—Weidenhoff Adapter #113, Rod #31.

Firing Order:—1-6-2-5-8-3-7-4 (see diagram).

Spark Plugs:—AC No. 46. 14 MM. Metric type.

Spark Plug Gaps—Set at .025". Limits .023-.028".

NOTE—Gap may be set at .030", if necessary, to secure good idle. May cause high speed missing in use.



Radio Suppressors—If installed on spark plugs, should be 10000 ohms maximum resistance.

CARBURETION:—Marvel or Stromberg Carburetors, Dual, Downdraft, 1" (40), 1¼" (60, 80, 90) type. Special type used when heavy duty oil-bath air cleaners installed (different jet calibrations).

Model	Std. Air Clnr.	Oil-bath Clnr.
40	Marvel CD-1B	10-1796 — 10-1797
40	Strmbg. AAV-1	A-18681 — A-18691
60, 80, 90..	Marvel CD-2B	10-1798 — 10-1799
60, 80, 90..	Strmbg. AAV-2	A-18682 — A-18692

See articles in Carburetion Section on each model.

Idle Adjustment (All Models)—With engine warm and idling at slow idle speed with choke valve wide open (Automatic Choke and Fast Idle inoperative), set throttle stopscrew for 7-8 MPH. idling speed (except 40 with Self-shifting transmission, 5-6 MPH. in third gear), turn idle adjusting screw for

each barrel (in succession) in until engine begins to lag or miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be approximately 1 turn (40—AAV-1), 1¼ turn (60, 80, 90—AAV-2), ¾-1 turn (all models—CD-1B, CD-2B) of screw open. Readjust stopscrew for idling speed.

Accelerating Pump (All Models)—Three holes in throttle lever for pump link engagement:
#1 (Inner—Min.). Hot weather, high-test gas.
#2 (Center)—All-year standard setting.
#3 (Outer—Max.). Cold weather, low-test gas.

Fast Idle:—Buick Cold Idle Control for all models.
See article in Carburetion Equipment Section.

Accelerator Linkage Adjustment:—Not required. See Automatic Choke (Vacuum Switch Adjustment).

IMPORTANT NOTE—(Model 40 with Self-Shifting Transmission):—See Buick Self-Shifting Transmission article in Transmission Section for throttle control lever setting (must be checked whenever linkage disconnected or disturbed).

Automatic Choke:—Delco-Remy Carburetor Control Model 1990101 (all carburetor models).
See article in Carburetion Equipment Section.

Volatility Selector Adjustment—Standard setting second notch on 'Low' side of scale. Turn adjusting nut toward 'High' end of scale for leaner setting, toward 'Low' end for richer setting.

Air Cleaner:—AC. Oil-wetted type Std. #1528533 (40), 1528535 (others), Heavy duty oil-bath type Optl. #1528534 (40), 1528616 (others).

Fuel Pump:—AC fuel pump std. (40), combination fuel and vacuum pump std. (60, 80, 90), optl. (40). Type W #1521854 (40 Std., first 54000), Type AF #1523703 (40 Std., after 54000), Type AJ #1523687 (40 Optl.), Type AB #1521838 (Std. 60, 80, 90).
See article in Carburetion Equipment Section.

Gasoline Gauge:—AC Electric. #1515347 (dash unit, all models), #1515469 (tank unit, 40, 60), #1515468 (tank unit 80, 90).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type.
Setting—Coil wind-up should be ¼ turn at 70°F. With coil engaged on heat valve shaft, wind up outer end ¼ turn and engage prong on anchor stud.
Thermostatic Coil Checking—To check thermostat on engine, install suitable lever 1½" long on forward end of heat valve shaft and hook spring balance to outer end of lever. With thermostatic coil and entire manifold at 70°F., pull required to start lever should be 5-6 ozs. (40), 8-9½ ozs. (60, 80, 90).

VALVE TIMING:—To Check—#2 or #7 exhaust valve should be .145" open (40), .155" open (60, 80, 90) with #1 and 8 pistons on top dead center and flywheel mark TDC/1-8 at indicator in inspection hole in right front face of flywheel housing above starter (actual valve opening—use a dial indicator).

Tappet Clearance:—.015" all valves, engine hot.

Valve Spring Pressure:—Total Pressure (inner and outer springs) 42-52 lbs. (closed), 112-124 lbs. (open).

LUBRICATION:—Crankcase Capacity—7 qts. (40, dry), 6 qts. (40 refill). Others 9 qts. (dry), 8 qts. (refill).
Normal Oil Pressure—45 lbs. at normal speeds.

BATTERY:—Delco Model 17E-1. 6 volt, 17 plate, 115 ampere hour capacity (20 hour rate).
Starting Capacity—137 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.3 minutes. Five second voltage—4.4 volts.
Grounded Terminal—Negative (—) terminal grounded to Coil mounting bolt on engine block.
Dimensions—Width 4". Length 19 5/16". Height 9".
Location—On right side under engine hood.

Series 80, 90 Exp rt Battery:—Delco Model 17K-1. 6 volt, 17 plate, 112 A.H. Capacity (20 hr. rate).
Starting Capacity—135 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.3 minutes. Five second voltage—4.38 volts.
Grounded Terminal—Negative (—) terminal.
Dimensions—Width 7". Length 10⅜". Height 8⅝".

STARTER:—734-Z (40), 727-W, 729-B RHD. (60, 80, 90).
Armature—823881 (734-Z), 820158 (727-W, 29-B).
Drive—Overrunning clutch (solenoid pinion shift).
Rotation—Counter-clockwise at commutator end.
Cranking Engine—(40) 135 RPM., 150 amperes, 4.5 volts. (60, 80, 90) 115 RPM., 175 amperes, 5 volts.
Brush Spring Tension—24-28 ozs. each.

Performance Data—734-Z.

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.37	525

Performance Data—727-W, 729-B.

0 ft. lbs.	5500	5.0	65
16 "	Lock	3.0	600

Removal:—Flange mounted on right front face of flywheel housing. To remove, take out capscrews.

Starting Switch:—Solenoid Switch No. 1542 (734-Z, 727-W), 1545 (729-B). Vacuum Switch No. 1868512 (part of Automatic Choke assembly). Solenoid controlled through relay by accelerator pedal with ignition 'on' (pedal and hand throttle must be fully off prior to starter operation).
See article in Electrical Equipment Section.

Solenoid Switch Types 1542, 1545.
Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with draw of 12-14 amperes (hold-in coil only).

Solenoid Relay.
Contacts Close—1.9 volts. max. **Contact Gap**—.035".
Contacts Open—1.0-1.2 volts. **Air Gap**—.010".

Vacuum Switch.
Contacts close at 30-40° throttle opening. Open with 3-6" of Hg. (stay open with more than ½").

GENERATOR:—Model 1101052 (40), 1101053 (60), 1101055 (80, 90). Armature No. 1866789 (all models). Split-field type with fixed third brush and vibrating voltage regulator control.
See article in Electrical Equipment Section.
NOTE—Generators same except for drive pulley. Interchangeable if correct pulley installed.

Pulley Specifications.

Groove	Top Width.	Diameter at rim.	Paint Color.
40	¾"	3½"	Black
60	⅞"	3¼"	Black
80, 90	⅞"	3½"	Aluminum

Charging Rate Adjustment—Adjusted by changing voltage regulator setting. See Regulator data.
Maximum Charging Rate—As given in table below. Reached at car speed of approx. 40 (40), 43 (60), 44 (80), 42 (90) MPH. cold. To check, connect test ammeter in line at 'BAT' terminal on regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action.

Performance Data.

	Amperes.	Volts.	R.P.M.
Cold	27-31	8.0	4000
Hot	25-28	8.0	4200

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces (main), 16-20 ounces (third brush).
Field Current—1.44-1.56 amperes at 6.0 volts (Shunt field), .89-.94 amps. at 6.0 volts (3rd brush field).

Removal:—New type pivot mounting (generator hung below pivot bracket). Removed in same manner as previous models.

Belt Adjustment:—Loosen all clamp bolts and pivot bolts, pull generator out and up until belt deflection midway between gen. and fan pulleys is ½".

CONTROL UNIT (VOLTAGE REGULATOR):—Model 5807. Cutout Relay and vibrating voltage regulator in case on left front face of engine dash.
See article in Electrical Equipment Section.

Cutout Relay
Cuts In—6.9-7.6 volts, approx. 800 RPM., 8 MPH.
Cuts Out—0-3 amperes discharge.
Contact Gap—.020". **Air Gap**—.020" (closed).

Voltage Regulator
Setting—7.5-7.9 volts (70°F), 7.4-7.6 volts (150°F). Regulator over-compensated for temperature and must be checked at these points.
Adjustment—Connect ammeter in charging line at 'BAT' terminal on regulator, disconnect lead on 'IGN' terminal and connect jumper between this terminal and 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3000 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set), adjust regulator by bending spring hanger at lower end of armature spring slightly.
NOTE—Regulator cover must be in place when testing. Do not run generator on open-circuit.
Contact Gap—.020". **Contact Sp. Tension**—2.7-3.5 oz.
Air Gap—.063" between armature and center of core with armature down. .010" between fibre bumper and stop with armature up.

LIGHTING:—Headlamps—Guide Multi-beam, prefocused type with non-interchangeable lenses (marked 'right' and 'left' at top). Beams same as on 1937 models except Fender Lamps lighted whenever City Beam or asymetrical Passing Beam in use.
Headlamp Adjustment—Must be adjusted with lenses in place (beams 4° to right without lenses), With the Upper Beams 'on', aim left hand headlamp so that upper edge of bright spot is on horizontal line at lamp center height and left edge is at lamp vertical center-line (entire bright spot to right of vertical line). Aim right hand headlamp for same height but center bright spot on vertical center-line (right cut-off approx. 8" to right of center-line).
Headlamp Beam Indicator—In speedometer dial. Lighted whenever upper beams in use.

Switches
Lighting—D-R No. 1994501, 1995001 (Exp).
Foot Selector—Delco-Remy Model 471-T.
Instrument Light—Delco-Remy Model 1404.
Stop Light—Delco-Remy Model 476-S.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Fender, Instrument, Map	1½	55
Clock, Radio, Trunk	1½	55
Beam Indicator, Glove Cmpt.	1	51
Stop & Tail	21-3	1154
License Plate	3	63
Dome	6	81

THERMOSTATIC RELAY:—No. 1865577. Mounted on lighting switch. Contacts remain closed with 25 ampere current but open within 1 minute with 38 ampere current (70°F). Non-adjustable

HORNS:—Klaxon Model K-33-S. Type 2051 (low note—right side), 2052 (high note—left side). Vibrator type blended tone twin horns operated by relay.

Horn Type	Current (at 6 volts)	Air Gap
2051 Low Note	11-13 amperes	.042-.046"
2052 High Note	10-12 amperes	.032-.036"

Horn Relay:—Model 271-A. **Contact Gap** .020".
Contacts Close—2.7-4.0 volts. **Air Gap**—.015".

FUSES:—Dome Light & Rear Cigar Lgtrs. (80, 90)—30 ampere in connector back of instrument panel.
Electric Clock—2 ampere on back of clock.

NOTE:—Engine hood hinged at cowl and lifts from forward end. Tilt radiator ornament back, raise hood enough to free safety catch at front under lower edge and raise hood. Side panels removed by freeing two bolts on upper edge of panels.

SERIAL NUMBER:—Engine number used.

ENGINE NUMBER:—First number (60) 8270001, (60S) 6270001, (65) 7270001, (75) 3270001. Stamped on left side of crankcase at rear of left cylinder block and on left frame side member in rear of front engine support.

COMPRESSION:—Ratio—6.25-1 (Std. 60, 60S, 65), 6.70-1 (Std. 75), 5.75-1 (Optl.—all models).

Pressure—155 lbs. (60, 60S, 65), 170 lbs. (75) at 1000 R.P.M. or approximately 105-110 lbs. (60, 60S, 65), 110-115 lbs. (75) at cranking speed.

VACUUM READING:—Gauge should show steady reading of 20-21" with engine idling at 6 M.P.H.

IGNITION:—Coil Model 539-C. Mounted on dash.

Ignition Current—2.2 amps. idling, 4.4 stopped.

Ignition Switch:—Delco-Remy Model 435-K (60S), 1116255 (others). Connected to coil by armored cable.

Ignition Lock—Briggs & Stratton.

Distributor Model 1110604. Single breaker, 8 lobe cam, full automatic advance type with manual adjustment at distributor. Vacuum spark control not used.

Breaker Gap—.0125-.0175".

Cam Angle or Dwell—31° closed, 14° open.

Breaker Arm Spring Tension—22 ounces.

Rotation—Clockwise viewed from top.

Condenser—Part No. 1869704. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	500	1	1000
3	820	6	1640
6	1200	12	2400
9	1600	18	3200
12	2000	24	4000

Removal:—Distributor mounted between cylinder banks at rear of engine. To remove, take out two capscrews in mounting bracket.

NOTE—When installing distributor on engine, turn crankshaft to firing position for #1 piston, mesh distributor drive gear so that slot in upper end of shaft is offset toward rear of engine.

IGNITION TIMING:—Setting below for fuel ratings as follows:—60 & 65—70 octane rating, 75—ethylized or other high octane fuel. NOTE—See Manual Adjustment (following) for final setting giving best performance with type of fuel regularly used.

Flywheel Degrees	Piston Position
5° BTDC	.0114" BTDC

To Set Timing (With Synchroscope)—Recommended by manufacturer. Clip Synchroscope lead to #1 spark plug, direct light on crankshaft pulley at front of engine. Idle engine, loosen hold-down screw in advance arm, rotate distributor until 'IG/A' mark on pulley (which is 5° before dead center mark 'C.1/6' appears to line up with pointer on chain case cover, tighten hold-down screw. Adjust for fuel (see Manual Adjustment).

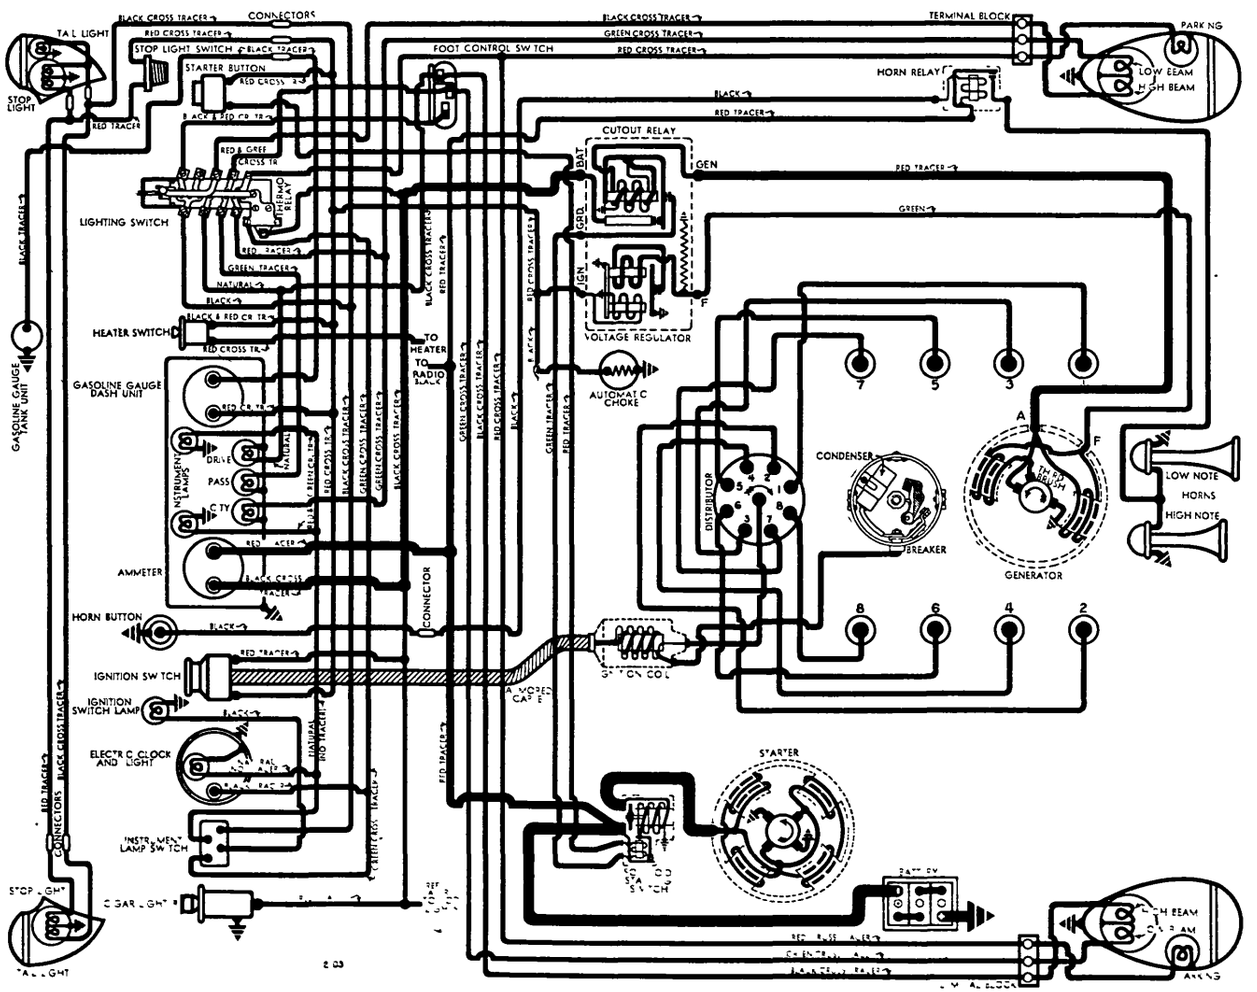
Timing (Without Synchroscope)—Turn engine over to firing position for piston #1 (front piston, left bank) with mark 'IG/A' on crankshaft pulley (5° before dead center mark 'C.1/6') lined up with pointer on chain case. Loosen hold-down screw on advance arm, center pointer on scale, tighten hold-down screw on advance arm. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt. Adjust for fuel (see Manual Adjustment).

Motor Gauge—Weidenhoff Adapter #114, Rod #42.

Manual Adjustment—Slight ping should be evident at speeds below 15 M.P.H. when car accelerated with wide open throttle. To adjust, loosen hold-down screw on advance arm, rotate distributor one graduation on scale clockwise (if ping too severe), counter-clockwise (if no ping noted), repeat test, adjust until best performance is secured. NOTE—Check engine for faulty spark plugs, excessive carbon deposits, localized hot spots, or lean carburetor setting before changing manual adjustment.

Firing Order:—1-8-7-3-6-5-4-2 with spark plugs numbered as shown on diagram.

Spark Plugs:—AC. Type 45. 14 MM. Metric type.



Spark Plug Gap—.025-.027".

CARBURETION:—Carburetor—Stromberg Model AAV-25, 1¼" dual downdraft, aircraft type.

See article in Carburetor Section for data.

NOTE—If engine idled after cold starting, open throttle momentarily. New choke design requires opening of throttle for proper choke release.

Idle Adjustment—With engine warm (fast idle and automatic choke inoperative) adjust throttle stopscrew so that engine idles at 6 M.P.H. Turn each idle adjusting screw in until engine begins to miss, then turn screws out until engine begins to roll, finally turn screws in slowly until engine fires smoothly. Both screws must be adjusted equally. Readjust throttle stopscrew for correct idling speed if necessary.

Accelerating Pump Setting—Two holes provided in throttle lever for pump link engagement. Set as follows:
Inner hole (short stroke)—Normal operation.
Outer hole (long stroke)—Winter temperatures.

Fast Idle:—Integral with carburetor. No adjustment. **See article in Carburetion Equipment Section.**

Automatic Choke:—Integral with carburetor (linked directly to choke valve shaft). No adjustment. **See article in Carburetion Equipment Section.**

Air Cleaner:—AC. #1528572 oil bath type used in conjunction with oil vent #864384.

Fuel Pump:—AC. Type AB #1523634. Diaphragm type. Combination fuel-and-vacuum pump. **See article in Carburetion Equipment Section.**

Gasoline Gauge:—AC. Electric type. #1515346 (dash unit), #1515461 (tank unit). **See article in Carburetion Equipment Section.**

VALVE TIMING:—To Check Timing—Intake valve for cylinder #1 (front cylinder, left bank) should open when piston reaches top dead center when mark 'C.1/6' on crankshaft pulley lines up with pointer on chain case cover.
Motor Gauge—Weidenhoff Adapter #114, Rod #42.
Tappet Clearance:—None in service (hydraulic take-up). **See article in Mechanical Equipment Section.**
Valve Spring Pressure:—66 lbs. at 1.926" (Valve closed), 145 lbs. at 1.581" (valve open).

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—25 lbs. at 30 M.P.H.

BATTERY (60, 65):—Delco, Type 17-K-1. 6 volt, 17 plate, 112 AH. capacity (20 hour rate).
Starting Capacity—135 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.3 minutes. Five second voltage—4.38 volts.
Grounded Terminal—Positive (+) terminal. Grounded to frame. Engine grounded to same point on right frame side member by strap connector (second ground at left front of engine on some models).
Dimensions—Length 10⅜". Width 7". Height 8⅝".
Location—Under hood on right side. NOTE—To remove, take out through bolt on outer edge (under fender), raise battery carrier and battery to free clamps from frame and lower assembly to floor.

BATTERY (75):—Delco, Type 17-D. 6 volt, 17 plate, 135 AH. capacity (20 hour rate).
Starting Capacity—156 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.5 minutes. Five second voltage—4.6 volts.
Dimensions—Length 11¾". Width 7". Height 9⅜".
Grounded Terminal & Location—As above.

STARTER:—Model No. 727-V, 1117904 (60 R.H.D.).
Armature—No. 820158.
Drive—Overrunning clutch (solenoid pinion shift).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
16 "	Lock	3.0	600

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws, pull starter forward, remove from below.

Starting Switch: Solenoid Switch Type 1542. Push-button Switch Type 1996001. Solenoid Switch controlled through relay in case by pushbutton on instrument panel. **See article in Electrical Equipment Section.**

Solenoid Switch Specifications

Closes against 70 lbs. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay Specifications

Contacts Close—1.9 volts Max.
Contacts Open 1.0-1.2 volts.
Contact Gap—.035". **Air Gap**—.010" (closed).

GENERATOR (60, 65):—Model 1101051 (60), 1101054 (65). Armature No. 1866789. Split-field type with fixed third brush and vibrating voltage regulator control. **See article in Electrical Equipment Section.**
Charging Rate Adjustment—Adjusted by changing regulator setting. See Regulator data.
Maximum Charging Rate—As given in table below. Reached at 4000 R.P.M. or 50 M.P.H. cold. To check charging rate, connect test ammeter in line at 'BAT' terminal on regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action.
NOTE—Do not operate generator on open-circuit.

Performance Data

	Amperes	Volts	R.P.M.
Cold	27-31	8.0	4000
Hot	25-28	8.0	4200

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces (main), 16-20 ounces (third brush).
Field Current—1.44-1.56 amperes at 6.0 volts (Shunt field), .89-.94 amperes at 6.0 volts (third brush field).

Removal:—Flange mounted at front of engine between cylinder banks. Belt driven in tandem with water pump (separate belt for fan). To remove, take out two flange mounting bolts.

Belt Adjustment:—Loosen both generator mounting bolts, lift generator up until only slight slack evident in belt (pivots on left bolt, right bolt hole slotted).
NOTE Fan driven by separate belt with adjustment at fan bracket.

GENERATOR (75):—Model 1102652. Armature No. 1857866.
Removal & Belt Adjustment—As given above.
For all other data (including wiring diagram) see Model 37-90 (following).

CONTROL UNIT (60, 65—VOLTAGE REGULATOR):—Model 5817. Cutout Relay and vibrating Voltage Regulator in case on engine side of dash. **See article in Electrical Equipment Section.**

Cutout Relay

Cuts In—6.9-7.6 volts.
Cuts Out—0-3.0 amperes discharge.
Contact Gap—.020". **Air Gap**—.020" (closed).

Voltage Regulator

Setting—7.5-7.9 volts (70°F.), 7.4-7.6 volts (150° F). Regulator over-compensated for temperature and must be checked at these points.
Adjustment—Connect ammeter in charging line at 'BAT' terminal on regulator, disconnect lead on 'IGN' terminal and connect jumper between this terminal and 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2000-3000 R.P.M., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set), adjust regulator by bending spring hanger at lower end of armature slightly.
NOTE—Regulator cover must be in place when making tests. Do not operate generator on open-circuit.
Contact Gap—.020". **Contact Sp. Tens.**—2.7-3.5 ozs. **Air Gap**—.063" between armature and center of core with armature down. .010" between fibre bumper and stop with armature up.

CONTROL UNIT (75—VOLTAGE-CURRENT REGULATOR):—Model 5818. See Model 37-90 for all data.

LIGHTING:—Headlamps—Guide Multi-beam, pre-focused type with non-interchangeable lenses (marked 'Right' and 'Left' at top). Asymetrical passing beam (upper beam left hand headlamp, lower beam right hand headlamp) controlled by foot selector switch with lighting switch in Country Driving position.
NOTE—With lighting switch in second position (City), foot selector switch controls upper 'driving' beam and lower 'City' beam (for both headlamps).
Headlamp Adjustment—Adjust lamps only with doors in place. Aim right hand headlamp so that top edge of high intensity spot is on horizontal line at lamp center height and centered on vertical lamp-center line. Aim left hand headlamp for same height but high intensity spot must be to right of vertical lamp-center line. Adjusting screw for up-and-down motion accessible through hole in bottom of each lamp, screw for side motion on inner side of each lamp body (accesible after removing spring-retained cup).
Headlamp Indicators—Located on lower edge of speedometer panel. Marked as follows:
Drive—Upper beam, both headlamps.
Pass—Special passing beam (see above).
City—Lower beam, both headlamps.

Switches

Lighting—D-R No. 1994502, 1995005 (Exp.).
Dimmer—D-R Model 471-T, 471-U (RHD).
Dash Lamp—D-R Model 1406.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-32	2330
Stop and Tail	21-3	1154
Parking	1½	55
License, Quarter	3	63
Dome	15	87
Instrument, Clock, Ind.	1	51

THERMOSTATIC RELAY:—No. 1866467. Mounted on lighting switch. Contacts remain closed with 25 ampere current but open within 1 minute with 38 ampere current (70°F.). Non-adjustable.

HORNS:—Klaxon Model K-33-D. Type 1967 (low note—left side), 1968 (high note right side). Vibrator type, blended tone, twin horns operated by horn relay.
NOTE—Horns mounted vertically behind radiator grille with horn relay on left front fender dust shield. Grille must be removed for horn service.

Horn Type	Current (at 6 volts)	Air Gap
1967 Low Note	12-14 amperes	.045-.050"
1968 High Note	11-13 amperes	.036-.040"

Horn Relay:—Model 271-A. **Contact Gap**—.020". **Contacts Close**—2.7-4.0 volts. **Air Gap**—.015".

ENGINE HOOD & SIDE PANEL REMOVAL:—See V8 models (previous page) for directions.

SERIAL NUMBER:—Same as engine number below.

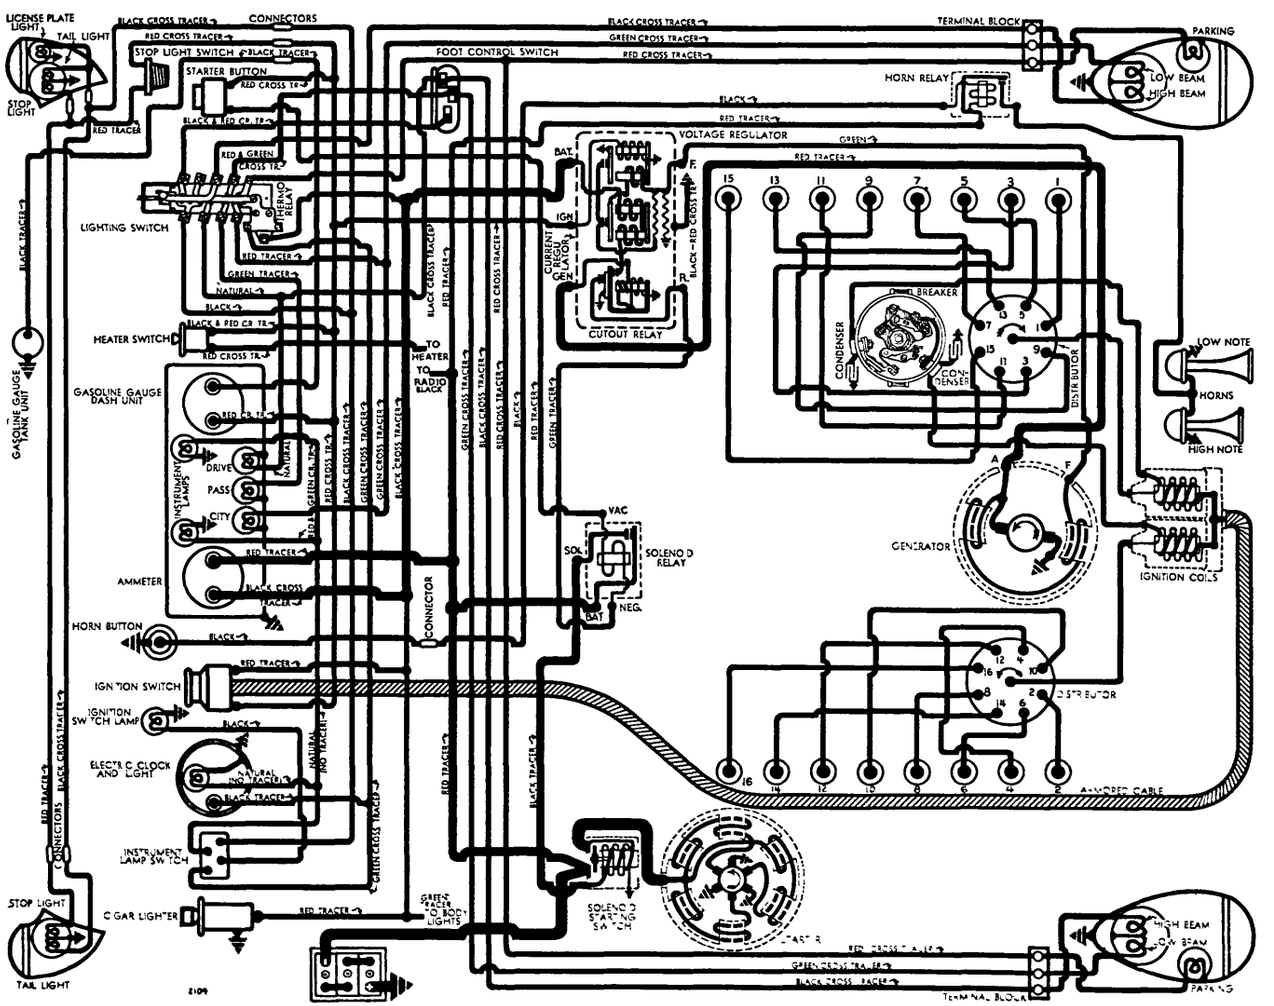
ENGINE NUMBER:—First number 5270001. Stamped on upper rear left hand cylinder block below head.

COMPRESSION:—Ratio—6.75-1 Std. 6.08-1 Optl.
NOTE—Ethylized fuel is required.
Pressure—180 lbs. at 1000 R.P.M. for Std. head or approximately 110-115 lbs. at cranking speed.

VACUUM READING:—20-21" steady reading at idling speed of 8-9 M.P.H.

IGNITION:—Coil Model 553-E. Two coil unit mounted on bracket at radiator top. Coil Cover No. 1854013.
Ignition Current—2.2 amperes idling, 4.4 amperes stopped for each coil.
Ignition Switch:—Delco-Remy No. 1116256 (switch and cable). Connected to coil unit by armored cable.
Ignition Lock—Briggs & Stratton.
Distributor Nos. 1110601 (L.H.), 1110602 (R.H.). Two distributors are used but Left Hand Distributor times ignition for entire engine (breaker assembly similar to design used on previous V16). This left hand distributor also distributes high tension current to spark plugs for left hand cylinder bank. Right Hand Distributor distributes high tension current to spark plugs of right hand cylinder bank (has no breaker mechanism, not used for timing).
IMPORTANT—**Distributor Change.** First left hand distributors had 'flat' advance curve causing knock around 50 M.P.H. and should be replaced, whenever found on cars in service, by later type distributor marked 'X' or 'L' stamped on number plate.
Type—Double breaker, 8 lobe cam, full automatic advance type with manual adjustment (see Timing).
Firing Interval—Regular 22½° intervals (contacts open alternately) corresponding to 45° firing interval of engine. Must be synchronized (see Timing).
Breaker Gap—Set at .015". Limits .0125-.0175".
Cam Angle or Dwell—31° closed. 14° open. Each set operates independently.
Breaker Arm Spring Tension—22 ozs.
Rotation—Clockwise viewed from top (L.H. No. 1110601). Counter-clockwise (R.H. No. 1110602).
Condenser—No. 1869707 (2 used, both mounted on No. 1110601 distributor). Capacity—.20-.25 mfd.
Manual Adjustment—20° (engine).

Automatic Advance



Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	700	0	1400
10	2000	20	4000

Distributor Removal: Distributor for each bank mounted at right or left hand side at front of engine. To remove distributors, take out hold-down screws in advance arm, lift distributor up to disengage coupling (does not disturb driving gear).
Distributor Installation. Drive slot not offset. To insure correct distributor position, install as follows: turn crankshaft to firing position for #1 cylinder (IG/A mark lined up with dampener at front of engine). Install both distributors with rotors pointing forward and to left (L.H.—38° to left from straight-ahead position, R.H.—56° to left).
Distributor Drive Shaft Installation. Must be installed correctly (engine cannot be timed if shaft location incorrect). Use Distributor Shaft Setting Gauge No. J-1212 as follows: With crankshaft and camshaft timing gear marks lined up, install gauge in dowel holes for distributor support, note pointer positions. Remove gauge, install drive shafts, recheck with gauge (slot must line up with pointer).

IGNITION TIMING:—Standard setting (for Ethylized Fuel) given below. See Manual Adjustment for recommended corrections.

Flywheel Degrees	Piston Position
6° BTDC.	.0012" BTDC.

To Set Timing (Stationary Contacts)—Loosen thumbscrew on pointer arm, center pointer on quadrant scale by rotating distributor, tighten thumbscrew. With #1 piston on compression (front cylinder, left bank), crank engine by engaging gears and rolling car on floor until piston reaches firing position when ignition mark 'IG/A' (which is slightly before top dead center mark 'C/1-15') on vibration dampener at front of engine lines up with pointer on chain case cover. Loosen advance arm clampscrew, rotate distributor until stationary contacts (mounted directly on breaker plate) begin to open, tighten clampscrew, then synchronize.
Synchronization (Timing Movable Contacts)—Manufacturer recommends that distributor be removed and synchronized on test fixture (set contacts to open at regular 22½-22½ distributor degree intervals). To synchronize on engine, turn engine over 45° or ⅛ revolution to firing position for #4 cylinder when 'IG/A' mark on dampener lines up with pointer, remove distributor cap, loosen two lockscrews on movable sub-plate (on which second set of contacts mounted), turn eccentric adjusting screw until contacts begin to open, tighten lockscrews. Check manual adjustment setting.
Manual Adjustment:—With ignition set as above, slight 'ping' should be noticeable when engine accelerated at wide open throttle at speeds below 15 M.P.H. (see note below). If ping too severe, loosen pointer thumbscrew, rotate distributor clockwise toward 'RET' end of scale one graduation at a time until performance satisfactory. Adjustment provides 10° advance ('ADV' end of scale), 10° retard ('RET' end of scale), from center position.
IMPORTANT NOTE—Before changing manual adjustment, check for detonation by accelerating car up to at least 60 M.P.H. (critical point is around 50 M.P.H.). If engine knocks at 50 M.P.H., make certain that correct second type left hand distributor is installed (marked 'X' or 'L' on name plate), check fuel being used, spark plug gaps, carburetor setting,

and engine for carbon deposits causing pre-ignition.

Firing Order:—1-4-9-12-3-16-11-8-15-14-7-6-13-2-5-10 with cylinders numbered as shown on diagram. See diagram for spark plug cable connections.

Spark Plugs—AC. No. 45. 14 MM. Metric type.

Spark Plug Gaps—Set at .032".

CARBURETION:—Carburetors. Carter Model WDO, Type 407-S (Left Hand), 408-S (Right Hand). 1⅛" Dual Downdraft type. One carburetor for each cylinder bank with interconnected throttle controls. **See article in Carburetor Section for data.**

NOTE—Carburetors must be synchronized or equalized at both idle and part throttle position.

Idle Adjustment—With engine warmed up and idling at hot or slow idling speed with Fast Idle and Automatic Choke inoperative, adjust each carburetor as follows: Set throttle stopscrew so that engine idles at 8-9 M.P.H., turn each idle adjusting screw (one for each barrel or two on each carburetor) in until engine begins to lag or miss, then turn screw out until engine fires smoothly. Re-adjust throttle stopscrew for correct idling speed. After adjusting both carburetors, equalize as follows:

Equalizing Carburetors—Use mercury column 'U' tube connected to ⅛" pipe plug openings in long leg of each intake manifold (do not connect gauge to vacuum balancing pipe between manifolds). Disconnect throttle rods, idle engine, note mercury level in tubes. Adjust throttle stopscrew at each carburetor so that engine idles at correct 8-9 M.P.H. speed and mercury level is equal in both tubes. Adjust throttle rod lengths (trunnion with fine threads located on each rod near carburetor) so that rods can be connected without disturbing position of throttles or unbalancing mercury levels. Open throttle approximately ¼ (use foot throttle, not hand throttle), make any necessary re-adjustment to secure equal column levels. If adjustments made, recheck idle settings (equalization at idle speed more important).

Accelerating Pump Setting—Not adjustable.

Automatic Choke & Fast Idle:—Carter Climatic Control (integral with Carburetor). **See article in Carburetion Equipment Section.**

Air Cleaner:—AC. #1528718 heavy duty oil-bath type std. (Single cleaner used for both carburetors).

NOTE—AC #1528732 oil vent Air Cleaner also used.

Fuel Pump:—AC Type AU (2 used). #1523695 (R.H.), #1523696 (L.H.). Diaphragm type. One pump mounted at forward end of each cylinder bank and supplies fuel for carburetor for that bank (fuel lines between pumps and carburetors interconnected so that each pump can supply both carburetors.

NOTE—One pump only may operate at idling speed. **See article in Carburetion Equipment Section.**

Noisy Fuel Pump Complaints—To correct noisy fuel pump action, pumps should be disassembled and new valve cages (Part No. 1523106—4 required) installed. Both valves in each pump should be changed.

Vacuum Pump—AC. Type K #1523394 (separate unit) mounted between cylinder banks at rear.

Gasoline Gauge:—AC Electric type. #1515346 (dash unit), #1515461 (tank unit). **See article in Carburetion Equipment Section.**

VALVE TIMING:—To Check—Intake valve for #1 cylinder should open with IG/A ignition mark for this cylinder slightly before pointer on chain cover.

Tappet Clearance:—None in service (hydraulic type).

Valve Spring Pressure:—49 lbs. at 1.812" (valve closed), 95.5 lbs. at 1.51" (valve open).

LUBRICATION:—Crankcase Capacity—11 qts.

Normal Oil Pressure—25 lbs. at 30 M.P.H.

BATTERY:—Delco Model 21-D. (Use 21-C for replacement). 6 volt, 21 plate, 164 A.H. capacity (20 hr. rate).

Starting Capacity—195 amperes for 20 minutes.

Zero Capacity—300 amperes for 7.1 minutes. Five second voltage—4.7 volts.

Grounded Terminal—Positive (+) terminal grounded to frame. Engine grounded to same point by strap connected to starter support bolt (second ground at left front corner on some models).

Dimensions—Width 7". L'gth. 13 9/16". Hgt. 9 5/32".

Location—On right hand side under front seat.

STARTER:—Model 714. Armature No. 1868165.

Drive—Solenoid shift and overrunning clutch.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—36-40 ozs. each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3000	5.0	70
17 " "	Lock	3.0	500

Removal:—Starter flange mounted on right front face of flywheel housing. To remove starter, take off cover in right hand side pan, take out flange mounting screws, remove starter and switch assembly from below.

Starting Switch:—Solenoid Switch No. 1555. Solenoid Relay No. 268-M. Pushbutton Switch No. 1996001. Solenoid mounted on starter field frame and controlled through Solenoid Relay (mounted separately on right front of dash) by pushbutton. **See article in Electrical Equipment Section.**

Solenoid Switch Specifications

Closes against 70 lb. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with current draw of 12-14 amperes (hold-in coil only).

Solenoid Relay 268-M

Contacts Close—3.2 volts Max. **Open**—1.6-2.0 volts.

Contact Gap—.035". **Air Gap**—.010" (contacts closed).

GENERATOR:—Model 1102651. Armature No. 1868601.

NOTE (For Model 75 Generator)—All data below (except mounting and drive adjustment) applies also to Model 1102652 generator used on Model 38-75.

Type—Two Brush, straight shunt, Peak-Load type with external vibrating voltage and current regulation. Generator is air-cooled by air scoop on forward end of field frame and fan on armature shaft.

Charging Rate Adjustment—Adjusted by changing regulator setting (no adjustment at generator). See Regulator data below.

Maximum Charging Rate—26 amperes cold with discharged battery (check with test ammeter connected in charging line at 'BAT' terminal on regulator). Actual charging rate controlled by regulator (decreases as battery is charged). Generator output constant at speeds above 1650 RPM. or 17 MPH.

Performance Data (Cold)

Amperes	Volts	R.P.M.
26	8.0	1650

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—22-26 ozs. each.

Field Current—2.0-2.2 amperes at 6.0 volts.

Removal:—Generator flange mounted on rear of fan pulley bracket between cylinder banks and driven by friction wheel from inner rim of pulley. To remove, take out two flange mounting screws.

Drive Adjustment:—Check fan belts and adjust belts first. Loosen generator mounting screws, back off adjusting screw locknut, turn adjusting screw in until pull required to rotate generator is 9-12 lbs. as measured by spring scale hooked to outer rim of generator cooling fan tangent to rim. Adjust cold and check at several points on driving ring.

CONTROL UNIT:—Model 5818. Consists of Cutout Relay, Voltage Regulator, and Current Regulator in single case on dash.

NOTE (For Model 75 Control Unit)—All data below applies to same type regulator as used on Model 75. **See article in Electrical Equipment Section.**

NOTE—Cover of regulator case is sealed. Units can be checked without breaking seals but cover must be removed to make adjustments.

Cutout Relay

Cuts In—6.7-7.6 volts.

Cuts Out—0-3.0 ampere discharge current.

Contact Gap—.020". **Air Gap**—.020" (contacts closed).

Voltage Regulator

Setting—7.5-7.95 volts (70°F), 7.4-7.6 volts (150°F). Over-compensated for temperature and must be checked at these points.

To Check (without breaking seal)—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 2800-3400 R.P.M., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set). Check voltmeter reading.

NOTE—Cover must be in place when tests are made. Do not operate generator on open-circuit.

To Adjust (with cover removed)—Change regulator armature spring tension slightly by bending spring hanger at lower end of spring slightly. Replace cover and test as directed above.

Contact Gap—.020". **Contact Spring Tension**—3.5 oz. **Air Gap**—.063" between armature and center of core with armature down so that fibre bumper just touches stop, .010" between fibre bumper and stop with armature up.

Current Regulator

Setting—26 amperes.

To Check (without breaking seal)—Disconnect 'IGN' lead on Regulator, connect test ammeter in charging line at 'BAT' terminal, operate generator and check performance.

NOTE—Do not allow generator voltage to exceed 8.5 volts with voltage regulator inoperative.

To Adjust (with cover removed)—Same as Voltage Regulator adjustment (above).

Contact Gap—.020". **Contact Spring Tension**—3.5 oz. **Air Gap**—.075" between armature and center of core with armature down so that fibre bumper just touches stop, .010" between fibre bumper and stop with armature up.

NOTE—Repolarize generator whenever Control Unit disconnected or removed by connecting jumper between 'GEN' and 'BAT' terminals momentarily after all other leads re-connected. Always disconnect 'BAT' lead first and connect this lead last.

LIGHTING:—Headlamps—Same lighting system as on V8 models. See preceding page for Headlamp adjustment, Beam patterns, and Beam Indicators.

Switches

Lighting—D-R. No. 1994502, 1995005 Exp.

Foot Selector—D-R. No. 471-T, 471-U Exp.

Bulb Specifications

Same as for V8 models. See preceding page for data.

THERMOSTATIC RELAY:—No. 1866467. Mounted on lighting switch. Contacts remain closed with 25 ampere current, but open in 1 minute with 38 ampere current at 70°F. Non-adjustable (sealed).

HORNS:—Klaxon Model K-33-D. Type 1967 (low note—left hand), 1968 (high note—right hand). Vibrator type, blended tone, twin horns operated by relay. **See V8 data (preceding page) for Horn and Relay data.**

FLEET MODEL NOTE:—Special Economy engine available for all models. Engine identified by code letter 'V' stamped ahead of engine number and special tune-up specification plate on Push Rod Cover listing special tune up data for this model. Engine standard except for these specifications and Carburetor which has stop-pin designed to limit throttle opening to half-throttle.

SERIAL NUMBER:—First number 1001. Prefixes 1-HA-03, indicate assembly plant (1-21), Model (HA,HB, HC, HD, HE, TA, TB, TC, TD) and month (01-12). Located on right side of body under hood (front of dash—Trucks).

ENGINE NUMBER:—First Engine number (Flint) 1,187,822, (Buffalo) 1. Prefixes as follows: Flint—Passenger car (none), ½ Ton Commercial (K), All others (T). Buffalo—Passenger cars (B), ½ Ton Commercial (BK), All others (BT). Economy engine indicated by 'V' thus VK, VKB, etc. Engine number stamped on boss on right side of block at rear of distributor.

COMPRESSION:—Ratio—6.25-1 cast-iron head.
Pressure—112 lbs. at 65 R.P.M. (cranking speed), 159 lbs. max. (each cylinder within 5-10 lbs.).

VACUUM READING:—Gauge should show steady reading of 20-22" with engine idling at 400 R.P.M.

IGNITION:—Coil Model 536-D. Mounted on right side of engine above distributor.
Ignition Current—2.5 amperes idling, 4.8 stopped.
Ignition Switch:—Delco-Remy model 435-F (passenger cars), 431-Y (commercial and trucks). Connected to coil by armored cable.
See article in Electrical Equipment Section.
Ignition Lock—Briggs & Stratton.
Distributor Model 1110008. Single breaker, 6 lobe cam, full automatic advance type with vacuum control and Octane Selector.
Breaker Gap—Set at .018". Limits .018-.024".
Cam Angle or Dwell—35° (closed), 25° (open).
Breaker Arm Spring Tension—20 ounces.
Rotation—Clockwise viewed from top.
Condenser—Part No. 1869704. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	1.75	600
25	1800	50.0	3600

Vacuum Spark Control Model 681-F. Mounted on Octane Selector and linked to distributor advance arm. Provides additional advance except when engine is suddenly accelerated (retarded by return spring within unit) or at high speeds with wide open throttle (vacuum port in carburetor cut off by throttle valve shaft).

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG.)
Start	0°	4.5" min.
8-9°	16-18°	9-11"

Octane Selector—Consists of adjustment at distributor providing 10° advance or retard from standard ignition setting to compensate for fuel rating. See Ignition Timing below.

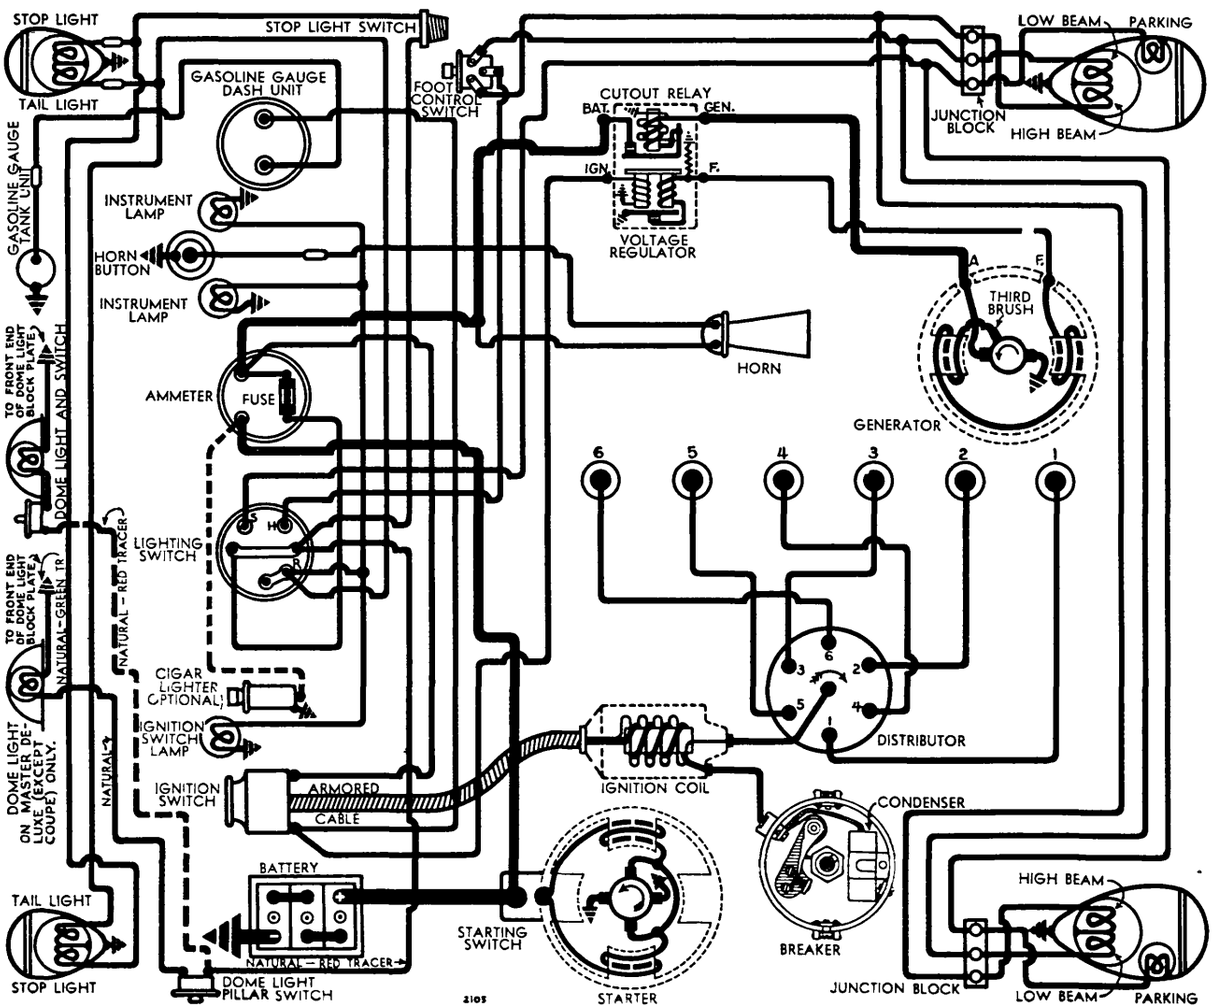
Removal:—Distributor mounted on right side of crankcase. To remove, loosen clamp bolt in advance arm (Octane Selector mounting not disturbed).

IGNITION TIMING:—Initial setting with Octane Selector set at '0' as follows. See Octane Selector for final setting.

	Flywheel Degrees	Piston Position
All Engines	5° BTDC	.0091" BTDC.

To Set Timing (Neon Light)—Recommended by manufacturer. Mount timing light so that it is directed on flywheel through inspection hole in right front face of housing. Clip one lead to #1 spark plug. Set Octane Selector at 'O' on scale by turning thumbnut. Idle engine, loosen advance arm clamp bolt, rotate distributor until steel ball timing mark on flywheel lines up with pointer on housing. Tighten clamp bolt.

Timing (Without Neon Light)—With #1 piston on compression, turn engine over until piston is 5° or .0091" before top dead center, stop when steel ball timing mark on flywheel lines up with pointer in inspection hole in right front face of housing, loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt.



Motor Gauge—Weidenhoff Adapter #113, Rod #33.

Final Setting (Octane Selector)—Provides 10° advance or retard from standard setting to compensate for fuel. For maximum performance and economy, road test car, advance Octane Selector setting until slight ping is noticeable when accelerating with wide open throttle.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—AC. Type 46. 14 MM. Metric type.
Spark Plug Gap—Set at .040".

CARBURETION:—Carburetor—Carter Model 391-S, (Std. all models), 358-S (Econ. models). 1¼" downdraft type.
See article in Carburetion Section for each model.
Idle Adjustment—With engine warm and choke valve wide open, adjust throttle stopscrew to idle engine at 400 R.P.M. Turn idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be 1-2 turns of screw from inner seated position. Readjust throttle stopscrew for correct idle speed.

Accelerating Pump Setting—Pump lever under dust cover at top of carburetor has three holes for pump link engagement. Settings as follows:
Lower Hole (med. stroke)—Std. gasoline.
Upper Hole (long stroke)—Cold climates.
Inner Hole (short stroke)—Hot climates, high test fuel or high altitudes.
NOTE—Lean and rich metering rods available to compensate for fuel or altitude requirements.
See Jet Specification Table in Carburetor Section.

Throttle Cracker:—Consists of a lug on the starting pedal linkage which engages the accelerator linkage to open the throttle 1/3 for starting. No adjustment required.

Air Cleaner:—AC #1528524 (Pass. cars), 1525978 (Trucks) oil-wetted type Std., #288 (all models) and #1525983 (comm chassis) heavy duty oil-bath type Optl.

Fuel Pump:—AC. Type AF #1523089 diaphragm type. AM #1523271 comb. fuel-and-vacuum pump optional.
See article in Carburetion Equipment Section.

Gasoline Gauge:—AC. Electric. **Dash Unit**—(HA, HB) #1515345, (all others) #1515207. **Tank Unit**—(HA, HB—except coupe) #1515463, (HA, HB—coupe only) #1515464, (com'l & trucks) #1515465, (panel & OOH) #1515466, (com'l chassis) #1515467.
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. Wind up spring just enough to slip over pin on manifold (approximately ½ turn)—IMPORTANT—excessive tension may cause detonation, sticking of heat control valve and poor performance.
Anti-rattle Spring Installation—Part No. 602799. Should be installed to stop noise (do not increase thermostatic spring tension). To install, rotate valve to 'heat off' position, insert spring in valve shaft slot, hold counterweight 3/16" above 'heat on' position, bend anti-rattle spring until it just contacts stop pin on manifold.

VALVE TIMING:—To Check—No flywheel marks provided. With intake tappet clearance set at .006", #1 intake valve should open with piston 9° or .0294" BTDC. when point on flywheel approx. 3.475 teeth before dead center lines up with indicator in inspection hole in right front face of flywheel housing.
Motor Gauge—Weidenhoff Adapter #113, Rod #33.

Tappet Clearance:—.006-.008" Intake, .013-.015" Exhaust (hot). NOTE—Car manufacturer recommends that engine be run 20 minutes at 600 R.P.M. (fast idle) to insure proper engine temperature for adjustment.
Economy Models—.010" Int., .016" Exh. (hot).

Valve Spring Pressure:—42-48 lbs. (valve closed), 111-119 lbs. (valve open). Free length—2 7/32". Spring compressed to 1½" should test 125-133 lbs.
NOTE—1938 springs cannot be used on earlier models.

LUBRICATION:—Crankcase Capacity—5 quarts.
Normal Oil Pressure—13.5 lbs. at 50 M.P.H.

BATTERY—PASSENGER CARS:—Delco, Type 17-M Chevrolet), 17-P (Delco Replacement). 6 volt, 17 6 volt, 15 plate, 94 AH. capacity (20 hour rate).
Starting Capacity—115 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.3 minutes. Five second voltage—4.2 volts.
Grounded Terminal—Negative (—) terminal. Grounded to rear of transmission case.
Dimensions—Width 7". Length 10 9/16". Height 7 7/16".
Location—Right side under front floor.

BATTERY—COMMERCIAL AND TRUCKS:—Delco, Type 15-X (Chevrolet), 15-AA (Delco Replacement). 6 volt, 15 plate, 94 AH capacity (20 hour rate).
Grounded Terminal—Negative (—) terminal.
Dimensions—Width 7". Length 8 15/16". Height 8 11/16". All other data same as passenger car battery.

STARTER:—Model 1107001. Armature No. 1867897.
Drive—Overrunning clutch and manual pinion shift operated by starting pedal.
Rotation—Counter-clockwise at commutator end.
Cranking Engine—65 RPM. Approx. 150 amps., 5.5 volts.
Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 " "	Lock	3.37	525

Removal:—Flange mounted on right front face of flywheel housing. To remove, disconnect cable (tape end), ammeter lead and capscrews.
Starting Switch:—Part No. 820052. Mounted on starter. Operated by starting pedal.

GENERATOR—PASSENGER CARS:—Model 1100004. Armature 1866789. Fixed third brush type with external vibrating voltage regulator. Ventilated by fan on pulley.
NOTE—Third brush is clamped in position for maximum safe output and must not be disturbed.
Charging Rate Adjustment—Adjusted by changing setting of voltage regulator. See Regulator data.
Maximum Charging Rate—As given in table below. Reached at car speed of 30-35 M.P.H. To check charging rate, connect test ammeter in line at 'BAT' terminal of regulator, voltmeter between 'GEN' terminal and ground, ground 'F' terminal to eliminate regulator action.
NOTE—Do not operate generator on open circuit.

Performance Data

	Amperes	Volts	R.P.M.
Cold	26-30	8.0	3400
Hot	25-28	8.0	3600

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—22-26 ounces (main), 16-20 ounces (third).
Field Current—2.3-2.6 amperes at 6 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out two pivot, one clamp bolt.
Belt Adjustment:—Loosen clamp bolts and pivot bolt. Swing generator out from engine until sideplay at point midway between fan and generator pulleys is 1½".

GENERATOR—COMMERCIAL AND TRUCKS:—Model 948-R. Armature No. 1853593. Third brush regulation, lighting switch control type. Field resistance on switch is shorted out with lamps 'on', increasing generator output. Special switch position between 'Off' and 'Park' provides this high charging rate with lights off. Ventilated by fan on drive pulley.
See article on Lamp Control Generators in Electri- Equipment Section.
Charging Rate Adjustment—Third brush set for maximum safe output at factory. Manufacturer recommends that position of third brush not be changed. See article on Lamp Control Generators for recommended changes in resistance (on switch) for various operating conditions.
Maximum Charging Rate—21 amperes (cold), 18 amperes (hot), 2400 R.P.M., 27 M.P.H. To check charging rate, ground field terminal on generator to frame, use test ammeter to check output.

Performance Data

	Amperes	Volts	R.P.M.
Cold	19-23	8.4-8.8	2800
Hot	16-20	8.1-8.5	3100

All other data as given above for Model 1100004.

VOLTAGE REGULATOR—PASSENGER CARS:—Model 5814. Cutout Relay and vibrating type Voltage Regulator in case on dash.
See article in Electrical Equipment Section.

Cutout Relay

Cuts In—6.9-7.6 volts.
Cuts Out—0-3.0 amps. maximum discharge.
Contact Gap and Air Gap—.020".

Voltage Regulator

Setting—7.5-7.9 volts at 70° F., 7.4-7.6 volts at 150°F. Regulator is over-compensated for temperature and must be checked at these points.
Adjustment—Disconnect lead on 'IGN' terminal of regulator, connect jumper between 'IGN' and 'BAT' terminals, connect test ammeter in charging line at 'BAT' terminal, connect voltmeter between 'IGN' terminal and ground. Operate generator at 30-35 M.P.H. (or 2800-3000 R.P.M.), adjust charging rate to 8-10 amperes, change regulator armature spring tension by bending spring hanger at lower end of spring slightly until setting is as given above.
Contact Gap—.020". **Contact Sp. Tens.**—2.7-3.5 ozs.
Air Gap—.063" between armature and center of core with armature down and fibre bumper touching stop; .010" between fibre bumper and stop with armature up.

CUTOUT RELAY—COMMERCIAL AND TRUCKS:—Model 265-G. Mounted on generator.
See article in Electrical Equipment Section.
Cuts In—6.75-7.5 volts.
Cuts Out—0-2.5 amperes discharge.
Contact Gap—.020". **Air Gap**—.015".
Armature Spring Tension—3.5 ounces.

LIGHTING:—Headlamps—Guide, Multi-beam, prefocused type. Upper and lower beams controlled by dimmer switch on toeboard with lighting switch in full out position.
Headlamp Adjustment—Aim headlamps straight ahead. Top of beam should be 36¼" (passenger cars). 39½" (½ton), 40" (¾, 1 ton), 43½" (1½ ton or 42" if state law requires) above floor at 25 feet. Horizontal adjusting screw inside lamp (accessible through radiator shell with hood raised), vertical adjusting screw on lower edge of lamp.

Switches

Lighting—D-R Mod. 1994001 (pass), 485-Z (trucks).
Dimmer—Delco-Remy Model 471-P.
Stop Light—D-R Model 476-U. Hydraulic type.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Parking, Instrument	1½	55
Ignition lock lamp	1½	55
Stop (Pass. Cars)	3	63
Stop (Trucks)	15	87
Tail	3	63
Dome	6	81

FUSES:—Lighting—20 ampere on back of ammeter.

HORNS:—Klaxon. Model K-16-2303 (HB), K-26-H-2251 (all others). Single horn, vibrator type.

Type	Current at 6 volts	Air Gap
K-16-2303	5.0-7.5 amperes	.020-.022"
K-26-H-2251	6.5-8.5 amperes	.025-.029"

SERIAL NUMBER:—First number 7,532,801 (Detroit), 9,709,266 (Canada). On right front door hinge post.

ENGINE NUMBER:—First number C-18-1001. Stamped on left side of block between #1 and #2 cylinders.

COMPRESSION:—Ratio and pressure as follows:

Ratio	Pressure at 1000 R.P.M.	At 100 R.P.M.
6.2-1 Std. hd.	140-150 lbs.	Approx. 115 lbs.
7.0-1 Optl. hd.	155-165 lbs.	Approx. 120 lbs.

VACUUM READING:—Gauge should show steady reading of 18-21" with engine idling at 6 M.P.H.

IGNITION:—Coil Model CL-4602, CL-4607. Service coil (less switch and cable) CL-3224-S. Mounted on dash.
Ignition Current—2.5 amperes idling, 5.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, Type 7055. Connected to coil by armored cable.
Ignition Lock—Yale & Towne, Mitchell No. 7075.

Distributor Model IGS-4010C-1. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control.
See Electrical Equipment Section for Distributor servicing data.
Breaker Gap—Set at .020".
Cam Angle or Dwell—38° (closed), 22° (open).
Breaker Arm Spring Tension—18-20 ounces.
Rotation—Clockwise viewed from top.
Condenser—Part IG-3927A. Capacity .25-.28 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral with distributor. Mounted on distributor housing and linked directly to breaker plate. Provides additional advance for speeds above idling except when engine is accelerated or operated with wide open throttle when spark is retarded by return spring within unit.

Vacuum Advance

Distributor Deg.	Engine Deg.	Vacuum (" of HG.)
Start	0	5"
1	2	6"
3	6	8"
5	10	10"
7	14	12"

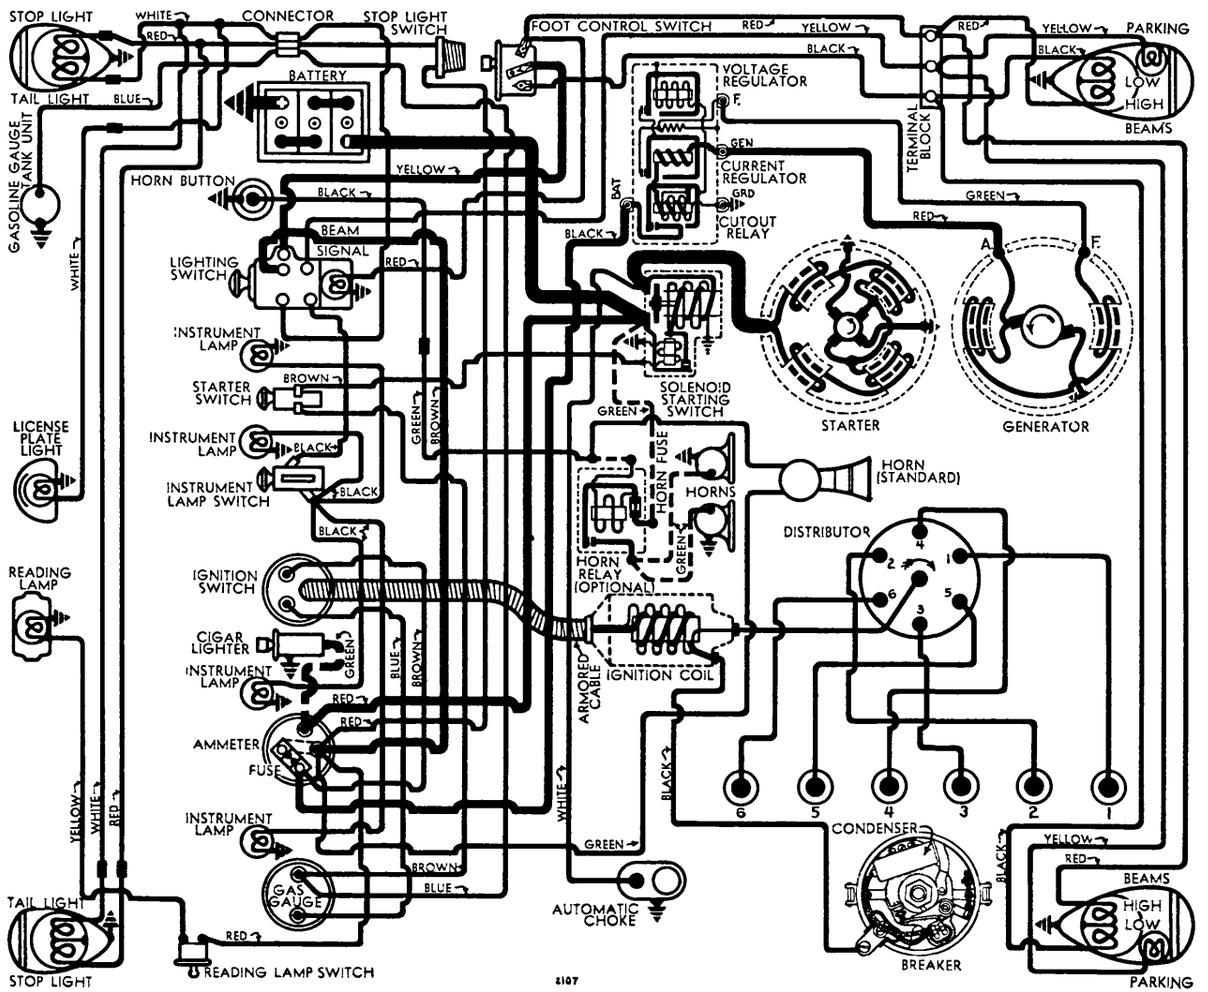
Manual Adjustment—Provided to compensate for fuel and altitude conditions. See Manual Adjustment Setting.

Distributor Removal:—Mounted on left side of crankcase. To remove, take out hold-down screw in advance arm, disconnect vacuum line.

IGNITION TIMING:—Initial setting (for gasoline of approximately 70 octane rating). See Manual Adjustment Setting (following).

	Flywheel Degrees	Piston Position
6.2-1 Std. hd.	0° TDC.	0000" TDC.
7.0-1 Optl. Al. hd.	3° ATDC.	0040" ATDC.

NOTE—Impulse neutralizer at front of engine marked '0' at top dead center with 15 one degree graduations before and after this point.
Timing (Using Timing Light)—Connect timing light between distributor and battery terminal on generator regulator. With #6 piston on compression, turn engine over until piston reaches firing position (see table), stop when correct line on impulse neutralizer lines up with pointer on chain case cover. Loosen distributor hold-down screw, center pointer on scale, tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt.
Motor Gauge—Weidenhoff Adapter #103, Rod #12. NOTE—Use indicator in #6 cylinder.
Timing (Using Synchroscope)—Tool No. C-374. Clip lead to #1 spark plug, direct light on impulse neutralizer, fill in correct mark with white chalk.
See article in Electrical Equipment Section.



Manual Adjustment Setting:—After ignition set as above, road test car and adjust to give slight ping with wide open throttle at speeds of 10-30 MPH. To adjust, loosen hold-down screw and advance (counter-clockwise) retard (clockwise) pointer on scale. Scale graduated in engine degrees. Do not advance pointer more than 5° on scale.

Firing Order:—1-5-3-6-2-4. See diagram.

Spark Plugs:—Champion Type J-8 (cast iron head), H-10 (aluminum head). 14 MM. Metric type.
NOTE—Auto-Lite Type A-7 plugs used on later cars with cast-iron heads only.
Spark Plug Gap—Set at .025".

CARBURETION:—Carburetor—Carter (Ball & Ball) Model E6M1. 1½" downdraft type.
See article in Carburetor Section for data.
Idle Adjustment—With engine warm and choke valve wide open (fast idle inoperative), adjust throttle stopscrew so that idle speed is approximately 300 R.P.M. or 6 M.P.H. Turn idle adjusting screw in until engine begins to hesitate or miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be ½-1¼ turns of screw from inner closed or seated position. Readjust throttle stopscrew for correct idling speed. NOTE—Car manufacturer recommends use of vacuum gauge. Idle screw should be set to give highest reading on gauge.

See Electrical Equipment Section for Regulator wiring with 2 Resistors (After Regulator Serial No. 8R-000001).

Accelerating Pump Setting—Pump lever has three holes for pump link engagement. Set as follows:
Inner Hole (Short stroke)—Extremely warm weather or altitudes above 3000 feet.
Center Hole—Normal summer temperatures.
Outer Hole (Long stroke)—Winter temperatures.
NOTE—Lean main metering jets (high altitude calibration) may be used at lower altitudes for maximum fuel economy although with considerable reduced speed and power. See Carter (B & B) Jet Specifications in Carburetor Section.

Fast Idle:—Integral with carburetor. No adjustment.

Automatic Choke—Sission Type AC-758B. See article in Carburetion Equipment Section for complete data and linkage adjustment.

Air Cleaner:—AC. #1528700 oil-wetted type standard. #1528197 oil-bath type optional used in conjunction with oil vent cleaner #1525313.

Fuel Pump:—AC. Type B #1522995 or AT #1523647 diaphragm type standard. Type AL #1523137 or AS #1523648 combination fuel-and-vacuum pumps optional.
NOTE—Types AT and AS are 'inverted' design.
See article in Carburetion Equipment Section.

Gasoline Gauge:—Auto-Lite (Motometer) Electric. No. NG8733D (dash unit), NG8697T (tank unit).
See article in Carburetion Equipment Section.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. On end of valve shaft next to counterweight and silencer.
Setting—Wind up thermostatic coil one-half turn counter-clockwise and hook end on stop pin on manifold.

VALVE TIMING:—To Check Timing—Set tappet clearance #1 intake valve at .014". This valve should open with piston 8° (.0281") before top dead center with 8° BTDC. mark on impulse neutralizer at front of engine lines up with pointer on chain case cover. Reset tappet clearance at .008" (hot).
Motor Gauge—Weidenhoff Adapter #103, Rod #12.

Tappet Clearance:—.008" Intake, .010" Exhaust (hot).
NOTE—.002" additional Exhaust tappet clearance recommended for sustained high speed driving.

Valve Spring Pressure:—40-45 lbs. at 1¾" (valve closed). 101-109 lbs. at 1 13/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—30-45 lbs. at 30 M.P.H.

BATTERY:—Willard, Type WH 2-15, RH 2-15 (Export). 6 volt, 15 plate, 119 AH. capacity (20 hr. rate).
Starting Capacity—140 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.3 minutes. Five second voltage—4.23 volts.
Grounded Terminal—Positive (+) terminal. Grounded to transmission.
Dimensions—Length 10 5/16". Width 7 1/16". Height 9 5/16".
Location—Left side under drivers seat.

STARTER:—Model MAX-4020A. Armature MAW-2030.
Drive—Solenoid operated pinion shift type. Drive through overrunning clutch.
Cranking Engine—Approx. 160 amperes, 5 volts.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
.65 " "	3300	5.5	100
2.75 " "	1630	5.0	200
5.5 " "	970	4.5	300
8.7 " "	600	4.0	400
12.0 " "	300	3.5	500
16.5 " "	Lock	3.	640
25.0 " "	Lock	4.	880

Removal:—Flange mounted on left front face of flywheel housing. Disconnect wire connections (tape battery lead) and oil filter lines. Remove two fastening bolts and withdraw unit.
Starting Switch:—Solenoid Switch Type SS-4206. Controlled through relay by pushbutton on instrument panel. Operative with ignition 'on'.

Solenoid Switch

Closes against 170 lb. pull with ⅜" air gap drawing 65 amperes. Holds switch closed with draw of 15 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—3.5-4.5 volts. **Open**—1.5-2.5 volts.
Contact Gap—.025-.030". **Air Gap**—.005-.007" (closed).

GENERATOR:—Model GDA-4801A, B (Export). Armature No. GDA-2006F. Two brush, straight shunt type with external voltage and current regulation. Ventilated by fan on drive pulley.
Charging Rate Adjustment—No adjustment at generator. See Regulator section for Voltage and Current settings.
Maximum Charging Rate—28 amperes, 8.00 volts, 2025 R.P.M. and above with load or discharged battery. (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and is dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	930	0	6.4	1010
4	6.6	1060	4	6.6	1180
8	6.85	1210	8	6.85	1350
12	7.1	1350	12	7.1	1530
16	7.3	1500	16	7.3	1730
20	7.5	1660	20	7.5	1950
24	7.75	1830	24	7.75	2220
28	8.0	2025	28	8.0	2520

NOTE—Current reg. limits output to 28 amps.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.66-1.84 amperes at 6.0 volts.
Motor Current—3.50-4.15 amperes at 6.0 volts.
